The bag net just described is practically a floating stake net. A simpler form is used in the Elbe, consisting of a pyramidal net whose mouth is held open by its sides being attached to spars, weighted at one end and buoyed at the other. This is the simplest form of stow net. The stow net is used in the Thames and Wash; it is specially designed for the capture of sprats, although many young herrings are sometimes caught, and it is worked most extensively at the entrance of the Thames. The stow net is a gigantic funnel-shaped bag having nearly a square mouth, 30 ft. from the upper to the lower side, and 21 ft. wide. It tapers for a length of about 90 ft. to a diameter of 5 or 6 ft., and further diminishes to about half that size for another 90 ft. to the end of the net. The whole net is therefore about 180 ft. or 60 yards long. The upper and lower sides of the square mouth are kept extended by two horizontal wooden spars called "balks," and the lower one is weighted so as to open the mouth of the net in a perpendicular direction when it is at work. The size of the meshes varies from $1\frac{3}{8}$ in. near the mouth to $\frac{1}{2}$ in. towards the end, where, however, it is again slightly enlarged to allow for the greater pressure of the water at that part. The mode of working the net is very simple. Oyster smacks are commonly used in this fishery, although shrimping boats are also employed in it in the Thames. The smack takes up a position at the first of the tide where there are signs of fish, or in such parts of the estuary as are frequented by the sprats during that part of the season; she then anchors, and at the same moment the net is put overboard and so handled that it at once takes its proper position, which is under the vessel. It is kept there by a very simple arrangement. Four ropes leading, one from each end of the two balks, and therefore from the four corners of the mouth of the net, are united at some little distance in front, forming a double bridle, and a single mooring rope leads from this point of union to the vessel's anchor; so that the same anchor holds both the vessel and the net. The net is kept at any desired distance from the bottom by means of two ropes, one from each end of the upper balk to the corresponding side of the smack, where it is made fast. The open mouth of the net is thus kept suspended below the vessel, and the long mass of netting streams away astern with the tide. The strain of this immense bag-net by the force of the tide is often very great, but if the vessel drags her anchor, the net being made fast to the same mooring, both keep their relative positions. Here they remain for several hours till the tide slackens, the vessel's sails being all taken in and only one hand being left on deck to keep watch. The way in which the fish are caught hardly requires explanation. The sprats, swimming in immense shoals, are carried by the tide into the open mouth of the net and then on to the small end, where they are collected in enormous numbers; from this there is no escape, as the crowd is constantly increasing, and they cannot stem the strong tide setting into the net. The first thing to be done in taking in the net is to close the mouth, and this is effected by means of a chain leading from the bow of the vessel through an iron loop in the middle of the upper balk down to the centre of the lower one, and by heaving in this chain the two balks are brought together and ultimately hoisted out of the water under the vessel's bowsprit. The net is then brought alongside and overhauled till the end is reached, and this is hoisted on board. The rope by which it is closed having been cast off, the sprats are then measured into the hold of the vessel by about three bushels at a time, until the net has been emptied. The quantity of sprats taken in this manner by many scores of fishing craft during the season, which lasts from November to February, is in some years simply enormous; the markets at Billingsgate and elsewhere are inundated with them, and at last in many years they can only be disposed of at a nominal price for manure; and in this way many hundreds of tons are got rid of. The stow boats do not generally take their fish on shore, but market boats come off to them and buy the fish out of the vessel's hold, and carry it away. The mode of working is the same in the Solent and the Wash as that we have described in the Thames and large quantities of sprats are landed by the Southampton boats.

Stow Nets.

"Whitebait," or young sprats, mixed with some young herring and other small fish, are caught in the Thames by a net which is practically nothing else but a very small stow net, and it is worked in essentially the same manner. An interesting form of stow net is used in the Channels of the Frisian Island, chiefly during the rush of the ebb-tide, for the capture of rays (principally *Raja clavata*, the Thornback) which are highly valued by the Dutch. It consists of a net shaped like an otter trawl, furnished with otter boards, which are attached to ropes passed to the ends of long booms which project from the sides of the vessel using the net, and also to the two anchors by which the former is anchored.

The remaining stationary nets to be mentioned partake of the nature of traps. The trammel net consists of three nets joined together at the top, bottom and sides. The whole system of nets hangs vertical, the head line being buoyed and the ground line weighted. The two outer nets are much smaller than the inner net, but of wide-meshed netting, whereas the inner net is of very small mesh. Consequently, a fish meeting an outer net passes through it, strikes the fine-meshed net and forces it before it through one of the meshes of the farther wide-meshed net; it is thus in a small pocket from which it cannot escape.

Trammel Nets.

The hose net is a long cylindrical net from which trap-like pockets open. The main cavity is kept open by rigid rings. The hose nets are set between tide marks, at low water, so that the tide runs through them; and they are emptied at next low tide.

Hose Net.

While unimportant compared with the huge quantity of fish landed from sea-going vessels, the catch of the in-shore nets described is of importance in respect of the kinds of fish taken, whitebait and pilchards, for instance, being not otherwise obtained, while salmon, though taken in rivers as well as in estuaries and along the coast, is very rarely captured at sea.

TRAY, a flat receptacle with a raised edge used for a variety of purposes, chiefly domestic. The tray takes many forms—oblong, circular, oval, square—and is made in a vast number of materials, from papier mâché to the precious metals. Duke Charles of Lorraine had a pen-tray of rock crystal standing on golden feet; Marie-Antoinette possessed a wonderful oval tray, silver gilt and enamelled, set with 144 cameos engraved with the heads of sovereigns and princes of the house of Austria, and their heraldic devices. The tea-tray is the most familiar form; next to it comes the small round tray, usually of silver or electro-plate, chiefly used for handing letters or a glass of wine. When thus employed it is usually called a "waiter." The English tea-trays of the latter part of the 18th century were usually oval in shape and sometimes had handles; mahogany and rosewood were the favourite materials. Sheraton and Shearer, among other cabinet-makers of the great English period, are credited with trays of this type. These were succeeded in the early and mid-Victorian period by trays of japanned iron, which possessed no charm but had the virtue of durability. Sheffield plate snuffer-trays of satisfying simplicity were made in large numbers, and are now much sought after.

TRAZ-OS-MONTES (*i.e.* across the Mountains), an ancient frontier province in the extreme N.E. of Portugal, bounded on the N. and E. by Spain, S. by the river Douro which separates it from Beira, and W. by the Gerez, Cabreira and Marão Mountains, which separate it from Entre-Minho-e-Douto. Pop. (1900), 427,358; area, 4,163 sq. m. For administrative purposes Traz-os-Montes was divided in 1833 into the districts of Braganza (*q.v.*) and Villa Real (*q.v.*). The surface is generally mountainous, although there are tracts of level land in the *veigas* or cultivated plains of Chaves and Miranda do Douro, and in the *cimas* or plateau region of Mogadouro. The highest peak is Marão (4642 ft.). The province belongs to the basin of the Douro and is chiefly drained by its tributaries the Tua, Tamega and Sabor. Its inhabitants belong to the old Portuguese stock, and resemble the Spaniards of Galicia in physical type, dialect and character. The Paiz do Vinho (see Oporto) is the chief wine-growing district in Portugal; other products are silk, maize, wheat, rye, hemp, olive oil and honey. There are important mineral springs and baths at Vidago and Pedras

Salgadas. The principal towns are Braganza, Chaves and Villa Real.

TREACLE, the thick viscid syrup obtained in the early processes of refining sugar, the uncrystallizable fluid obtained in the process of procuring refined crystallized sugar being known as "golden syrup" and the drainings from the crude sugar as "molasses" (see SUGAR: *Manufacture*). The word was properly and first used for a medical compound of varying ingredients which was supposed to be a sovereign remedy against snake bites or poison generally. A well-known specific was Venice treacle, *Theriaca Andromachi*, a compound of a large number of drugs reduced to an electuary,[1] a medicinal compound prepared with honey, which dissolves in the mouth. The old French *triacle*, of which "treacle," earlier "triacle," is an adaptation, is a corruption of *theriaque*, Latin *theriaca*, Greek θηριακά (*sc.* φάρμακα), literally drugs used as an antidote against the bite of poisonous or wild animals (θήριον, dim. of θήρ, wild beast). The word "triacle" came to be used of any remedy or antidote. The composition of electuaries with honey or syrup naturally transferred the name to the most familiar syrup, that obtained from the drainings of sugar.

TREAD-MILL, a penal appliance introduced by Sir William Cubitt in 1818 and intended by him as a means of employing criminals usefully. It was a large hollow cylinder of wood on an iron frame, round the circumference of which were a series of steps about 7½ in. apart. The criminal, steadying himself by hand-rails on either side, trod on these, his weight causing the mill to revolve and compelling him to take each step in turn. In the brutalizing system formerly in vogue the necessary resistance was obtained by weights, thus condemning the offender to useless toil and defeating the inventor's object. The tread-mill, however, was subsequently utilized for grinding corn, pumping water and other prison purposes. The speed of the wheel was regulated by a brake. Usually it revolved at the rate of 32 ft. per minute. The prisoner worked for 6 hours each day, 3 hours at a time. He was on the wheel for 15 minutes and then rested for 5 minutes. Thus in the course of his day's labour he climbed 8640 ft. Isolation of prisoners at their work was obtained by screens of wood on each side of the mill, converting the working space into a separate compartment. Each prisoner was medically examined before going to the mill.

By the Prison Act 1865 every male prisoner over 16, sentenced to hard labour, had to spend three months at least of his sentence in labour of the first class. This consisted primarily of the tread-mill, or, as an alternative, the crank. The latter consisted of a small wheel, like the paddle-wheel of a steamer, and a handle turned by the prisoner made it revolve in a box partly filled with gravel. The amount of gravel regulated the hard labour; or the necessary resistance was obtained by a brake, by which a pressure, usually of 12 lb, was applied. The prisoner had to make 8000 or 10,000 revolutions during his 6 hours' work, according to his strength, the number being registered on a dial. The crank too, however, was subsequently made to serve useful purposes. Both tread-mill and crank have gradually been abolished; in 1895 there were 39 tread-mills and 29 cranks in use in English prisons, and these had dwindled down to 13 and 5 respectively in 1901. They are now disused.

The fundamental idea of Cubitt's invention, *i.e.* procuring rotary motion for industrial purposes by the weight of men or animals, is very old. "Tread-wheels," of this type, usually consist of hollow cylinders, round the inner surface of which a horse, dog or man walks, foothold being kept by slabs of wood nailed across at short intervals.

TREASON (Fr. *trahison*, Lat. *traditio*), a general term for the crime of attacking the safety of a sovereign state or its head. The law which punishes treason is a necessary consequence of the idea of a state, and is essential to the existence of the state. Most, if not all, nations have accordingly, at an early period of their history, made provision by legislation or otherwise for its punishment. The principle is universal, though its application has led to differences of opinion. What would have been a capital crime at Rome under Tiberius may be no offence at all in England. It is to the advantage of the state and the citizen that what is treason and what is not should be clearly defined, so that as little as possible discretionary power, apt to be strained in times of popular excitement, should be left to the judicial or executive authorities. The importance of this was seen by Montesquieu. Vagueness in the crime of treason, says he, is sufficient to make the government degenerate into despotism.[2] At the same time, it may be observed that despotic governments have not always left the crime undefined. The object of Henry VIII., for instance, was rather to define it as closely as possible by making certain acts treason which would not have been so without such definition. In both ancient and modern history treason has generally been a crime prosecuted by exceptional procedure, and visited with *afflictive* as distinguished from *simple* punishments (to use the terminology of Bentham).

Roman Law.—In Roman law the offences originally falling under the head of treason were almost exclusively those committed in military service, such as in England would be dealt with under the Army Act. The very name *perduellio*, the name of the crime in the older Roman law, is a proof of this. *Perduelles* were, strictly, public enemies who bore arms against the state; and traitors were regarded as having no more rights than public enemies. The Twelve Tables made it punishable with death to communicate with the enemy or to betray a citizen to the enemy. Other kinds of *perduellio* were punished by interdiction of fire and water. The crime was tried before a special tribunal, the *duumviri perduellionis*, perhaps the earliest permanent criminal court existing at Rome. At a later period the name of *perduellio* gave place to that of *laesa majestas*, *deminuta* or *minuta majestas*, or simply *majestas*. The *lex Julia majestatis*, to which the date of 48 B.C. has been conjecturally assigned, continued to be the basis of the Roman law of treason until the latest period of the empire, and is still, with the law of *perduellio*, the basis of the law of British South Africa as to treason. The original text of the law appears to have still dealt with what were chiefly military offences, such as sending letters or messages to the enemy, giving up a standard or fortress, and desertion. With the empire the law of *majestas* received an enormous development, mainly in the reign of Tiberius, and led to the rise of a class of professional informers, called *delatores*.[3] The conception of the emperor as divine[4] had much to do with this. It became a maxim that treason was next to sacrilege[5] in gravity. The law as it existed in the time of Justinian is contained chiefly in the titles of the *Digest*[6] and *Code*[7] "*Ad legem Juliam majestatis.*" The definition given in the *Digest* (taken from Ulpian) is this: "majestatis crimen illud est quod adversus populum Romanum vel adversus securitatem ejus committitur." Of treasons other than military offences, some of the more noticeable were the raising of an army or levying war without the command of the emperor, the questioning of the emperor's choice of a successor, the murder of (or conspiracy to murder) hostages or certain magistrates of high rank, the occupation of public places, the meeting within the city of persons hostile to the state with weapons or stones, incitement to sedition or administration of unlawful oaths, release of prisoners justly confined, falsification of public documents, and failure of a provincial governor to quit his province at the expiration of his office or to deliver his army to his successor. The intention (*voluntas*) was punishable as much as an overt act (*effectus*).[8] The reported opinions as to what was not treason

[1] Electuary (Lat. *electuarium*), is probably derived from Gr. ἐκλεικτόν, used in the same sense, from ἐκλείχειν, to lick out.

[2] *Esprit des lois*, bk. xii. c. 7.

[3] See Merivale, *History of the Romans under the Empire*, iii. 467, v. 141.

[4] "Principes instar deorum esse" are the words of Tacitus.

[5] This crime was called *laesa majestas divina* in later law.

[6] xlviii. 4.

[7] ix. 8.

[8] A similar provision was contained in the Golden Bull of Charles IV. c. 24. In English law, with the one exception of a statute of 1397 (21 Ric. II. c. 3) repealed in the first year of Henry IV.,

show the lengths to which the theory of treason was carried. It was not treason to repair a statue of the emperor which had decayed from age, to hit such a statue with a stone thrown by chance, to melt down such a statue if unconsecrated, to use mere verbal insults against the emperor, to fail in keeping an oath sworn by the emperor or to decide a case contrary to an imperial constitution. Treason was one of the *publica judicia, i.e.* one of those crimes in which any citizen was entitled to prosecute. The law deprived the accused in a charge of treason of his ordinary remedy for malicious prosecution, and also took from him the privilege (which those accused of other crimes generally possessed) of immunity from accusation by women or infamous persons, from liability to be put to the torture, and from having his slaves tortured to make them testify against him (see TORTURE). The punishment from the time of Tiberius was death (usually by beheading)[1] and confiscation of property, coupled with complete civil disability. A traitor could not make a will or a gift or emancipate a slave. Even the death of the accused, if guilty of treason of the gravest kind, such as levying war against the state, did not extinguish the charge, but the memory of the deceased became infamous, and his property was forfeited as though he had been convicted in his lifetime.

English Law.—The law of England as to treason corresponds to a considerable extent with Roman law; in fact, treason is treated by Blackstone as the equivalent of the *crimen laesae majestatis.* The history of the crime in the two systems agrees in this that in both the law was settled by legislation at a comparatively early period, and subsequently developed by judicial construction. In both, too, there were exceptional features distinguishing this crime from other offences.[2] For instance, at common law treason was not bailable (except by the king's bench) nor clergyable, could not be cleared by sanctuary, and did not admit of accessories before or after the fact, for all were principals, nor could a married woman plead coercion by her husband. To stand mute and refuse to plead did not save the lands of the accused, as it did in felony, so that the *peine forte et dure* (see TORTURE) was unnecessary in treason. These severities were due to the conception of treason as a breach of the oath of allegiance. Other differences introduced by statute will be mentioned later. In some cases a statute simply affirmed the common law, as did the Treason Act 1351 to a great extent, and as did an act of 1534, depriving those accused of treason of the benefit of sanctuary. How far the Roman law was consciously imitated in England it is impossible to determine. It was certainly not adopted to its full extent, for many acts were *majestas* which were never high treason, even in the most despotic periods. Treason was the subject of legislation in many of the pre-Conquest codes. The laws of Alfred[3] and Æthelred[4] punished with death any one plotting against the life of the king. The *Leges Henrici Primi*"[5] put anyone slaying the king's messenger in the king's mercy. The crime was shortly defined by Glanvill,[6] and at a greater length by Britton,[7] and by Bracton,[8] who follows Roman law closely.

The offence of high treason was not precisely defined by the common law (1 Hale, 76), and until the passing of the Treason Act 1351 depended much on the opinions of the king and his judges. That statute appears to be the answer to a petition of the Commons in 1348 (1 Hale, 87), praying for a definition of the offence of accroaching royal power, a charge on which several persons—notably Gaveston and the Despensers—had suffered. The offences made high treason by the statute which still remain are these: (1) to compass or imagine[9] the death of the king,[10] the queen or their eldest son and heir; (2) to violate the king's companion, or his eldest daughter unmarried, or the wife of his eldest son and heir; (3) to levy war against the king in his realm, or be adherent to the king's enemies in his realm, giving them aid and comfort in the realm or elsewhere (*perduellio*); (4) to slay the chancellor, treasurer, or the king's justices of the one bench or the other, justices in eyre, or justices of assize, and all other justices assigned to hear and determine, being in their places doing their offices. In all cases of treason not specified in the statute the justices before whom the case came are to tarry without going to judgment until the cause has been showed and declared before the king and his parliament whether it ought to be judged treason or felony. The statute, so far as it defines the offence of high treason, is still law.

The statute also treated as high treason forgery of the great or privy seal, counterfeiting the king's coin and importing counterfeits thereof. These offences are now felonies. It also defined petty treason (now merged in wilful murder) as the slaying of a master by his servant, a husband by his wife, or a prelate by a man secular or religious owing him allegiance. The act of 1351 protects only the king's life, and its insufficiency was supplemented in periods of danger by legislation, often of a temporary nature. Under Richard II. many new offences were made treason,[11] but the acts creating these new treasons were repealed at the earliest opportunity by the parliaments of his successors. The reign most prolific in statutory additions to the law of treason was that of Henry VIII. Legislation in this reign was little more than a register of the fluctuating opinions of the monarch. Thus, by one act of 1534 it was treason not to believe Mary illegitimate and Elizabeth legitimate; by another act of 1536 it was treason to believe either legitimate; by an act of 1543 it was treason not to believe both legitimate. Another act of this reign (1545) shows that a class of men like the Roman *delatores* must have been called into existence by all the new legislation. The act made it felony to make anonymous charges of treason without daring to appear in support of them before the king or council. These acts were repealed in 1553 (1 Mar. st. 1. c. 1. s. 1.) and the act of 1351 was made the standard of the offence.

Besides the acts of 1351 and 1553 the following statutes are still in force with respect to the substantive law of treason. By an obscurely penned statute of 1495 (11 Hen. VII. c. 1. s. 1) persons serving the king for the time being in war are not to be convicted or attainted of treason; see Steph., *Dig. Cr. Law* (6th ed.), article 56. This statute has been held not to apply in British South Africa.

By an act of 1571 (13 Eliz. c. 2) as a counterblast to papal attacks on the right of Elizabeth to the English crown, it was declared that persons using in England papal bulls offering absolution and reconciliation to persons forsaking their due obedience to the English crown should be punishable as traitors. The penalties were abolished in 1846, but the acts against which the statute was aimed were declared to be still unlawful (see Steph., *Dig. Cr. Law*, 6th ed., p. 45*n*.). By an act of 1702 (1 Anne st. 2. c. 21 s. 3) it is treason to endeavour to hinder the next successor to the crown from succeeding, and by the Succession to the Crown Act 1707 it is treason maliciously, advisedly and directly by writing or printing to maintain and affirm that any person has a right to the crown otherwise than according to the Acts of Settlement and Union, or that the crown and parliament cannot pass statutes for the limitation of the succession to the crown.

By an act of 1796, made perpetual in 1817, the definition of treason is extended so as to include plots within or without Great Britain to cause the death or destruction, or any bodily harm tending to the death, destruction, maiming, or wounding, imprisonment or restraint of the king, if such plots are expressed by publishing any printing or writing, or by any overt act or deed. Since that date no new forms of treason have been created. There are many instances of offences temporarily made treason at different times. A

an overt act has always been necessary. The difficulty of proving a mere intention is obvious. In French and German law the overt act (*Attentat* or *Unternehmen*) is as indispensable as in English.

[1] To harbour a fugitive enemy was punishable only by deportation, *Dig.*, xlviii. 19, 40.

[2] The position of treason as a special crime prosecuted by special procedure is one common to most legal systems at some period of their existence. For instance, in Germany, by a constitution of Henry VII. the procedure was to be summary, *sine strepitu et figura judicii.*

[3] c. 4. [4] v. 30. [5] lxxix. 2.
[6] xiv. 1. [7] cc. 20, 21, 22. [8] de Corona 118*b*.

[9] These words, according to Luders (*Law Tracts*, note *ad fin.*), mean to attempt or contrive.

[10] This by act of 1553 includes a queen regnant.

[11] One reason for making offences treason rather than felony was no doubt to give the Crown rather than the lord of the fee the right to the real estate of the criminal on forfeiture. Had the offences been felony the king would have had only his year, day and waste on the estate escheating to the lord, as was the case in treason before the Statute of Treasons.

few of the more interesting may be briefly noticed. It was treason to attempt to appeal or annul judgments made by parliament against certain traitors (1398); to break a truce or safe-conduct (1414–1450); to hold castles, fortresses or munitions of war against the king (1552); to adhere to the United Provinces (1665); to return without licence if an adherent of the Pretender (1696); to correspond with the Pretender (1701); and to compass or imagine the death of the prince regent (1817). In addition to these, many acts of attainder were passed at different times. One of the most severe was that against Catherine Howard (1541), which went as far as to make it treasonable for any queen to conceal her ante-nuptial incontinence. Other acts were those against Archbishop Scrope, Owen Glendower, Jack Cade, Lord Seymour, Sir John Fenwick, James Stuart and Bishop Atterbury. In one case, that of Cromwell, Ireton and Bradshaw, an act of attainder was passed after the death of those guilty of the treason (1660), and their bodies were exhumed, beheaded and exposed. Acts of indemnity were passed to relieve those who had taken part in the suppression of rebellion from any possible liability for illegal proceedings. Three such acts were passed in the reign of William III. (1689–1690). Similar acts were passed after the Irish rebellion of 1798.

Punishment.

The punishment of treason at common law was barbarous in the extreme.[1] The sentence in the case of a man was that the offender be drawn on a hurdle to the place of execution, that there he be hanged by the neck but not till he be dead, and that while yet alive he be disembowelled and that then his body be divided into four quarters, the head and quarters to be at the disposal of the Crown.[2] Until 1790 at common law a woman was drawn to the place of execution and there burned. In that year hanging was substituted for burning in the case of female traitors. In 1814 the part of the sentence relating to hanging and to disembowelling was altered to hanging until death supervened. Drawing and beheading and quartering after hanging were abolished in 1870. There is no legislation authorizing the execution of traitors within the walls of a prison as in the case of murder (see CAPITAL PUNISHMENT). The act of 1814 in the case of men enables the Crown, by warrant under the sign manual, countersigned by a secretary of state, to change the sentence to beheading. Attainder and forfeiture for treason are abolished by the Forfeitures Act 1870, except where the offender has been outlawed.[3] The maximum penalty for a felony under the act of 1848 is penal servitude for life. In every pardon of treason the offence is to be particularly specified therein (see PARDON).

Trials for treason in Great Britain and Ireland were at one time frequent and occupy a large part of the numerous volumes of the *State Trials*. Some of the more interesting may be mentioned. Before the Statute of Treasons were those of Gaveston and the Despensers in the reign of Edward II. on charges of accroaching the royal power. After the statute were those (some before the peers by trial or impeachment, most before the ordinary criminal courts) of Empson and Dudley, Fisher, More, the earl of Surrey, the duke of Somerset, Anne Boleyn, Lady Jane Grey, Sir Thomas Wyatt, Cranmer, the queen of Scots, Sir Walter Raleigh, Strafford, Laud, Sir Henry Vane and other regicides, William Lord Russell, Algernon Sydney, the duke of Monmouth, and those implicated in the Pilgrimage of Grace, the Gunpowder, Popish, Rye House and other plots. Cases where the proceeding was by bill of attainder have been already mentioned. Occasionally the result of a trial was confirmed by statute. In some of these trials, as is well known, the law was considerably strained in order to insure a conviction. Since the Revolution there have been the cases of those who took part in the risings of 1715 and 1745, Lord George Gordon in 1780, Thomas Hardy and Horne Tooke in 1794, the Cato Street conspirators in 1820, Thomas Frost in 1840, Smith O'Brien in 1848, and in 1903 Arthur Lynch, for adhering to, aiding and comforting the king's enemies in the South African war.[4] The bulk of the treason trials are reported in Howell's *State Trials* and the *New Series of State Trials*. The statute of 1351 as interpreted by the judges in these cases is still the standard by which an act is determined to be treason or not. The judicial interpretation has been sometimes strained to meet cases scarcely within the contemplation of the framers of the statute: *e.g.* it became established doctrine that a conspiracy to levy war against the king's person or to imprison or depose him might be given in evidence as an overt act of compassing his death, and that spoken words, though they could not in themselves amount to treason, might constitute an overt act, and so be evidence. Besides decisions on particular cases, the judges at different times came to general resolutions which had an appreciable effect on the law. The principal resolutions were those of 1397 (confirmed 1398), of 1557, and those agreed to in the case of the regicides at the Restoration and reported by Sir John Kelyng. The effect of this legislation, according to Sir James Stephen, is that such of the judicial constructions as extend the imagining of the king's death to imagining his death, destruction or any bodily harm tending to death or destruction, maim or wounding, imprisonment or restraint, have been adopted, while such of the constructions as make the imagining of his deposition, conspiring to levy war against him, and instigating foreigners to invade the realm, have not been abolished, but are left to rest on the authority of decided cases. The legislation in force in 1878 as to treason and kindred offences was collected by the late Mr R. S. Wright and its substance embodied in a draft consolidation bill (Parl. Pap. 1878 H. L. 178), and in 1879 the existing law was incorporated in the draft criminal codes of 1879. The code draws a distinction between treason and treasonable crimes, the former including such acts (omitting those that are obviously obsolete) as by the Treason Act 1351 and subsequent legislation are regarded as treason proper, the latter including the crimes contained in the Treason Felony Act 1848.

In the words of the draft (§ 76) "treason is (*a*) the act of killing Her Majesty, or doing her any bodily harm tending to death or destruction, maim or wounding, and the act of imprisoning or restraining her; or (*b*) the forming and manifesting by an overt act an intention to kill Her Majesty, or to do her any bodily harm tending to death or destruction, maim or wounding, or to imprison or to restrain her; or (*c*) the act of killing the eldest son and heir-apparent of Her Majesty, or the queen consort of any king of the United Kingdom of Great Britain and Ireland; or (*d*) the forming and manifesting by an overt act an intention to kill the eldest son and heir-apparent of Her Majesty, or the queen consort of any king of the United Kingdom of Great Britain and Ireland; or (*e*) conspiring with any person to kill Her Majesty, or to do her any bodily harm tending to death or destruction, maim or wounding, or conspiring with any person to imprison or restrain her; or (*f*) levying war against Her Majesty either with intent to depose Her Majesty from the style, honour and royal name of the Imperial Crown of the United Kingdom of Great Britain and Ireland or of any other of Her Majesty's dominions or countries; or in order by force or constraint to compel Her Majesty to change her measures or counsels, or in order to intimidate or overawe both Houses or either House of Parliament; or (*g*) conspiring to levy war against Her Majesty with any such intent or for any such purpose as aforesaid; or (*h*) instigating any foreigner with force to invade this realm or any other of the dominions of Her Majesty; or (*i*) assisting any public enemy at war with Her Majesty in such war by any means whatsoever; or (*j*) violating, whether with her consent or not, a queen consort, or the wife of the eldest son and heir-apparent for the time being of the king or queen regnant."

No amount of residence abroad exempts a British subject from the penalty of treason if he bears arms against the king,[5] unless he has become naturalized as the subject of a foreign state before the outbreak of the war in which he bears arms. To become naturalized as the subject of an enemy during a war is in itself an act of treason. It is well established that an alien resident within British territory owes local allegiance to the Crown and may be indicted for high treason, and there are numerous instances of prosecution of foreigners for treason. Such are the cases of Leslie, bishop of Ross, ambassador to Elizabeth from the queen of Scots (1584), the marquis de Guiscard in Queen Anne's reign and Gyllenborg, the ambassador from Sweden to George I. (1717). Proceedings against ambassadors for treason have never gone beyond imprisonment, more for safe custody than as a punishment. In 1781 La Motte, a Frenchman resident in England, was convicted of holding treasonable communications with France, and in Canada American citizens were tried for treason for aiding in the rebellion of 1837–1838 (Forsyth, 200). Assistance by a resident alien to invaders of British territory is high treason even if the territory in question is in military occupation by the forces of the foreign power.[6]

Court and Place of Trial.

Of the modes of trying high treason two are obsolete, viz. (1) by appeal in the common law courts, which ceased by the effect of statutes between 1322 and 1399 and were finally abolished in 1819; (2) before the constable and marshal. The last instance of this mode of trial was an

[1] The exceptional character of the punishment, like that of the procedure, may be paralleled from Germany. The punishment of traitors by Frederick II. by wrapping them in lead and throwing them into a furnace is alluded to by Dante, *Inferno*, xxiii. 66.

[2] See the sentence in full in Latin in *R.* v. *Walcot*, 1696, 1 Eng. Rep. 87.

[3] Proceedings after the death of an alleged traitor might at one time have been taken, but only to a very limited extent as compared with what was allowed in Roman and Scots law. Coke (4 *Rep.* 57) states that there might have been forfeiture of the land or goods of one slain in rebellion on view of the body by the lord chief justice of England as supreme coroner.

[4] 1903, 1 K.B. 446. He was sentenced to death. The sentence was commuted to penal servitude for life. Lynch was released on licence after one year in prison and has since been pardoned.

[5] Aeneas Macdonald's case, 18 *St. Tr.* 857; *R.* v. *Lynch* (1903) 1 K.B. 446—see Mayne, *Ind. Cr. Law* (1896), pp. 459, 460.

[6] De Jager's case (1907) App. Cas. 326.

award of battle in 1631 in the case of Lord Reay.[1] Four modes of trying high treason still remain, viz. impeachment, trial of a peer by his peers, trial by court-martial and trial by jury on indictment before the High Court or a court of assize or a special commission. The offence is not triable at quarter sessions.

At common law and under the Great Charter a peer, and, by an act of 1442, a peeress in right of her husband, are triable for treason before the House of Lords, or, when parliament is not sitting, in the court of the lord high steward. The last trial of a peer for treason was that of Lord Lovat in 1746–1747 (18 Howell's *St. Tr.* 529).

In the reign of Edward IV., and perhaps later, treason was at times tried by martial law. The issue of commissions of martial law in time of peace was in 1628 declared illegal by the Petition of Right. But the prerogative of the Crown to deal by martial law with traitors in time of war or open rebellion within the realm or in a British possession still exists.[2]

Treasons committed within the admiralty jurisdiction or out of the realm were originally triable only by the admiral or the constable and marshal according to the civil law, but were made triable according to the courts of the common law by the Offences at Sea Act 1536, and by acts of 1543, 1552[3] and 1797. Provision is made for the trial in British possessions of treasons committed in the admiralty jurisdiction (Offences at Sea Act 1806).

Treasons committed within the realm are tried in the High Court, the central criminal court or another court of assize, or by special commission, except in the case of peers. In two acts dealing with Ireland (of 1809 and 1833) it was provided that nothing in the acts was to take away the undoubted prerogative of the Crown for the public safety to resort to the exercise of martial law against open enemies and traitors, while actual war or insurrection is raging (see MARTIAL LAW).[4] Treason by persons subject to military law is triable by court-martial under the Army Act (1881) ss. 4, 41 (*a*), where the offence cannot with reasonable convenience be tried in a civil court, and treason by persons subject to naval discipline by court-martial under the Naval Discipline Act (1866) s. 7. The procedure in such trials is regulated by the acts.

Procedure.

In certain cases of treason the procedure on the trial is the same as upon a charge of murder. Those cases, which are statutory exceptions from the statutory procedure prescribed for the trial of high treason and misprision thereof, are: (*a*) Assassination or killing of the king, or any heir or successor of the king, or any direct attempt against his life or any direct attempt against his person whereby his life may be endangered or his person may suffer bodily harm (1800, 1814); (*b*) attempts to injure in any manner the person of the king (1842).

In all other cases of treason the procedure is regulated by acts of 1695, 1708 and 1825. A copy of the indictment must be delivered to the accused ten days at least before his arraignment, with a list of the witnesses for the prosecution (1708) and a list of the petty jury, except in the High Court, where the petty jury list is to be delivered ten days before the trial (1825).[5] The accused is entitled to be defended by counsel, and on application to the court may have two counsel assigned to him (1695), a right extended in 1746 to impeachments for treason. Witnesses for the defence have since 1702 been examinable upon oath. The accused may by the Criminal Evidence Act 1898 consent to be called as witness for the defence. It is doubtful whether the wife or husband of the accused is a compellable witness for the Crown (*Archb. Crim. Pleading*, 23rd ed., 398).

Prosecutions for treason must be begun within three years of the offence, except in cases of attempts to assassinate the king. The rules as to the indictment are stricter than in the case of felony and misdemeanour, much of the modern statutory power of amendment not extending to indictments for the graver offence. No evidence may be given of any overt act (*voie de fait*) not expressly stated in the indictment. The accused is entitled to peremptory challenge of thirty-five of the jurors summoned for the petty jury; but they need not now be freeholders. The accused can be convicted only on his own confession in open court, or by the oath of two witnesses either both to the same overt act charged, or one to one overt act and the other to another overt act of the same treason. If two or more treasons of different kinds are charged on the same indictment, one witness to prove one treason and another to prove another are not sufficient for a lawful conviction. Persons charged with treason are not admitted to bail except by order of a secretary of state or by the High Court (k.b.d.) or a judge thereof in vacation (Indictable Offences Act 1848, s. 23). Witnesses for the defence are examined on oath and their attendance is secured in the same way as that of witnesses for the Crown (1695, 170).

Misprision of Treason.

Misprision of treason consists in the concealment or keeping secret of any high treason. (*a*) This offence was in 1552 declared to be high treason (5 and 6 Edw. VI. c. 11, s. 8), but the former law was restored in 1553–1554 (1 Mary st. i. c. 1 s.1; 1 & 2 Ph. and Mary c. 10, s.7). The definition is vague and the exact scope of the offence uncertain, but in strictness it does not include acts which in the case of felony would constitute an accessory after the fact. In the Queensland Code of 1899 (s. 38) every person is guilty of a crime who, knowing that any person intends to commit treason, does not give information thereof with all reasonable despatch to a justice or use other reasonable endeavours to prevent the commission of that crime. The procedure for the trial of misprision of treason is the same as in the case of high treason. The punishment is imprisonment for life and forfeiture of the offender's goods and of the profits of his lands during his life. (Steph. *Dig. Cr. Law*, 6th ed., 121, 401.) The forfeitures are not abolished by the Forfeitures Act 1870. There is no case of prosecution of this offence recorded during the last century.

Offences akin to Treason.

The necessity of prosecutions for treason has been greatly lessened by a series of statutes beginning in 1744 which provide for the punishment as felonies of certain acts which might fall within the definition of treason, *e.g.* piracies (1744, 18 Geo. II. c. 30), incitement to mutiny (1797), unlawful oaths, including oaths to commit treason (1797, 1812), and aiding the escape of prisoners of war (1812). By the Treason Act 1842 it is a high misdemeanour, punishable by penal servitude for seven years, wilfully to discharge, point, aim or present at the person of the king any gun or other arms, loaded or not, or to strike at or attempt to throw anything upon the king's person, or to produce any firearms or other arms, or any explosive or dangerous matter, near his person, with intent to injure or alarm him or to commit a breach of the peace.[6] The offence is one of the few for which flogging may be awarded.

By the Treason Felony Act 1848, s. 1., it was made a felony within or without the United Kingdom to plot (*a*) to deprive or depose the king from the style, &c., of the imperial crown of the United Kingdom, (*b*) to levy war against the king in any part of the United Kingdom in order by force or constraint to change his measures or counsels or to put force or constraint on or to intimidate or overawe either or both houses of parliament, (*c*) to move or stir any foreigner with force to invade the United Kingdom or any of the king's dominions. The plot to be within the act must be expressed by publishing in printing or writing or by an overt act or deed. "Open and advised speaking," originally included as an alternative, was removed from the act in 1891. For other offences more or less nearly connected with treason reference may be made to the articles: LIBEL; OATHS; PETITION; RIOT; SEDITION.

The act of 1848 does not abrogate the Treason Act of 1351, but merely provides an alternative remedy. But with the exception of the case of Lynch in 1903, all prosecutions in England for offences of a treasonable character since 1848 have been for the felony created by the act of 1848. The trials under the act, mostly in Ireland, are collected in vols. 6, 7 and 8 of the *New Series of State Trials*. The procedure in the case of all the offences just noticed is governed by the ordinary rules as to the trial of indictable offences, and the accused may be convicted even though the evidence proves acts constituting high treason.

Scotland.—Treason included treason proper, or crimes against the Crown or the state, such as rebellion, and crimes which, though not technically treasonable, were by legislation punished as treason. Scottish procedure was as a rule less favourable to the accused than English. In one matter, however, the opposite was the case. Advocates compellable to act on behalf of the accused were allowed him by 1587, c. 57, more than a century before the concession of a similar indulgence in England. At one time trial in absence and even after death was allowed, as in Roman law. In the case of Robert Leslie, in 1540, a summons after death was held by the estates to be competent, and the bones of the deceased were exhumed and presented at the bar of the court.[7] The act of 1542, c. 13 (rep. 1906), confined this revolting procedure to certain treasons of the more heinous kind.

[1] A case of treason out of the realm as to which alone the constable and marshal had jurisdiction (3 Howell's *St. Tr.* 1).

[2] See case of D. F. Marais (1902, App. Cas. 109).

[3] There is no trace of recourse to the act of 1552. In 1903 Arthur Lynch was tried under the act of 1543 for high treason in South Africa, and Lord Maguire in 1645 for treason in Ireland (4 *St. Tr.* 653).

[4] The decisions of courts of martial law appear not to be reviewable by ordinary civil courts (re Marais, 1907, App. Cas. 109).

[5] In these respects persons accused of treason are in a better position than those accused of felony.

[6] This act was passed in consequence of a series of assaults on Queen Victoria. See 4 *St. Tr. N. S.* 1382; 7 *St. Tr. N. S.* 1130, and 8 *St. Tr. N. S.* 1.

[7] In the one instance in England—that of Cromwell, Ireton and Bradshaw—where the bodies of alleged traitors were exhumed after death they were not brought to the bar of a court as in Scotland.

By the Treason Act 1708 trial in absence—the last instance of which had occurred in 1698—was abolished. The same act assimilates the law and practice of treason to that of England by enacting that no crime should be treason or misprision in Scotland but such as is treason or misprision in England. The act further provides for the finding of the indictment by a grand jury as in England and that the trial is to be by a jury of twelve, not fifteen as in other crimes, before the court of justiciary, or a commission of oyer and terminer containing at least three lords of justiciary. To slay a lord of justiciary or lord of session sitting in judgment, or to counterfeit the great seal, is made treason. The act also contains provisions as to forfeiture,[1] qualification of jurors and procedure, which are not affected by the Criminal Procedure (Scotland) Act 1887. The punishment is the same as it was in England before the Forfeitures Act 1870, which does not extend to Scotland; and attainder and forfeiture are still the effects of condemnation for treason in Scotland.

One or two other statutory provisions may be briefly noticed. By acts of 1706 and 1825 the trial of a peer of Great Britain or Scotland for treason committed in Scotland is to be by a commission from the Crown, on indictment found by a grand jury of twelve. Bail in treason-felony is only allowed by consent of the public prosecutor or warrant of the high or circuit court of justiciary (Treason Felony Act 1848, s. 9). The term *lese-majesty* was sometimes used for what was treason proper (*e.g.* in 1524, c. 4, making it lese-majesty to transport the king out of the realm, repealed in 1906), sometimes as a synonym of *leasing-making*. This crime (also called verbal sedition) consisted in the engendering discord between king and people by slander of the king.[2] The earliest act against leasing-making *eo nomine* was in 1524. The reign of James VI. was pre-eminently prolific in legislation against this crime. It is now of no practical interest, as prosecutions for leasing-making have long fallen into desuetude. At one time, however, the powers of the various acts were put into force with great severity, especially in the trial of the earl of Argyll in 1681. The punishment for leasing-making, once capital, is now, by acts of 1825 and 1837, fine or imprisonment or both.

Ireland.—The Treason Act 1351 was extended to Ireland by Poyning's law, but at the union there were considerable differences between the Irish and the English law. The law and practice of Ireland as to treason were assimilated to those of England by acts of 1821 (1 & 2 Geo. IV. c. 24), 1842 (5 & 6 Vict. c. 51), 1848 (11 & 12 Vict. c. 12, s. 2), and 1854 (17 & 18 Vict. c. 56).

Prior to 1854 the provisions as to procedure in the English treason acts did not apply to Ireland (Smith O'Brien's case, 1848, 7 *St. Tr. N. S.* 1). A series of enactments called the "Whiteboy Acts" (passed by the Irish and the United Kingdom parliaments between 1775 and 1831) was intended to give additional facilities to the executive for the suppression of tumultuous risings, and powers for dealing with "dangerous associations" are given by the Criminal Law and Procedure (Ireland) Act 1887. Prosecutions for treason in Ireland were numerous in 1848. Since that date numerous prosecutions have taken place under the Treason Felony Act 1848.

British Possessions.—Numerous temporary acts were passed in India at the time of the Mutiny, one of the most characteristic being an act of 1858 making rebellious villages liable to confiscation. By the Indian Penal Code, s. 121, it is an offence punishable by death or transportation for life and by forfeiture of all property to wage or attempt to wage war against the king. By s. 125 it is an offence punishable by transportation for life (as a maximum) to wage or attempt to wage war against any Asiatic government in alliance or at peace with the king or to abet the waging of such war. By s. 121 A., added in 1870, it is an offence punishable by transportation for life (as a maximum) to conspire within or without British India to commit an offence against s. 121 or to deprive the king of the sovereignty of British India or of any part thereof, or to overawe by criminal force or the show of criminal force the government of India or any local government in India. Other cognate offences are included in the same chapter (vi.) of the Criminal Code.

The Penal Codes of Canada (1892, ss. 65–73) and New Zealand (1893, ss. 77–82) closely follow the provisions of the English draft code of 1879. Prosecutions for treason have been rare in Canada. Those of most note were in 1837, after the rebellion (see the Canadian Prisoners case, 1839, 9 Ad(olphus) El(les) [731]) and of Riel after the Red River rising in 1884 (see *Riel* v. *R.* 1885, 10 App. Cas. 675).

The Commonwealth parliament of Australia has not legislated on the subject of high treason, which is in Australia governed by the laws of the constituent states, *i.e.* by the law of England as it stood when they were colonized, subject to local legislation. In the codes of Queensland (1899) and West Australia (1902) the offence is defined in a form which is little more than a redrafting of the English statutes. The provisions of the Treason Felony Act 1848 have been adapted by legislation to New South Wales (1900), Queensland (1899), Western Australia (1902) and Tasmania (1868). In Victoria there is legislation as to procedure but none as to the substantive law of treason. In Mauritius the offence is regulated by the Penal Code of 1838, arts. 50–61 (*Mauritius Laws Revised*, 1903, i. 372).

In the Asiatic colonies treason is defined on the lines of the Indian Penal Code, *i.e.* Ceylon, Straits Settlements, and Hong-Kong.

In the West Indies the law of treason is defined by code in Jamaica and in British Guiana (the code superseding the Dutch Roman law).

In South Africa the law of treason is derived through Holland from the Roman law. It includes the *crimen perduellionis*, *i.e.* disturbing the security or independence of the state with hostile intent. This is spoken of as high treason, as distinct from the *crimen laesae majestatis*, in which the hostile intent need not be proved, and from *vis publica*, *i.e.* insurrection and riot involving danger to public peace and order. By a Cape law of 1853 passed during the Griqualand rebellion it is made treason to deliver arms or gunpowder to the king's enemies.

The Treason Felony Act 1848 was also adopted in Natal in 1868.

During the South African War of 1899–1902 many trials took place for treason, chiefly under martial law, including cases of British subjects who had joined the Boer forces. In some cases it was contended that the accused had been recognized by the British authorities as a belligerent (Loŭw. 1904, 21 Cape Supreme Court Reports, 36). The decisions of the ordinary courts are collected in Nathan, *Common Law of South Africa*, iv. 2425 (London, 1907). The decisions of courts-martial were not reviewable by the ordinary courts and are also protected by acts of indemnity. A striking feature of colonial legislation is the great number of such acts passed after rebellions and native risings. Instances of such acts occur in the legislation of Canada, Ceylon, the Cape of Good Hope, Natal, New Zealand, St Vincent and Jamaica. The most important in the history of law is the Jamaica Act of 1866, indemnifying Governor Eyre for any acts committed during the suppression of the rising in the previous year. It was finally held that this act protected Eyre from being civilly sued or criminally prosecuted in England for acts done during the outbreak (*Phillips* v. *Eyre*, 1871, *L. R.* 6 Q. B. 1). The validity of an act passed in 1906 after disturbances among the Kaffirs of Natal was unsuccessfully challenged in 1907 (Tilonko's case, 1907, App. Cas. 93).

United States.—The law is based upon that of England. By art. 3, s. 3 of the constitution "treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court. The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood or forfeiture, except during the life of the person attainted." By art. 2, s. 4 impeachment for and conviction of treason is a ground for removing the president, vice-president and other civil officers. The punishment by an act of 1790 was declared to be death by hanging. But during the Civil War an act (July 17, 1862) was passed, providing that the punishment should be death, or, at the discretion of the court, imprisonment at hard labour for not less than five years, and a fine of not less than 10,000 dollars to be levied on the real and personal property of the offender, in addition to disability to hold any office under the United States. The act of 1862 and other acts also deal with the crimes of inciting or engaging in rebellion or insurrection, criminal correspondence with foreign governments in relation to any disputes or controversies with the United States, or to defeat the measures of the government of the United States, seditions, conspiracy, recruiting soldiers or sailors and enlistment to serve against the United States. The act of 1790 further provides for the delivery to the prisoner of a copy of the indictment and a list of the jurors, for defence by counsel, and for the finding of the indictment within three years after the commission of the treason (see Story, *Constitution of the United States*, Rev. Stat. U.S. p. 1041). Treason against the United States cannot be inquired into by any state

[1] The provisions in the act as to forfeiture (now repealed) were, according to Blackstone (*Comm.* iv. 384), the result of a compromise between the House of Lords, in favour of its continuance and the House of Commons, supported by the Scottish nation, struggling to secure a total immunity from this disability.

[2] It is called by Hallam "the old mystery of iniquity in Scots law."

court, but the states may, and some of them have, their own constitutions and legislation as to treasons committed against themselves, generally following the lines of the constitution and legislation of the United States. In some cases there are differences which are worth notice. Thus the constitution of Massachusetts, pt. 1, § 25, declares that no subject ought in any case or in any time to be declared guilty of treason by the legislature. The same provision is contained in the constitutions of Vermont, Connecticut, Pennsylvania, Alabama and others. In some states the crime of treason cannot be pardoned; in others, as in New York, it may be pardoned by the legislature, and the governor may suspend the sentence until the end of the session of the legislature next following conviction. In some states a person convicted of treason is disqualified for exercising the franchise. In New York conviction carries with it forfeiture of real estate for the life of the convict and of his goods and chattels.

France.—By the *Code Pénal* treason falls under the head of crimes against the safety of the state (bk. iii. tit. i. c. 1). It is a capital offence for a Frenchman to bear arms against France (s. 75) or to plot with a foreign power or its agents to commit hostilities or undertake war against France whether war follows or not (s. 76), or to intrigue with the enemies of the state for facilitating their entry into French territory, or to deliver to them French ships or fortresses, or to supply them with munitions of war, or aid the progress of their arms in French possessions or against French forces by sea or land (s. 78).

Germany.—The *Strafgesetzbuch* distinguishes between high treason (*Hochverrat*) and treason (*Landesverrat*). The offences denominated high treason are (1) murder or attempt to murder the emperor or a federal sovereign in his own state, or during the stay of the offender in the sovereign's state (s. 80); (2) undertaking to kill, take prisoner, or deliver into an enemy's power, or make incapable of government a federal sovereign; to change by violence the constitution of the empire or a state thereof or the successor to the throne therein; to incorporate by force the federal territory or the territory of any such state with a foreign or another federal state (s. 81). The code treats as treason, but does not punish by death, the offences included in the French code (ss. 87–89), and under certain circumstances punishes alien residents for these offences (s. 91). The code also punishes insults on the emperor and federal sovereigns (ss. 95, 97) under the name of *Majestätsbeleidigung.*

Italy.—Treason in the Penal Code 1888 (tit. i. c. 1) includes direct acts to subject Italy or any part thereof to foreign domination or to diminish its independence or break up its unity (s. 104), to bear arms against the state (s. 105)) or intrigue with foreign states with the object of their levying war against Italy or helping them in such war (s. 106), or to reveal political or military secrets affecting the national independence (s. 107).

Spain.—The Spanish code distinguishes between treason (*lesa majestad*) and rebellion (*rebelión*). Under the former are included assassination, or attempts on the life or personal liberty of the king (arts. 158, 159), or insults to the king (161, 162), and provisions are made as to attacks on the heir or consort of the sovereign (163, 164). Under rebellion are included violent attempts to dethrone the king or to interfere with the allegiance to him of his forces or any part of the realm (243). (W. F. C.)

TREASURE TROVE, the legal expression for coin, bullion, gold or silver articles, found (Fr. *trouvé*) hidden in the earth, for which no owner can be discovered. In Roman law it was called *thesaurus,* and defined as an ancient deposit of money (*vetus depositio pecuniae*) found accidentally. Under the emperors half went to the finder and half to the owner of the land, who might be the emperor, the public treasury (*fiscus*), or some other proprietor. Property found in the sea or on the earth has at no time been looked on as treasure trove. If the owner cannot be ascertained it becomes the property of the finder (see Lost Property). As the feudal system spread over Europe and the prince was looked on as the ultimate owner of all lands, his right to the treasure trove became, according to Grotius, *jus commune et quasi gentium,* in England, Germany, France, Spain and Denmark. In England for centuries the right to treasure trove has been in the Crown, who may grant it out as a franchise. It is the duty of the finder, and indeed of any one who acquires knowledge, to report the matter to the coroner, who must forthwith hold an inquest to find whether the discovery be treasure trove or no. Although the taking of the find is not larceny until this be done, the concealment is an indictable offence still punishable in practice, and formerly was held "akin both to treason and to larceny." In the statute *De officio coronatoris* 1276 (4 Edw. I. c. 2) the coroner is enjoined to inquire as to treasure trove both as to finders and suspected finders, "and that may be well perceived where one liveth riotously and have done so of long time." The Coroners Act of 1887 continues this power as heretofore. In Scotland the law is the same, but the concealment is not a criminal offence; it is there the duty of the king's and lord treasurer's remembrancer, with the aid of the local procurator fiscal, to secure any find for the Crown, whose rights in this respect have been pushed to some length. Thus in 1888 a prehistoric jet necklace and some other articles found in Forfarshire were claimed by the authorities, though they were neither gold nor silver. The matter was finally compromised by the deposit of the find in the National Museum. By a treasury order of 1886 provision is made for the preservation of suitable articles so found in the various national museums and payment to the finders of sums in respect of the same. Also if the things are not required for this purpose they are to be returned to the finder. In India the Treasure Trove Act (16 of 1878) makes elaborate provision on the subject. It defines treasure as "anything of value hidden in the soil." When treasure over Rs. 10 is discovered, the finder must inform the collector and deposit the treasure or give security for its custody. Concealment is a criminal offence. An inquiry is held upon notice; if declared ownerless the finder has three-fourths and the owner of the ground one-fourth. The government, however, has the right of pre-emption.

In the United States the common law, following English precedent, would seem to give treasure trove to the public treasury, but in practice the finder has been allowed to keep it. In Louisiana French codes have been followed, so that one-half goes to finder and one-half to owner of land. Modern French law is the same as this, as it is also in Germany, in Italy and in Spain. In the latter country formerly the state had three-quarters, whilst a quarter was given to the finder. In Austria a third goes to the finder, a third to the owner of the land, and a third to the state, and provision is made for the possible purchase of valuable antiquities by the state. In Denmark treasure trove is known as "treasure of Denmark," and is the property of the king alone. In Russia the usage varies. In one or two of the governments, in Poland and the Baltic provinces, the treasure is divided between the owner of the land and the finder, but throughout the rest of Russia it belongs exclusively to the owner of the land. This was also the law amongst the ancient Hebrews, or so Grotius infers from the parable of the treasure hid in a field (Matt. xiii. 44).

See Blackstone's *Commentaries*; Chitty's *Prerogatives of the Crown*; R. Henslowe Wellington, *The King's Coroner* (1905–1906); Rankine on *Landownership*; Murray, *Archaeological Survey of the United Kingdom* (1896), containing copious references to the literature of the subject. (F. Wa.)

TREASURY, a place for the storage of treasure (Fr. *trésor,* Lat. *thesaurus,* Gr. θησαυρός, store, hoard); also that department of a government which manages the public revenue. The head of the department was an important official in the early history of English institutions. He managed the king's hoard or treasury, and under the Med. Latin name of *thesaurarius, i.e.* treasurer, grew into increased importance in times when the main object of government seemed to be to fill the king's purse. He received the title of lord high treasurer (*q.v.*) and ranked as the third great officer of state. In course of time the English treasury grew into two departments of state (see Exchequer). Since 1714 the office of lord high treasurer has been in commission, and his duties have been administered by a board, consisting of a first lord, a chancellor and four or more junior lords. The board itself never meets, except on extraordinary occasions, although until the commencement of the 19th century it was its practice to meet almost daily to discuss matters of financial detail. There were originally separate treasury boards for England, Scotland and Ireland, but the English and Scottish were united by the act of union, and that of Ireland was joined with the English in 1816. The first lord of the treasury (see Ministry) takes practically no part in the duties of the board, the office being to all intents and purposes a sinecure; it is usually held by the prime minister of the day. Indeed from 1783 to 1885 it was invariably so held, but in the latter year there was a departure from the practice, and again in 1887, 1891 and 1895. The junior lords of the treasury are also political rather than financial officers, acting as assistant whips in the House of Commons. There are two joint secretaries to the treasury, one of whom, the patronage secretary, is merely a political officer, acting as chief whip; the other is termed financial secretary and is the chancellor of the exchequer's chief assistant. All the above officers are members of the House of Commons and of the government. The salaries of the first lord of the treasury and of the chancellor of the exchequer are £5000 per annum; of the joint secretaries £2000 per annum each; of three of the junior lords £1000 per annum each, the other junior lords being unpaid. The vast bulk of the work of the treasury department is performed by the permanent staff, at whose head is the permanent secretary and auditor of the civil list, with a salary of £2500 per annum. The chancellor of the exchequer (see MINISTRY), as finance minister of the Crown, is the officer who is responsible to parliament for the carrying out of the business of the treasury. He performs practically the ancient duties of under-treasurer and presents the annual budget of revenue and expenditure.

The treasury department of the United States is responsible for the finances of the government and the control of the currency. Its genesis was a treasury office of accounts established in 1776 for the purpose of examining and auditing accounts. In 1779 it was reorganized, but was abolished in 1781, on the election of Robert Morris as superintendent of finances, and in 1789 the present executive department of the treasury was established by act of Congress. Its scope is more varied and complex than that of any other United States government department. It is presided over by a secretary, who is a member of the cabinet and has a salary of $12,000 per annum. He is assisted by three assistant secretaries, two of them having salaries of $5000 and the third a salary of $4500. The treasury department looks after the revenue administration of the United States, and has for this purpose a customs service division and an internal revenue division. There is also the division of the treasury, in the strictest sense of the word; bureaus of auditing and accounting, of currency and of banking and certain miscellaneous bureaus, as the life-saving service, the public health and marine hospital service, the supervising architect and the bureau of engraving and printing.

TREATIES. A treaty is a contract between two or more states. The Latin term "tractatus," and its derivatives, though of occasional occurrence in this sense from the 13th century onwards, only began to be commonly so employed, in lieu of the older technical terms "conventio publica," or "foedus," from the end of the 17th century. In the language of modern diplomacy the term "treaty" is restricted to the more important international agreements, especially to those which are the work of a congress; while agreements dealing with subordinate questions are described by the more general term "convention." The present article will disregard this distinction.

The making and the observance of treaties is necessarily a very early phenomenon in the history of civilization, and the theory of treaties was one of the first departments of international law to attract attention. Treaties are recorded on the monuments of Egypt and Assyria; they occur in the Old Testament Scriptures; and questions arising under συνθῆκαι and *foedera* occupy much space in the Greek and Roman historians.[1]

Treaties have been classified on many principles, of which it will suffice to mention the more important. A "personal treaty," having reference to dynastic interests, is contrasted with a "real treaty," which binds the nation irrespectively of constitutional changes; treaties creating outstanding obligations are opposed to "transitory conventions," *e.g.* for cession of territory, recognition of independence, and the like, which operate irrevocably once for all, leaving nothing more to be done by the contracting parties; and treaties in the nature of a definite transaction (*Rechtsgeschäft*) are opposed to those which aim at establishing a general rule of conduct (*Rechtssatz*). With reference to their objects, treaties may perhaps be conveniently classified as (1) political, including treaties of peace, of alliance, of cession, of boundary, for creation of international servitudes, of neutralization, of guarantee, for the submission of a controversy to arbitration; (2) commercial, including consular and fishery conventions, and slave trade and navigation treaties; (3) confederations for special social objects, such as the Zollverein, the Latin monetary union, and the still wider unions with reference to posts, telegraphs, submarine cables and weights and measures; (4) relating to criminal justice, *e.g.* to extradition and arrest of fugitive seamen; (5) relating to civil justice, *e.g.* to the protection of trade-mark and copyright, to the execution of foreign judgments, to the reception of evidence, and to actions by and against foreigners; (6) promulgating written rules of international law, upon topics previously governed, if at all, only by unwritten custom, with reference *e.g.* to the peaceful settlement of international disputes, or to the conduct of warfare.

Classification.

It must be remarked that it is not always possible to assign a treaty wholly to one or other of the above classes, since many treaties contain in combination clauses referable to several of them.

The analogy between treaty-making and legislation is striking when a congress agrees upon general principles which are afterwards accepted by a large number of states, as, for instance, in the case of the Geneva conventions for improving the treatment of the wounded. Many political treaties containing "transitory conventions," with reference to recognition, boundary or cession, become, as it were, the title-deeds of the nations to which they relate.[2] But the closest analogy of a treaty is to a contract in private law.

Requisites.

The making of a valid treaty implies several requisites. (1) It must be made between competent parties, *i.e.* sovereign states. A "concordat," to which the pope, as a spiritual authority, is one of the parties, is therefore not a treaty, nor is a convention between a state and an individual, nor a convention between the rulers of two states with reference to their private affairs. Semi-sovereign states, such as San Marino or Egypt, may make conventions upon topics within their limited competence. It was formally alleged that an infidel state could not be a party to a treaty. The question where the treaty-making power resides in a given state is answered by the municipal law of that state. In Great Britain it resides in the executive (see the parliamentary debates upon the cession of Heligoland in 1890); sometimes, however, it is shared for all purposes, as in the United States, or for certain purposes only, as in many countries of the European continent, by the legislature, or by a branch of it. (2) There must be an expression of agreement. This is not (as in private law) rendered voidable by duress; *e.g.* the cession of a province, though extorted by overwhelming force, is nevertheless unimpeachable. Duress to the individual negotiator would, however, vitiate the effect of his signature. (3) From the nature of the case, the agreement of states, other than those the government of which is autocratic, must be signified by means of agents, whose authority is either express, as in the case of plenipotentiaries, or implied, as in the case of *e.g.* military and naval commanders, for matters, such as truces, capitulations and cartels, which are necessarily confided to their discretion. When an agent acts in excess of his implied authority, he is said to make no treaty, but a mere "sponsion," which, unless adopted by his government, does not bind it, *e.g.* the affair of the Caudine Forks

[1] For the celebrated treaty of 509 B.C. between Rome and Carthage, see Polybius iii. 22; and, on the subject generally, Barbeyrac's full but very uncritical *Histoire des anciens traitéz*, (1739); Müller-Jochmus, *Geschichte des Völkerrechts im Alterthum* (1848); E. Egger, *Études historiques sur les traités publics chez les grecs et chez les romains* (new ed., 1866).

[2] Cf. Sir Edward Hertslet's very useful collections entitled: *The Map of Europe by Treaty* (4 vols., 1875–1891), and *The Map of Africa by Treaty* (2 vols., 1894).

(Livy ix. 5) and the convention of Closter Seven in 1757. (4) Unlike a contract in private law, a treaty, even though made in pursuance of a full power, is, according to modern views, of no effect till it is ratified. It may be remarked that ratification, though hitherto not thought to be required for "declarations," such as the Declaration of Paris of 1856, was expressly stipulated for in the case of those signed at the peace conferences of 1899 and 1907. (5) No special form is necessary for a treaty, which in theory may be made without writing. It need not even appear on the face of it to be a contract between the parties, but may take the form of a joint declaration, or of an exchange of notes. Latin was at one time the language usually employed in treaties, and it continued to be so employed to a late date by the emperor and the pope. Treaties to which several European powers of different nationalities are parties are now usually drawn up in French (the use of which became general in the time of Louis XIV.), but the treaties of Aix-la-Chapelle of 1748 and 1784 contain, as does the final act of the congress of Vienna, a protest against the use of this language being considered obligatory. French is, however, exclusively used in the treaties constituting the great "international unions"; and bilingual treaties are sometimes accompanied by a third version in French, to be decisive in case of alleged variances between the other two. A great European treaty has usually commenced "In the name of the Most Holy and Indivisible Trinity," or, when the Porte is a party, "In the name of Almighty God." (6) It is sometimes said that a treaty must have a lawful object, but the danger of accepting such a statement is apparent from the use which has been made of it by writers who deny the validity of any cession of national territory, or even go so far as to lay down, with Fiore, that "all should be regarded as void which are in any way opposed to the development of the free activity of a nation, or which hinder the exercise of its natural rights." (7) The making of a treaty is sometimes accompanied by acts intended to secure its better performance. The taking of oaths, the assigning of "conservatores pacis" and the giving of hostages are now obsolete, but revenue is mortgaged, territory is pledged, and treaties of guarantee are entered into for this purpose.

Duration.

A "transitory convention" operates at once, leaving no duties to be subsequently performed, but with reference to conventions of other kinds questions arise as to the duration of the obligation created by them; in other words, as to the moment at which those obligations come to an end. This may occur by the dissolution of one of the contracting states, by the object-matter of the agreement ceasing to exist, by full performance, by performance becoming impossible, by lapse of the time for which the agreement was made, by *contrarius consensus* or mutual release, by "denunciation" by one party under a power reserved in the treaty. By a breach on either side the treaty usually becomes, not void, but voidable. A further cause of the termination of treaty obligations is a total change of circumstances, since a clause "rebus sic stantibus" is said to be a tacit condition in every treaty.[1] Such a contention can only be very cautiously admitted. It has been put forward by Russia in justification of her repudiation of the clauses of the Treaty of Paris neutralizing the Black Sea, and of her engagements as to Batoum contained in the Treaty of Berlin. The London protocol of 1871, with a view to prevent such abuses, lays down, perhaps a little too broadly, "that it is an essential principle of the law of nations that no power can liberate itself from the engagements of a treaty, nor modify the stipulations thereof, unless with the consent of the contracting powers, by means of an amicable arrangement." Treaties are in most cases suspended, if not terminated, by the outbreak of a war between the contracting parties (though the Spanish decree of the 23rd of April 1898 went too far when it asserted that the war with the United States had terminated "all conventions that have been in force up to the present between the two countries"), and are therefore usually revived in express terms in the treaty of peace.

[1] Cf. Bynkershoek, *Quest. sur pub.* vol. ii. ch. 10.

The rules for the interpretation of treaties are not so different from those applicable to contracts in private law as to need here a separate discussion.

Collections.

Collections of treaties are either (i.) general or (ii.) national.

i. The first to publish a general collection of treaties was Leibnitz, whose *Codex juris gentium*, containing documents from 1097 to 1497, "ea quae sola inter liberos populos legum sunt loco" appeared in 1693, and was followed in 1700 by the *Mantissa*. The *Corps universel diplomatique du droit des gens* of J. Dumont, continued by J. Barbeyrac and Rousset in thirteen folio volumes, containing treaties from A.D. 315 to 1730, was published in 1726–1739. Wenck's *Corpus juris gentium recentissimi* (3 vols. 8vo, 1781–1795) contains treaties from 1735 to 1772. The 8vo *Recueil* of G. F. de Martens, continued by C. de Martens, Saalfeld, Murhard, K. F. Samwer, K. Hopf, F. Stoerk and H. Triepel, commenced in 1791 with treaties of 1761, and is still in progress. The series in 1910 extended to eighty-eight volumes; that for 1910 being the third of the *Nouveau recueil général* (23me série). See also the *Recueil international des traités de xxe siècle* (1904, sqq.), by Descamps en Renault, and the following periodical publications: *Das Staatsarchiv, Sammlung der officiellen Actenstücke zur Geschichte der Gegenwart* (Leipzig, commencing in 1861); *Archives diplomatiques* (Stuttgart, since 1821); *Archives diplomatiques, recueil mensuel de diplomatie et d'histoire* (Paris, since 1861); and Hertslet's *British and Foreign State Papers, from the Termination of the War of 1814 to the Latest Period, compiled at the Foreign Office by the Librarian and Keeper of the Papers* (London, since 1819, and still in progress).

ii. The more important collections of national treaties are those of MM. Neumann and de Plasson from 1855, and of the commission for modern history from 1903, for Austria; Beutner for the German Empire, 1883; C. Calvo for "l'Amérique latine," 1862–1869; de Clercq for France, 1864–1908; De Garcia de la Vega for Belgium, 1850, &c., Lagemans and Breukelman for the Netherlands, 1858, &c.; Soutzo for Greece, 1858; Count Solar de la Marguerite for Sardinia, 1836–1861; Olivart for Spain, 1890, &c.; Da Castro for Portugal, 1856–1879; Rydberg for Sweden, 1877; Kaiser, 1861, and Eichmann, 1885, for Switzerland; Baron de Testa, 1864, &c., Aristarchi Bey 1873–1874, and Effendi Noradounghian, 1897–1903, for Turkey; F. de Martens for Russia (the 9 vols. published 1874–1907 contain the treaties made by Russia with Austria, Germany, Great Britain and France respectively); W. F. Mayers for China, 1877. The official publication for Italy begins in 1864 (see also the collection by Luigi Palma, 1879, &c.), for Spain in 1843, for Denmark in 1874. The treaties of Japan were published by authority in 1899. Those of the United States are contained in the *Statutes at Large* of the United States, and in the *Treaties, Conventions, etc., between the United States of America and Other Powers, 1776–1909* (Washington, 1910); also in the collections of J. Elliott (1834) and H. Minot (1844–1850); see also Mr Bancroft Davis's *Notes upon the Treaties of the United States with other Powers, preceded by a list of the Treaties and Conventions with Foreign Powers, chronologically arranged and followed by an Analytical Index and a Synoptical Index of the Treaties* (1873). In England no treaties were published before the 17th century, such matters being thought "not fit to be made vulgar." The treaty of 1604 with Spain was, however, published by authority, as were many of the treaties of the Stuart kings. Rymer's *Foedera* was published, under the orders of the government, in twenty volumes, from 1704 to 1732; but for methodical collections of the earlier British treaties we are indebted to private enterprise, which produced three volumes in 1710–1713, republished with a fourth volume in 1732. Other three volumes appeared in 1772–1781, the collection commonly known as that of C. Jenkinson (3 vols.) in 1785 and that of G. Chalmers (2 vols.) in 1795. The recent treaties made by Great Britain, previously dispersed through the numbers of the *London Gazette* or embedded in masses of diplomatic correspondence presented to parliament at irregular intervals, are now officially published as soon as ratified in a special 8vo. "Treaty Series" of parliamentary papers commenced in 1902. J. Macgregor published (1841–1844) eight volumes of commercial treaties, but the great collection of the commercial treaties of Great Britain is that of L. Hertslet, librarian of the foreign office, continued by his son, Sir Edward Hertslet, and later holders of the same office, entitled *A Complete Collection of the Treaties and Conventions and Reciprocal Regulations at present subsisting between Great Britain and Foreign Powers, and of the Laws and Orders in Council concerning the same, so far as they relate to Commerce and Navigation, the Slave Trade, Post Office, &c., and to the Privileges and Interests of the Subjects of the Contracting Parties* (24 vols., 1820–1907). Sir Edward Hertslet also commenced in 1875 a series of volumes containing *Treaties and Tariffs regulating the Trade between Britain and Foreign Nations, and Extracts of Treaties between Foreign Powers, containing the Most Favoured Nation Clauses applicable to Great Britain*. Both of these publications are still continued. He also published, in 1891, *Treaties, &c., concluded between Great Britain and Persia, and between Persia and Foreign Powers*; and, in 1896, a similar work on treaties with China The treaties affecting British India are officially set out, with historical notes, in *A Collection of Treaties,* *Engagements and Sannuds relating to India and Neighbouring Countries*, by C. V. Aitchison. This work, with the index, extends to eight volumes, which appeared at Calcutta in 1862–1866. A continuation by A. C. Talbot was published in 1876, and it was brought up to date by the government of India in 1909. Useful lists of national collections of treaties will be found in the *Revue de droit international* for 1886, pp. 169–187, and in the Marquis Olivart's *Catalogue de ma bibliothèque* (1899–1910).

List of Important Treaties.

It may be worth while to add a list of some of the more important treaties, now wholly or partially in force, some of which are discussed under separate headings, especially those to which Great Britain is a party, classified according to their objects, in the order suggested above.

i. The principal treaties affecting the distribution of territory between the various states of Central Europe are those of Westphalia (Osnabrück and Münster), 1648; Utrecht, 1713; Paris and Hubertusburg, 1763; for the partition of Poland, 1772, 1793; Vienna, 1815; London, for the separation of Belgium from the Netherlands, 1831, 1839; Zürich, for the cession of a portion of Lombardy to Sardinia, 1859; Vienna, as to Schleswig-Holstein, 1864; Prague, whereby the German Confederation was dissolved, Austria recognizing the new North German Confederation, transferring to Prussia her rights over Schleswig-Holstein, and ceding the remainder of Lombardy to Italy, 1866; Frankfort, between France and the new German Empire, 1871. The disintegration of the Ottoman Empire has been regulated by the Great Powers, or some of them, in the treaties of London, 1832, 1863, 1864, and of Constantinople, 1881, with reference to Greece; and by the treaties of Paris, 1856; London, 1871; Berlin, 1878; London, 1883, with reference to Montenegro, Rumania, Servia, Bulgaria and the navigation of the Danube. The encroachments of Russia upon Turkey, previous to the Crimean War, are registered in a series of treaties beginning with that of Kuchuk-Kainarji, 1774, and ending with that of Adrianople in 1829. The independence of the United States of America was acknowledged by Great Britain in the treaty of peace signed at Paris in 1783. The boundary between the United States and the British possessions is regulated in detail by the treaties of Washington of 1842, 1846, 1871, 1903 and 1908. The territorial results of the war of 1898 between the United States and Spain are registered in the treaty of 1899, and those of the Russo-Japanese War in the treaty of Portsmouth of 1905. Various causes of possible misunderstanding between Great Britain and France were removed by the convention of 1904; and a similar treaty was concluded with Russia in 1908. The navigation of the Suez Canal is regulated by a treaty of 1888, and that of the future Panama Canal by one of 1901. The boundaries of the territories, protectorates and spheres of influence in Africa of Great Britain, Germany, France, Italy, Belgium and Portugal have been readjusted by a series of treaties, especially between the years 1885 and 1894. Switzerland, Belgium, Corfu and Paxo and Luxemburg are respectively neutralized by the treaties of Vienna, 1815, and of London, 1839, 1864, 1867. A list of treaties of guarantee supposed to be then in force, to which Great Britain is a party, beginning with a treaty made with Portugal in 1373, was presented to parliament in 1859. Treaties of alliance were made between Great Britain and Japan in 1902 and 1905.

ii. For the innumerable conventions, to which Great Britain is a party, as to commerce, consular jurisdiction, fisheries and the slave trade, it must suffice to refer to the exhaustive and skilfully devised index to vols. 1–21 of Hertslet's *Commercial Treaties*, published in 1905 as vol. 22 of the series.

iii. The social intercourse of the world is facilitated by conventions, such as those establishing the Latin monetary union, 1865; the international telegraphic union, 1865; the universal postal union, 1874; the international bureau of weights and measures, 1875; providing for the protection of submarine cables in time of peace, 1884; the railway traffic union, 1890. Such treaties, now very numerous, are somewhat misleadingly spoken of by recent writers (L. von Stein and F. de Martens) as constituting a "droit administratif international."

iv. For the now operative treaties of extradition to which Great Britain is a party, it will be sufficient to refer to the article EXTRADITION. It may be observed that all of them, except the treaty of 1842, now, however, varied by one of 1889, with the United States, are subsequent to, and governed by, the provisions of 33 & 34 Vict. c. 52, The Extradition Act 1870. Before the passing of this general act it had been necessary to pass a special act for giving effect to each treaty of extradition. The most complete collection of treaties of extradition is that of F. J. Kirchner, *L'Extradition, Recueil, &c.* (London, 1883).

v. General conventions, to which most of the European states are parties, were signed in 1883 at Paris for the protection of industrial, and in 1886 at Bern for the protection of literary and artistic, property, and, from 1899 onwards, a series of general treaties, to none of which is Great Britain a party, have been signed at the Hague, as the result of conferences, invited by the government of the Netherlands, for solving some of the more pressing questions arising out of "the conflict of laws."

vi. Quasi-legislation by treaty has been directed mainly to encouraging the settlement of international disputes by peaceful methods, and to regulating the conduct of warfare.

The first peace conference, held at the Hague in 1899, devoted much time to producing the generally accepted "Convention for the Pacific Settlement of International Disputes." An important achievement of this convention was the establishment at the Hague of an international tribunal, always ready to arbitrate upon cases submitted to it; and the convention recommended recourse not only to arbitration, but also to good offices and mediation, and to international commissions of inquiry. This convention has now been superseded by the revised and amplified edition of it adopted by the second peace conference in 1907. The provisions of neither convention are obligatory, but merely "facultative," amounting only to recommendations. Great efforts were made, especially in 1907, but without success, to draft a generally acceptable convention, making resort to arbitration compulsory, at any rate with reference to certain classes of questions. In the meantime, however, agreements of this nature between one power and another have multiplied rapidly within the last few years (see ARBITRATION).

Certain bodies of rules intended to mitigate the horrors of war have received the adhesion of most civilized states. Thus the declaration of Paris, 1856 (to which, however, the United States, Venezuela and Bolivia have not yet formally acceded), prohibits the use of privateers and protects the commerce of neutrals; the Geneva conventions, 1864 and 1906, give protection to the wounded and to those in attendance upon them; the St Petersburg declaration, 1868, prohibits the employment of explosive bullets weighing less than 400 grammes; and the three Hague declarations of 1899 prohibit respectively (1) the launching of projectiles from balloons, (2) the use of projectiles for spreading harmful gases, and (3) the use of expanding bullets. The second Hague conference, of 1907, besides revising the convention made by the first conference, of 1899, as to the laws of war on land, produced new conventions, dealing respectively with the opening of hostilities; neutral rights and duties in land warfare; the status of enemy merchant ships at the outbreak of war; the conversion of merchant ships into ships of war; submarine mines; bombardment by naval forces; the application of the Geneva principles to naval warfare; the rights of maritime capture; the establishment of an international prize court; and neutral rights and duties in maritime warfare. These conventions, as well as a republication of the first Hague declaration, which had in 1907 expired by efflux of time, have been already largely ratified.

It were greatly to be wished that the official publication of treaties could be rendered more speedy and more methodical than it now is. The labours of the publicist would also be much lightened were it possible to consolidate the various general collections of diplomatic acts into a new *Corps diplomatique universel*, well furnished with cross references, and with brief annotations showing how far each treaty is supposed to be still in force.

Literature.—In addition to the works already cited in the course of this article the following are for various reasons important:

Joh. Lupus, *De confederatione principum* (Strassburg, 1511, the first published monograph upon the subject); Bodinus, *Dissertatio de contractibus summarum potestatum* (Halle, 1696); Neyron, *De vi foederum inter gentes* (Göttingen, 1778); Neyron, *Essai historique et politique sur les garanties, &c.* (Göttingen, 1797); Wächter, *De modis tollendi pacta inter gentes* (Stuttgart, 1780); Dresch, *Ueber die Dauer der Völkerverträge* (Landshut, 1808); C. Bergbohm, *Staatsverträge und Gesetze als Quellen des Völkerrechts* (Dorpat, 1877); Jellinck, *Die rechtliche Natur der Statenverträge* (Vienna, 1880); D. Donati, *Trattati internazionali nel diritto costituzionale* (1907); Holzendorff, *Handbuch des Völkerrechts* (1887) vol. iii.; Fleischmann, *Völkerrechtsquellen in Auswahl herausgegeben* (1905); de Lapradelle, *Recueil des arbitrages internationaux* (1905); J. B. Moore, *History and Digest of the International Arbitrations to which the United States has been a Party* (1898) 6 vols. For a list of the principal "concordats," see Calvo, *Droit international théorique et pratique* t. i. On the history of the great European treaties generally, see the *Histoire abrégée des traités de paix entre les puissances de l'Europe*, by Koch, as recast and continued by Schöll (1817 and 1818), and again by Count de Garden in 1848–1859, as also the *Recueil manuel* of De Martens and Cussy, continued by Geffcken. For the peace of Westphalia, Pütter's *Geist des westphälischen Friedens* (1795) is useful; for the congress of Vienna Klüber's *Acten des Wiener Congresses* (1815–1819) and *Le Congrès de Vienne et les traités de 1815 précédé des conférences de Dresde, de Prague et de Chatillon, suivi des Congrès d'Aix-la-Chapelle, Troppau, Laybach et Vérone*, by Count Angeberg. The last-mentioned writer has also published collections of treaties relating to Poland, 1762–1862; to the Italian question, 1859; to the Congress of Paris, 1856 and the revision of its work by the Conference of London, 1871; and to the Franco-German War of 1870–71. For the treaties regulating the Eastern question see *The European Concert in the Eastern Question*, by T. E. Holland (1885) and *La Turquie et le Tanzimat*, by E. Engelhardt (1882–1884). (T. E. H.)

TREATISE, a written composition, dealing fully and systematically with the principles of some subject of serious importance. The M. Eng. *tretis*, O. Fr. *tretis*, or *treitis*, is a doublet of "treaty," which also meant a discourse or account. Both words are to be referred to Lat. *tractare*, to treat, handle, frequentative of *trahere*, *tractus*, to draw. "Treatise" thus would mean, by etymology, something well handled, nicely made.

TREBIA (mod. *Trebbia*), a river of Cisalpine Gaul, a tributary of the Padus (Po) into which it falls some 4 m. west of Placentia (Piacenza). It is remarkable for the victory gained on its banks by Hannibal over the Romans in 218 B.C. The latest investigations make it clear that Polybius's account, according to which the battle took place on the left bank of the river, is to be preferred to that of Livy (see W. J. Kromayer in *Anzeiger der phil. hist. Klasse der k. Akademie der Wissenschaften*, Vienna, October 14, 1908). Its valley is followed past Bobbio by the modern highroad from Piacenza to Genoa (88 m.).

TREBINJE, a town of Herzegovina, situated 9 m. N.E. of Ragusa, on the small river Trebinjčica, and on a branch of the railway from Metkovic to Castelnuovo, near Cattaro. Pop. (1895), about 1700. Trebinje is built in a low-lying oasis among the desolate limestone mountains, close to the Dalmatian and Montenegrin frontiers. Its half-ruined wall and citadel testify to its former strategic importance. Trebinje was built by the Slavs, probably on the site of a Roman town laid waste by the Saracens in 840. In the tenth century Constantine Porphyrogenitus mentions it as *Terbunia*. It commanded the road from Ragusa to Constantinople, traversed, in 1096, by Raymond of Toulouse and his crusaders. Under the name of Tribunia or Travunja (the *Trebigne* of the Ragusans), it belonged to the Servian Empire until 1355. In 1483 it was captured by the Turks.

TREBIZOND (Gr. *Trapezus*), a city of Asia Minor, situated on the Black Sea, near its south-eastern angle. From the time of its foundation as a Greek colony to the present day it has always been a considerable emporium of commerce, and it was for two centuries and a half the capital of an empire. Its importance is due to its command of the point where the chief trade route from Persia and Central Asia to Europe, over the table-land of Armenia by Bayezid and Erzerum, descends to the sea. Its safety also was secured by the barrier of rugged mountains (7000 to 8000 ft.) which separates its district from the rest of Asia Minor. So complete is the watershed that no streams pass through these ranges, and there is hardly any communication in this direction between the interior of Asia Minor and the coast. For the same reason, together with its northern aspect, the climate is humid and temperate, unlike that of the inland regions, which are exposed to great extremes of heat in summer and cold in winter. The position which was occupied by the Hellenic and medieval city is a sloping table of ground (whence the original name of the place, Trapezus, the "Table-land"), which falls in steep rocky precipices on the two sides, where two deep valleys, descending from the interior, run parallel at no great distance from one another down to the sea. The whole is still enclosed by the Byzantine walls, which follow the line of the cliffs and are carried along the sea-face; and the upper part of the level, which is separated from the lower by an inner cross wall, forms the castle; while at the highest point, where a sort of neck is formed between the two valleys, is the keep which crowns the whole. On each side, about half-way between the keep and the sea, these ravines are crossed by massive bridges, and on the farther side of the westernmost of these, away from the city, a large tower and other fortifications remain. The area of the ancient city is now called the Kaleh, and is inhabited by the Turks; eastward of this is the extensive Christian quarter, and beyond this again a low promontory juts northward into the sea, partly covered with the houses of a well-built suburb, which is the principal centre of commerce. The harbour lies on the eastern side of this promontory, but it is an unsafe roadstead, being unprotected towards the north-east and having been much silted up, so that vessels cannot approach within a considerable distance of the shore. From here the caravans start for Persia, and at certain periods of the year long trains of camels may be seen, and Persian merchants conspicuous by their high black caps and long robes. The route which these caravans follow is a *chaussée* as far as Erzerum, but this in places is too much broken to admit of the transit of wheeled vehicles. The railway by Batoum to Baku by way of Tiflis has tended greatly to turn the channel of commerce from Trebizond into Russian territory, since it helps to open the route to Erivan, Tabriz and the whole of Persia. The total population of the place amounts to about 40,000, of whom 22,000 are Moslems and 18,000 Christians. Great Britain and all the larger European states have consulates there.

The vilayet, of which Trebizond is the chief town, consists of a long irregular strip of coast country, the eastern half of which is deeply indented and mountainous.

History.—The city of Trapezus was a colony of Sinope, but it first comes into notice at the time of the Retreat of the Ten Thousand, who found repose there. Notwithstanding its commercial importance, the remoteness of its position prevented it from being much known to fame either in the Hellenic or the early medieval period; its greatness dates from the time of the fourth crusade (1204), when the Byzantine Empire was dismembered and its capital occupied by the Latins. During the confusion that followed that event Alexius Comnenus escaped into Asia, and, having collected an army of Iberian mercenaries, entered Trebizond, where he was acknowledged as the legitimate sovereign, and assumed the title of Grand Comnenus. Though only twenty-two years of age, Alexius was a man of ability and resolute will, and he succeeded without difficulty in making himself master of the greater part of the southern coast of the Black Sea. The empire thus founded continued to exist until 1461, when the city was taken by Mahommed II. The cause of this long duration, and at the same time the secret of its history, is to be found in the isolated position of Trebizond and its district, between the mountains and the sea, which has already been described. By this means it was able to defy both the Seljuks and the Ottomans, and to maintain its independence against the emperors of Nicaea and Constantinople. But for the same reason its policy was always narrow, so that it never exercised any beneficial influence on the world at large. It was chiefly in the way of matrimonial alliances that it was brought into contact with other states. The imperial family were renowned for their beauty, and the princesses of this race were sought as brides by Byzantine emperors of the dynasty of the Palaeologi, by Western nobles, and by Mahommedan princes; and the connexions thus formed originated a variety of diplomatic relations and friendly or offensive alliances. The palace of Trebizond was famed for its magnificence, the court for its luxury and elaborate ceremonial, while at the same time it was frequently a hotbed of intrigue and immorality. The Grand Comneni were also patrons of art and learning, and in consequence of this Trebizond was resorted to by many eminent men, by whose agency the library of the palace was provided with valuable manuscripts and the city was adorned with splendid buildings. The writers of the time speak with enthusiasm of its lofty towers, of the churches and monasteries in the suburbs, and especially of the gardens, orchards and olive groves. It excited the admiration of Gonzales Clavijo, the Spanish envoy, when he passed through it on his way to visit the court of Timur at Samarkand (Clavijo, *Historia del gran Tamorlan*, p. 84); and Cardinal Bessarion, who was a native of the place, in the latter part of his life, when the city had passed into the hands of the Mahommedans, and he was himself a dignitary of the Roman Church, so little forgot the impression it had made upon him that he wrote a work entitled "The Praise of Trebizond" (Ἐγκώμιον Τραπεζοῦντος), which exists in manuscript at Venice. Little was known of the history of the empire of Trebizond until the subject was taken in hand by Professor Fallmerayer of Munich, who discovered the chronicle of Michael Panaretus among the books of Cardinal Bessarion, and from that work, and other sources of information which were chiefly unknown up to that time, compiled his *Geschichte des Kaiserthums von Trapezunt* (Munich, 1827). From time to time the emperors of Trebizond paid tribute to the Seljuk sultans of Iconium, to the grand khans of the Mongols, to Timur the Tatar, to the Turkoman chieftains, and to the Ottomans; but by means of skilful negotiations they were enabled practically to secure their independence. We find them also at war with many of these powers, and with the Genoese, who endeavoured to monopolize the commerce of the Black Sea. The city was several times besieged, the most formidable attack being that which occurred in the reign of Andronicus I., the second emperor, when the Seljuks, under the command of Melik, the son of the great sultan Ala-ed-din, first assaulted the northern wall in the direction of the sea, and afterwards endeavoured to storm the upper citadel by night. They failed, however, in both attempts; and in the latter, owing to the darkness, and to the occurrence of a violent storm which suddenly swelled the torrents in the ravines, their force was thrown into inextricable confusion, and they were compelled to abandon their camp and make the best of their escape from the country. So great was the strength of the fortifications that Mahommed II. might have experienced much difficulty in reducing it, had it not been for the pusillanimous conduct of David, the last emperor, who surrendered the place almost unconditionally.

Ancient Memorials.—Several interesting monuments of this period remain at Trebizond in the form of churches in the Byzantine style of architecture. One of these is within the area of the old city, viz. the church of the Panaghia Chrysokephalos, or Virgin of the Golden Head, a large and massive but excessively plain building, which is now the Orta-hissar mosque. On the farther side of the eastern ravine stands a smaller but very well proportioned structure, the church of St Eugenius, the patron saint of Trebizond, now the Yeni Djuma djami, or New Friday mosque. Still more important is the church of Haghia Sophia, which occupies a conspicuous position overlooking the sea, about 2 m. west of the city. The porches of this are handsomely ornamented, and about 100 ft. from it rises a tall campanile, the inner walls of which have been covered in parts with frescoes of religious subjects, though these are now much defaced. But the most remarkable memorial of the middle ages that exists in all this district is the monastery of Sumelas, which is situated about 25 m. from Trebizond, at the side of a rocky glen, at a height of 4000 ft. above the sea. Its position is most extraordinary, for it occupies a cavern in the middle of the face of a perpendicular cliff 1000 ft. high, where the white buildings offer a marked contrast to the brown rock which forms their setting. It is approached by a zigzag path at the side of the cliff, from which a flight of stone steps and a wooden staircase give access to the monastery. The valley below is filled with the richest vegetation, the undergrowth being largely composed of azaleas and rhododendrons. An antiquity of 1500 years is claimed for the foundation of the monastery, but it is certain that the first person who raised it to importance was the emperor Alexius Comnenus III. of Trebizond; he rebuilt it in 1360, and richly endowed it. The golden bull of that emperor, which became thenceforth the charter of its foundation, is still preserved; it is one of the finest specimens of such documents, and contains portraits of Alexius himself and his queen. The monastery also possesses the firman of Mahommed II. by which he accorded his protection to the monks when he became master of the country.

Texier and R. P. Pullan, *Byzantine Architecture* (London, 1864); G. Finlay, *History of Greece*, vol. iv. (Oxford, 1877); H. F. Tozer, *Turkish Armenia and Eastern Asia Minor* (London, 1881). (H. F. T.)

TREBLE (a doublet of "triple," three-fold, from Lat. *triplus*, triple; cf. "double" from *duplus*), the term applied, in music, to the high or acute part of the musical system, as opposed to and distinguished from the "bass," the lower or grave part. The middle C is the practical division between the parts. The word is also used as equivalent to the "soprano" voice, the highest pitch or range of the human voice, but generally it is confined to a boy's voice of this quality, "soprano" being used of the corresponding female voice. The treble-clef is the G-clef on the second line. The origin of this application of the term "treble," *triplus*, threefold, to the highest voice or part is due to the fact that in the early plain-song the chief melody was given to the tenor, the second part to the alto (*discantus*) and where a third part (*triplum*) was added it was assigned to the highest voice, the soprano or treble.

TRÉBUCHET, a medieval siege engine, employed either to batter masonry or to throw projectiles over walls. It was developed from the post-classical Roman *onager* (wild ass), which derived its name from the kicking action of the machine. It consisted of a frame placed on the ground to which a vertical frame of solid timber was rigidly fixed at its front end; through the vertical frame ran an axle, which had a single stout spoke. On the extremity of the spoke was a cup to receive the projectile. In action the spoke was forced down, against the tension of twisted ropes or other springs, by a windlass, and then suddenly released. The spoke thus kicked the crosspiece of the vertical frame, and the projectile at its extreme end was shot forward. In the trébuchet the means of propulsion was a counter-weight. The axle which was near the top of a high strutted vertical frame served as the bridge of a balance, the shorter arm of which carried the counter-weight and the longer arm the carrier for the shot. An alternative name for the trébuchet is the mangonel (*mangonneau*).

TREBULA, the name of five ancient towns in Italy. (1) Trebula in Samnium, a town of the Caraceni, on the left bank of the Sangro, some 20 m. below Castel di Sangro; the church of the Madonna degli Spineti near Quadri marks the site. It appears to have been a *municipium*, but we only know of its existence in Hadrian's time. (2) Trebula in Campania, between Saticula and Suessula. The site is probably identical with the hills bearing the modern name Tripaola (about 1000 ft. above sea level) above the entrance to the valley of Maddaloni. It is possibly this Trebula the citizens of which received Latin rights in 303 B.C. Its territory extended as far as the Via Appia, and its place was taken in imperial times by the Vicus Novanensis, on the road itself, near Suessula. (3) Trebula Balliensis (mod. Treglia), also in Campania, 22 m. north of Capua, in the mountains, about 1000 ft. above sea-level. It revolted to Hannibal and was reduced to obedience by Fabius. Remains of walls, aqueduct and tombs exist. Its territory was mentioned in the projected distributions of land in Cicero's time: and its wine was well thought of under Nero. It was a *municipium*. (4) Trebula Mutuesca in the Sabine country, 2 m.

east of the point where the Via Caecilia diverges from the Via Salaria. It lies about 1 m. south-west of the modern Monteleone, and an amphitheatre and other remains are visible. In a dedication made there by the consul Mummius in 146 B.C. it is spoken of as a *vicus*, but when the *praefecturae* were abolished it became a *municipium*. The post station of Vicus Novus on the Via Salaria (mod. Osteria Li Massacci) belonged to its territory (see N. Persichetti in *Römische Mitteilungen*, 1898, p. 193). (5) TREBULA SUFFENAS is generally placed 6 m. south of Reate (mod. *Rieti*) on the Via Quinctia, but is with considerable probability identified with Ciciliano, 10 m. east of Tivoli, 2030 ft. above sea-level, by Q. Cuntz (*Jahreshefte des oesterr. arch. Instituts*, 1899, ii. 89), who combines the evidence of inscriptions and of the description in Martial (v. 71), with a new interpretation of the *Itineraries*. There are remains of an ancient road, with substructures in rough polygonal work ascending to it in zigzags. (T. As.)

TREDEGAR, an urban district in the western parliamentary division of Monmouthshire, England, on the Sirhowy river, 24 m. north of Cardiff, on a joint line of the London & North-Western and the Rhymney railways. Pop. (1901), 18,497. It stands at an elevation of about 1000 ft., and owes its existence to the establishment in the beginning of the 19th century of the works of the Tredegar Iron and Coal Company, which employ most of the large industrial population. The place gave the title of Baron Tredegar (*c.* 1859) to Sir Charles Morgan Robinson Morgan, Bart. (1792–1875), whose grandfather, Sir Charles Gould, Bart., married the heiress of John Morgan of Tredegar and changed his name to Morgan. He was M.P. for Brecknock in 1835–1847. He married a granddaughter of the 1st Lord Rodney. His son Godfrey (b. 1830), who succeeded to the barony, was created Viscount Tredegar in 1905; he had served in the Crimea and taken part in the famous Balaclava charge.

TREDGOLD, THOMAS (1788–1829), English engineer, was born at Brandon, near Durham, on the 22nd of August 1788, and at the age of fourteen was apprenticed to a carpenter. In 1808 he went to Scotland, and after working there as a journeyman for five years, obtained employment in London with an architect. He began to practice as a civil engineer on his own account in 1823, but much of his time was devoted to the preparation of his engineering text-books, which gained a wide reputation. They included *Elementary Principles of Carpentry* (1820), almost the first book of its kind in English; *Practical Treatise on the Strength of Cast Iron and other Metals* (1824); *Principles of Warming and Ventilating Public Buildings* (1824); *Practical Treatise on Railroads and Carriages* (1825); and *The Steam Engine* (1827). He died in London on the 28th of January 1829.

TREE, SIR HERBERT BEERBOHM (1853–), English actor and manager, was born in London, on the 17th of December 1853, the son of Julius Beerbohm, a London merchant of German parentage; his half-brother, Max Beerbohm (b. 1872), became well known as a dramatic critic, a miscellaneous writer and caricaturist. Taking the stage name of Beerbohm Tree he made his first professional appearance in London in 1876. After some years of varied experience he made a striking success in 1884 as the curate in *The Private Secretary*, but he was making himself well known meanwhile in dramatic circles as an admirable actor in many rôles. In September 1887 he became lessee and manager of the Haymarket theatre, London, where his representations of melodramatic "character" parts, as in *Jim the Penman*, *The Red Lamp*, and *A Man's Shadow*, were highly successful. His varied talents as an actor were displayed, however, not only in a number of modern dramas, such as H. A. Jones's *Dancing Girl*, but also in romantic parts such as Gringoire, and in the production of so essentially a literary play as Henley's *Beau Austin*; and in classic parts his ability as a comedian was shown in *The Merry Wives of Windsor*, in which he played Falstaff, and as a tragedian in *Hamlet*; his presentations of Shakespeare were notable too as carrying forward the methods of realistic staging inaugurated at the Lyceum under Irving. In 1897 Mr Tree moved to the new Her Majesty's (afterwards His Majesty's) theatre, opening with Gilbert Parker's *Seats of the Mighty*; but his chief successes were in Stephen Phillips's poetical dramas, and in his splendid revivals of Shakespeare (especially *Richard II.* and the *Merchant of Venice*). The magnificence of the mounting, the originality and research shown in the "business" of his productions, and his own versatility in so many different types of character, made his management memorable in the history of the London stage; and on the death of Sir Henry Irving he was generally recognized as the leader in his profession. His wife (Maud Holt), an accomplished actress, and their daughter Viola, were also prominently associated with him. In 1907 he took his company to Berlin at the invitation of the German emperor, and gave a selection from his *répertoire* with great success. In the same year he established a school of dramatic art, for the training of actors, in London; and in this and other ways he was prominent in forwarding the interests of the stage. He was knighted in 1909.

TREE (O. Eng. *trēo*, *treow*, cf. Dan. *trae*, Swed. *träd*, tree, *trä*, timber; allied forms are found in Russ. *drevo*, Gr. δρῦς, oak, and δόρυ, spear, Welsh *derw*, Irish *darog*, oak, and Skr. *dāru*, wood), the term, applied in a wide sense, to all plants which grow with a permanent single woody stem or trunk of some height, branching out at some distance from the ground. There is a somewhat vague dividing line, in popular nomenclature, between "shrubs" and "trees," the former term being usually applied to plants with several stems, of lower height, and bushy in growth. The various species to which the name "tree" can be given are treated under their individual titles, *e.g.* oak, ash, elm, &c.; the articles FIR and PINE treat of two large groups of conifers; general information is provided by the articles PLANTS and GYMNOSPERMS; tree cultivation will be found under FORESTS AND FORESTRY and HORTICULTURE; and the various types of tree whose wood is useful for practical purposes under TIMBER. Apart from this general meaning of the word, the chief transferred use is that for a piece of wood used for various specific purposes, as a framework, bar, &c., such as the tree of a saddle, axle-tree, cross-tree, &c.

TREE-CREEPER, one of the smallest of British birds, and, regard being had to its requirements, one very generally distributed. It is the *Certhia familiaris* of ornithology, and is remarkable for the stiffened shafts of its long and pointed tail-feathers, aided by which, and by its comparatively large feet, it climbs the trunks or branches of trees, invariably proceeding upwards or outwards and generally in a spiral direction, as it seeks the small insects that are hidden in the bark and form its chief food. When in the course of its search it nears the end of a branch or the top of a trunk, it flits to another, always alighting lower down than the place it has left, and so continues its work. Inconspicuous in colour—for its upper plumage is mostly of various shades of brown mottled with white, buff and tawny, and beneath it is of a silvery white—the tree-creeper is far more common than the incurious suppose; but, attention once drawn to it, it can be frequently seen and at times heard, for though a shy singer its song is loud and sweet. The nest is neat, generally placed in a chink formed by a half-detached piece of bark, which secures it from observation, and a considerable mass of material is commonly used to stuff up the opening and give a sure foundation for the tiny cup, in which are laid from six to nine eggs of a translucent white, spotted or blotched with rust-colour.

The tree-creeper inhabits almost the whole of Europe as well as Algeria and has been traced across Asia to Japan. It is now recognized as an inhabitant of the greater part of North America, though for a time examples from that part of the world, which differed slightly in the tinge of the plumage, were accounted a distinct species (*C. americana*) and even those from Mexico and Guatemala (*C. mexicana*) have lately been referred to the same. It therefore occupies an area not exceeded in extent by that of many passerine birds and is one of the strongest witnesses to the close alliance of the so-called Nearctic and Palaearctic regions.

Allied to the tree-creeper, but without its lengthened and stiff tail-feathers, is the genus *Tichodroma*, the single member of which is the wall-creeper (*T. muraria*) of the Alps and some other mountainous parts of Europe and Asia. It is occasionally seen in Switzerland, fluttering like a big butterfly against the face of a rock conspicuous from the scarlet-crimson of its wing-coverts and its white spotted primaries. Its bright hue is hardly visible when the bird is at rest, and it then presents a dingy appearance of grey and black. It is a species of wide range, extending from Spain to China; and, though but seldom leaving its cliffs, it has wandered even so far as England. Merrett (*Pinax*, p. 177) in 1667 included it as a British bird, and the correspondence between Marsham and Gilbert White (*Proc. Norf. and Norw. Nat. Society*, ii. 180) proves that an example was shot in Norfolk, on the 30th of October 1792; while another is reported (*Zoologist*, 2nd series, p. 4839) to have been killed in Lancashire on the 8th of May 1872.

The passerine family Certhiidae contains a number of genera of birds to which the general name "creeper" is applied; they occur in North America, Europe and Asia, the greater part of Africa, and Australia and New Guinea. (A. N.)

TREE-FERN. In old and well-grown specimens of some of the familiar ferns of temperate climates the wide-spreading crown of fronds may be observed to rise at a distance often of a good many inches above the ground, and from a stem of considerable thickness. The common male fern *Lastraea* (*Filix-mas*) affords the commonest instance of this; higher and thicker trunks are, however, occasionally presented by the royal fern (*Osmunda regalis*), in which a height of 2 ft. may be attained, and this with very considerable apparent thickness, due, however, to the origin and descent of a new series of adventitious roots from the bases of each annual set of fronds. Some tropical members and allies of these genera become more distinctly tree-like, *e.g. Todea*; *Pteris* also has some sub-arboreal forms. *Oleandra* is branched and shrub-like, while *Angiopteris* and *Marattia* may also rise to 2 ft. or more. But the tree-ferns proper are practically included within the family Cyatheaceae. This includes seven genera (*Cyathea, Alsophila, Hemitelia, Dicksonia, Thyrsopteris, Cibotium* and *Balantium*) and nearly 300 species, of which a few are herbaceous, but the majority arboreal and palm-like, reaching frequently a height of 50 ft. or more, *Alsophila excelsa* of Norfolk Island having sometimes measured 60 to 80 ft. The fronds are rarely simple or simply pinnate, but usually tripinnate or decompound, and may attain a length of 20 ft., thus forming a splendid crown of foliage. The stem may occasionally branch into many crowns.

The genera are of wide geographical range, mostly within the tropics; but South Australia, New Zealand, and the southern Pacific islands all possess their tree-ferns. In Tasmania *Alsophila australis* has been found up to the snow-level, and in the humid and mountainous regions of the tropics tree-ferns are also found to range up to a considerable altitude. The fronds may either contribute to the apparent thickness of the stem by leaving more or less of their bases, which become hardened and persistent, or they may be articulated to the stem and fall off, leaving characteristic scars in spiral series upon the stem. The stem is frequently much increased in apparent thickness by the downgrowth of aerial roots, forming a black coating several inches or even a foot in thickness, but its essential structure differs little in principle from that familiar in the rhizome of the common bracken (*Pteris*). To the ring or rather netted cylinder of fibrovascular bundles characteristic of all fernstems scattered internal as well as external bundles arising from these are superadded and in a tree-fern the outer bundles give off branches to the descending roots from the region where they pass into the leaves.

Tree-ferns are cultivated for their beauty alone; a few, however, are of some economic applications, chiefly as sources of starch. Thus the beautiful *Alsophila excelsa* of Norfolk Island is said to be threatened with extinction for the sake of its sago-like pith, which is greedily eaten by hogs; *Cyathea medullaris* also furnishes a kind of sago to the natives of New Zealand, Queensland and the Pacific islands. A Javanese species of *Dicksonia* (*D. chrysotricha*) furnishes silky hairs, which have been imported as a styptic, and the long silky or rather woolly hairs, so abundant on the stem and frond-leaves in the various species of *Cibotium* have not only been put to a similar use, but in the Sandwich Islands furnish wool for stuffing mattresses and cushions, which was formerly an article of export. The "Tartarian lamb," or *Agnus scythicus* of old travellers' tales in China and Tartary, is simply the woolly stock of *Cibotium Barometz*, which, when dried and inverted, with all save four of its frond-stalks cut away, has a droll resemblance to a toy sheep.

TREE FROG. Many different groups of tailless Batrachians (see FROG) are adapted to arboreal life, which is indicated by expansions of the tips of the fingers and toes, adhesive disks which assist the animal in climbing on vertical smooth surfaces. These disks do not act as suckers, but adhere by rapid and intense pressure of the distal phalanx and special muscles upon the lower surface, which is also provided with numerous glands producing a viscous secretion.

The best-known tree frog is the little *Hyla arborea* of continental Europe, *rainette* of the French, *Laubfrosch* of the Germans, often kept in glass cylinders provided with a ladder, which the frog is supposed to ascend or descend in prevision of the weather. But recent experiments conducted on scientific principles show that not much reliance can be placed on its prophecies. This frog is one of the smallest of European Batrachians, rarely reaching 2 in. in length; its upper parts are smooth and shiny, normally of a bright grass-green, which may change rapidly to yellow, brown, olive or black; some specimens, deprived of the yellow pigment which contributes to form the green colour, are sky-blue or turquoise blue; the lower parts are granulate and white.

The family Hylidae, of which the European tree frog is the type, is closely related to the Bufonidae or true roads, being distinguished from them by the presence of teeth in the upper jaw and by the claw-like shape of the terminal phalanx of the digits. It is a large family, represented by about three hundred species, two hundred and fifty of which belong to the genus *Hyla*, distributed over Europe, temperate Asia, North Africa, North and South America, Papua and Australia. Close allies of *Hyla* are the *Nototrema* of Central and South America, in which the female develops a dorsal broad pouch in which the young undergo part or the whole of their metamorphoses. The genus *Phyllomedusa*, also from Central and South America, are quadrumanous; the inner finger and the toe being opposable to the others, and the foot being very similar to the hand. These frogs deposit their spawn between the leaves of branches overhanging water, into which the tadpoles drop and spend their larval life.

TREE KANGAROO, any individual of the diprotodont marsupial genus *Dendrolagus* (see MARSUPIALIA). Three species are inhabitants of New Guinea and the fourth is found in North Queensland. They differ greatly from all other members of the family (Macropodidae), being chiefly arboreal in their habits, and feeding on bark, leaves and fruit. Their hinder limbs are shorter than in the true kangaroos, and their fore limbs are longer and more robust, and have very strong curved and pointed claws. The best-known species, Lumholtz' tree kangaroo (*Dendrolagus lumholtzi*), is found in North Queensland. It was named by Professor Collett in honour of its discoverer, who described it as living on the highest parts of the mountains, in the densest scrub and most inaccessible places. It is hunted by the blacks with trained dingoes; the flesh is much prized by the blacks, but the presence of a worm between the muscles and the skin renders it less inviting to Europeans.

TREE-SHREW, any of the arboreal insectivorous mammals of the genus *Tupaia*. There are about a dozen species, widely distributed over the east. There is a general resemblance to squirrels. The species differ chiefly in the size and in colour and length of the fur. Nearly all have long bushy tails. Their food consists of insects and fruit, which they usually seek for in the trees. When feeding they often sit on their haunches, holding the food, after the manner of squirrels, between their fore paws. The pen-tailed tree-shrew (*Ptilocercus lowi*), from Borneo, Sumatra and the Malay Peninsula, is the second generic representative of the family Tupaiidae. The head and body, clothed in blackish-brown fur, are about 6 in. long; the tail, still longer, is black, scaled and sparsely haired for the upper two-thirds, while the lower third is fringed on each side with long hairs, mostly white. One shrew from Borneo and a second from the Philippines have been referred to a separate genus under the name *Urogale everetti* and *U. cylindrura*, on account of their uniformly short-haired, in place of varied, tails. (See INSECTIVORA.)

TREE-WORSHIP. Primitive man, observing the growth and death of trees, the elasticity of their branches, the sensitiveness and the annual decay and revival of their foliage, anticipated in his own way the tendency of modern science to lessen the gulf between the animal and the vegetable world. When sober Greek philosophers (Aristotle, Plutarch) thought that trees had perceptions, passions and reason, less profound thinkers may be excused for ascribing to them human conceptions and supernatural powers, and for entertaining beliefs which were entirely rational and logical from primitive points of view. These beliefs were part of a small stock of fundamental ideas into which scientific knowledge of causation did not enter, ideas which persist in one form or another over a large portion of the world, and have even found a place in the higher religions, inevitably conditioned as these positive faiths are by the soil upon which they flourish.[1] In fact, the evidence for tree-worship is almost unmanageably large, and since comparative studies do not as yet permit a concise and conclusive synopsis of the subject, this article will confine itself to some of the more prominent characteristics.

Trees and Human Life. Numerous popular stories reflect a firmly rooted belief in an intimate connexion between a human being and a tree, plant or flower. Sometimes a man's life depends upon the tree and suffers when it withers or is injured, and we encounter the idea of the *external soul*, already found in the Egyptian "Tale of the Two Brothers" of at least 3000 years ago. Here one of the brothers leaves his heart on the top of the flower of the acacia and falls dead when it is cut down. Sometimes, however, the tree is an *index*, a mysterious token which shows its sympathy with an absent hero by weakening or dying, as the man becomes ill or loses his life. These two features very easily combine, and they agree in representing a—to us—mysterious sympathy between tree- and human-life, which, as a matter of fact, frequently manifests itself in recorded beliefs and customs of historical times.[2] Thus, sometimes the new-born child is associated with a newly planted tree with which its life is supposed to be bound up; or, on ceremonial occasions (betrothal, marriage, ascent to the throne), a personal relationship of this kind is instituted by planting trees, upon the fortunes of which the career of the individual depends. Sometimes, moreover, boughs or plants are selected and the individual draws omens of life and death from the fate of his or her choice. Again, a man will put himself into relationship with a tree by depositing upon it something which has been in the closest contact with himself (hair, clothing, &c.). This is not so unusual as might appear; there are numerous examples of the conviction that a sympathetic relationship continues to subsist between things which have once been connected (*e.g.* a man and his hair), and this may be illustrated especially in magical practices upon material objects which are supposed to affect the former owner.[3] We have to start then with the recognition that the notion of a real inter-connexion between human life and trees has never presented any difficulty to primitive minds.

The custom of transferring disease or sickness from men to trees is well known.[4] Sometimes the hair, nails, clothing, &c., of a sickly person are fixed to a tree, or they are forcibly inserted in a hole in the trunk, or the tree is split and the patient passes through the aperture. Where the tree has been thus injured, its recovery and that of the patient are often associated. Different explanations may be found of such customs which naturally take rather different forms among peoples in different grades of civilization. Much depends upon the theory of illness. In India, for example, when the patient is supposed to be tormented by a demon, ceremonies are performed to provide it with a tree where it will dwell peacefully without molesting the patient so long as the tree is left unharmed.[5] Such ideas do not enter, of course, when the rite merely removes the illness and selfishly endangers the health of those who may approach the tree.[6] Again, sometimes it is clearly felt that the man's personality has been mystically united with some healthy and sturdy tree, and in this case we may often presume that such trees already possessed some peculiar reputation. The custom finds an analogy when hair, nail-clippings, &c., are hung upon a tree for safety's sake lest they fall into the hands of an enemy who might injure the owner by means of them.

Veneration of Trees. In almost every part of the world travellers have observed the custom of hanging objects upon trees in order to establish some sort of a relationship between the offerer and the tree. Such trees not infrequently adjoin a well or are accompanied by sacred buildings, pillars, &c. Throughout Europe, also, a mass of evidence has been collected testifying to the lengthy persistence of "superstitious" practices and beliefs concerning them. The trees are known as the scenes of pilgrimages, ritual ambulation, and the recital of (Christian) prayers. Wreaths, ribbons or rags are suspended to win favour for sick men or cattle, or merely for "good luck." Popular belief associates the sites with healing, bewitching, or mere "wishing"; and though now perhaps the tree is the object only of some vague respect, there are abundant allusions to the earlier vitality of coherent and systematic cults.[7] Decayed or fragmentary though the features may be in Europe, modern observers have found in other parts of the world more organic examples which enable us, not necessarily to reconstruct the fragments which have survived in the higher religions and civilizations, but at least to understand their earlier significance. In India, for example, the Korwas hang rags on the trees which form the shrines of the village-gods. In Nebraska the object of the custom was to propitiate the supernatural beings and to procure good weather and hunting. In South America Darwin recorded a tree honoured by numerous offerings (rags, meat, cigars, &c.); libations were made to it, and horses were sacrificed.[8] If, in this instance, the Gauchos regarded the tree, not as the embodiment or abode of Walleechu, but as the very god himself, this is a subtle but very important transference of thought, the failure to realize which has not been confined to those who have venerated trees.

Embody Spirits. Among the Arabs the sacred trees are haunted by angels or by *jinn*; sacrifices are made, and the sick who sleep beneath them receive prescriptions in their dreams. Here, as frequently elsewhere, it is dangerous to pull a bough. This dread of damaging special trees is familiar: Cato instructed the woodman to sacrifice to the male or female deity before thinning a grove (*De re rustica*, 139), while in the Homeric poem to Aphrodite the tree nymph is wounded when the tree is injured, and dies when the trunk falls.[9] Early Buddhism decided that trees had neither mind nor feeling and might lawfully be cut; but it recognized that certain spirits might reside in them, and this the modern natives of India firmly believe. Propitiation is made before the sacrilegious axe is laid to the holy trees; loss of life or of wealth and the failure of rain are feared should they be wantonly cut; and there are even trees which it is dangerous to climb.[10] The Talein of Burma prays to the tree before he cuts it down, and the African woodman will place a fresh sprig upon the

[1] In this as in other subjects of comparative religion (see SERPENT-WORSHIP), the comparative and historical aspects of the problems should not be severed from psychology, which investigates the actual mental processes themselves. A naïve rationalism or intellectualism which would ridicule or deplore the modern retention of "primitive" ideas has to reckon with the psychology of the modern average mental constitution; a more critical and more sympathetic attitude may recognize in religious and in other forms of belief and custom the necessary consequences of a continuous development linking together the highest and the lowest conceptions of life.

[2] See the evidence collected by E. S. Hartland, *The Legend of Perseus* (1894–1896), ii.; J. G. Frazer, *The Golden Bough* (1900), iii. 351 sqq., 391; and in general, A. E. Crawley, *The Idea of the Soul* (1909).

[3] There appears to be a fundamental confusion of association, likeness and identity, which on psychological grounds is quite intelligible. It is appropriate to notice the custom of injuring an enemy by simply beating a tree-stump over which his *name* had previously been pronounced (A.B. Ellis, *The Ewe-speaking Peoples of the Slave Coast of West Africa*, 1890, p. 98). The folk-lore of the "name" is widespread and of great antiquity, and certain features of it show that a thing (individual or object) and its name were not easily disconnected, and that what affected the one affected the other. In this case, by pronouncing the name the tree-stump for all intents and purposes became the enemy.

[9] See generally Frazer i. 170 sqq., Tylor i. 475 sqq., ii. 219 seq. For the survival of the idea of modern Greece, see J. C. Lawson, *Modern Greek Folk-lore* (1910), p. 158 seq.

[10] Crooke ii. 77, 87, 90 sqq.

stump as a new home for the spirit. In the Gold Coast the silk-cotton and odum (poison) trees are especially sacred as the abode of the two deities, who are honoured by sacrifices—even of human victims; these indwelt trees must not be cut, and, since all trees of these species are under their protection, they can be felled only after certain purificatory ceremonies.[1] In general the evidence shows that sacred trees must not be injured unless they (*i.e.* their spirits) have been appeased, or means taken to provide the occupant with another abode. That the difference between the sacred *object* and the sacred *occupant* was not always clearly drawn is quite intelligible from those beliefs of much less rudimentary religions which confuse the unessential with the essential.

Again, when the jungle-races of India clear the forests, they leave behind certain trees which are carefully protected lest the sylvan gods should abandon the locality (Crooke ii. 90). These trees embody the local deities much in the same way as the north European homestead had a tree or a small grove for the guardian-spirit or "lord of the home," and they resemble the tree tutelary genius of old German villages and the Japanese trees which are the terrestrial dwelling-places of the guardian of the hamlets.[2] Such beliefs as these are more significant when trees are associated with the spirits of the dead. Trees were planted around graves in Greece, and in Roman thought groves were associated with the *manes* of the pious. The Baduyas of the central provinces of India worship the souls of their ancestors in groves of Sāj trees, and this may be supplemented by various modern burial usages where the dead are buried in trees, or where the sacred tree of the village enshrines the souls of the dead forefathers. Thus among the natives of South Nigeria each village has a big tree into which the spirits of the dead are supposed to enter; when a woman wants a child or when a man is sick, sacrifice is made to it, and if the "Big God" Osòwo who lives in the sky is favourable the request is granted.[3]

Often the tree is famous for oracles. Best known, perhaps, is the oak of Dodona tended by priests who slept on the ground. The tall oaks of the old Prussians were inhabited by gods who gave responses, and so numerous are the examples that the old Hebrew "terebinth of the teacher" (Gen. xii. 6), and the "terebinth of the diviners" (Judg. ix. 37) may reasonably be placed in this category. Important sacred trees are also the object of pilgrimage, one of the most noteworthy being the branch of the Bo tree at Ceylon brought thither before the Christian era.[4] The tree-spirits will hold sway over the surrounding forest or district, and the animals in the locality are often sacred and must not be harmed. Thus, the pigeons at the grove of Dodona, and the beasts around the north European tree-sanctuaries, were left untouched, even as the modern Dyak would allow no interference with the snake by the side of the bush which enshrined a dead kinsman.[5] Sacred fires burned before the Lithuanian Perkuno and the Roman Jupiter; both deities were closely associated with the oak, and, indeed, the oak seems to have been very commonly used for the perpetual holy fires of the Aryans.[6] The powers of the tree-deities, though often especially connected with the elements, are not necessarily restricted, and the sacred trees can form the centre of religious, and sometimes, also, of national life. Such deities are not abstract beings, but are potent and immediate, and the cultus is primarily as utilitarian as the duties of life itself. They may have their proper ministrants: (*a*) the chief sanctuary of the old Prussians was a holy oak around which lived priests and a high priest known as "God's mouth"; (*b*) in Africa there are sacred groves into which the priest alone may enter, and (*c*) among the Kissil-Bashi (or Kizilbashes) of the Upper Tigris and Euphrates, the holy tree of the village stands in an enclosure to which only the father-priest has access.[7] The trees may be the scene of religious festivals, and—what sometimes goes with these—of periodical fairs and markets. Among the Lousiade group in British New Guinea the religious feasts are held under the sacred tree and a portion is laid aside for the spirit-occupants. That the invisible spirit naturally enjoyed only the *spiritual* part of the offerings is a belief which may have been shared by others than the African negro.[8] Human sacrifice is known on the Slave Coast and in the Punjab; it was practised among the Druids, and at Odin's grave at Upsala. It is also said that the pollution of old Prussian sacred groves and springs by the intrusion of Christians was atoned for by human victims. Indeed, to judge from later popular custom and tradition, and from the allusion in ancient writers, various grisly rites and acts of licentiousness (such as the more advanced Hebrew prophets denounced) were by no means unusual features in the cults of trees and vegetation.[9]

Forms of Cult.

Although trees have played so prominent a part in the history of religions, the utmost caution is necessary in any attempt to estimate the significance of isolated evidence and its relation to the contemporary thought. Let it suffice to notice that in West Equatorial Africa the death of the sacred tree near the temples leads to the abandonment of the village, that in Rome the withering of the sacred fig-tree of Romulus in the Forum caused the greatest consternation. One can now understand in some measure why so much importance should be attached to a venerated tree, but these examples will illustrate the different historical and religious conditions which require study in any investigation of tree-worship. Unfortunately one constantly reaches the point where the ancient writer or the modern observer has failed to record the required information. Moreover, we do not encounter tree-cults at their rise: in every case we arrest the evidence at a certain stage of development. It is often impossible to determine why certain trees are sacred; sometimes it may be that the solitary tree is the survivor of a forest or grove, or it has attracted attention from its curious or uncanny form, or again it stands on a spot which has an immemorial reputation for sanctity. The persistence of sacred localities is often to be observed in the East, where more rudimentary forms of tree-cults stand by the side of or outlive higher types of religion.[10] The evolution of sacred trees and of religious beliefs and practices associated therewith have not always proceeded along parallel lines. As ideas advanced, the spirits associated with trees were represented by posts, idols, or masks; altars were added, and the trunk was roughly shaped to represent the superhuman occupant. There is reason to believe that the last-mentioned transformation has frequently happened in the development of iconography. Indeed, the natives of the Antilles suppose that certain trees instructed sorcerers to shape their trunks into idols, and to instal them in temple-huts where they could be worshipped and could inspire their priests with oracles.[11]

Forms of Development.

[1] A. B. Ellis, *op. cit.* pp. 49 sqq.; cf. further Frazer i. 180, 182 sqq.

[10] So in Asia Minor where a tree hung with rags stands by a rock with an ancient "Hittite" representation of the god of vegetation (W. M. Ramsay, *The Expositor*, Nov., 1906, p. 461 seq.). "Hittite" religion has long passed away, but the locality preserves its sacred character and presents a form of cult older than the "Hittite" civilization itself (cf. also the persistence of the veneration of trees in Palestine in spite of some four thousand years of history). There has not been a reversion to ancient forms of cult in their organic entirety, but with the weakening and loss of the positive influences in the course of history, there has been no progression, and the communities live in simpler conditions and at a simpler stage of mental evolution and they are "childlike" rather than "senile" or "decadent."

[11] Tylor, ii. 216. Here one may observe: (*a*) the virtues of the tree as a whole will be retained—as in the case of the relic of a medieval saint—in any part of it (cf. ibid. 217; the offshoots of the oak of

The development of the beliefs relating to the spirit-occupants themselves would take us along quite another line of inquiry. When the tree-spirit was conceived to be of human shape the numerous stories which associate trees with men or deities of flesh and blood would easily arise; and just as Indian natives have gods which are supposed to dwell in trees, so in higher religions we find a Zeus or a Dionysus *Endendros*, gods, "occupants of trees," who have been identified with one or other of the leading members of a recognized pantheon.[1]

Later Vicissitudes. The vicissitudes of the old tree-spirits are influenced by the circumstances of history. Syrian writers speak of a "king of the forest" and of a tall olive tree to the worship of which Satan seduced the people. But these "trees of the demons" were hewn down by zealous Syrian Christians. So also the caliph Omar cut down the tree at Ḥodaibaya visited by pilgrims, lest it should be worshipped, and the Council of Nantes (A.D. 895) expressly enjoined the destruction of trees which were consecrated to demons. Tradition has preserved some recollections of the overthrow of tree-cult in Europe. Bonifacius destroyed the great oak of Jupiter at Geismar in Hesse, and built of the wood a chapel to St Peter. (A similar continuity was maintained near Hebron when Constantine destroyed the idols and altars beneath the oak or terebinth of Abraham at Mamre and replaced them by a basilica.) On the Heinzenberg near Zell the Chapel of Our Lady stands where the old tree uttered its complaint as the woodman cut it down; and at Kildare (*cilldara*, church of the oak), "Saint" Brigit or Bridget built her church under an oak tree.[2] On the other hand, at Samosata, the sacred tree worshipped in Christian times, was honoured as the wood of Christ's cross, and this growth of a new tradition to justify or at least to modify an old survival recurs in Palestine where the holy trees, whether adjoining a venerated tomb or not, are often connected with the names of saints or prophets and sometimes with appropriate traditions.

It is impossible to do more than indicate the outlines of an intricate subject which concerns the course of certain fundamental ideas, their particular development so far as trees are concerned, and the more accidental factors which have influenced these two lines within historical times. Several important aspects have been inevitably ignored, *e.g.* the marriage of trees and tree-spirits, the annual festivals at the growth and decay of vegetation, and the evidence for the association of prominent deities with tree-spirits. For these features and for other general information see especially the works of J. G. Frazer (*Golden Bough*; *Lectures on Kingship*; *Adonis, Attis and Osiris*; *Totemism and Exogamy*), other literature cited in the course of this article, and the numerous works dealing with primitive religious and other customs. Among the most useful monographs are those of C. Boetticher, *Der Baumkultus d. Hellenen* (1856); W. Mannhardt, *Der Baumkultus der Germanen und ihrer Nachbarstämme* (1875), *Antike Wald- und Feldkulte* (1877), and, for introductory study, Mrs J. H. Philpot, *The Sacred Tree, or the Tree in Religion and Myth* (1897). (S. A. C.)

TREFOIL (Lat. *trifolium*, three-leaved plant, Fr. *trèfle*, Ger. *Dreiblatt* and *Dreiblattbogen*), the term in Gothic architecture given to the ornamental foliation or cusping introduced in the heads of window-lights, tracery, panellings, &c., in which the centre takes the form of a three-lobed leaf, one of the earliest examples being in the plate tracery at Winchester (1222–1235); see QUATREFOIL.

TREGELLES, SAMUEL PRIDEAUX (1813–1875), English theologian, was born at Wodehouse Place, near Falmouth, on the 30th of January 1813. His parents were Quakers, and he himself for many years was in communion with the (Darbyite) Plymouth Brethren, but afterwards became a Presbyterian. For a while he worked at the ironworks, Neath Abbey, Glamorgan, and then set up as a private tutor in Falmouth, finally devoting himself to a laborious student life, until he was incapacitated by paralysis in 1870. He received the LL.D. degree from St Andrews and a pension of £200 from the civil list. He died at Plymouth on the 24th of April 1875.

Most of his numerous publications had reference to his great critical edition of the New Testament (1857–1872; see BIBLE; *New Testament, Textual Criticism*). They include an *Account of the Printed Text of the Greek New Testament* (1854), a new edition of T. H. Horne's *Introduction* (1860), and *Canon Muratorianus: Earliest Catalogue of Books of the New Testament* (1868). As early as 1844 he published an edition of the Book of the Revelation, with the Greek text so revised as to rest almost entirely upon ancient evidence. Tregelles wrote *Heads of Hebrew Grammar* (1852), translated Gesenius's *Hebrew Lexicon*, and was the author of a little work on the *Jansenists* (1851) and of various works in exposition of his special eschatological views (*Remarks on the Prophetic Visions of Daniel*, 1852, new ed., 1864).

TRÉGUIER, a port of western France, in the department of Côtes-du-Nord, 36 m. N.W. of St Brieuc by road. Pop. (1906), 2605. The port is situated about 5½ m. from the English Channel at the confluence of two streams that form the Tréguier river; it carries on fishing and a coasting and small foreign trade. The cathedral, remarkable in having three towers over the transept, one of which is surmounted by a fine spire, dates from the 14th and 15th centuries. It contains the sumptuous modern mausoleum of St Yves (d. 1303), a canon of the cathedral, the building of which was largely due to him. To the south of the church there is a cloister (latter half of the 15th century) with graceful arcades. There is a statue of Ernest Renan, a native of the town. Saw-milling, boat-building and flax-stripping are carried on, together with trade in cereals, cloth, potatoes, &c.

Tréguier (*Trecorum*), which dates from the 6th century, grew up round a monastery founded by St Tugdual. In the 9th century it became the seat of a bishopric, suppressed in 1790.

TREILHARD, JEAN BAPTISTE (1742–1810), French revolutionist, was born at Brives (Corrèze). In Paris he gained reputation as an avocat at the parlement, and was a deputy to the states-general in 1789. In the Constituent Assembly he showed great capacity in dealing with the reorganization of the Church and the nationalization of ecclesiastical property. Ineligible, like all the members of the Constituent Assembly, for the Legislative Assembly, he became president of the criminal tribunal of Paris, but failed through lack of firmness. The department of Seine-et-Oise elected him to the Convention, where he attached himself to the group known as the Mountain (*q.v.*) and voted for the death of Louis XVI. He was a member of the committee of public safety, and became president of the Convention on the 27th of December 1792. Under the Directory he entered the Council of the Five Hundred (of which he was president during the month of Nivose, year IV.), was a member of the Tribunal of Cassation, plenipotentiary at the Congress of Rastatt, and became a director in the year VI. After the *coup d'état* of 18 Brumaire he became president of the tribunal of appeal and councillor of state. He took an important part in drafting the civil code, the criminal code, the code of civil procedure and the commercial code. He died on the 1st of December 1810, a senator and count of the empire.

See Bonnal de Ganges, "Représentants du peuple dignitaires par Napoléon . . . Treilhard," in the *Revue du monde catholique* (7th series, vol. iii., 1900); Guyot d'Amfreville, *Vie de J. B. Treilhard* (Limoges, 1879).

TREITSCHKE, HEINRICH VON (1834–1896), German historian and political writer, was born at Dresden on the 15th of September 1834. He was the son of an officer in the Saxon army who rose to be governor of Königstein and military governor of Dresden. Young Treitschke was prevented by deafness from entering the public service. After studying at Leipzig and Bonn, where he was a pupil of Dahlmann, he established himself as a *privatdozent* at Leipzig, lecturing on history and politics. He at once became very popular with the students, but his political opinions made it impossible for the Saxon government to appoint him to a professorship. He was at that

Dodona; the sacred oak of which the Argo was built); also (*b*) it was believed that the divine essence could be made to enter—transubstantiated as it were—into an image (cf. Rameses II. and his idols; see Breasted, *Egypt. Hist. Doc.* iii. 179, note; and for analogies see *Folk-Lore*, viii. 325).

[1] Even the Hebrews knew of the good-will of "Him who dwelt in the bush" (Deut. xxxiii. 16). For ideas associating Yahweh (Jehovah) with trees, see J. G. Frazer, *Anthrop. Essays to E. B. Tylor* (1907), p. 125 seq.

[2] See Chadwick 33, 35; Frazer, *Lectures*, 225; and Hartland ii. 181, 184 (who refers to the tree-worship taken over by St Maree and St Etto). Even the temples of Dodona and of Jupiter Capitolinus stood on the sites of older tree-worship.

time a strong Liberal; he hoped to see Germany united into a single state with a parliamentary government, and that all the smaller states would be swept away. In 1863 he was appointed professor at Freiburg; in 1866, at the outbreak of war, his sympathies with Prussia were so strong that he went to Berlin, became a Prussian subject, and was appointed editor of the *Preussische Jahrbücher*. A violent article, in which he demanded the annexation of Hanover and Saxony, and attacked with great bitterness the Saxon royal house, led to an estrangement from his father, who enjoyed the warm friendship of the king. It was only equalled in its ill humour by his attacks on Bavaria in 1870. After holding appointments at Kiel and Heidelberg, he was in 1874 made professor at Berlin; he had already in 1871 become a member of the Reichstag, and from that time till his death in 1896 he was one of the most prominent figures in the city. On Sybel's death he succeeded him as editor of the *Historische Zeitschrift*. He had outgrown his early Liberalism and become the chief panegyrist of the house of Hohenzollern. He did more than any one to mould the minds of the rising generation, and he carried them with him even in his violent attacks on all opinions and all parties which appeared in any way to be injurious to the rising power of Germany. He supported the government in its attempts to subdue by legislation the Socialists, Poles and Catholics; and he was one of the few men of eminence who gave the sanction of his name to the attacks on the Jews which began in 1878. As a strong advocate of colonial expansion he was also a bitter enemy of Great Britain, and he was to a large extent responsible for the anti-British feeling of German Chauvinism during the last years of the 19th century. In the Reichstag he had originally been a member of the National Liberal party, but in 1879 he was the first to accept the new commercial policy of Bismarck, and in his later years he joined the Moderate Conservatives, but his deafness prevented him from taking a prominent part in debate. He died at Berlin on the 28th of April 1896.

As an historian Treitschke holds a very high place. He approached history as a politician and confined himself to those periods and characters in which great political problems were being worked out: above all, he was a patriotic historian, and he never wandered far from Prussia. His great achievement was the *History of Germany in the Nineteenth Century*. The first volume was published in 1879, and during the next sixteen years four more volumes appeared, but at his death he had only advanced to the year 1847. The work shows extreme diligence, and scrupulous care in the use of authorities. It is discursive and badly arranged, but it is marked by a power of style, a vigour of narrative, and a skill in delineation of character which give life to the most unattractive period of German history; notwithstanding the extreme spirit of partisanship and some faults of taste, it will remain a remarkable monument of literary ability. Besides this he wrote a number of biographical and historical essays, as well as numerous articles and papers on contemporary politics, of which some are valuable contributions to political thought.

The most important of the essays have been collected under the title *Historische und politische Aufsätze* (4 vols., Leipzig, 1896); a selection from his more controversial writings was made under the title *Zehn Jahre deutscher Kämpfe*; in 1896 a new volume appeared, called *Deutsche Kämpfe, neue Folge*. After his death his lectures on political subjects were published under the title *Politik*. He brought out also in 1856 a short volume of poems called *Vaterländische Gedichte*, and another volume in the following year. The only works translated into English are two pamphlets on the war of 1870, *What we demand from France* (London, 1870), and *The Firetest of the North German Confederation* (1870).

See Schiemann, *Heinrich v. Treitschkes Lehr- und Wanderjahre, 1836–1866* (Munich, 1896); *Gustav Freitag und Heinrich v. Treitschke im Briefwechsel* (Leipzig, 1900); *Deutsche Rundschau* (Oct. 1896); and article by J. W. Headlam, *Hist. Rev.* (Dec. 1897). (J. W. He.)

TRELAWNY, EDWARD JOHN (1792–1881), English sailor and friend of Shelley and Byron, was born in London on the 13th of November 1792, the son of an army officer. After a short term in the navy and a naval school, he shipped for India, but deserted at Bombay. For several years he led an adventurous life in India, but about 1813 returned to England, married and settled down. In was early in 1822 that he met Shelley and Byron at Pisa and passed nearly every day with one or both of them until the drowning of Shelley (*q.v.*) and Williams on the 8th of July. He it was who superintended the recovery and cremation of the bodies, snatching Shelley's heart from the flames, and who added the lines from the *Tempest* to Leigh Hunt's "Cor Cordium"; and, finally, who supplied the funds for Mrs Shelley's return to England. In 1823 he set out with Byron for Greece, to aid in the struggle for independence. Distressed by his companion's dilatoriness, Trelawny left him and joined the insurgent chief Odysseus and afterwards married his sister Tersitza. While in charge of the former's fortress on Parnassus he was assaulted by two Englishmen and nearly killed. Returning to England, he lived for a time in Cornwall with his mother and afterwards in London, where his romantic associations, picturesque person and agreeable manners made him a great social favourite. Permission having been refused him to write the life of Shelley, he began an account of his own life in the *Adventures of a Younger Son* (1835), followed much later by a second part: *Recollections of Shelley and Byron* (1858). This gives an admirable portrait of Shelley, and a less truthful one of Byron. He married a third time, but the irregularity of his life estranged him from his wife, and he died at Sompting, near Worthing, on the 13th of August 1881. His ashes were buried in Rome by the side of those of Shelley. The old seaman in Millais's picture, "The North-West Passage," in the Tate Gallery, London, gives a portrait of him.

See the *Letters of Edward J. Trelawny*, edited with Introduction by H. Buxton Forman, C.B. (1910).

TRELAWNY, SIR JONATHAN, Bart. (1650–1721), English prelate, was a younger son of Sir Jonathan Trelawny, bart. (1624–1685), a member of a very old Cornish family, and was born at Pelynt in Cornwall on the 24th of March 1650. Educated at Westminster School and at Christ Church, Oxford, Trelawny took holy orders in 1673, and in 1685, his elder brother having died in 1680, became third baronet in succession to his father. Having rendered good service to James II. during Monmouth's rebellion, Trelawny was consecrated bishop of Bristol on the 8th of November 1685. He was loyal to King James until the first declaration of indulgence in April 1687, when, as a bishop, he used his influence with his clergy against the king, and, as a Cornish landowner, resisted the attempt to assemble a packed parliament. In May 1688 Trelawny signed the petition against the second declaration of indulgence, and in the following month was imprisoned in the Tower of London with Archbishop Sancroft and five other bishops, sharing their triumphant acquittal. In spite of Burnet's assertion, it is probable that Trelawny did not sign the invitation to William of Orange, although he certainly welcomed his army into Bristol. Before this James II., anxious to regain the bishop's support, had nominated him to the see of Exeter; but Trelawny lost nothing, as this appointment was almost at once confirmed by William III. Unlike five of his colleagues among the "seven bishops," Trelawny took the oaths of allegiance to William and Mary; but he was soon estranged from the new king and sided with the princess Anne, who showed him some favour after she became queen. In 1707 Trelawny was appointed bishop of Winchester and became prelate of the Order of the Garter, but henceforward he took very little part in politics. He died at his residence at Chelsea on the 19th of July 1721, and was buried at Pelynt. His wife was Rebecca (d. 1710), daughter of Thomas Hele of Bascombe, Devon, by whom he had a family of six sons and six daughters. His eldest son, John, the 4th baronet, died without sons in 1756, and the present baronet is descended from the bishop's brother, Henry (d. 1702). Another of his sons was Edward Trelawny (1699–1754), governor of Jamaica from 1738 to 1752. When bishop of Exeter, Trelawny, as visitor of Exeter College, Oxford, deprived the rector of his office, a sentence which was upheld on appeal by the House of Lords; and when bishop of Winchester he completed the rebuilding of Wolvesey Palace. Trelawny is the hero, or one of the heroes, of the refrain:—

"And shall Trelawny die,
Here's twenty thousand Cornishmen
Will know the reason why."

These words were sung by the men of Cornwall, who seem to have assembled during the bishop's short imprisonment in 1688. It is probable, however, that a similar threat was heard in 1628, when John Trelawny (1592–1665), grandfather of the bishop, was imprisoned by the House of Commons for opposing the election of Sir John Eliot to parliament. The "Song of the Western Men," which contains the above refrain, was composed in 1825 by R. S. Hawker.

TREMATODES, or flukes (as they are called from their fish-like shape), one of the three classes that compose the phylum Platyelmia (*q.v.*). They are flattened organisms provided with two or more suckers, hence their name (τρηματώδης, pierced with holes), and are exclusively parasitic both in their earlier and mature stages of life. Their structure has undergone little degeneration in connexion with this habit, and may be compared organ for organ with that of the Planarians (*q.v.*). The chief peculiarities that distinguish Trematodes from their free-living allies, the Turbellaria, are the development of adhering organs for attachment to the tissues of the host; the replacement of the primitively ciliated epidermis by a thick cuticular layer and deeply sunk cells to ensure protection against the solvent action of the host; and (in one large order) a prolonged and peculiar life-history. The only organs that exhibit any sign of degeneration are those of sense, but in the ectoparasitic Trematodes simple eye-like structures are present and perhaps serve as organs of temperature. The class as a whole is linked to the Turbellaria not only by its similarity of structure, but by the intermediation of the singular class the Temnocephaloidea (see PLANARIANS), which in habit and in organization form an almost ideal annectant group.

External Characters.—The body, which varies in length from a few millimetres to a couple of feet, is usually oval and flattened. In certain genera the margins are infolded either along their whole length (the male of *Schistostomum haematobium*; fig. 9, A) or anteriorly only (Holostomidae). The anterior third of the body is attenuated and sharply marked off from the bulbous trunk in *Didymozoon*. Trematodes never exhibit segmentation, though a superficial annulation may occur, *e.g.* in *Udonella*.

The ventral surface is characterized by one or more suckers and apertures. The mouth lies usually in the centre of the anterior and sub-terminal sucker or between two adoral suckers, but in *Gasterostomum* and its allies it is mid-ventral. A second sucker of variable size and shape lies behind the oral one. In the ectoparasitic Trematodes this post-oral sucker is a complex disk placed near the hinder end and provided with suckerlets, hooks and a musculature arising from a special skeleton. In the majority of endoparasitic forms it is merely a muscular disk just behind the mouth; but in the Aspidocotylea this sucker forms a muscular ribbed sole extending over the greater part of the ventral surface (fig. 7).

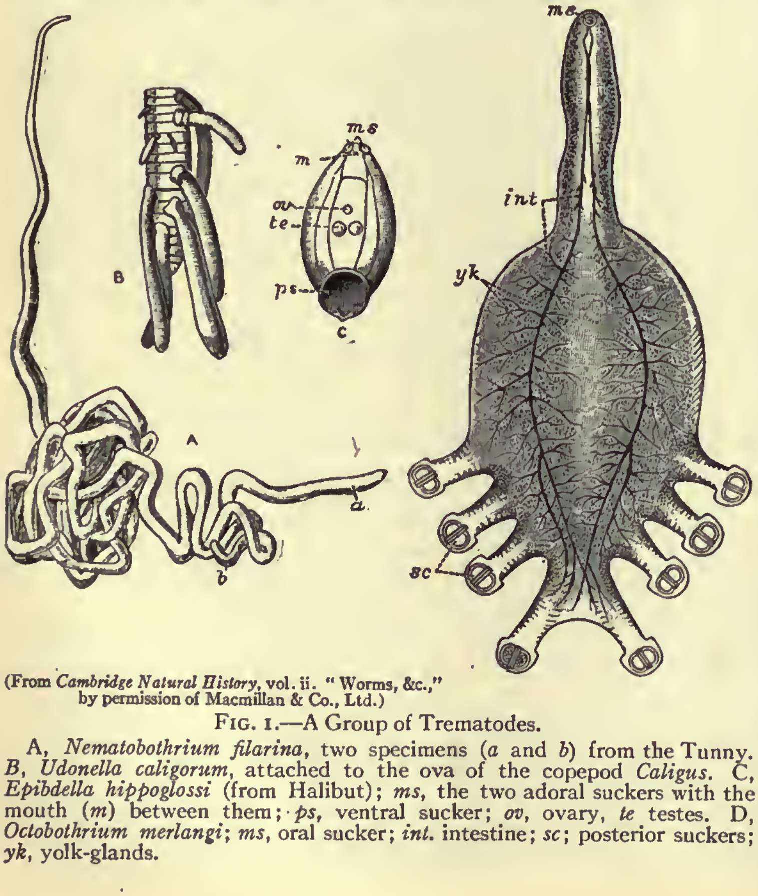
The anterior and posterior ends of the body are well defined. The former is specially modified in a few genera in a manner analogous to the "proboscis" of certain Rhabdocoel Turbellaria. Thus in the recently discovered arctic genus *Prosorhynchus* the muscular and glandular extremity is protrusible, but in the allied *Gasterostomum* this organ is represented by a sucker with fimbriated or tentacular margins. Another form, *Rhopalophorus*, has two cephalic tentacles that are retractile and covered with hooks. The chief genital pore is placed anteriorly between the oral sucker and the ventral one, and is posterior only in Holostomidae, Gasterostomidae and a few Distomidae. Usually this aperture is median, but occasionally asymmetrical. Both male and female gonoducts open through a common atrium to the exterior by this pore, but in three bisexual genera the male and female ducts are developed in separate individuals (*Bilharzia*, *Didymozoon*, *Koellikeria*). A single or paired accessory gonopore is met with in many Trematodes just as in certain Turbellaria (*e.g. Cylindrostomum, Trigonoporus*). This accessory pore is not of uniform significance. In ectoparasitic Trematodes it is paired and usually ventral (fig. 4 B, *v*), but the two apertures may run into one, and may also open dorsally (*Hexacotyle*). In this group, the accessory gonopore is the opening of the "vagina," in contradistinction to the median and atrial opening of the uterus which is a "birth-pore." In most endoparasitic Trematodes the accessory gonopore is a median and dorsal structure. It is the opening of Laurer's canal and is homologous not with that of the "vagina" just mentioned, but with a totally distinct structure—the "yolk-receptacle"—which in ectoparasitic forms discharges into the gut instead of to the exterior (see fig. 3).

The excretory pore is terminal and posterior in endoparasitic forms: paired, anterior and dorsal in the ectoparasitic class.

Parasitic Habits.—The Trematodes with few exceptions select a vertebrate for their host. Speaking generally each species of parasite has a particular host, upon the blood of which it nourishes itself and matures its reproductive organs. This strange partiality is now to some extent intelligible. It has been shown in the mammals that blood-relationship, in the strict and literal sense, holds good. The blood of most species behaves differentially towards precipitants, and it is therefore conceivable that when blood is used as food and is elaborated into special compounds for the nutrition of the reproductive organs of a parasite, these specific or larger differences in the blood of animal hosts may prevent the ripening of the gonads of a widely diffused parasite and only one particular kind of blood prove suitable. It would seem that the Trematodes present various degrees of such adaptation, for whilst some—*e.g.* the common liver-fluke (*Distomum hepaticum*)—mature equally well in the bile-ducts of a man as in those of a sheep or rabbit, others and in fact the majority are restricted apparently to one host. It must, however, be borne in mind that a Trematode may develop in an "aberrant" manner in one host and "normally" in another; and unless we knew the initial stock, the two forms would be regarded as distinct species, each with its own host.

The position of the Trematode on its host is of far-reaching importance. If ectoparasitic and attached to the skin, apertures or gills, the Trematode adopts more elaborate adhesive organs and undergoes a less complex development than are required for the endoparasitic members of the class. The latter are almost invariably swallowed by their host in an immature state with its food, and from the stomach or intestine they work their way into the lungs, liver, body-cavity or blood vessels. These endoparasites have a peculiar larval development, the results of which are to increase their numbers and enhance the opportunity of their gaining the necessarily remote station in some fresh individual host. It is usual to consider the ectoparasitic habit as leading up to the endoparasitic one. From what we know of the Platyelmia, however, it is more probable that the two are quite independent and have been evolved separately.

The influence of Trematodes on their hosts is a varied one. Probably all of them secrete an active poison by the aid of their glands, but the effects of these substances are not readily perceptible. In addition to this, they constitute a drain upon the blood which may result in anaemia. If present in large numbers they may give rise to obstruction of the liver-ducts or to inflammation of other tissues. The most important of the Trematodes in its effect on man is *Schistostomum* (*Bilharzia*). This parasite is one of the plagues



(From *Cambridge Natural History*, vol. ii. "Worms, &c.," by permission of Macmillan & Co., Ltd.)

of Africa. In Egypt 30% of the natives are affected by haematuria which arises from congestion of the bladder consequent upon the attacks of this animal. The noxious influence of Trematodes is, moreover, not confined to their mature phase of life. The rapid multiplication that takes place in the larval stage of nearly all endoparasitic forms affects the tissues of the "intermediate" host in which they live. In most cases this is a mollusc, and the larvae bore their way into the most diverse organs, often accumulating to such an extent as to give a distinctly orange colour to an otherwise colourless tissue, and to cause the demolition of particular structures *e.g.* the liver and gonad. Perhaps the most remarkable of these effects is that produced by the larvae of *Gasterostomum*. These organisms live in cockles, oysters and other lamellibranchs and they so affect the gonads of these molluscs as to castrate and sterilize their host. A different but still more interesting result is produced by these Trematode larvae on certain lamellibranchs. The production of pearls by oysters and mussels is common knowledge, but it is only recently that the origin of pearls has been traced and admitted to be due to inflammation set up by a parasite. In the case of the pearl oyster this parasite is a cestode larva, but in the less valuable but no less genuine pearl produced by *Mytilus*, &c., the nucleus is a Trematode-larva (Jameson).

Structure.—The anatomical structure of the Trematodes is fairly uniform (Braun). The body is enveloped by a thick striated protective cuticle which is frequently raised into hooks or spines. In *Distomum acanthocephalum* the cuticle forms circlets of large and small hooks at the anterior end, somewhat as in Cestodes. The epidermis has lost its connected epithelial character and its cilia, and the isolated cells have become sunk inwards retaining their

attachment to the innermost cuticular layer by slender processes. This layer also forms the attachment for the muscles, of which there are two enveloping coats, a circular and a longitudinal layer and also dorso-ventral fibres. The muscles are remarkable for two reasons. They occasionally exhibit striation and originate from large branched cells, the nucleus and unmodified part of which form conspicuous elements. The digestive system consists of a simple or bifurcated sac, opening through the mouth by means of a "pharynx bulbosus," adapted to act primarily as a sucker, and secondarily, when drawing blood, as an aspirator. Between the blind gut and the cuticle is a reticular branched tissue which forms the chief substance of the body. This is the mesenchyma. As in other Platyelmia the elements of this tissue undergo the most varied differentiation. The main mass of it forms a spongy vacuolated matrix, but some of the cells become glandular and open by pores on the surface of the cuticle, others become "flame-cells" (fig. 2, D) and canaliculi of the excretory system as in Turbellaria, others again muscle-cells. Embedded in the matrix lies the complex genital apparatus composed usually of both male and female reproductive organs (fig. 2, B). The former consist of one pair or more of vesicular testes communicating by fine ducts with a vesicula seminalis. From this point a glandular tube runs to the genital atrium and during the last part of its course is converted into an eversible hooked "cirrus" or penis. The female organs consist of distinct ovaries and yolk-glands, the ducts of which unite in the neighbourhood of a "shell-gland" or "ootype." Here the two elements, ovum and yolk-cells, are surrounded by a shell of operculate or of spindle-capped types. Coincidently, to allow of fertilization and the escape of excess of yolk, and of spermatozoa, other accessory ducts open at this point. Thus in ectoparasitic Trematodes, the paired vagina transmits spermatozoa to the egg: and a canal carries off yolk from this point of junction either to the gut for resorption or to the exterior for exudation. This duct (Laurer's canal) is sometimes rudimentary and ends blindly beneath the skin. The fertilized ova, provided with yolk and a shell, are next transferred to the "uterus" along which they travel to the exterior. In the endoparasitic trematodes the uterus is the only passage by which fertilization can be effected, and in cases of cross and self-impregnation this duct is physiologically a vagina. Lastly the nervous system is well developed and consists of a pair of well-marked and interconnected ganglia placed near the anterior end and dorsal to the oesophagus. From these ganglia, nerve-tracts provided with ganglion-cells are given off. Of these there are three on each side of the body: a large ventral tract, smaller lateral strands and dorsal ones. From these tracts a plexus of nerve-fibres is developed in connexion with the musculature and cuticle.

The Trematodes are divided into three orders, primarily distinguished by the character of their suckers, viz.: Heterocotylea, Aspidocotylea and Malacocotylea.

Order 1. *Heterocotylea.*—Ectoparasitic Trematodes, in which a large posterior adhesive apparatus is present and is usually accompanied by a pair of suckers placed anteriorly in relation to the mouth. The large posterior organ of attachment is usually wheel-shaped and provided with hooks; but the ridges may become separated

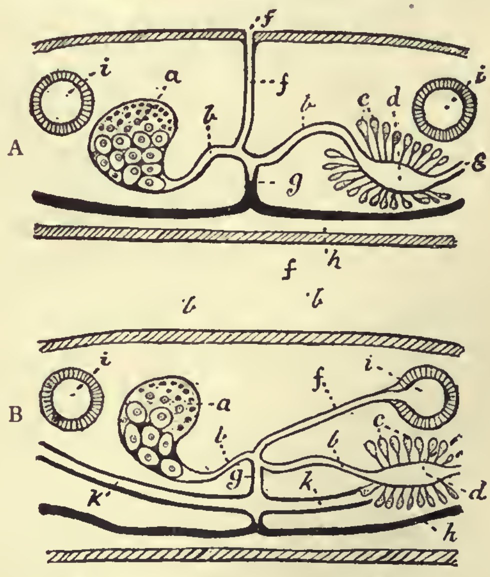

Fig. 3.—Diagrammatic projections to show the relations of the female reproductive ducts; A, in the Malacocotylea; B, in the Heterocotylea. The ovary (*a*) leads into (*bb*) the oviduct, which is joined at (*g*) by the duct of the yolk-glands (*h*). In B it is also joined by a paired vagina (*kk*) and by the "vitello-intestinal duct" (Laurer's canal), *f*. (*c*) Shell-glands; (*d*) ootype; (*ε*) uterus; (*g*) median-vitello-duct; (*i*, *i*) intestine.

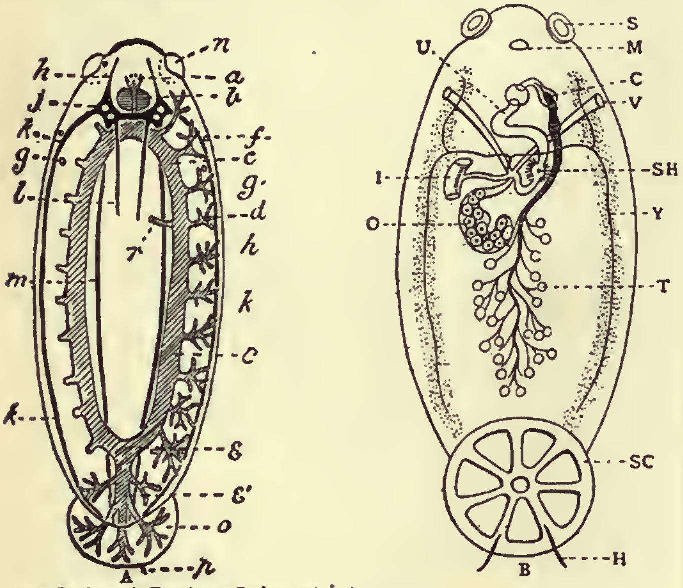
into a number of independent suckers set on a disc or "cotylophore." Eye-spots are general and the nervous system maintains a primitive diffused condition. The excretory system opens to the exterior by a pair of dorsal pores at the level of the pharynx. The eggs are comparatively few, and development is direct, the embryo after reaching its host remaining attached to it for life.

All the members of this order are parasitic on aquatic vertebrates and in rare cases derive their food from a vertebrate host indirectly by means of another invertebrate parasite (*e.g. Udonella* occurs on parasitic Crustacea). They are transparent leaf-like organisms and may often be found attached to the skin, mouth, nostrils or gills of fish; on the skin and bladder of Amphibia; and on those of certain Reptilia. *Polystomum integerrimum* (fig. 5) occurs commonly in the "bladder" of frogs and toads; *Diplozoon* on the skin of the minnow; *Gyrodactylus* (figs. 5, 6) on the gills of various fresh-water fish; and a large number of genera occur on the skin, cloaca and gills of Elasmobranchs and other marine fish. They ingest the mucus and, to some extent, the blood of their host by the aid of a sucking pharynx through which the food passes into the bifurcated alimentary sac and its branched caeca.

The life-history of this order offers many points of interest. The eggs are stalked and provided with chitinoid often operculate shell. Each shell contains a single ovum and a mass of yolk-cells. In most cases the eggs are attached to the host, but in *Polystomum* the eggs are laid in water. The egg of *Gyrodactylus* develops in the body of the parent.



(From Lankester's *Treatise on Zoology*, pt. iv.)

FIG. 4.—Schematic figures of a Heterocotylean Trematode to illustrate its structure (after Benham).

The further history of the animal is only known in a few cases. *Polystomum* hatches out six weeks after ovi-position as a minute (·3 mm. long) larva capable of swimming freely for a short time by the aid of five girdles of ciliated cells. If in the course of the first twenty-four hours this larva meet with a tadpole it attaches itself at once and undergoes further development. If unsuccessful it dies. In the former case the larva creeps along the tadpole until it reaches the branchial opening into which it darts, fixes its sucker, and then throws off its cilia. Its further development takes place partly in the branchial chamber and partly in the bladder, which it reaches by travelling the whole length of the alimentary canal. In the former position the suckers are developed and growth proceeds for 8 to 10 weeks until the metamorphosis of its host. In the bladder it remains for three years before attaining maturity. Sometimes the *Polystomum*-larva attaches itself to a young tadpole, and in that case grows so rapidly as to become mature in five weeks. These *Polystomum* deposit their eggs in the branchial chamber and die at the metamorphosis of their host. They differ structurally from the normal form in being capable of self-fertilization only, and in the shape and details of their spermatozoa.

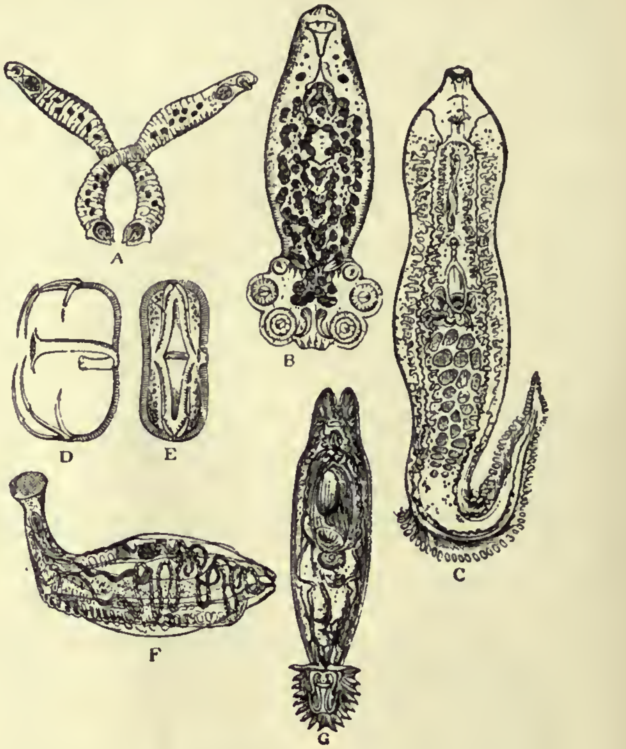

FIG. 5.

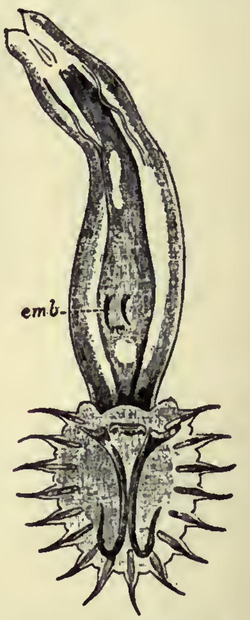
A, *Diplozoon paradoxum*; two united specimens.
B, *Polystomum integerrimum*. (×about 100; after Zeller.)
C, *Microcotyle mormyri*. (×7.)
D, E, Two views of the chitinous framework of a sucker of *Axine belones*; highly magnified (after Lorenz).
F, *Aspidogaster conchicola*. (×about 25; after Aubert.)
G, *Gyrodactylus elegans*. (×about 80; after Wagener.)

The life-history of *Diplozoon* (fig. 5) is remarkable in that two larvae (the so-called *Diporpae*) unite and fuse permanently into an X-shaped organism. Unless this occurs, the development of the larvae is soon arrested. The ciliated stage is only capable of free life for five or six hours, and if at the end of that time it has not encountered and attached itself to a minnow, it dies. If successful, the larva throws off its cilia and develops a dorsal papilla, a median ventral sucker and an additional pair of lateral suckers. Then the *Diporpa* stage is attained. This stage is capable of isolated existence for two or three months but remains immature. Should it, however, encounter another *Diporpa*, the mid-ventral sucker of either is applied to the dorsal papilla of the other, and complete fusion takes place across the junction. The compound organism now develops two sets of inter-connected genitalia and becomes a *Diplozoon*.

Gyrodactylus produces only one large egg at a time and this develops *in situ* into an embryo: but within this embryo another appears before the first leaves the parent. This anomalous phenomenon is still obscure, for we do not yet know whether the second embryo is developed sexually or asexually from the first. Von Linstow has indeed suggested that *Gyrodactylus* is a larval form capable of reproduction by an asexual method.

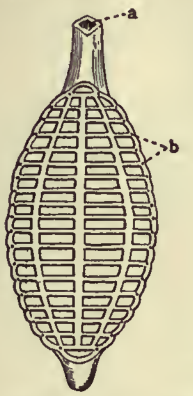
Order 2. *Aspidocotylea.*—Endoparasitic Trematodes provided with a large ventral sucker which is almost co-extensive with the lower surface of the body and is divided into rectangular compartments. The alimentary sac is simple and devoid of caeca. The development is direct.



(After v. Nordmann. From *Cambridge Natural History*, vol. ii. "Worms, &c," by permission of Macmillan & Co., Ltd.)

FIG. 6.—*Gyrodactylus elegans* from the fins of the Stickleback; *emb.* embryo. (×100.)

These Trematodes occur in the alimentary canal and adjacent organs of Mollusca, the gall-bladder of *Chimaera*, and the intestine of Chelonia and of certain fish. *Aspidogaster conchicola* is a form not uncommon in *Anodon*, *Unio* and certain fresh-water Gastropods. When young it is found in the intestine, but becomes mature in "Keber's organ" and the pericardium. An allied form (*A. margaritiferae*) occurs in the pericardium of the Ceylon pearl-oyster (9).



(After Monticelli. From Lankester's *Treatise on Zoology*, part iv.)

FIG. 7.—*Aspidogaster conchicola*; ventral aspect; *a*, mouth; *b*, marginal sense organs.

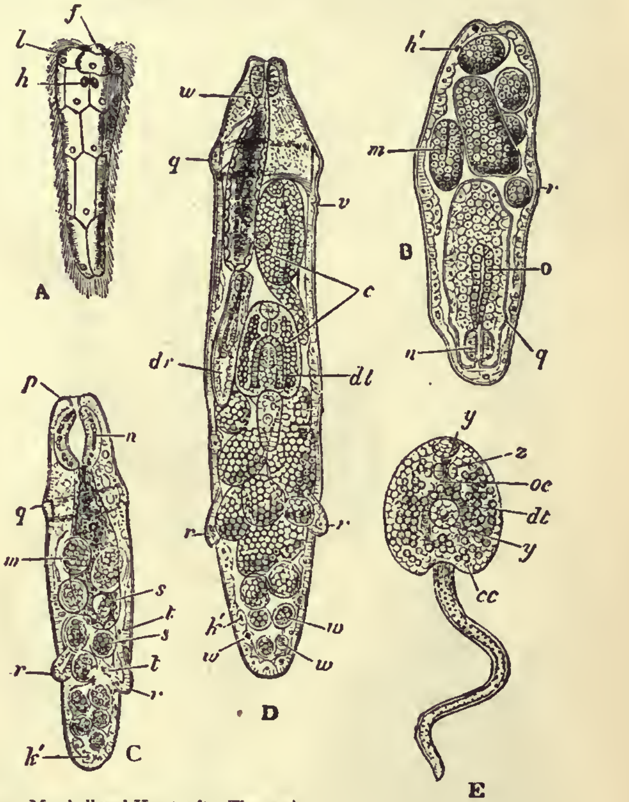
This order differs in several points from the preceding one. The excretory system is highly developed and opens at the posterior extremity by a paired muscular bladder. The testis is a single compact organ. From the oviduct a long duct full of yolk passes backwards almost to the hinder end of the body and ends blindly in a globular dilatation just below the skin. This structure is regarded as the homologue of a canal (Laurer's canal) which in the Heterocotylea opens into the intestine and so gets rid of the excess of yolk. The life-history of the order is almost unknown, but at the time of hatching the young Aspidocotylean has an oral sucker at the anterior extremity and an equally simple post-oral one at the other, thus resembling the members of the next order. Subsequently the body grows backwards and the ventral sucker comes to occupy a relatively more anterior position. Concomitantly its cavity is sub-divided by transverse ridges into a single row and later on into paired rows of compartments. A curious form (*Stichocotyle*) described in an immature condition by Cunningham from the lobster and Norway lobster probably belongs to this order.

Order 3. *Malacocotylea* (Distomae, Leuck: Digenea v. Ben.). Endoparasitic Trematodes with a variable adhesive apparatus. The oral sucker may alone be present (Monostomidae), more usually a second is developed on the under surface, but may be mid-ventral (Distomidae) or terminal. It is posterior (Amphistomidae), or anterior (Gasterostomidae). In addition to these suckers the sides of the anterior region may become infolded and give rise to an accessory adhesive organ (Holostomidae). In all these families spines and glandular papillae may be super-added. The intestinal sac has become bifid and is usually devoid of branches. The excretory system is highly developed; the larger collecting ducts are elaborately looped and open posteriorly by a single terminal aperture. A canal (Laurer's canal) leads from the oviduct or yolk-duct to the dorsal surface. The development is indirect. From the egg a larva arises. This enters a temporary host. Here it gives rise by a peculiar process to numerous individuals of a second larval form, and these usually produce a third form from which the minute immature Trematode is developed. In this manner a single egg may give rise to a large number of sexual individuals. The larvae usually live in Molluscs, the mature worm in vertebrates, and the immature but metamorphosed Trematode in either host and also in pelagic and littoral marine and fresh-water invertebrates.

The Malacocotylea occur in all classes of vertebrates. They are usually found in the alimentary canal or its appendages but occasionally work their way into the serous cavities, nervous system and blood vessels. Fourteen species belonging to five genera have been found in man, but only one [*Schistostomum* (*Bilharzia*) *haematobium*] is of serious medical importance, the others being rare and occasioned by want of cleanliness and close association with infected domestic animals. Domestic animals suffer periodically to a much greater extent. The liver-fluke (*Distomum hepaticum*) unlike most Trematodes flourishes in a wide range of hosts and infects man, horse, deer, oxen, sheep, pig, rabbit and kangaroo. Sheep, however, suffer most from this parasite and from the allied *D. magnum*. The former fluke is found in Europe, North Africa, Abyssinia, North Asia, South America, Australia and the Hawaiian Islands; the latter in the United States. Wet summers are followed by an acute outbreak of liver-rot amongst sheep and this, together with the effects of other diseases that accompany wet seasons, cause the death of vast numbers of sheep, the numbers from both sources being estimated in bad years at from 1½ to 3 millions in England alone. The anatomy of *Distomum hepaticum* is fully described in many accessible memoirs [Sommer (10), Marshall and Hurst, Braun (3)]. It has been shown that this parasite feeds upon the blood, not the bile of its host, though it occurs mainly in the bile ducts.

The life-histories of the Malacocotylea form the most interesting feature of the order. The majority of species are hermaphrodite and many are capable of self-impregnation. In these, the male organs ripen before the ova and spermatozoa may pass into the uterus before the external pore is formed (Looss). A few species, however, are bisexual, *e.g. Schistostomum* (*Bilharzia*) *haematobium* in which the male is larger than the female and encloses the latter in a ventral canal; *Koellikeria filicolle* Rud (*Distomum okenii*, Köll) which also occurs in pairs, a large female and a small male being found together encysted in the branchial chamber of *Brama raji*: and *Didymozoon thynni* (*Monostomum bipartitum*) which occurs in pairs fused for the greater part of their length and only free anteriorly; the larger individual is the female.

The egg consists of a fertilized ovum and a mass of yolk-cells. Segmentation takes place during its passage down the uterus. The result of this process is a minute ovoid embryo consisting of a solid mass of cells surrounded by a follicle of flattened yolk-cells. The central mass soon becomes differentiated into an outer epidermal and a dermal layer of flat-cells. Some of the central cells remain in clumps as "germ-balls," others form a mesenchyma in which "flame-cells" arise; others again give rise to muscles; and at the thicker end of the body, rudiments of the brain and digestive system are observable. A pair of "eye-spots" develops immediately over the brain. If the egg with its contained embryo falls into water



(All from Marshall and Hurst, after Thomas.)

FIG. 8.—Five stages in the life-history of *Fasciola hepatica*; all highly magnified.

A, The free-swimming embryo. B, A sporocyst containing young rediae. C, A young redia, the digestive tract shaded. D, An adult redia, containing a daughter-redia, two almost mature cercariae, and germs. E, A free cercaria. The letters have the same significance throughout.

c, Nearly ripe cercariae; *cc*, cystogenous cells; *dr*, daughter-redia; *dt*, limbs of the digestive tract; *f*, head-papilla; *h*, eye-spots; *h′*, same degenerating; *k′*, germinal cell; *l*, cells of the anterior row; *m*, embryo in optical section, gastrula stage; *n*, pharynx of redia; *o*, digestive sac; *oe*, oesophagus.

p, Lips of redia; *q*, collar; *r*, processes serving as rudimentary feet; *s*, embryos; *t*, trabecula crossing body-cavity of redia; *u*, glandular cells; *v*, birth-opening; *w*, *w′*, morulae; *y*, oral sucker; *y′*, ventral sucker; *z*, pharynx.

with the faeces of the host the larva hatches out and swims freely for a time. In dry localities or in the absence of the intermediate host (usually a mollusc) this larva soon dies. If, however, it encounters the host the larva bores its way in, and attacks the liver, mouth or gonad in which it comes to rest. In all Malacocotylea except the Holostomidae the ensuing change is a degenerative one. The cilia are lost, the eye-spots disappear, the digestive sac vanishes and the larva becomes a sac or "sporocyst" full of germ-cells. The origin of these cells is a moot point. According to some writers (Leuckart) they are derived from undifferentiated blastomeres, other authorities (Thomas, Biehringer, Heckert) trace them to the parietal cells of the larva. These cells aggregated in masses become the bodies of another generation of larvae within the sporocyst. By a series of changes similar to those by which the primary larva arose from a segmented egg, so do these secondary larvae or "rediae" arise from the germ-cells or germ-balls within the sporocyst. The structure of a redia, however, is an advance on that of its parent. Though not possessing eyes or cilia, it has a pharynx and short straight digestive sac: and its mesenchymatous cavities are filled with germ-balls in various stages of development.

The movements and activity of the redia cause it to burst the wall of the sporocyst. It escapes into the adjacent tissue and there gives rise either to one or more generations of rediae or at once to a new type of organism—the cercaria. What determines the origin of the cercaria rather than a new generation of rediae is unknown. It originates from germ-balls by a differentiation similar in general to that already described, though profoundly different in detail. The cercaria is just visible to the naked eye and has an oval or discoidal body and usually a long tail of variable form. The tail may be a simple hollow muscular process or provided with stiff bristles set in transverse rows, or divided into two equally long processes, or finally it may form a large vesicular structure. The body contains in miniature all the organs of the adult fluke, including the gonads and in addition "eye-spots," a stylet, rod-cells and cystogenous cells. The latter structures are only employed for an interval before the final host is entered.

The number of cercariae produced by the pullulating rediae in a single water-snail is immense, and as they are emitted at a given period or a few successive periods, the snail at these times appears enclosed in a cloud of whitish flocculent matter. The cercaria swims freely for a time and either encysts directly on grass or weeds or it enters a second host which may be another mollusc, an insect, crustacean or fish, and then encysts. In this process it is aided by the stylet with which it actively bores its way, throws off its tail

Fig. 9.

A, *Schistostomum* (*Bilharzia*) *haematobium*, the thin female in the gynaecophoric canal of the stouter male. (× 15 after Leuckart.)
B, *Distomum macrostomum*, showing the digestive and the greater part of the genital apparatus with the cirrus protruded. (× 30.)
C, Snail (*Succinea*), the tentacles deformed by *Leucochloridium*. (Natural size.)
D, *Leucochloridium* removed from the tentacle. (Natural size; after Zeller.)
E, *Bucephalus polymorphus*. (Highly magnified; after Ziegler.)
F, Portion of a sporocyst containing *Bucephali* in process of development. (× about 50; after Lacaze-Duthiers.)

and then, surrounding itself with the secretion of its cystogenous cells, comes to rest. The further development of the cercaria is dependent on the weed or animal in which it lies being eaten by the final host which is usually a predaceous fish or one of the higher vertebrates. When that occurs, the cyst is dissolved and the minute fluke works its way down the alimentary canal into some part of which it inserts its suckers and commences to feed on the blood of its host. Occasionally the fluke migrates into the blood vessels and may reach the lungs, kidneys, urethra and bladder. In the course of a few months it attains full size and maturity and probably in most cases dies in the course of a year after having given rise to another generation of larvae.

A few special cases of this general description of the life-history may be mentioned. The liver-fluke (*Distomum hepaticum*) passes through its larval stages in the water snail *Limnaea truncatula* in Europe; in *L. oahuensis* in the Hawaiian Islands; in *L. viator* in South America and in *L. humilis* in North America: and is eaten by sheep during its encysted stage attached to herbage. *Distomum macrostomum*, which occurs in various birds, produces a very curious sporocyst in the body of the snail *Succinea putris*. This sporocyst assumes a branched structure and penetrates into the tentacles of the snail (fig. 9, *c*, *d*). In this situation it becomes much swollen and banded with colours, and produces a large number of ecaudate cercariae. The attention of birds is speedily attracted to the snail by this appearance and by the peculiar movements which the worm executes, and the passage of the parasite into its final host is advantageously effected. In many cases it appears that only the brilliantly coloured tentacle is pecked off by the bird, and as the snail can easily regenerate a new one, this in turn becomes infected by a fresh branch of the sporocyst ramifying through the snail and thus a new supply of larvae is speedily provided (Heckert).

The life-history of *Schistostomum haematobium* is still unknown, but the difficulty in obtaining developmental stages in any of the numerous intermediate hosts that have been tried suggests that the ciliated larvae may develop directly in man and either gain access to him by the use of impure water for drinking or may perforate his skin when bathing. Experiments on monkeys have, however, given negative results.

The life-history of the Holostomidae differs from that of the Distomidae in an important regard. These Trematodes live chiefly in the intestine of aquatic birds or reptiles. The ciliated larva escapes from the egg into the water and enters an intermediate host (leech, mollusc, arthropod, batrachian or fish) where it undergoes a metamorphosis into a second stage in which most of the adult organs are present. In this condition they remain encysted as immature flukes until eaten by their final host.

The cycle of development taken by the Malacocotylea has been generally regarded as an alternation of one or more asexual generations with a sexual one. The question, however, is complicated by the uncertain nature of the germ-cells in the sporocysts and rediae. Some authors looking upon these as parthenogenetic ova regard the developmental cycle as one composed of an alternation of parthenogenetic and of sexual generations. Others again consider that the whole cycle is a metamorphosis which, beginning in the Heterocotylea as a direct development, has become complicated in the Holostomidae by a larval history, and finally in the Malacocotylea has acquired additional complexity by the intercalation of two larval forms, and is thus spread over several generations.

TREMOLITE, a member of the amphibole group of rock-forming minerals (see Amphibole). It is a calcium and magnesium metasilicate, $CaMg_3(SiO_3)_4$, crystallizing in the monoclinic system with an angle of 55° 49′ between the perfect prismatic cleavages. It occurs sometimes as distinct crystals, but more usually as long bladed and fibrous forms. The colour is white or grey, but when iron is present it is green, then forming a passage to actinolite. The hardness is $5\frac{1}{2}$ and the specific gravity 3·0. Tremolite is a characteristic mineral of crystalline limestones, especially dolomitic limestones, but also occurs as an alteration-product of olivine in basic igneous rocks. Typical specimens have long been known from the white crystalline dolomite of Campolongo in the St Gotthard region, Switzerland, near to which is the Tremola Valley, after which the mineral was named in 1796. Fine crystals are found in crystalline limestone at Gouverneur, Pierrepont and other places in New York, and at several localities in Sweden. (L. J. S.)

TRENCH, RICHARD CHENEVIX (1807–1886), Anglican archbishop and poet, was born at Dublin on the 9th of September 1807. He went to school at Harrow, and graduated at Trinity College, Cambridge, in 1829. In 1830 he visited Spain. While incumbent of Curdridge Chapel near Bishops Waltham in Hampshire, he published (1835) *The Story of Justin Martyr and Other*

Poems, which was favourably received, and was followed in 1838 by *Sabbation, Honor Neale, and other Poems*, and in 1842 by *Poems from Eastern Sources*. These volumes revealed the author as the most gifted of the immediate disciples of Wordsworth, with a warmer colouring and more pronounced ecclesiastical sympathies than the master, and strong affinities to Tennyson, Keble and Monckton Milnes. In 1841 he resigned his living to become curate to Samuel Wilberforce, then rector of Alverstoke, and upon Wilberforce's promotion to the deanery of Westminster in 1845 he was presented to the rectory of Itchenstoke. In 1845 and 1846 he preached the Hulsean lecture, and in the former year was made examining chaplain to Wilberforce, now bishop of Oxford. He was shortly afterwards appointed to a theological chair at King's College, London. In 1851 he established his fame as a philologist by *The Study of Words*, originally delivered as lectures to the pupils of the Diocesan Training School, Winchester. His purpose, as stated by himself, was to show that in words, even taken singly, "there are boundless stores of moral and historic truth, and no less of passion and imagination laid up"—a truth enforced by a number of most apposite illustrations. It was followed by two little volumes of similar character—*English Past and Present* (1855) and *A Select Glossary of English Words* (1859). All have gone through numerous editions and have contributed much to promote the historical study of the English tongue. Another great service to English philology was rendered by his paper, read before the Philological Society, "On some Deficiencies in our English Dictionaries" (1857), which gave the first impulse to the great Oxford *New English Dictionary*. His advocacy of a revised translation of the New Testament (1858) aided to promote another great national undertaking. In 1856 he published a valuable essay on Calderon, with a translation of a portion of *Life is a Dream* in the original metre. In 1841 he had published his *Notes on the Parables*, and in 1846 his *Notes on the Miracles*, popular works which are treasuries of erudite and acute illustration.

In 1856 Trench was raised to the deanery of Westminster, probably the position which suited him best. Here he instituted evening nave services. In January 1864 he was advanced to the more dignified but less congenial post of archbishop of Dublin. A. P. Stanley had been named, but rejected by the Irish Church, and, according to Bishop Wilberforce's correspondence, Trench's appointment was favoured neither by the prime minister nor the lord-lieutenant. It was, moreover, unpopular in Ireland, and a blow to English literature; yet the course of events soon proved it to have been most fortunate. Trench could do nothing to prevent the disestablishment of the Irish Church, though he resisted with dignity. But, when the disestablished communion had to be reconstituted under the greatest difficulties, it was found of the highest importance that the occupant of his position should be a man of a liberal and genial spirit. This was the work of the remainder of Trench's life; it exposed him at times to considerable misconstruction and obloquy, but he came to be appreciated, and, when in November 1884 he resigned his archbishopric from infirmity, clergy and laity unanimously recorded their sense of his "wisdom, learning, diligence, and munificence." He had found time for *Lectures on Medieval Church History* (1878); his poetical works were rearranged and collected in two volumes (last edition, 1885). He died in London, after a lingering illness, on the 28th of March 1886.

See his *Letters and Memorials* (2 vols., 1886).

TRENCHARD, SIR JOHN (1640–1695), English politician, belonged to an old Dorset family, his father being Thomas Trenchard (1615–1671), of Wolverton, and his grandfather Sir Thomas Trenchard (1582–1657), also of Wolverton, who was knighted by James I. in 1613. Born at Lytchett Matravers, near Poole, on the 30th of March 1640, and educated at New College, Oxford, John Trenchard entered parliament as member for Taunton in 1679, and associated himself with those who proposed to exclude the duke of York from the throne. He attended some of the meetings held by these malcontents and was possibly concerned in the Rye House plot; at all events he was arrested in July 1683, but no definite evidence was brought against him and he was released. When Monmouth landed in the west of England in June 1685 Trenchard fled from England, but was pardoned through the good offices of William Penn and returned home two years later. Again he entered parliament, but he took no active part in the Revolution of 1688, although he managed to secure the good will of William III. He was knighted by the king and made chief justice of Chester, and in 1692 he was appointed a secretary of state. He and the government incurred much ridicule through their failure to prove the existence of a great Jacobite plot in Lancashire and Cheshire in which they had been led to believe. Sir John died on the 27th of April 1695. His wife was Philippa (d. 1743), daughter of George Speke (d. 1690) of White Lackington, Somerset.

Another member of the Trenchard family was the writer, JOHN TRENCHARD (1662–1723), erroneously referred to by Macaulay as a son of Sir John Trenchard. Educated at Trinity College, Dublin, Trenchard inherited considerable wealth and was thus able to devote the greater part of his life to writing on political subjects, his point of view being that of a Whig and an opponent of the High Church party. His chief works are *A Short History of Standing Armies in England* (1698 and 1731) and *The Natural History of Superstition* (1709). With Thomas Gordon (d. 1750) he produced a weekly periodical, *The Independent Whig*, and with the same colleague he wrote a number of letters to the *London Journal* and to the *British Journal* under the pseudonym of Cato. These letters were published in four volumes in 1724 and the collection has often been reprinted. Trenchard died on the 17th of December 1723.

TRENCHER (M. Eng. *trenchour*, *trenchere*, &c., O. Fr. *trencheoir trenchoier*, a place on which to cut up food, from *trencher*, mod. *trancher*, to cut, probably from Lat. *truncare*, lop, cut off, or from *transecare*, to cut across), a platter, being a flat piece of wood, in its earliest form square, later circular, on which food was carved or cut up and served. These wooden "trenchers" took the place of earlier ones which were thick slices of coarse bread; these, after being soaked with the gravy and juices from the meat and other food were eaten or thrown to the alms basket for the poor. The wooden trencher went out of use on the introduction of pottery and later of porcelain plates. At Winchester College, the old square beechwood trenchers are still in use. The potters of the 18th century made earthenware plates very flat and with a shallow rim; these were known as "trencher plates." "Trencher salt-cellars" were the small salts placed near each person for use, as opposed to the ornamental "standing" salts.

For "trench," a ditch, and "entrenchment," see FORTIFICATION AND SIEGECRAFT.

TRENCK, FRANZ, FREIHERR VON DER (1711–1749), Austrian soldier, was born on the 1st of January 1711, of a military family. Educated by the Jesuits at Oedenburg, he entered the Imperial army in 1728 but resigned in disgrace three years later. He then married and lived on his estates for some years. Upon the death of his wife in 1737 he offered to raise an irregular corps of "Pandours" for service against the Turks, but this offer was refused and he then entered the Russian army. But after serving against the Turks for a short time as captain and major of cavalry he was accused of bad conduct, brutality and disobedience and condemned to death, the sentence being commuted by Field Marschal Münnich to degradation and imprisonment. After a time he returned to Austria, where his father was governor of a small fortress, but there too he came into conflict with every one and actually "took sanctuary" in a convent in Vienna. But Prince Charles of Lorraine, interesting himself in this strange man, obtained for him an amnesty and a commission in a corps of irregulars. In this command, besides his usual truculence and robber manners, he displayed conspicuous personal bravery, and in spite of the general dislike into which his vices brought him his services were so valuable that he was promoted lieutenant-colonel (1743) and colonel (1744). But at the battle of Soor he and his irregulars plundered when they should have been fighting and Trenck was accused (probably falsely) of having allowed the king of Prussia himself to escape. After a time he was brought before a court-martial in Vienna, which convicted him of having sold and withdrawn commissions to his officers without the queen's leave, punished his men without heed to the military code, and drawn pay and allowance for fictitious men. Much was allowed to an irregular officer in all these respects, but Trenck had far outrun the admitted limits, and above all his brutalities and robberies had made him detested throughout Austria and Silesia. A death sentence followed, but the composition of the court-martial and its proceedings were thought to have been such as from the first forbade a fair trial, and the sentence was commuted by the queen into one of cashiering and imprisonment. The rest of his life was spent in mild captivity in the fortress of Spielberg, where he died on the 4th of October 1749.

His cousin, FRIEDRICH, FREIHERR VON DER TRENCK (1726–1794), the writer of the celebrated autobiography, was born on the 16th of February 1726 at Königsberg, his father being a Prussian general. After distinguishing himself for his quickness and imagination at the university of Königsberg, he entered the Prussian army in 1742, and soon became an orderly officer on Frederick's own staff. But within a year he fell into disgrace because of a love affair—whether real or imaginary—with the king's sister Princess Amalie, and when in 1743 his Austrian cousin presented him with a horse and opened a correspondence, Frederick had him arrested, a few days after the battle of Soor, and confined in the fortress of Glatz, whence in 1746 he escaped. Making his way home and thence to Vienna, in the vain hope of finding employment under his now disgraced cousin, he finally met a Russian general, who took him into the Russian service But, receiving news that owing to his cousin's death he had become the owner of the family estates, he returned to Germany almost immediately He was made a captain of Austrian cavalry, but never served, as his time was fully taken up with litigation connected with the inherited estates. In 1754 he visited Prussia, but was there arrested and confined in Magdeburg for ten years, making frequent attempts, of incredible audacity, to escape from the harshness of his gaolers. But after the close of the Seven Years' War, Maria Theresa requested that he should, as being a captain in her service, be at once released. Trenck then spent some years in Aix-la-Chapelle, managing an agency for Hungarian wines and publishing a newspaper, and on the failure of these enterprises he returned to his Hungarian estates. Here he composed his celebrated autobiography and many other writings. He visited England and France in 1774–1777, and was afterwards employed by the government in diplomatic or secret service missions. After the death of Frederick the Great he was allowed to enter Prussia, and stayed in Berlin for two years. In 1788 he visited Paris, where he was the hero of society for a moment; next year he returned to Hungary in order to collect his writings in a uniform edition, but in 1791 he returned to Paris to be a spectator of the Revolution, and after living in safety throughout the Terror he was at last denounced as an Austrian spy and guillotined on the 25th of July 1794.

His autobiography, which has been translated into several languages, first appeared in German at Berlin and Vienna (13 vols.) in 1787. Shortly afterwards a French version, by his own hand, was published at Strassburg. His other published works are in eight volumes and appeared shortly after the autobiography at Leipzig. A reprint of the autobiography appeared in 1910 in "Reclam's Universal Series."

See Wahrmann, *Leben und Thaten des Franz, Freiherr von der Trenck* and *Friedrich Freiherrn von der Trencks Leben, Kerker und Tod* (both published at Leipzig in 1837).

TRENDELENBURG, FRIEDRICH ADOLF (1802–1872), German philosopher and philologist, was born on the 30th of November 1802 at Eutin, near Lübeck. He was educated at the universities of Kiel, Leipzig and Berlin. He became more and more attracted to the study of Plato and Aristotle, and his doctor's dissertation (1826) was an attempt to reach through Aristotle's criticisms a more accurate knowledge of the Platonic philosophy (*Platonis de ideis et numeris doctrina ex Aristotele illustrata*). He declined the offer of a classical chair at Kiel, and accepted a post as tutor to the son of an intimate friend of Altenstein, the Prussian minister of education. He held this position for seven years (1826–1833), occupying his leisure time with the preparation of a critical edition of Aristotle's *De anima* (1833; 2nd ed. by C. Belger, 1877). In 1833 Altenstein appointed Trendelenburg extraordinary professor in Berlin, and four years later he was advanced to an ordinary professorship. For nearly forty years he proved himself markedly successful as an academical teacher, during the greater part of which time he had to examine in philosophy and pedagogics all candidates for the scholastic profession in Prussia. In 1865 he became involved in an acrimonious controversy on the interpretation of Kant's doctrine of Space with Kuno Fischer, whom he attacked in *Kuno Fischer und sein Kant* (1869), which drew forth the reply *Anti-Trendelenburg* (1870). He died on the 24th of January 1872.

Trendelenburg's philosophizing is conditioned throughout by his loving study of Plato and Aristotle, whom he regards not as opponents but as building jointly on the broad basis of idealism. His own standpoint may almost be called a modern version of Aristotle thus interpreted. While denying the possibility of an absolute method and an absolute philosophy, as contended for by Hegel and others, Trendelenburg was emphatically an idealist in the ancient or Platonic sense; his whole work was devoted to the demonstration of the ideal in the real. But he maintained that the procedure of philosophy must be analytic, rising from the particular facts to the universal in which we find them explained. We divine the system of the whole from the part we know, but the process of reconstruction must remain approximative. Our position forbids the possibility of a final system. Instead, therefore, of constantly beginning afresh in speculation, it should be our duty to attach ourselves to what may be considered the permanent results of historic developments. The classical expression of these results Trendelenburg finds mainly in the Platonico-Aristotelian system. The philosophical question is stated thus: How are thought and being united in knowledge? how does thought get at being? and how does being enter into thought? Proceeding on the principle that like can only be known by like, Trendelenburg next reaches a doctrine peculiar to himself (though based upon Aristotle) which plays a central part in his speculations. Motion is the fundamental fact common to being and thought; the actual motion of the external world has its counterpart in the constructive motion which is involved in every instance of perception or thought. From motion he proceeds to deduce time, space and the categories of mechanics and natural science. These, being thus derived, are at once subjective and objective in their scope. It is true matter can never be completely resolved into motion, but the irreducible remainder may be treated like the πρώτη ὕλη of Aristotle as an abstraction which we asymptotically approach but never reach. The facts of existence, however, are not adequately explained by the mechanical categories. The ultimate interpretation of the universe can only be found in the higher category of End or final cause. Here Trendelenburg finds the dividing line between philosophical systems. On the one side stand those which acknowledge none but efficient causes—which make force prior to thought, and explain the universe, as it were, *a tergo*. This may be called, typically, Democritism. On the other side stands the "organic" or teleological view of the world, which interprets the parts through the idea of the whole, and sees in the efficient causes only the vehicle of ideal ends. This may be called in a wide sense Platonism. Systems like Spinozism, which seem to form a third class, neither sacrificing force to thought nor thought to force, yet by their denial of final causes inevitably fall back into the Democritic or essentially materialistic standpoint, leaving us with the great antagonism of the mechanical and the organic systems of philosophy. The latter view, which receives its first support in the facts of life, or organic nature as such, finds its culmination and ultimate verification in the ethical world, which essentially consists in the realization of ends. Trendelenburg's *Naturrecht* may, therefore, be taken as in a manner the completion of his system, his working out of the ideal as present in the real. The ethical end is taken to be the idea of humanity, not in the abstract as formulated by Kant, but in the context of the state and of history. Law is treated throughout as the vehicle of ethical requirements. In Trendelenburg's treatment of the state, as the ethical organism in which the individual (the potential man) may be said first to emerge into actuality, we may trace his nurture on the best ideas of Hellenic antiquity.

Trendelenburg was also the author of the following: *Elementa logices Aristotelicae* (1836; 9th ed., 1892; Eng. trans., 1881), a selection of passages from the *Organon* with Latin translation and notes, containing the substance of Aristotle's logical doctrine, supplemented by *Erläuterungen zu den Elementen der Aristotelischen Logik* (1842; 3rd ed. 1876); *Logische Untersuchungen* (1840; 3rd ed. 1870), and *Die logische Frage in Hegels System* (1843), important factors in the reaction against Hegel; *Historische Beiträge zur Philosophie*

(1846–1867), in three volumes, the first of which contains a history of the doctrine of the Categories; *Das Naturrecht auf dem Grunde der Ethik* (1860); *Lücken im Völkerrecht* (1870), a treatise on the defects of international law, occasioned by the war of 1870. A number of his papers dealing with non-philosophical, chiefly national and educational subjects, are collected in his *Kleine Schriften* (1871).

On Trendelenburg's life and work see H. Bonitz, *Zur Erinnerung an F.A.T.* (Berlin, 1872); P. Kleinert, *Grabrede* (Berlin, 1872); E. Bratuschek, *Adolf Trendelenburg* (Berlin, 1873); C. von Prantl, *Gedächtnissrede* (Munich, 1873); G. S. Morris in the *New Englander* (1874), xxxiii.

TRENT (Lat. *Tridentum*; Ital. *Trento*; Ger. *Trient*), the capital of the south or Italian-speaking portion of the Austrian province of Tirol. It stands on the left bank of the Adige where this river is joined by the Fersina, and is a station on the Brenner railway, 35 m. S. of Botzen and 56½ m. N. of Verona. It has a very picturesque appearance, especially when approached from the north, with its embattled walls and towers filling the whole breadth of the valley. A conspicuous feature in the view is the isolated rocky citadel of Doss Trento (the Roman *Verruca*), that rises on the right bank of the Adige to a height of 308 ft. above the city and is now very strongly fortified, as are various other positions near Trent giving access to Trent from the east (Val Sugana) or the west (valley of the Sarca). With its numerous palaces, substantial houses, broad streets, and spacious squares, Trent presents the aspect of a thoroughly Italian city, and its inhabitants (24,868 in 1900, including a garrison of over 2000 men) speak Italian only—it is the centre of the region called *Italia Irredenta* by fervent Italian patriots. The Duomo or cathedral church (dedicated to San Vigilio, the first bishop) was built in four instalments between the 11th and 15th centuries, and was restored in 1882–1889. More interesting historically is the church of Santa Maria Maggiore, built in 1514–1539, and the scene of the sessions of the famous Ecumenical Council (as to which, see below) which lasted, with several breaks, from 1545 to 1563; near it, in the open, a column was erected in 1845, on the occasion of the three hundredth anniversary of the opening of the Council. To the east of the city rises the Castello del Buon Consiglio, for centuries the residence of the prince-bishops, but now used as barracks. There is a huge town hall, which also houses the museum and the very extensive town library. Trent lives rather on its historical souvenirs than on its industries, which are not very extensive, viticulture, silk-spinning and the preparation of salami (a strongly spiced kind of Italian sausage) being the chief. Ecclesiastically Trent is a suffragan see of the archbishopric of Salzburg. Opposite the railway station a statue of Dante was erected in 1896, for he is believed to have visited this region about 1304.

Trent was originally the capital of the Tridentini, and is mentioned in the *Antonine Itinerary* as a station on the great road from Verona to Veldidena (Innsbruck) over the Brenner. It was later ruled by the Ostrogoths (5th century) and the Lombards (6th century) after the conquest of whom by the Franks (774) Trent became part of the kingdom of Italy. But in 1027 the emperor Conrad II. bestowed all temporal rights in the region on the bishop (the see dates from the 4th century) and transferred it to Germany, an event which fixed all its later history. The Venetian attacks were finally repulsed in 1487, and the bishop retained his temporal powers till 1803 when they passed to Austria, to which (save 1805–1814, when first the Bavarians and then Napoleon held the region) they have ever since belonged, the Trentino being annexed formally to Tirol in 1814. (W. A. B. C.)

TRENT, COUNCIL OF. The Council of Trent (1545–1563) has a long antecedent history of great significance for the fortunes of the Catholic Church. During the 15th and the earlier half of the 16th century, the conception of an "ecumenical council" remained an ideal of which the realization was expected to provide a solution for the serious ecclesiastical difficulties which were then prevalent. True, the councils of Constance and Basel had fallen short of the desired goal; but confidence in the unknown quantity persisted and took deeper root as the popes of the Renaissance showed themselves less and less inclined to undertake the reforms considered necessary in wide circles of the Church. The papacy indeed did not recognize the jurisdiction of the ecumenical council, and in 1459 Pius II. had prohibited any appeal to such a tribunal under penalty of excommunication. This, however, had no effect on public opinion, and the council continued to be invoked as the supreme court of Christianity. So in 1518, for instance, the university of Paris demanded the convocation of a general council, to which it referred its solemn protest against the papal encroachments on the privileges of the French Church. Thus, when Luther took this very step in the same year, and repeated it later, his action was not devoid of precedent. Again in 1529 the evangelical estates of Germany made a formal appeal in the Diet of Spires, and, in the preface to the Augsburg Confession of 1530, requested a "general, unfettered council of Christendom." The same demand was formulated by Charles V. The emperor indeed—though, as a statesman, he had found himself in frequent opposition to the papal policy of his day—had never entertained the slightest doubt as to the truth of Catholic doctrine, and had rendered inestimable services to the Church in the perilous years which followed the emergence of Protestantism. Still he could not blind himself to the fact that ecclesiastical life stood in urgent need of reform; and the only method of effecting an alteration in the existing régime was by means of a council. Consequently he declared himself in favour of convening a general assembly of the church—a project which he pursued with the greatest energy. True, the passive resistance of the Curia was so stubborn that the decisive step was postponed time and again. But the goal was finally attained, and this result was essentially the work of Charles. Actually, the meeting came too late: the Evangelical Church had gathered strength in the interim, and the council failed to exercise the decisive influence anticipated on the relations between Catholicism and Protestantism. In 1536 its convocation seemed imminent. Pope Paul III., who in the conclave had already admitted the necessity of a council, convened it on the 2nd of June 1536, for the 23rd of May 1537, at Mantua. He then altered the date to the 1st of November of the same year. Later it was summoned to meet at Vicenza on the 1st of May 1538, only to be postponed till the Easter of 1539. Finally, he adjourned the execution of the project *sine die*. Charles met this dilatory policy by arranging colloquies between Protestant and Catholic at Worms and Regensburg, the result being that the Curia became afraid that the emperor might take the settlement of the religious question into his own hands. This consideration forced Paul III. to compliance, and fresh writs were issued convoking the council, first for Whitsuntide, 1542, then for the 1st of November of the same year. In consequence, however, of the hostilities between Charles and the French king Francis I., the conference was so scantily attended that it was once more prorogued to the 6th of July 1543, before it had come into active existence. Not till the peace of Crespy, 1544, when the emperor showed some disposition to attempt an accommodation of the ecclesiastical feud in a German Diet, did the pope resolve to translate his numerous promises into deeds. The bull *Laetare Hierusalem* (November 19, 1544) fixed the meeting of the council for the 15th of March 1545, in Trent, and assigned it three tasks: (1) the pacification of the religious dispute by doctrinal decisions, (2) the reform of ecclesiastical abuses, (3) the discussion of a crusade against the infidels. The selection of the town of Trent, the capital of the Italian Tirol, and part of the empire had a two-fold motive: on the one hand it was a token of concession to the emperor, who wished the synod to be held in his dominions; on the other, there was no occasion to fear that an assembly, meeting on the southern border of Germany, would fall under the imperial influence.

The opening of the council was deferred once again. Towards the end of May 1545, twenty bishops were collected at Trent; but there was no sign of action, and the papal legates—Del Monte, Corvinus and Reginald Pole—delayed the inauguration. The cause of this procrastinating policy was that the emperor and the pope were at cross purposes with regard to the mode of procedure. In the eyes of Paul III. the council was simply the means by which he expected to secure a condemnation of the Protestant heresy, in hopes that he would then be in a position to impose the sentence of the Church upon them by force. For him the question of ecclesiastical reform possessed no interest whatever. In contrast to this, Charles demanded that these very reforms should be given precedence, and the decisions on points of dogma postponed till he should have compelled the Protestants to send representatives to the council. The pope, however, alarmed by the threat of a colloquy in Germany, recognized the inadvisability of his dilatory tactics, and at last ordered the synod to be opened (December 13, 1545).

Since there was no definite method by which the deliberations of ecumenical councils were conducted, special regulations were necessary; and those adopted were of such a nature as to assure the predominance of the Roman chair from the first. As the voting was not to be by nations, as at Constance, but by individuals, the last word remained with the Italians, who were in the majority. In order to enhance this superiority the legates as a rule denied the suffrage to those foreign bishops who desired to be represented by procurators; and a number of Italian prelates were enabled to make their appearance at Trent, thanks to special allowances from the pope. The dispute as to the order of precedence among the subjects for deliberation was settled by a compromise, and the questions of dogma and ecclesiastical abuses were taken simultaneously, the consequence being that in the decisions of the council the doctrinal and reformatory decrees rank side by side. In pursuance of a precedent established by the last Lateran Council, the sessions were divided into two classes: those devoted to discussion (*congregationes generales*), and those in which the results of the discussion were put to the vote and formally enacted (*sessiones publicae*). To ensure a thorough consideration of every proposition, and also to facilitate the exercise of the papal influence on the proceedings, the delegates were split into three groups (*congregationes*), each group debating the same question at the same time. This arrangement, however, only endured till 1546. Since these sections were only brought into conjunction by the legates, and met under their presidency, the pontifical envoys in effect regulated the whole course of the deliberations. They claimed, moreover, the right of determining the proposals submitted, and were throughout in active and constant communication with Rome—a circumstance which provoked the *bon mot* of the French deputy (1563), that when the rivers were flooded and the Roman post delayed the Holy Ghost postponed his descent. These precautions nullified any possible disposition on the part of the council to enter on dangerous paths; and in addition the clause "under reservation of the papal authority" was affixed to all enactments dealing with ecclesiastical irregularities—thus leaving the pope a free hand with regard to the practical execution of any measures proposed. Contrary to the emperor's wish, the council began its labours in the region of dogma by defining the doctrines of the Church with reference to the most important controversial points—a procedure which frustrated all his projects for a reconciliation with the Protestants. On the 8th of April 1546 the doctrine of the Holy Scriptures and tradition (*sessio* iv.) was proclaimed; on the 17th of June 1546, the doctrine of original sin (*sessio* v.); on the 13th of January 1547, the doctrine of justification (*sessio* vi.); and on the 3rd of March 1547, the decree concerning the sacraments in general, and baptism and confirmation in particular (*sessio* vii.). On the 11th of March, however, the council was transferred to Bologna on the pretext that an epidemic was raging in Trent (*sessio* viii.), though, at the imperial command, part of the bishops remained behind. But on the 2nd of June the council of Bologna resolved (*sessio* x.) to adjourn its labours. The emperor's demands that the council should again be removed to Trent were vain, till on the 24th of April 1547, the battle of Mühlberg decided the struggle with the Schmalkaldic league, formed by the Evangelical princes of Germany, in his favour. His hands were now free, and he utilized his military successes to balance his account with the Church. At the Diet of Augsburg he secured the enactment of a *modus vivendi*, leavened by the Catholic spirit, between the adherents of either religion; and this provisory settlement—the so-called *Interim* of Augsburg—was promulgated as a law of the empire (June 3, 1548), and declared binding till the council should reassemble. The Protestants, it is true, received certain concessions—the non-celibacy of the priesthood and the lay chalice—but the Roman hierarchy, the old ceremonial, the feast-days and the fasts, were reinstated. Since the bishops who had remained in Trent abstained, at the emperor's request, from any display of activity *qua* synod, the outbreak of a schism was avoided. But the confusion of ecclesiastical affairs had grown worse confounded through the refusal of the pope to continue the council, when the death of Paul III. (November 10, 1549) gave a new turn to events.

Pope Julius III., the former legate Del Monte, could not elude the necessity of convening the council again, and, though personally he took no greater interest in the scheme than his predecessor in office, caused it to resume its labours on the 1st of May 1551 (*sessio* xi.), under the presidency of the legate, Cardinal Crescentio. The personnel of the synod was, for the most part, different; and the new members included the Jesuits, Laynez and Salmeron. More than this, the general character of the second period of the council was markedly distinct from that of its earlier stages. The French clergy had not a single delegate, while the Spanish bishops maintained an independent attitude under the aegis of the emperor, and Protestant deputies were on this occasion required to appear at Trent. The German Protestants who, in the first phase of the council, had held aloof from its proceedings, since to have sent representatives to this assemblage would have served no good purpose, had now no choice but to obey the imperial will. Charles V. was anxious to assure them not merely of a safe conduct, but also of a certain hearing. But in this he ran counter to the established facts: the Catholic Church had already defined its attitude to the dogmas above mentioned, and the Curia showed no inclination to question these results by reopening the debate. Thus the participation of the Protestants was essentially superfluous, for the object they had at heart—the discussion of these doctrines on the gound of Holy Writ—was from the Catholic standpoint an impossible aspiration. The Württemberg deputies had already submitted a creed, composed by the Swabian reformer Johann Brenz, to the council, and Melanchthon was under way with a *confessio saxonica*, when there came the revolt of the Elector Maurice of Saxony (March 20, 1552), which compelled the emperor to a speedy flight from Innsbruck, and dissolved the conclave. Its dogmatic labours were confined to doctrinal decrees on the Lord's Supper (*sessio* xiii. October 11, 1551), and on the sacraments of penance and extreme unction (November 25, 1551, *sessio* xiv.). On the 28th of April 1552, the sittings were suspended on the news of the elector's approach.

Ten years had elapsed before the council reassembled for the third time in Trent; and on this occasion the circumstances were totally changed. During the intervening period, the religious problem in Germany had received such a solution as the times admitted by the peace of Augsburg (1555); and the equality there guaranteed between the Protestant estates and the Catholic estates had left the former nothing to hope from a council. Thus the motive which till then had governed the emperor's policy was now nullified, as there was no necessity for seeking a reconciliation of the two parties by means of a conference. The incitement to continue the council came from another quarter. It was no longer anxiety with regard to Protestantism that exercised the pressure, but a growing conviction of the imperative need of more stringent reforms within the Catholic Church itself. Pope Paul IV. (1551–1559), the protector of the Inquisition, and the opponent of Philip II. of Spain as well as of the emperor Ferdinand, turned a deaf ear to all requests for a revival of the synod. The regime of Pius IV. (1559–1566) was signalized by an absolute reversal of the papal policy: and it was high time. For in France and Spain—

the very countries where the Protestant heresy had been most vigorously combated—a great mass of discontent had accumulated; and France already showed a strong inclination to attempt an independent settlement of her ecclesiastical difficulties in a national council. Pius IV. saw himself constrained to take these circumstances into account. On the 29th of November 1560 he announced the convocation of the council; and on the 18th of January 1562 it was actually reopened (*sessio* xvii.). The presidency was entrusted to Cardinal Gonzaga, assisted by Cardinals Hosius, bishop of Ermeland, Seripando, Simonetta, and Marc de Altemps, bishop of Constance. The Protestants indeed were also invited but the Evangelical princes, assembled in Naumburg, withheld their assent—a result which was only to be expected. In order to enhance the synod's freedom of action, France and the emperor Ferdinand required that it should rank as a new council, and were able to adduce in support of their claim the fact that the resolutions of the two former periods had not yet been formally recognized. Pius IV., however, designated it a continuation of the earlier meetings. Ferdinand, in addition to regulations for the amendment of the clergy and the monastic system, demanded above all the legalization of the marriage of the priesthood and the concession of the "lay chalice," as he feared further defections to Protestantism. France and Spain laid stress on the recognition of the divine right of the episcopate, and its independence with regard to the pope. These episcopal tendencies were backed by a request that the bishops should reside in their sees—a position which Pius IV. acknowledged to be *de iure divino*; though, as it would have implied the annihilation of the Roman Curia, he refused to declare it as such. In consequence of these reformatory aspirations, the position of the pope and the council was for a while full of peril. But the papal diplomacy was quite competent to shatter an opposition which at no time presented an absolutely unbroken front, and by concessions, threats and the utilization of political and politico-ecclesiastical dissensions, to break the force of the attack. In the third period of the council, which, as a result of these feuds, witnessed no session from September 1562 to July 1563, doctrinal resolutions were also passed concerning the Lord's Supper *sub utraque specie* (*sessio* xxi., July 16, 1562), the sacrifice of the Mass (*sessio* xxii., September 27, 1562), the sacrament of ordination (*sessio* xxiii., July 15, 1563), the sacrament of marriage (*sessio* xxiv., November 11, 1563), and Purgatory, the worship of saints, relics and images (December 3, 1563). On the 4th of December 1563 the synod closed.

The dogmatic decisions of the Council of Trent make no attempt at embracing the whole doctrinal system of the Roman Catholic Church, but present a selection of the most vital doctrines, partly chosen as a counterblast to Protestantism, and formulated throughout with a view to that creed and its objections. From the discussions of the council it is evident that pronounced differences of opinion existed within it even on most important subjects, and that these differences were not reconciled. Hence came the necessity for reticences, equivocations and temporizing formulae. Since, moreover, the council issued its pronouncements without any reference to the decisions of earlier councils, and omitted to emphasize its relation to these, it in fact suppressed these earlier decisions, and posed not as continuing, but as superseding them.

The reformatory enactments touch on numerous phases of ecclesiastical life—administration, discipline, appointment to spiritual offices, the marriage law (*decretum de reformatione matrimonii* "*Tametsi*," *sessio* xxiv.), the duties of the clergy, and so forth. The resolutions include many that marked an advance; but the opportunity for a comprehensive and thorough reformation of the life of the Church—the necessity of which was recognized in the Catholic Church itself—was not embraced. No alteration of the abuses which obtained in the Curia was effected, and no annulment of the customs, so lucrative to that body and deleterious to others, was attempted. The question of the annates, for instance, was not so much as broached.

The Council of Trent in fact enjoyed only a certain appearance of independence. For the freedom of speech which had been accorded was exercised under the supervision of papal legates, who maintained a decisive influence over the proceedings and could count on a certain majority in consequence of the overwhelming number of Italians. That the synod figured as the responsible author of its own decrees (*sancta oecumenica et generalis tridentina synodus in spiritu sancto legitime congregata*) proves very little, since the following clause reads *praesidentibus apostolicae sedis legatis*; while the legates and the pope expressly refused to sanction an application of the words of the Council of Constance—*universalem ecclesiam repraesentans*. The whole course of the council was determined by the presupposition that it had no autonomous standing, and that its labours were simply transacted under the commission and guidance of the pope. This was not merely a claim put forward by the Roman see at the time: it was acknowledged by the attitude of the synod throughout. The legates confined the right of discussion to the subjects propounded by the pope, and their position was that he was in no way bound by the vote of the majority. In difficult cases the synod itself left the decision to him, as in the question of clandestine marriages and the administration of the Lord's Supper *sub utraque specie*. Further, at the close of the sessions a resolution was adopted, by the terms of which all the enactments of the council *de morum reformatione atque ecclesiastica disciplina* were subject to the limitation that the papal authority should not be prejudiced thereby (*sessio* xxv. *cap.* 21). Finally, every doubt as to the papal supremacy is removed when we consider that the Tridentine Fathers sought for all their enactments and decisions the ratification (*confirmatio*) of the pope, which was conferred by Pius IV. in the bull *Benedictus Deus* (January 26, 1564). Again, in its last meeting (*sessio* xxv.), the synod transferred to the pope a number of tasks for which their own time had proved inadequate. These comprised the compilation of a catalogue of forbidden books, a catechism, and an edition of the missal and the breviary. Thus the council presented the Holy See with a further opportunity of extending its influence and diffusing its views. The ten rules *de libris prohibitis*, published by Pius IV. in the bull *Dominici gregis custodiae* (March 24, 1564), became of great importance for the whole spiritual life of the Roman Catholic Church: for they were an attempt to exclude pernicious influences, and, in practice, led to a censorship which has been more potent for evil than good. These regulations were modified by Leo XIII. in his Constitution *Officiorum ac munerum* (January 24, 1897). Acting on a suggestion of the council (*sessio* xxiv. *c.* 2; *sessio* xxv. *c.* 2), Pius IV. published a short conspectus of the articles of faith, as determined at Trent, in the bull *Injunctum nobis* (November 13, 1564). This so-called *Professio fidei tridentinae*, however, goes beyond the doctrinal resolutions of the synod, as it contains a number of clauses dealing with the Church and the position of the pope within the Church—subjects which were deliberately ignored in the discussions at Trent. In 1877 this confession—binding on every Roman Catholic priest—was supplemented by a pronouncement on the dogma of papal infallibility.

The great and increasing need of a manual for the instruction of the people gave rise in the first half of the 16th century to numerous catechisms. At the period of the council, that composed by the Jesuit Peter Canisius, father-confessor of the emperor Ferdinand, enjoyed the widest vogue. It failed, however, to receive the sanction of the synod, which preferred to undertake the task itself; and, as that body left its labours unfinished, the pope was entrusted with the compilation of a textbook. Pius V. appointed a commission (Leonardo Marini, Egidio Foscarari, Francisco Fureiro and Murio Calini) under the presidency of three cardinals, among them Charles Borromeo; and this commission discharged its duties with such rapidity that the *Catechismus a decreto concilii tridentini ad parochos* was published in Rome as early as the year 1568. The book is designed for the use of the cleric, not the layman. The *Missale romanum*, moreover, underwent revision: also the *Breviarium romanum*, the daily devotional work of the Roman priest. The necessity of still further improvements in the latter was forcibly urged in the Vatican Council.

The numerical representation of the Council of Trent was marked by considerable fluctuations. In the first session (December 13, 1545) the spiritual dignitaries present—omitting the 3 presiding cardinals—consisted of one other cardinal, 4 archbishops, 21 bishops and 5 generals of orders. On the other hand, the resolutions of the synod were signed at its close by the 4 presidents, then by 2 cardinals, 3 patriarchs, 25 archbishops, 166 bishops, 7 abbots, 7 generals of orders and 19 procurators of archbishops and bishops. In this council—as later in the Vatican—Italy was the dominant nation, sending two-thirds of the delegates; while Spain was responsible for about 30, France for about 20, and Germany for no more than 8 members. In spite of the paucity of its numbers at the opening and the unequal representation of the Church, which continued to the last, the oecumenical character of the council was never seriously questioned. On the motion of the legates, the resolutions were submitted to the ambassadors of the secular powers for signature, the French and Spanish envoys alone withholding their assent. The recognition of the council's enactments was, none the less, beset with difficulties. So far as the doctrinal decisions were concerned no obstacles existed; but the reformatory edicts—adhesion to which was equally required by the synod—stood on a different footing. In their character of resolutions claiming to rank as ecclesiastical law they came into conflict with outside interests, and their acceptance by no means implied that the rights of the sovereign, or the needs and circumstances of the respective countries, were treated with sufficient consideration. The consequence was that there arose an active and, in some cases, a tenacious opposition to an indiscriminate acquiescence in all the Tridentine decrees. Under Charles IX. and Henry IV. the situation was hotly debated in France: but these monarchs showed as little complaisance to the representations and protests of the Curia as did the French *parlement* itself; and only those regulations were recognized which came into collision neither with the rights of the king nor with the liberties of the Gallican Church. In Spain, Philip II. allowed, indeed, the publication of the *Tridentinum*, as also in the Netherlands and Naples, but always with the reservation that the privileges of the king, his vassals and his subjects, should not thereby be infringed. The empire, as such, never recognized the *Tridentinum*. Still it was published at provincial and diocesan synods in the territories of the spiritual princes, and also in the Austrian hereditary states.

In his official confirmation Pius IV. had already strictly prohibited any commentary on the enactments of the council unless undertaken with his approval, and had claimed for himself the sole right of interpretation. In order to supervise the practical working of these enactments, Pius created (1564) a special department of the Curia, the *Congregatio cardinalium concilii tridentini interpretum*; and to this body Sixtus V. entrusted the further task of determining the sense of the conciliar decisions in all dubious cases. The *resolutiones* of the congregation—on disputed points—and their *declarationes*—on legal questions—exercised a powerful influence on the subsequent development of ecclesiastical law.

The Council of Trent attained a quite extraordinary significance for the Roman Catholic Church; and its pre-eminence was unassailed till the *Vaticanum* subordinated all the labours of the Church in the past—whether in the region of doctrine or in that of law—to an infallible pope. On the theological side it fixed the results of medieval scholasticism and gleaned from it all that could be of service to the Church. Further, by pronouncing on a series of doctrinal points till then undecided it elaborated the Catholic creed; and, finally, the bold front which it offered to Protestantism in its presentation of the orthodox faith gave to its members the practical lead they so much needed in their resistance to the Evangelical assault. The regulations dealing with ecclesiastical life, in the widest sense of the words, came, for the most part, to actual fruition, so that, in this direction also, the council had not laboured in vain. For the whole Roman Catholic Church of the 16th century its consequences are of an importance which can scarcely be exaggerated: it showed that Church as a living institution, capable of work and achievement; it strengthened the confidence both of her members and herself, and it was a powerful factor in heightening her efficiency as a competitor with Protestantism and in restoring and reinforcing her imperilled unity. Indeed, its sphere of influence was still more extensive, for its labours in the field of dogma and ecclesiastical law conditioned the future evolution of the Roman Catholic Church. As regards the position of the papacy, it is of epoch-making significance—not merely in its actual pronouncements on the papal see, but also in its tacit subordination to that see, and the opportunities of increased influence accorded to it.

There were three periods of the council, separated by not inconsiderable intervals, each of an individual character, conducted by different popes, but forming a single unity—an indivisible whole, so that it is strictly correct to speak of one Council of Trent, not of three distinct synods.

TRENT, the chief river in the midlands of England, the third in length in the country, exceeded only by the Thames and Severn. It rises in the north of Staffordshire, and discharges through the Humber into the North Sea, having a course of about 170 m., and a drainage area of 4052 sq. m. The source is on Biddulph Moor, which rises to a height of 1100 ft. The course of the river is at first southerly, and it skirts the manufacturing district of the Potteries, passing Stoke-upon-Trent. Immediately below this town the valley widens, and the fall of the river, from a point 15 m. from the source to the mouth, is only 338 ft. Passing Stone, the course becomes south-easterly, and the united waters of the Sow and the Penk are received on the right. Near Rugeley the direction becomes easterly, and near Alrewas the Trent receives the Tame on the right, and turns to the north-east. Much of the valley above this point is well wooded and picturesque, though the flanking hills are gently sloping, and of no great elevation. The river now passes

Burton-upon-Trent, in this part of its course forming the boundary between Staffordshire and Derbyshire. The fall from Burton to the mouth, a distance of 109 m., is 148 ft. The valley opens out as the stream, dividing into several channels at Burton and receiving on the left the Dove, enters Derbyshire. It then separates that county from Leicestershire and Nottinghamshire, receives in quick succession the Derwent (left), Soar (right) and Erewash (left), enters Nottinghamshire, and passes Nottingham, $81\frac{1}{4}$ m. from the mouth. The next important town is Newark, which, however, the main channel of the river passes at a considerable distance to the west; the Devon joins here on the right, and the fall from this point to the mouth, a distance of $57\frac{1}{2}$ m., is only 18 ft. The valley becomes flat, though the river is rather deeply entrenched in some parts. Forming the boundary between Nottingham and Lincolnshire, the Trent passes Gainsborough ($26\frac{1}{2}$ m. from the mouth), receives the Idle on the left, and, entering Lincolnshire and skirting the Isle of Axholme, joins the Yorkshire Ouse near Faxfleet. The lower part of the valley resembles the Fens in character, and is drained by many artificial channels. The northward turn at Newark is of interest inasmuch as it is considered that the river from this point formerly flowed towards Lincoln, and, following a depression in the escarpment there, passed down the valley at present occupied by the Witham to the Wash. It is suggested that the waters were diverted to the Humber by a stream within that system cutting back southward and tapping the Trent in the vicinity of Newark; and in high flood the Trent has been known to send water across the low parting to the Witham (see Avebury, *Scenery of England*, ch. xi.). The highest tides are felt about 40 m. up river, and the phenomenon of an "eagre" (bore or tidal wave) is seen rising on spring tides to a height of 4 or 5 ft., 15 m. above the mouth of the river.

The Trent is navigable for a distance of $94\frac{3}{4}$ m. from its junction with the Ouse, to a point a short distance above the junction of the Derwent, the Trent Navigation Company having a general control of the navigation down to Gainsborough, the line of which passes through Nottingham by canals. On the river itself there are eight locks. Below Gainsborough the navigation is open, and vessels drawing 9 ft. can reach this point on spring tides. From the Derwent mouth the Trent and Mersey Canal follows the Trent valley upward, and gives connexion with the entire inland navigation system of the midlands and west of England. Short canals give access to Derby and the Erewash valley; the Leicester Navigation, following the Soar, connects with the Grand Junction canal; and the Grantham Canal carries a little traffic between that town and Nottingham. The Fossdyke, distinguished as the oldest navigable waterway still in use in England, as it was originally of Roman construction, connects the Trent with Lincoln and the Witham, and lower down the Sheffield and South Yorkshire canal joins the river from the west at Keadby. There is also a canal, little used, to Chesterfield.

TRENTE ET QUARANTE (called also *Rouge et Noir*), a game of French origin played with cards and a special table. It is one of the two games played in the gambling rooms at Monte Carlo, roulette being the other. The diagram illustrates one half of the table, the other half precisely corresponding to it. Two croupiers sit on each side, one of them being the dealer; behind the two on the side opposite to the dealer a supervisor of the game has his seat. Six packs of fifty-two cards each are used; these are well shuffled, and the croupier asks any of the players to cut, handing him a blank card with which to divide the mixed packs. There are only four chances at trente et quarante: *rouge* or *noir*, known as the *grand tableau*; *couleur* or *inverse*, known as the *petit tableau*. At Monte Carlo the stakes are placed on the divisions indicated on the table, the maximum being 12,000 francs and the minimum 20 francs which must be staked in gold. The dealer, who has placed all the cards before him, separates a few with the blank card, takes them in his left hand and invites the players to stake with the formula, "Messieurs, faites votre jeu!" After a pause he exclaims "Le jeu est fait, rien ne va plus!" after which no stake can be made. He then deals the cards in a row until the aggregate number of pips is something more than thirty, upon which he deals a second row, and that which comes nearest to thirty wins, the top row being always distinguished as *noir*, and the lower as *rouge*. In announcing the result the word *trente* is always omitted, the dealer merely announcing *un*, *trois*, *quatre*, as the case may be, though when forty is turned up it is described as *quarante*. The words *noir* and *inverse* are also never used, the announcement being *rouge gagne* or *rouge perd*, *couleur gagne* or *couleur perd*. Gain or loss over *couleur* and *inverse* depends upon the colour of the first card dealt. If this should be also the colour of the winning row, the player wins. Assuming, for example, that the first card dealt is red, and that the lower row of the cards dealt is nearest to thirty, the dealer will announce "Rouge gagne et le couleur." If the first card dealt is red, but the black or top row of cards is nearest to thirty, the dealer announces "Rouge perd et le couleur." It frequently happens that both rows of cards when added together give the same number. Should they both, for instance, add up to thirty-three, the dealer will announce "Trois après," and the deal goes for nothing except in the event of their adding up to thirty-one. *Un après* (*i.e.* thirty-one) is known as a *refait*; the stakes are put in prison to be left for the decision of the next deal, or if the player prefers it he can withdraw half his stake, leaving the other half for the bank. Assurance against a *refait* can be made by paying 1% on the value of the stake with a minimum of five francs. When thus insured against a *refait* the player is at liberty to withdraw his whole stake. It has been calculated that on an average a *refait* occurs once in thirty-eight coups. After each deal the cards are pushed into a metal bowl let into the table in front of the dealer. When he has not enough left to complete the two rows, he remarks "Les cartes passent"; they are taken from the bowl, reshuffled, and another deal begins.

TRENTON, a city and the county-seat of Grundy county, Missouri, U.S.A., on the E. fork of the Grand River, in the north central part of the state, about 100 m. N.E. of Leavenworth. Pop. (1890), 5039; (1900), 5396, including 192 foreign-born and 200 negroes; (1910), 5656. It is served by the Chicago, Rock Island & Pacific (which has repair shops here) and the Quincy, Omaha & Kansas City railways. It has a picturesque situation, and is laid out over a high uneven bluff. The city is a trading centre for a prosperous farming region, and coal is mined in the vicinity. Trenton was platted in 1841, became the county-seat in the same year, and was incorporated as a town in 1857. In 1893 it received a city charter under a general state law. In 1900–1903 it was the seat of Ruskin College, an institution founded by Walter Vrooman (b. 1869), a native of Missouri, and the organizer of the Ruskin Hall Workingmen's College, Oxford, England. The college was removed to Glen Ellyn, Illinois, in 1903 and after 1906 to Ruskin, Florida.

TRENTON, the capital of New Jersey, U.S.A., and the county-seat of Mercer county, on the eastern bank of the Delaware river, about 33 m. N.E. of Philadelphia, and about 59 m. S.W. of New York. Pop. (1890), 57,458; (1900), 73,307, of whom 16,793 were foreign-born (including 4114 Germans, 3621 English, 3292 Irish, and 1494 Hungarians), and 32,879 were of foreign parentage (both parents foreign-born), including 8873 of German parentage, 8324 of Irish parentage, 5513 of English parentage, and 2243 of Hungarian parentage; (1910 census), 96,815. Area, 9 sq. m. Trenton is served by the Pennsylvania (main line and Belvidere division) and the Philadelphia & Reading railway systems, by inter-urban electric railways, and by small freight and passenger steamers on the Delaware river; the Delaware & Raritan Canal connects with the Raritan river at New Brunswick. Trenton is at the head of navigation on the Delaware river, which falls 8 ft. here. Riverside park extends along its water front for about 3 m., and on the outskirts of the city lies Cadwalader park (100 acres), containing a zoological garden. In the centre of the city, marking the spot where Washington planted his guns at the battle of Trenton, stands the Battle monument, a Roman-Doric column of granite, 150 ft. high, hollow and fluted, its cap forming an observatory, with a statue of Washington by William R. O'Donovan (b. 1844). In Perry Street, mounted on a granite pedestal, is the "Swamp Angel," the great gun used by Federal troops in the marshes near Charleston, South Carolina, during their attack on that city in August 1863. There are many buildings in the city which are rich in historic associations. Chief among these is the barracks, erected by the colony in 1758 to mitigate the evils of billeting, and occupied by British troops during the Seven Years' War, and at different times by British, Hessian and American troops during the War of Independence. Other interesting landmarks are "Woodland" (formerly called "Bloomsbury Court"), built early in the 18th century by William Trent, and said to have sheltered, at various times, Washington, Lafayette and Rochambeau; the "Hermitage," erected some time before the War of Independence; and "Bow Hill," in the suburbs of the city, a quaint old colonial mansion which for some time before 1822 was a home of Joseph Bonaparte. Among the public buildings are the state capitol, the post office building, the county court house, the city hall, the second regiment armoury, public library (containing about 42,000 volumes in 1909), and the building (1910) given by Henry C. Kelsey to the city for the school of industrial arts (founded in 1898). Here also are the state normal and model schools (1855), the state library, housed in the capitol, the state school for deaf mutes, the state home for girls, one of the two state hospitals for the insane (opened in 1848), the state arsenal—the building being the old state prison—the state prison (1836), St Francis hospital (1874), Mercer hospital (1892), the William McKinley memorial hospital (1887), the city hospital, two children's day nurseries, the Friends' home, the Union industrial home (for destitute children), the Florence Crittenton home (1895), the indigent widows' and single women's home (1854), the Har Sinai charity society, the home for friendless children, and the society of St Vincent de Paul. Trenton is the see of Protestant Episcopal and Roman Catholic bishops.

Trenton is an important industrial centre. Its proximity to the coal fields of Pennsylvania and to the great markets of New York and Philadelphia, and its excellent transportation facilities by rail and by water, have promoted the development of its manufactures. The city is the greatest centre for the pottery industry in the United States. In 1905 there were 40 establishments for the manufacture of pottery and terra-cotta, employing 4571 labourers; and their total product was valued at $5,882,701—or 9·2% of the value of the pottery product of the United States, and 18% of the value of all the city's factory products, in this year. The chief varieties of this ware are vitrified china, belleek china, semi-porcelain, white granite and c. c. ware, vitrified porcelain for electrical supplies, porcelain bath tubs and tiles, and terra-cotta. Clay for the "saggers," or cases in which the wares are fired, is mined in the vicinity, but the raw materials for the fine grades of pottery are obtained elsewhere. Some pottery was made in Trenton by crude and primitive methods near the beginning of the 19th century, but the modern methods were not introduced until 1852, when yellow and Rockingham wares were first made here. In 1859 the manufacture of white granite and cream-coloured ware was successfully established. The fine exhibits from the Trenton potteries at the Centennial Exhibition in Philadelphia in 1876 greatly stimulated the demand for these wares and increased the competition among the manufacturers; and since that date there has been a marked development in both the quantity and the quality of the product. In Trenton, also, are manufactured iron, steel and copper wire, rope, cables and rods—the John A. Roebling's Sons Company has an immense wire and cable manufactory here—iron and steel bridge building materials and other structural work, plumbers' supplies (manufactured by the J. L. Mott Company), and machinery of almost every character, much of it being exported to foreign countries. Much rubber ware is also manufactured. In 1905 Trenton contained 312 factories, employing 14,252 labourers, and the total value of the factory products was $32,719,945.

The charter, as amended, provides for a mayor elected for two years and a common council of two members from each ward elected for two years. Other elected officers are: city clerk, comptroller, treasurer, counsel, receiver of taxes, engineer, inspector of buildings, overseer of poor, street commissioner and sealer of weights and measures. The municipality owns the water works and the sewer system; the water supply is obtained from the Delaware and is stored in a reservoir having a capacity of about 110,000,000 gallons.

The settlement of Trenton began in 1680 with the erection by Mahlon Stacy, a Quaker colonist of Burlington, of a mill at the junction of the Assanpink creek[1] with the Delaware river. By 1685 a number of colonists had settled at this point, which became known as "The Falls" on account of the rapids in the Delaware here. In 1714 Stacy sold his plantation at "The Falls" to William Trent (*c.* 1655–1724), speaker of the New Jersey Assembly (1723) and chief justice of the colony (1723–1724), in whose honour the place came to be called Trent-town or Trenton. In 1745 Trenton received a royal charter incorporating it as a borough, but in 1750 the inhabitants voluntarily surrendered this privilege, deeming it "very prejudicial to the interest and trade" of the community. In 1783 the New Jersey delegates in Congress proposed that Trenton be made the seat of the general government, but as this measure was opposed by the Southern delegates, it was agreed that Congress, pending a final decision, should sit alternately at Annapolis and Trenton. Congress accordingly met in Trenton in November 1784, but soon afterwards removed to New York, where better accommodation could be obtained. Trenton became the capital of the state in 1790, was chartered as a city in 1792, and received new charters in 1837, 1866, and 1874. The borough of South Trenton was annexed in 1850; the borough of Chambersburg and the township of Millham in 1888; the borough of Wilbur in 1898; and parts of the townships of Ewing and Hamilton in 1900.

See *The City of Trenton, N.J., a Bibliography* (1909), prepared by the Trenton Free Library; John O. Raum, *History of the City of Trenton* (Trenton, 1871); George A. Wolf, *Industrial Trenton* (Wilmington, Del., 1900); F. B. Lee, *History of Trenton* (Trenton, 1895).

TRENTON AND PRINCETON, BATTLES OF (1776–1777). These battles in the War of American Independence are noted as the first successes won by Washington in the open field. Following close upon a series of defeats, their effect upon his troops and the population at large was marked. After the capture of Fort Washington on Manhattan Island, on the 16th of November 1776, the British general, Sir William Howe, forced the Americans to retreat through New Jersey and across the Delaware into Pennsylvania. Howe then went into winter quarters, leaving the Hessian general, Rahl, at Trenton on the river with a brigade of 1200 men. Although Washington's army had dwindled to a mere handful and was discouraged by the year's disasters, it could still be trusted for a promising exploit. Ascertaining that the Hessians at Trenton were practically unsupported, the American general determined to attempt their capture. On the night of the 25th of December 1776 he recrossed the Delaware through floating ice to a point 9 m. above the enemy, whom he expected to reach at dawn of the following day, the 26th. Dividing his force of 2500 men

[1] The name Assanpink is a corruption of an Indian word said to mean "place of stone implements." In gravel deposits in and near Trenton many stone implements, human skulls and remains of extinct animals have been found, and according to some scientists they are evidences of Glacial man, a conclusion disputed by others. (See AMERICA, vol. i. p. 817.)

into two divisions under Generals Sullivan and Greene, he approached the town by two roads, surprised the Hessian outposts, and then rushed upon the main body before it could form effectively. The charge of the American troops and the fire of their artillery and musketry completely disconcerted the enemy. All avenues of retreat being closed and their general mortally wounded, the latter to the number of 950 quickly surrendered and were marched back into Pennsylvania on the same day. The American loss was five or six wounded.

Elated by this success and eager to beat up the enemy's advanced posts at other points, Washington again crossed the Delaware on the 30th of December and occupied Trenton. Hearing of this move Lord Cornwallis at Princeton, 10 m. north of Trenton, marched down with about 7000 troops upon the Americans on the 2nd of January 1777, and drove them across the Assanpink, a stream running east of the town. The Americans, who encamped on its banks that night, were placed in a precarious position, as the Delaware, with no boats at their disposal at that point, prevented their recrossing into Pennsylvania, and all other roads led towards the British lines to the northward. Washington accordingly undertook a bold manœuvre. Fearing an attack by Cornwallis on the next morning, he held a council of war, which confirmed his plan of quietly breaking camp that night and taking a by-road to Princeton, then cutting through any resistance that might be offered there and pushing on to the hills of northern New Jersey, thus placing his army on the flank of the British posts. His tactics succeeded. At Princeton (*q.v.*) he came upon three British regiments which for a time held him at bay. The 17th foot especially, under Colonel Mawhood, twice routed the American advanced troops, inflicting severe loss, but were eventually driven back toward Trenton. The other regiments retreated north toward New Brunswick, and Washington continued his march to Morristown, New Jersey. He had broken through Howe's lines and placed himself in an advantageous position for recruiting his army and maintaining a strong defensive in the next campaign. These two affairs of Trenton and Princeton put new life into the American cause, and established Washington in the confidence of his troops and the country at large.

See W. S. Stryker, *The Battles of Trenton and Princeton* (Boston, 1898).

TREPIDATION (from Lat. *trepidare*, to tremble), a term meaning, in general, fear or trembling, but used technically in astronomy for an imagined slow oscillation of the ecliptic, having a period of 7000 years, introduced by the Arabian astronomers to explain a supposed variation in the precession of the equinoxes. It figured in astronomical tables until the time of Copernicus, but is now known to have no foundation in fact, being based on an error in Ptolemy's determination of precession.

TRESCOT, WILLIAM HENRY (1822–1898), American diplomatist, was born in Charleston, South Carolina, on the 10th of November 1822. He graduated at Charleston College in 1840, studied law at Harvard, and was admitted to the bar in 1843. In 1852–1854 he was secretary of the U.S. legation in London. In June 1860 he was appointed assistant secretary of state, and he was acting secretary of state in June–October, during General Lewis Cass's absence from Washington, and for a few days in December after Cass's resignation. His position was important, as the only South Carolinian holding anything like official rank, because of his intimacy with President Buchanan, and his close relations with the secession leaders in South Carolina. He opposed[1] the re-enforcement of Fort Sumter, used his influence to prevent any attack on the fort by South Carolina before the meeting of the state's convention called to consider the question of secession, and became the special agent of South Carolina in Washington after his resignation from the state department in December. He returned to Charleston in February 1861; was a member of the state legislature in 1862–1866, and served as colonel on the staff of General Roswell S. Ripley during the Civil War; and later returned to Washington. He was counsel for the United States before the Halifax Fishery Commission in 1877; was commissioner for the revision of the treaty with China in 1880; was minister to Chile in 1881–1882; in 1882 with General U.S. Grant negotiated a commercial treaty with Mexico; and in 1889–1890 was a delegate to the Pan-American Congress in Washington. He died at Pendleton, South Carolina, his country place, on the 4th of May 1898.

His writings include *The Diplomacy of the Revolution* (1852), *An American View of the Eastern Question* (1854) and *The Diplomatic History of the Administrations of Washington and Adams* (1857).

[1] His "Narrative...concerning the Negotiations between South Carolina and President Buchanan in December 1860," written in February 1861, edited by Gaillard Hunt, appeared in the *American Historical Review*, xiii. 528–556 (1908).

TRESHAM, FRANCIS (*c.* 1567–1605), English Gunpowder Plot conspirator, eldest son of Sir Thomas Tresham of Rushton, Northamptonshire (a descendant of Sir Thomas Tresham, Speaker of the House of Commons, executed by Edward IV. in 1471), and of Muriel, daughter of Sir Thomas Throckmorton of Coughton, was born about 1567, and educated at Oxford. He was, like his father, a Roman Catholic, and his family had already suffered for their religion and politics. He is described as "a wild and unstayed man," was connected intimately with many of those afterwards known as the Gunpowder Plot conspirators, being cousin to Catesby and to the two Winters, and was implicated in a series of seditious intrigues in Elizabeth's reign. In 1596 he was arrested on suspicion together with Catesby and the two Wrights during an illness of Queen Elizabeth. In 1601 he took part in Essex's rebellion and was one of those who confined the Lord Keeper Egerton in Essex House on the 8th of February. He was imprisoned and only suffered to go free on condition of a fine of 3000 marks paid by his father. He was one of the promoters of the mission of Thomas Winter in 1602 to Madrid to persuade the king of Spain to invade England. On the death of Elizabeth, however, he, with several other Roman Catholics, joined Southampton in securing the Tower for James I.

Tresham was the last of the conspirators to be initiated into the Gunpowder Plot. According to his own account, which receives general support from Thomas Winter's confession, it was revealed to him on the 14th of October 1605. Inferior in zeal and character to the rest of the conspirators, he had lately by the death of his father, on the 11th of September 1605, inherited a large property and it was probably his financial support that was now sought. But Tresham, as the possessor of an estate, was probably less inclined than before to embark on rash and hazardous schemes. Moreover, he had two brothers-in-law, Lords Stourton and Monteagle, among the peers destined for assassination. He expressed his dislike of the plan from the first, and, according to his own account, he endeavoured to dissuade Catesby from the whole project, urging that the Romanist cause would derive no benefit, even in case of success, from the attempt. His representations were in vain and he consented to supply money, but afterwards discovered that no warning was to be given to the Roman Catholic peers. All the evidence now points to Tresham as the betrayer of the plot, and it is known that he was in London within 24 hours of the despatch of the famous letter to Lord Monteagle which revealed the plot (see GUNPOWDER PLOT). In all probability he had betrayed the secret to Monteagle previously, and the method of discovery had been settled between them, for it bears the marks of a prearranged affair, and the whole plan was admirably conceived so as to save Monteagle's life and inform the government, at the same time allowing the conspirators, by timely warning, opportunity to escape (see MONTEAGLE, WILLIAM PARKER, 4th baron). Tresham avoided meeting any of the conspirators as he had agreed to do at Barnet, on the 29th of October, but on the 31st he was visited by Winter in London, and summoned to Barnet on the following day. There he met Catesby and Winter, who were prepared to stab him for his betrayal, but were dissuaded by his protestations that he knew nothing of the letter. His entreaties that they would give up the whole project and escape to Flanders were unavailing. After the arrest of Fawkes on the night of the 4th Tresham did not fly with the rest of the conspirators, but remained at court and offered his services for apprehending them. For some days he was not suspected, but he was arrested on the 12th. On the 13th he confessed his share in the plot, and on the 29th his participation and that of Father Garnet in the mission to Spain. Shortly afterwards he fell ill with a complaint from which he had long suffered. On the 5th of December a copy of the *Treatise of Equivocation*, in which the Jesuit doctrine on that subject was treated, was found amongst his papers by Sir Edward Coke (see GARNET, HENRY). From the lessons learnt here he had evidently profited. On the 9th of December he declared he knew nothing about the book, and shortly before his death, with the desire of saving his friend, he withdrew his statement concerning Garnet's complicity in the Spanish negotiations, and denied that he had seen him or communicated with him for 16 years. His death took place on the 22nd. His last transparent falsehoods had removed any thoughts of leniency in the government. He was now classed with the other conspirators, and though he had never been convicted of any crime or received sentence, his corpse was decapitated and he was attainted by act of parliament. Tresham had married Anne, daughter of Sir John Tufton of Holtfield in Kent, by whom he had two daughters. His estates passed, notwithstanding the attainder, to his brother, afterwards Sir Lewis Tresham, Bart.

TRESPASS (O. Fr. *trespas*, a crime, properly a stepping across, from Lat. *trans*, across, and *passus*, step, cf. "transgression," from *transgredi*, to step across), in law, any transgression of the law less than treason, felony or misprision of either. The term includes a great variety of torts committed to land, goods or person, distinguished generally by names drawn from the writs once used as appropriate to the particular transgression, such as *vi et armis*, *quare clausum fregit de bonis asportatis*, *de uxore abducta cum bonis viri*, *quare filium et heredem rapuit*, &c. Up to 1694 the trespasser was regarded, nominally at any rate, as a criminal, and was liable to a fine for the breach of the peace, commuted for a small sum of money, for which 5 Will. and Mar. c. 12 (1693) substituted a fee of 6s. 8d. recoverable as costs against the defendant. Trespass is not now criminal except by special statutory enactment, *e.g.* the old statutes against forcible entry, the game acts, and the private acts of many railway companies. When, however, trespass is carried sufficiently far it may become criminal, and be prosecuted as assault if to the person, as nuisance if to the land. At one time an important distinction was drawn between trespass general and trespass special or trespass on the case, for which see TORT. The difference between trespass and case was sometimes a very narrow one: the general rule was that where the injury was directly caused by the act of the defendant the proper remedy was trespass, where indirectly case. The difference is illustrated by the action for false imprisonment: if the defendant himself imprisoned the plaintiff the action was trespass; if a third person did so on the information of the defendant it was case. A close parallel is found in Roman law in the *actio directa* under the lex Aquilia for injury caused directly, the *actio utilis* for that caused indirectly. One of the reasons for the rapid extension of the action on the case, especially that form of it called *assumpsit*, was no doubt the fact that in the action on the case the defendant was not allowed to wage his law (see WAGER).

In its more restricted sense trespass is generally used for entry on land without lawful authority by either a man, his servants or his cattle. To maintain an action for such trespass the plaintiff must have possession of the premises. The quantum of possession necessary to enable him to bring the action is often a question difficult to decide. In most instances the tenant can bring trespass, the reversioner only case. Remedies for trespass are either judicial or extra-judicial. The most minute invasion of private right is trespass, though the damages may be nominal if the injury was trivial. On the other hand, they may be exemplary if circumstances of aggravation were present. Pleading in the old action of trespass was of a very technical nature, but the old-fashioned terms *alia enormia*, replication *de injuria*, new assignment, &c., once of such frequent occurrence in the reports, are of merely historical interest since the introduction of a simpler system of pleading, unless in those American states where the old pleading has not been reformed. The venue in trespass was formerly local, in case transitory. In addition to damages for trespass, an injunction may be granted by the court. The principal instances of extra-judicial remedies are distress damage feasant of cattle trespassing, and removal of a trespasser without unnecessary violence, expressed in the terms of Latin pleading by *molliter manus imposuit*.

Trespass may be justified by exercise of a legal right, as to serve the process of the law, or by invitation or license of the owner, or may be excused by accident or inevitable necessity, as deviation from a highway out of repair. Where a man abuses an authority given by the law, his wrongful act relates back to his entry, and he becomes a trespasser *ab initio*, that is, liable to be treated as a trespasser for the whole time of his being on the land. Mere breach of contract, such as refusal to pay for wine in a tavern which a person has lawfully entered, does not constitute him a trespasser *ab initio*. A trespass of a permanent nature is called a continuing trespass; such would be the permitting of one's cattle to feed on another's land without authority.

In Scots law trespass is used only for torts to land. By the Trespass (Scotland) Act 1865 trespassers are liable on summary conviction to fine and imprisonment for encamping, lighting fires, &c., on land without the consent and permission of the owner.

TRES TABERNAE (Three Taverns), an ancient village of Latium, Italy, a post station on the Via Appia, at the point where the main road was crossed by a branch from Antium. It is by some fixed some 3 m. S.E. of the modern village of Cisterna just before the Via Appia enters the Pontine marshes, at a point where the modern road to Ninfa and Norba diverges to the north-east, where a few ruins still exist (Grotte di Nottola), 33 m. from Rome. It is, however, more probable that it stood at Cisterna itself, where a branch road running from Antium by way of Satricum actually joins the Via Appia. Ulubrae, mentioned as a typical desert village by Roman writers, lay in the plain between Cisterna and Sermoneta. Tres Tabernae is best known as the point to which St Paul's friends came to meet him on his journey to Rome (Acts xxviii. 15). It became an episcopal see, but this was united with that of Velletri in 592 owing to the desertion of the place.

The name occurs twice in other parts of Italy as the name of post stations.

TRESVIRI, or TRIUMVIRI, in Roman antiquities, a board of three, either ordinary magistrates or extraordinary commissioners.

1. *Tresviri capitales*, whose duty it was to assist the higher officials in their judicial functions, especially criminal, were first appointed about 289 B.C., unless they are to be identified with the *tresviri nocturni* (Livy ix. 46, 3), who were in existence in 304. They possessed no criminal jurisdiction or *jus prensionis* (right of arrest) in their own right, but acted as the representatives of others. They kept watch over prisoners and carried out the death sentence (*e.g.* the Catilinarian conspirators were strangled by them in the *Carcer Tullianum*); took accused or suspected persons into custody; and exercised general control over the city police. They went the rounds by night to maintain order, and had to be present at outbreaks of fire. Amongst other things they assisted the aediles in burning forbidden books. It is possible that they were entrusted by the praetor with the settlement of certain civil processes of a semi-criminal nature, in which private citizens acted as prosecutors (see G. Götz in *Rheinisches Museum*, xxx. 162). They also had to collect the *sacramenta* (deposit forfeited by the losing party in a suit) and examined the plea of exemption put forward by those who refused to act as jurymen. Caesar increased their number to four, but Augustus reverted to three. In imperial times most of their functions passed into the hands of the *praefectus vigilum*.

2. *Tresviri epulones*, a priestly body (open from its first institution to the plebeians), assisted at public banquets. Their number was subsequently increased to seven, and by Caesar to ten, although they continued to be called *septemviri*, a name which was still in use at the end of the 4th century A.D. They were first created in 196 B.C. to superintend the *epulum Jovis* on the Capitol, but their services were also requisitioned on the occasion of triumphs, imperial birthdays, the dedication of temples, games given by private individuals, and so forth, when entertainments were provided for the people, while the senate dined on the Capitol.

3. *Tresviri monetales* were superintendents of the mint. Up to the Social War they were nominated from time to time, but afterwards became permanent officials. Their number was increased by Caesar to four, but again reduced by Augustus. As they acted for the senate they only coined copper money under the empire, the gold and silver coinage being under the exclusive control of the emperor. The official title was "tresviri aere argento auro flando feriundo."

4. *Tresviri reipublicae constituendae* was the title bestowed upon Octavianus, Lepidus and Antony for five years by the lex Titia, 43 B.C. The coalition of Julius Caesar, Pompey and Crassus has also been wrongly called a "triumvirate," but they never had the title *tresviri*, and held no office under that name.

See T. Mommsen, *Römisches Staatsrecht* (1888), ii. 594–601, 638, 601, 718; J. Marquardt, *Römische Staatsverwaltung* (1885), iii. 347.

TREVELYAN, SIR GEORGE OTTO, BART. (1838–), British author and statesman, only son of Sir Charles Trevelyan, was born on the 20th of July 1838 at Rothley Temple, Leicestershire. His mother was Lord Macaulay's sister. He was educated at Harrow and at Trinity College, Cambridge, where he was second in the classical tripos. In 1861 he wrote his *Horace at the University of Athens*, a topical drama in verse, parts of which are said to have offended Whewell and lost Trevelyan a fellowship. The following year he went out as a civil servant to India, where he spent several years. During his stay he contributed "Letters of a Competition Wallah" to *Macmillan's Magazine* (republished 1864). *Cawnpore*, an account of that terrible tragedy, was published in 1865. During the same year he was elected to parliament for Tynemouth in the Liberal interest. In 1867 he wrote *The Ladies in Parliament*, a humorous political brochure in verse. At the general election of 1868 he was returned for the Hawick burghs, which he continued to represent until 1886. When the first Gladstone ministry was formed, in December 1868, Trevelyan was appointed civil lord of the Admiralty, but resigned in July 1870 on a point of conscience connected with the government Education Bill. He advocated a sweeping reform of the army, including the abolition of the purchase of commissions, and both in and out of parliament he was the foremost supporter for many years of the extension of the county franchise. In the session of 1874 he brought forward his Household Franchise (Counties) Bill, which was lost on the second reading; it was not till ten years later that the agricultural labourer was enfranchized. Among other causes which he warmly supported were women's suffrage, a thorough reform of metropolitan local government, and the drastic reform or abolition of the House of Lords. He was also in favour of the direct veto and other temperance legislation. In 1876 he published *The Life and Letters of Lord Macaulay*, one of the most admirable and most delightful of modern biographies; and in 1880 he published *The Early History of Charles James Fox*. In the latter year he was appointed parliamentary secretary to the Admiralty. This office he held until May 1882, when, after the assassination of Lord Frederick Cavendish, he became for two years chief secretary for Ireland. From November 1884 to June 1885 he was chancellor of the duchy of Lancaster. In February 1886 he became secretary for Scotland, but resigned on the 26th of March on account of his disagreement with some of Mr Gladstone's Irish Home Rule proposals. The same year he succeeded his father in the baronetcy. At the general election of 1886 Sir George Trevelyan lost his seat for Hawick. As a representative of the Unionist party he took part in the Round Table Conference, and, being satisfied with the modifications made by Mr Gladstone in his Home Rule scheme, he formally rejoined the Liberal party. In August 1887 he re-entered the House of Commons as member for the Bridgeton division of Glasgow; and from 1892 to 1895 he was secretary for Scotland. Early in 1897 he resigned his seat in parliament and retired into private life. In 1899 he published the first volume of a *History of the American Revolution*, which was completed (3 vols.) in 1905; in the latter year, as *Interludes in Prose and Verse*, he republished his early classical *jeux d'esprit* and Indian pieces. He had married in 1869 Caroline Philips, whose father was M.P. for Bury. His eldest son, Charles Philips Trevelyan (b. 1870), became Liberal M.P. for the Elland division of Yorkshire in 1899, and in 1908 was appointed parliamentary secretary to the Board of Education. The third son, George Macaulay Trevelyan (b. 1876), became well known as a brilliant historical writer, notably with two books on Garibaldi (1907 and 1909).

TREVET (or TRIVET), **NICHOLAS** (*c.* 1258–*c.* 1328), English chronicler, was the son of Sir Thomas Trevet (d. 1283), a judge, and became a Dominican friar. After studying at Oxford and in Paris, he spent most of his subsequent years in writing and teaching, and died about 1328. His chief work is his *Annales sex regum Angliae*, a chronicle of English history covering the period between 1135 and 1307; this is valuable for the later part of the reign of Henry III. and especially for that of Edward I., who was the author's contemporary. A member of the same family was Sir Thomas Trivit (d. 1383), a soldier of repute, who saw a good deal of service in France, and died in October 1383.

The *Annales* were published in Paris in 1668, in Oxford in 1719, and were edited by Thomas Hog for the English Historical Society in 1845. Manuscripts are at Oxford and in the British Museum. Trevet's other historical works are *Catalogus regum anglo-saxonum durante heptarchia*, and *Les Cronicles qe frere N. Trevet escript a dame Marie* ("Marie" was Edward I.'s daughter Mary). From the latter Chaucer is believed to have obtained his *Man of Law's Tale*. Trevet also wrote a number of works of a theological and philological character.

TREVI (anc. *Trebiae*), a town of the province of Perugia, Italy, 30 m. S.E. of Perugia and 5 m. S. of Foligno by rail. Pop. (1901), 5708. The town stands on a steep hill 1355 ft. above sea-level. Several of its churches are architecturally interesting, especially the Madonna delle Lacrime (1487) outside the town, the elegant early Renaissance architecture of which resembles that of the Madonna del Calcinaio at Cortona, and most of them (and also the municipal picture gallery) contain paintings by artists of the Umbrian school—notably Lo Spagna, a pupil of Perugino. S. Emiliano has a group of three altars decorated with fine sculptures by Rocco da Vicenza (1521). The ancient town is believed to have been situated $1\frac{1}{2}$ m. to the north-west, but little is known of it, and no remains save inscriptions exist.

TREVIGLIO, a town of Lombardy, Italy, in the province of Bergamo, 14 m. by rail S. by W. of that town, 410 ft. above sea-level. Pop. (1901), 5899 (town); 14,897 (commune). It has a fine church (S. Martino) containing pictures by Butinone and Zenale (1436–1526), both natives of the town, and having a lofty campanile of the 13th and 14th centuries. It has important silk works, wool-spinning, and other manufactories. It is a junction for Verona, Cremona and Bergamo, and steam tramways run to Monza, Lodi, &c.

TREVIRANUS, GOTTFRIED REINHOLD (1776–1837), German naturalist, was born at Bremen on the 4th of February 1776. He studied medicine at Göttingen, where he took his doctor's degree in 1796, and a year later he was appointed professor of medicine and mathematics in the Bremen lyceum. He died at Bremen on the 16th of February 1837.

In the first of his larger works, *Biologie; oder die Philosophie der lebenden Natur*, which appeared from 1802–1805, Treviranus gave clear expression to the theory of "descent with modification." He believed that simple forms (Protists), which he termed "zoophytes," were "the primitive types from which all the organisms of the higher classes had arisen by gradual development," and he laid down as a fundamental proposition "that all living forms are the results of physical influences which are still in operation, and vary only in degree and direction." Like many after him, he directed attention to the influence of the male elements in fertilization as a source of variation, but laid emphasis only on the intra-organismal power of adaptation to surroundings. Whatever opinion be entertained in regard to the priority and the importance of the contribution made by Treviranus to the theory of evolution, it is at least certain that he was a learned naturalist and an acute thinker. His most important later work of a synthetic nature was entitled *Erscheinungen und Gesetze des organischen Lebens* (1831).

His younger brother, LUDOLPH CHRISTIAN TREVIRANUS (1779–1864), studied medicine at Jena, and was successively professor of medicine at Bremen lyceum (1807), professor of natural history at Rostock (1812), professor of botany and director of the botanical garden at Breslau (1816), and professor of botany at Bonn (1830).

TREVISO (anc. *Tarvisium*), a town and episcopal see of Venetia, Italy, capital of the province of Treviso, 49 ft. above sea-level. Pop. (1901), 16,933 (town); 36,433 (commune). It is situated on the plain between the Gulf of Venice and the Alps, 18 m. by rail N. of Venice, at the confluence of the Sile with the Botteniga. The former flows partly round its walls, the latter through the town; and it has canal communication with the lagoons. It is an old town, with narrow irregular colonnaded streets and some interesting old frescoed houses. The cathedral of San Pietro, dating from 1141 and restored and enlarged in the 15th century by Pietro Lombardo, with a classical façade of 1836, has five domes. It contains a fine "Annunciation" by Titian (1519), an important "Adoration of the Shepherds" by Paris Bordone (born at Treviso in 1500), and frescoes by Pordenone. There are also sculptures by Lorenzo and Battista Bregno and others. The Gothic church of San Niccolò (1310–1352) contains a fine tomb by Tullio Lombardo, and a large altarpiece by Fra Marco Pensabene and others; in the church and adjoining chapter-house are frescoes by Tommaso da Modena (1352), some frescoes by whom (life of S. Ursula) are also in the Museo Civico. The Monte de Pietà contains an "Entombment" by an artist of the school of Pordenone (wrongly attributed to Giorgione). The churches of S. Leonardo, S. Andrea, S. Maria Maggiore, and S. Maria Maddalena also contain art treasures. The Piazza dei Signori contains picturesque brick battlemented palaces—the Salone del Gran Consiglio (1184) and the Palazzo del Commune (1268). Treviso is the seat of various manufactures—ironworks and pottery, macaroni, cotton-spinning and rice-husking, paper, printing, brushes, brickyards, flourmills—and is the centre of a fertile district.

The ancient Tarvisium was a *municipium*. It lay off the main roads, and is hardly mentioned by ancient writers, though Pliny speaks of the Silis as flowing "ex montibus Tarvisanis." In the 6th century it appears as an important place and was the seat of a Lombard duke. Charlemagne made it the capital of a marquisate. It joined the Lombard league, and was independent after the peace of Constance (1183) until in 1339 it came under the Venetian sway. From 1318 it was for a short time the seat of a university. In the 15th century its walls and ramparts (still extant) were renewed under the direction of Fra Giocondo, two of the gates being built by the Lombardi. Treviso was taken in 1797 by the French under Mortier (duke of Treviso). In March 1848 the Austrian garrison was driven from the town by the revolutionary party, but in the following June the town was bombarded and compelled to capitulate.

TREVITHICK, RICHARD (1771–1833), English engineer and inventor, was born on the 13th of April in the parish of Illogan, Cornwall, and was the only son of Richard Trevithick (1735–1797), manager of the Dolcoath and other important Cornish mines. He attended his first and only school at Camborne, and was in general a slow and obstinate scholar, though he showed considerable aptitude for figures. He inherited more than the average strength for which his family was famous; he stood 6 ft. 2 in. in height, and his feats in wrestling and in lifting and throwing weights were unexampled in the district. At the age of eighteen he began to assist his father, and, manifesting great fertility of mechanical invention, was soon recognized as the great rival of James Watt in improvements on the steam-engine (*q.v.*). His earliest invention of importance was his improved plunger pole pump (1797) for deep mining, and in 1798 he applied the principle of the plunger pole pump to the construction of a water-pressure engine, which he subsequently improved in various ways. Two years later he built a high-pressure non-condensing steam-engine, which became a successful rival of the low-pressure steam-vacuum engine of Watt. He was a precursor of George Stephenson in the construction of locomotive engines. On Christmas Eve 1801 his common road locomotive carried the first load of passengers ever conveyed by steam, and on the 24th of March 1802 he and Andrew Vivian applied for a patent for steam-engines in propelling carriages. In 1803 another steam vehicle made by him was run in the streets of London, from Leather Lane along Oxford Street to Paddington, the return journey being made by Islington. He next directed his attention to the construction of a steam locomotive for tramways, with such success that in February 1804 at Pen-y-darran in Wales he worked a tramroad locomotive which was able to haul twenty tons of iron; a similar engine was supplied to the Wylam colliery (Newcastle) in the following year. In 1808 he constructed a circular railway in London near Euston Square, on which the public were carried at the rate of twelve or fifteen miles an hour round curves of 50 or 100 ft. radius. Trevithick applied his high-pressure engine with great success to rock boring and breaking, as well as to dredging. In 1806 he entered into an engagement with the board of Trinity House, London, to lift ballast from the bottom of the Thames, at the rate of 500,000 tons a year, for a payment of 6d. a ton. A little later he was appointed to execute a driftway under the Thames, but the work was abandoned owing to the water breaking in. He then set up workshops at Limehouse, for the construction of iron tanks and buoys. He was the first to recognize the importance of iron in the construction of large ships, and in various ways his ideas also influenced the construction of steamboats. In the application of steam to agriculture his name occupies one of the chief places. A high-pressure steam threshing engine was erected by him in 1812 at Trewithen, while in the same year, in a letter to the Board of Agriculture, he stated his belief that every part of agriculture might be performed by steam, and that such a use of the steam-engine would "double the population of the kingdom and make our markets the cheapest in the world." In 1814 he entered on an agreement for the construction of engines for mines in Peru, and to superintend their working removed to Peru in 1816. Thence he went in 1822 to Costa Rica. He returned to England in 1827, and in 1828 petitioned parliament for a reward for his inventions, but without success. He died, penniless, at Dartford on the 22nd of April 1833.

A *Life of Richard Trevithick, with an account of his Inventions* was published in 1872 by his third son, Francis Trevithick (1812–1877).

TREVOR, SIR JOHN (1626–1672), English politician, was a son of Sir John Trevor (d. 1673) of Trevelyn, Denbighshire. His father was a member of parliament under James I. and Charles I., and sat also in the parliaments of Oliver and of Richard Cromwell, and was a member of the council of state during the Commonwealth. One of his uncles was Sir Sackvill Trevor (d. *c.* 1640), a naval officer, who was knighted in 1604; and another was Sir Thomas Trevor (1586–1656), the judge who decided in favour of the Crown in the famous case about the legality of ship-money, and was afterwards impeached and fined. Sir John Trevor was returned to parliament in 1646 as member for Flintshire. After filling several public positions under the Commonwealth and Protectorate he was a member of the council of state appointed in February 1660 and under Charles II. he rose to a high position. Having purchased the office of secretary of state he was knighted and entered upon its duties towards the end of 1668, just after he had helped to arrange an important treaty between England and France. He married Ruth, daughter of the great John Hampden, and died on the 28th of May 1672.

His second son, Thomas, Baron Trevor (1658–1730), was knighted in 1692 as solicitor-general and in 1695 became attorney-general. In 1701 he was appointed chief justice of the common pleas, and in 1712 he was created a peer as Baron Trevor of Bromham. On the accession of George I. in 1714 he was deprived of the justiceship, but from 1726 to 1730 he was lord privy seal. Three of his sons succeeded in turn to his barony, and a fourth son, Richard Trevor (1707–1771), was bishop of St Davids from 1744 to 1752, and then bishop of Durham. Robert, 4th Baron Trevor and 1st Viscount Hampden (1706–1783), represented his country at the Hague from 1739 to 1746, during which time he maintained a regular correspondence with Horace Walpole. He took the additional name of Hampden in 1754, on succeeding to the estates of that family, and in 1776, twelve years after he had become Baron Trevor, he was created Viscount Hampden. From 1759 to 1765 he was joint post-master-general. He wrote some Latin poems which were published at Parma in 1792 as *Poemata Hampdeniana*. His second son, John Hampden-Trevor (1749–1824), British minister at Munich from 1780 to 1783 and at Turin from 1783 to 1798, died only three weeks after he had succeeded his brother Thomas as 3rd Viscount Hampden, the titles becoming extinct.

Another member of this family was Sir John Trevor (1637–1717), Speaker of the House of Commons (1685). A partisan of James II., he was deprived of his office on the accession of William III., but in 1690 he was again a member of parliament, becoming Speaker for the second time in 1690 and master of the rolls in 1693. In 1695 he was found guilty of accepting a bribe and was expelled from the House of Commons, but he retained his judicial position until his death on the 20th of May 1717. Through his daughter Anne Sir John was the ancestor of the Hills, marquesses of Downshire, and of the family of Hill-Trevor, Viscounts Dungannon from 1766 to 1862.

TRÉVOUX, a town of eastern France, chief town of an arrondissement in the department of Ain, 16 m. N. of Lyons on the Paris-Lyons railway. Pop. (1906), 1934. The town is situated on the slope of the left bank of the Saône, which is here crossed by a suspension bridge and is dominated by two towers, remains of a feudal castle of the 12th century. The fortifications date from the 14th century, and the church from the same period. The law-court is a building of the 17th century, and was once the seat of the parlement of Dombes. Trévoux has a sub-prefecture and a tribunal of first instance. Gold and silver wire-drawing, introduced into the town by Jews in the 14th century, and the manufacture of apparatus for wire-drawing, are its chief industries.

Trévoux (Trevos) was hardly known before the 11th century, after which it was included in the domain of the lords of Thoire-Villars, from whom it acquired its freedom. It was bought by the Bourbons in 1402, became the capital of the Dombes, and had its own mint. In 1603 a well-known printing works was established there, from which in the 18th century the *Journal de Trévouse* and a universal dictionary known as the *Dictionnaire de Trévoux* were issued by the Jesuits.

TRIAL, in English law, the hearing by a court of first instance of the issues of fact and law involved in a civil or criminal cause. The term is inappropriate to rehearing by an appellate court. Trial follows upon the completion of the steps necessary to bring the parties before the court and to adjust the issues upon which the court is to adjudicate, which may be summed up in the term pleading (*q.v.*). In England the trial is usually in open court, and it is rare to try cases *in camera*, or to attempt to exclude the public from the hearing. The essential part of the trial is that there should be full opportunity to both sides for evidence and argument on the questions in dispute. At present in England, as distinguished from the rest of Europe, the evidence is ordinarily taken viva voce in court, and affidavits and depositions are sparingly accepted, whereas under the continental system the bulk of the proofs in civil cases are reduced to writing before the hearing.

The modes of trial have altered with legal development in English as in Roman law (see ACTION). Many forms of trial, notably those by ordeal, by wager of battle or of law (see ORDEAL and WAGER), and by grand assize, have become obsolete, and new forms have been created by legislation in order to meet altered circumstances of society. Up to a very recent date the tendency of the Roman and English systems was in opposite directions. In the former and in systems founded on it, such as the Scottish and French, trial by the judge became the rule, in the latter trial by judge and jury. In England the method of trial of issues of fact arising under the common law was by jury and a bench of judges. In truth the trials were the sittings of commissioners sent to inquire and report with the aid of the neighbourhood on questions of crime and civil wrongs in a county; the practice is summed up in the old phrase *ad quaestionem juris judices respondeant, ad quaestionem facti juratores.* In courts which administered equity or derived their law or procedure from the civil or canon law no jury was used, and the judges determined both law and fact. The system of trial before a full bench of judges even with a jury is now used on the European continent, but has been superseded in England by trial before a single judge with a jury except in the rare cases of *trial at bar*. This latter mode of trial is a survival of the mode universal in the superior courts before the writ of *nisi prius*, and is now only used in the king's bench division, when claimed by the Crown as of right or in cases of unusual importance and difficulty. Recent instances are the trial in 1904 of Arthur Lynch for treason in South Africa, and in 1905 of questions raised on a petition of right in respect of a claim to make the Crown responsible on the conquest of the Transvaal for acts of the Transvaal government before or during the war.

The necessity for trial by jury has been removed in many cases by legislation and rules of court (see JURY; SUMMARY JURISDICTION), and the present English practice is summarized in the following statement.

In the High Court of Justice in England and Ireland several modes of trial are now used:—

1. Trial by judge with a jury used in the king's bench division and in probate and matrimonial cases. There is a right to have a jury as a matter of course in actions of defamation, false imprisonment, malicious prosecution, seduction and breach of promise of marriage. In other cases, subject to exceptions to be noted, a jury can be obtained on the application of either party.

2. Trial by a judge without a jury is invariable in the chancery division and now common in the other divisions. Cases in the chancery division are not tried with a jury unless a special order is made (Ord. 36, r. 3); and the High Court in cases in which trial without jury could be ordered without consent (1875) still retains the power of so trying them, and has also acquired power to direct trial without a jury of any issue requiring prolonged examination of documents or accounts or scientific or local investigation.

3. Trial with assessors, usual in admiralty cases (the assessors being nautical) but rare in other divisions.

4. Trial by an official referee in certain cases involving much detail (R.S.C.O. 36). In the county court the ordinary mode of trial is by the judge alone, but a jury of eight is allowed in certain cases on application, and in the admiralty jurisdiction marine assessors can be called in. In other local civil courts the trial is often by jury, as in the mayor's court of London, sometimes without, as in the vice-chancellor's court of the university of Oxford. In all civil cases the parties can by a proper submission have a trial before an arbitrator selected by or for them. As regards criminal cases the right to trial by due process of law before condemnation is given by art. 29 of Magna Carta; and the trial must be by jury unless a statute otherwise provides (see COURT-MARTIAL; SUMMARY JURISDICTION).

The parties may be represented by lawyers, solicitor or counsel or both, according to the court, in county courts by accredited lay agents, or may conduct their case in person. The trial is carried on by stating to the court the pleadings if any and by opening the plaintiff's case. This is followed by the evidence of the witnesses, who are sworn and examined and cross-examined. On the completion of the plaintiff's case and evidence, the defendant's case is stated and evidence adduced in support of it. The plaintiff or his lawyer has as a rule the reply or last word, though in some courts, described as single speech courts, no reply is given. At the conclusion the judge sums up the law and facts of the case to the jury, if there is one, and their verdict is returned, or if there is no jury gives judgment, stating his conclusions on the law and facts involved.

There remain certain modes of trial not obsolete but rarely used. Such are impeachment of the House of Commons before the House of Lords; and in the case of a charge of treason or felony by a person having privilege of peerage, trial on indictment before the House of Lords, or in vacation before the court of the lord high steward. Trials by certificate, by inspection and by record, are obsolete.

The decisions on a trial at first instance are reviewed by appeal (*q.v.*), or in trial cases heard before a jury by application for a new trial, where the judge has not directed the jury correctly as to the law or has permitted them to consider inadmissible evidence, or the jurors have in their verdict acted without evidence or against the weight, *i.e.* the quality not the quantity of the evidence. Under the Criminal Appeal Act 1907 the decisions in criminal trials on indictment, whether on matters of law or of fact or on mixed questions of law or fact, are reviewable by the court of criminal appeal; but that court has no power to order a retrial of the case before a jury.

Scotland.—Jury trial was introduced into Scotland for certain classes of civil cases in the 19th century but is not much used. In criminal cases it is used where summary jurisdiction has not been conferred.

Ireland.—The law of Ireland as to trials is in substance the same as in England, except as to appeals in criminal cases.

United States.—In the United States the system of trial is that of the English common law as varied by Federal and state legislation. (W. F. C.)

TRIANGLE, in geometry, a figure enclosed by three lines; if the lines be straight the figure is called a plane triangle; but if the figure be enclosed by lines on the surface of a sphere it is a spherical triangle. The latter are treated in TRIGONOMETRY; here we summarize the more important properties of plane triangles. In a plane triangle any one of the angular points can be regarded as the *vertex*; and the opposite side is called the *base*. The three sides and angles constitute the six elements of a triangle; it is customary to denote the angular points by capital letters and refer to the angles by these symbols; the sides are usually denoted by the lower case letter corresponding to that of the opposite angular point. Triangles can be classified according to the relative sizes of the sides or angles. An equilateral triangle has its three sides equal; an isosceles triangle has only two sides equal; whilst a scalene triangle has all its sides unequal. Also a right-angled triangle has one angle a right angle, the side opposite this angle being called the hypothenuse; an obtuse-angled triangle has one angle obtuse, or greater than a right angle; an acute-angled triangle has three acute angles, *i.e.* angles less than right angles. The triangle takes a prominent place in book i. of Euclid; whilst the relation of the triangle to certain circles is treated in book iv. (See GEOMETRY: § *Euclidean.*)

The following is a summary of the Euclidean results. The angles at the base of an isosceles triangle are equal and conversely; hence it follows that an equilateral triangle is also equiangular and conversely (i. 5, 6). If one side of a triangle be produced then the exterior angle is greater than either of the two interior opposite angles (i. 16), and equal to their sum (i. 32); hence the sum of the three interior angles equals two right angles. (In i. 17 it is shown that any two angles are less than two right angles.) The greatest angle in a triangle is opposite the greatest side (i. 18, 19). On the identical equality of triangles Euclid proves that two triangles are equal in all respects when the following parts are equal each to each (*a*) two sides, and the included angle (i. 4), three sides (i. 8, cor.), two angles and the adjacent side, and two angles and the side opposite one of them (i. 26). The mensuration is next treated. Triangles on the same base and between the same parallels, *i.e.* having the same altitude, are equal in area (i. 37); similarly triangles on equal bases and between the same parallels are equal in area (i. 38). If a parallelogram and triangle be on the same base and between the same parallels then the area of the parallelogram is double that of the triangle (i. 41). These propositions lead to the result that the area of a triangle is one half the product of the base into the altitude. The penultimate proposition (i. 47) establishes the beautiful theorem, named after Pythagoras, that in a right-angled triangle the square on the hypothenuse equals the sum of the squares on the other two sides. Two important propositions occur in book ii. viz. 12 and 13; these may be stated in the following forms: If ABC is an obtuse-angled triangle with the obtuse angle at C and a perpendicular be drawn from the angular point A cutting the base BC produced in D, then AB^2 (*i.e.* square on the side subtending the obtuse angle) $= BC^2 + CA^2 + 2BC \cdot CD$ (ii. 12); in any triangle (with the same construction but with the side AC subtending an acute angle B, we have $AC^2 = AB^2 + BC^2 - 2CB \cdot BD$ (see TRIGONOMETRY).

Book iv. deals with the circles of a triangle. To inscribe a circle in a given triangle is treated in iv. 4; to circumscribe a circle to a given triangle in iv. 5. The centre of the first circle is the intersection of the bisectors of the interior angles; if the meet of the bisectors of two exterior angles be taken, a circle can be drawn with this point as centre to touch two sides produced and the third side; three such circles are possible and are called the escribed circles. The centre of the circum circle is the intersection of the perpendiculars from the middle points of the sides. Concerning the circum circle we observe that the feet of the perpendiculars drawn from any point on its circumference to the sides are collinear, the line being called Simson's line. We may here notice that the perpendiculars from the vertices of a triangle to the opposite sides are concurrent; their meet is called the orthocentre, and the triangle obtained by joining the feet of the perpendiculars is called the pedal triangle. Also the lines joining the middle point of the sides to the opposite vertices, or medians, are concurrent in the centroid or centre of gravity of the triangle. There are several other circles, points and lines of interest in connexion with the triangle. The most important is the "nine point circle," so called because it passes through (*a*) the middle points of the sides; (*b*) the feet of the perpendiculars from the vertices to the opposite sides; and (*c*) the middle points of the lines joining the orthocentre to the angular points. This circle touches the inscribed and escribed circles. For the Brocard points and circle, Tucker's circles—with the particular forms cosine circle, triplicate ratio (T.R.) circle, Taylor's circle, McCay's circles, &c., see W. J. M'Clelland, *Geometry of the Circle*; or Casey, *Sequel to Euclid.*

TRIANGLE, in music (Fr. *triangle*, Ger. *Triangel*, Ital. *triangolo*), an instrument of percussion of indefinite musical pitch, consisting of a triangular rod of steel, open and slightly curved at one corner. The triangle, suspended by a loop, is played by means of a steel stick with a wooden handle. Varied rhythmical effects and different grades of forte and piano can be obtained. A sort of tremolo or roll can be produced by striking each end of the triangle alternately in rapid succession. When the triangle is scored for on a separate staff, the treble clef is used, but it is more often included with the bass drum on the bass stave. The tone of the triangle is clear and ringing, but it should have no definite pitch. The small triangles are the best. Beethoven, Mozart, Weber and other great masters employed the instrument.

TRIASSIC SYSTEM, in geology, the lowest or youngest system of the Mesozoic era; it occupies a position above the Permian and below the Jurassic system of rocks. The principal formations of the type region, Germany, are the Bunter, Muschelkalk and Keuper; these were for the first time grouped together

After Prof F. Frech, Lethaea Geognostica (E. Schweizerbart'sche Verlagsbuchhandlung, E. Nägele) E.W.S.

under the systematic name "Trias" by F. von Alberti (1834). A description of the rocks in these formations will be found under their respective headings. For a long time this German development of the strata was regarded as typical of the period; later, however, the discovery of another more fossiliferous phase in the Alps and Mediterranean region, and subsequently in Asia and elsewhere, led geologists to take a different view of the system as a whole. It was clearly seen that there existed two distinct phases of Triassic rock-building, the one continental (terrestrial and lagoonal), the other marine (pelagic).

The original Trias of the "Germanic" area (including Great Britain) must be understood as a special local expression of the continental Trias, while the thoroughly marine type represents the normal aspect of sedimentation. Similarly, the fauna of the marine Trias is the standard for comparison with the life of other geological systems. The term Trias—indicative of the threefold grouping in Germany—thus loses its original significance when applied to the world-wide deposits of the period; its use, however, is continued by general consent.

Continental Trias.—The records of the terrestrial and lagoonal conditions during this period are to be found in the coarse conglomerates, red and mottled sandstones, marls and clays with their accompanying beds of dolomite and limestone, and layers of gypsum, anhydrite, rock-salt and coal. The coarser breccias and conglomerates appear to represent ancient screes and shore deposits, and in part at least their formation may have been due to torrential action. The remarkable oblique bedding in many of the sandstones, coupled with the fact that the sand grains are often very perfectly rounded, points to the transporting action of wind. Even the pebbles occasionally exhibit the *dreikanter* form, familiar in our modern deserts. But the marls, muds and many sandy beds were certainly deposited in sheets of water, which were evidently shallow and subject to frequent periods of desiccation. Of this we have evidence in the great abundance of reptilian foot-prints, of rain pits, ripple marks, and sun cracks upon what were once surface muds and sands. That the drying up of the water sheets repeatedly produced a highly saline condition is shown by the common occurrence of rock-salt, gypsum and anhydrite. In short, the physical conditions under which the continental Trias was formed appear to have been similar to those obtaining at the present day in the Caspian region.

In Europe the earlier deposits of the continental Trias occupy a compact area covering nearly the whole of Germany, whence they may be followed into central and northern England, Heligoland, Upper Silesia and the Vosges. Another tract lay over what are now the western Alps and south-east France; also in the Pyrenees, Balearic Islands, Sardinia, Sicily and southern Spain, and on to the north coast of Africa. In the Carpathians the same rocks appear, and they cover a large area in north-east Russia (Tartarian), and north-west Siberia. Later, the Muschelkalk limestones point to a temporary influx of the sea involving most of the above regions except Britain and Russia. Three encroachments of the sea are indicated, each followed by a period of excessive evaporation and contraction; these happened in the time of the Röth, the Lower and the Upper Muschelkalk. Finally the last influx, that of the Rhaetic Sea, not only spread much beyond the limits of the earlier incursions but remained as the forerunner of the succeeding Jurassic waters. In North America the continental Trias appears with a close resemblance to that of western Europe along the Atlantic coastal strip from Prince Edward's Island, through New Brunswick, Nova Scotia, Connecticut, New York, Pennsylvania, Virginia, to North Carolina. These are the rocks of the Newark series. Southwards it may be traced in Honduras, the Andes, Brazil, Argentina and Chile. Another large area in the western interior, Wyoming and New Mexico, is occupied by "red beds" (600–2000 ft., in part Permian) with gypsum and rock-salt. In southern Africa the upper part of the Karoo formation appears to represent Triassic time—the Stormberg beds (Permo-Trias) and the Beaufort beds (Rhaetic). In India the Panchet beds of the Gondwana system and in New South Wales the Hawkesbury series (Wianametta shales with coals and iron-stone, Hawkesbury sandstone, and at the base the Narraburra beds) belong to about the same horizon. In New Zealand the Otapiri, Wairoa and Oreti series appear to contain fossils indicating a transition from Permian to Rhaetic.

The Marine or Open-sea Trias.—This type of Triassic deposit is frequently referred to under the titles "Alpine," "Mediterranean" or "Pelagic." It first came into notice through the discovery of fossils in the neighbourhood of Recoaro and St Cassian on the southern side of the Alps, and these rocks were subsequently correlated with those at Hallstatt on the northern side. On both sides of the Alps rocks of this age flank the central core, but they are better developed, thicker and less altered towards the east than towards the west. In the western Alps Triassic beds can be only dimly recognized amongst the masses of schists called the *Schistes-lustrés* and *Bundnerschiefer*. In the eastern Alps, however, although there are sandy and conglomeratic members, such as the Werfen beds and Lunz sandstone, yet the most striking feature, in contrast with the continental Trias, is the prevalence of calcareous and dolomitic strata, to which must be added the enormously greater abundance of organic remains. The Alpine Trias varies in lithological character so rapidly from point to point, and has furthermore been subjected to so much dislocation, that great difficulty has been experienced in correlating the beds in different areas and in placing them in their proper order of sequence. The result of this difficulty has been the production of a nomenclature so unwieldy that no attempt at a detailed exposition is possible in the space here available. The principal members of the Alpine Trias will be found in their correct relative positions in the table. One of the most striking aspects of the Alpine Trias, on both the northern and southern sides, is the great development of dolomite which is so prominent a feature in the scenery of southern Tirol (Drei Zinnern, &c.). Some of these rocks contain the remains of corals, still more bear the fossils of calcareous algae, and although the view originally advanced by F. v. Richthofen that they represent Triassic coral reefs has been strongly opposed, it still seems to be the most reasonable explanation of their origin. The rocks of the marine Trias generally are argillaceous beds and dark limestones; in the Alpine regions many of the latter have been marmorized. The well-known white marble of Carrara in the Apuan Mountains is a metamorphosed Triassic limestone. The same type of Trias occurs also in south Italy (Longobardian), in Sicily, Barcelona, Balearic Islands, Crete, Bosnia, East Hungary, and the Carpathian Mountains by Bukovina and Dobrudja.

The Alpine-Mediterranean Trias sea evidently had a prolongation into Western Asia, for in Asia Minor, Armenia and Bokhara rocks with closely related fossils have been found. In Central Asia Triassic rocks are known in Afghanistan (sandstones with coal), Russian Turkestan, and in the Pamir. In India the lower Trias of the Salt Range presents the most typical example of the marine deposits of this stage. The Himalayan Trias more perfectly represents the upper portion of the system. Triassic limestones are found also in Kashmir and Hazara, and shales in Baluchistan. The marine Trias is known in Burma, Tongking, China and north-east Tibet; also in Japan, Siberia and in the arctic regions of Spitsbergen and Bear Island. In the Australasiatic region the marine Trias is found in the Sunda Islands, Sumatra, Roth and Timor and in New Caledonia.

Climate, Vulcanism.—There seems little room for doubt that the climate of Triassic times was, over large tracts of the northern continental region, dry and arid in character, certain features in the flora tending to support this view. On the other hand, the southern continental deposits, with *Glossopteris* and its allies, is more suggestive of a moist climate. There is no evidence of the glacial condition of the preceding Permian period. The Triassic period was one of rest so far as crustal movements were concerned. Volcanic activity, however, was exhibited on a large scale in the north-western part of North America, the great batholith of the Coast Range being nearly 1000 m. long; in British Columbia and Alaska large bodies of igneous rock are supposed to belong to this period. On the eastern side of the continent the diabase and dolerite lava flows, veins and sills of the famous Palisades of the Hudson valley belong to the Newark system. In Europe and Asia igneous rocks are scarce, but tuffs, porphyrites, &c., occur in the Schlern district (Upper Cassian age) and at Falzarego Strasse, Trarenanzes (Wengen horizon), in the Alpine region.

Life of the Triassic Period.—The plant life of this period exhibits on the whole a closer relationship with the Jurassic than with the preceding Palaeozoic formations. Flowering plants are unknown in the Triassic deposits and the dominant forms are all gymnosperms, the prevailing types being ferns and fern-like plants, cycadeans, conifers and equisetums. The Palaeozoic calamites, sigillarias and lepidodendrons became extinct early in this period; but in the southern hemisphere the *Glossopteris* flora still held on in considerable force. Amongst the ferns were *Lepidopteris*, *Sagenopteris*, *Danaeopteris*, with the Carboniferous genera *Sphenopteris*, *Pecopteris* and others. *Equisetites* and *Schizoneura* became common. Characteristic conifers were *Voltzia*, *Araucarites*, *Brachyphyllum*. The Cycadeans were represented by *Pterophyllum*, *Cycadites*, *Podozamites*, &c. *Baiera* was the representative of the ginkgos. Calcareous algae were important rock builders in some of the Triassic seas (*Gyroporella*, *Diplopora*). Fish remains are not generally common in the Trias; teeth and scales are crowded together in the "bone beds" in the Rhaetic and between the Keuper and Muschelkalk; in the marine Trias of the Alpine region skeletons are much more common. They are abundant also in the bituminous shales of the Connecticut Valley and in the Hawkesbury series of New South Wales. Selachians are represented by species of *Hybodus*, *Acrodus* and *Palaeobates*; dipnoids by *Ceratodus* and *Gosfordia*. The ganoids, with Palaeozoic as well as younger forms, include *Gyrolepis*, *Semionotus*, *Dictyopyge*, *Graphiurus*, *Belonorhynchus* and *Pholidopleuras*. Bony fish were very feebly represented. The amphibian labyrinthodonts (*Stegocephalia*) were numerous, their bones being found in the "bone beds" and in the Bunter and Keuper sandstones and their equivalents in North America, South Africa and India (*Labyrinthodont*, *Mastodonsaurus*, *Trematosaurus*, *Capitosaurus*). Their footprints are often very abundant, *e.g. Cheirotherium*. The reptiles of the Triassic deposits, unlike the amphibians, which are Permian in character, show a closer relationship with Jurassic forms; one of the most interesting facts in the life-history of the group is the development during this period of sea-going forms such as at a later geological period played so prominent a part. Early crocodilian reptiles are represented by *Belodon*, *Mystriosuchus*, *Stagonolepis*, *Parasuchus*; and *Rhyncocephalia* by *Telerpeton* and *Hyperodapedon*. Ichthyopterygians were represented by *Mixosaurus*, *Nothosaurus*, *Cymatosaurus*; early dinosaurs (carnivorous) by *Zanclodon*, *Anchisaurus*, *Thecodontosaurus*, *Palaeosaurus*; the remarkable theromorphs (anomodonts), by *Elginia*, *Dicynodon*, *Geikia*, *Gordonia*.

Turtles became well established during this period (*Psammochelys*, *Chelyzoon*). Of great interest is the discovery of the earliest traces of mammals in the Trias of Europe, South Africa and North America. The imperfect remains (teeth and jaw-bones) do not admit of any certainty in deciphering their relationships. *Microlestes* from the Rhaetic of England and Württemberg and *Dromatherium* from North America are perhaps the best known; *Tritylodon* from South Africa may also be added. Among the lower forms of marine life foraminifera and sponges play a subordinate part. Corals, which with the calcareous algae built considerable reefs in some regions, at this time began to assume a modern aspect, and henceforth the Hexacorallids took the place of the Palaeozoic Tetracorallid forms (*Stylophyllum*, *Pinacophyllum*, *Thecosmilia*). Crinoids were locally very numerous individually (*Encrinus liliiformis*, *Dadocrinus gracilis*). Urchins were not very common, but an important change from the Palaeozoic to the Mesozoic type of shell took place about this time. Brachiopods were important; rostrate forms like *Terebratula* and *Rhynchonella* from this time onward became more prevalent than broad hinged genera. Pelecypods were abundant, *Myophoria*, *Halobia*, *Daonella*, *Pseudomonotis*, *Avicula*, *Gervillia* and many others. Gasteropods also were numerous; at the beginning of the period, as in other groups, many Palaeozoic forms lingered on, but one of the main changes about this time was the development and expansion of siphonostomous forms with canaliculate shells. Quite the most important Mollusca were the Cephalopods. In the early Trias there still remained a few of the Palaeozoic genera, *Orthoceras*, *Hungarites*, and forms which linked up the goniatites with the ammonites, which henceforth took the lead in numbers and variety. *Prionolobus*, *Aspidites*, *Celtites*, *Meekoceras*, *Tirolites*, *Ptychites*, *Tropites*, *Ceratites*, *Arcestes*, *Psiloceras* and *Flemingites* are a few of the prominent Triassic genera. The nautiloids were fairly well represented, but they exhibit no such marked development from Palaeozoic to Mesozoic types as is shown among the ammonoids.

In the tabulated synopsis of the Triassic system given below it has been impossible to include many of the names of groups and subordinate divisions. Some of these, such as the term "Noric" (Norian), have been used in a variety of ways. A clear account of the history of the study of the Trias will be found in K. A. von Zittel's *History of Geology and Palaeontology* (Eng. trans., London 1901).

References.—The literature of the Trias is very voluminous. A full account, with full references as to date of publication, in *Lethaea Geognostica*, ed. by F. Frech, Theil II.; *Das Mesozoicum*, Bd. i. "Einleitung des Mesozoicum und der Trias" (F. Frech); "Continentale Trias" (E. Philippi and J. Wysogorski), 1903; 2nd Lieferung, "Die asiatische Trias" (F. Noetling), 1905; 3rd Lieferung, "Die Alpine Trias des Mediterran-Gebietes" (G. von Hathaber), Stuttgart, 1905. (J. A. H.)

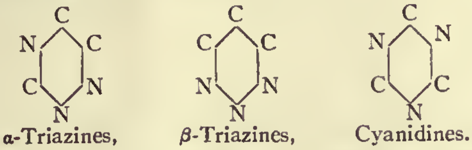
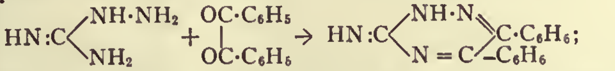
the various units of the ring system being illustrated in the annexed formulae:—

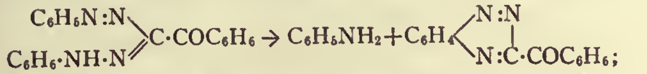


α-Triazines, β-Triazines, Cyanidines.

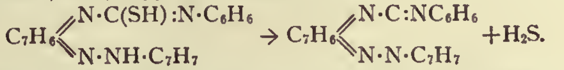
Few simple derivatives of the α-series are known, those which have been prepared result by such reactions as the condensation of aminoguanidine or a similar type of compound (*e.g.* semicarbazide) with ortho-diketones (J. Thiele, *Ann.*, 1898, 302, p. 299):



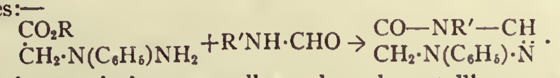
Wolff has obtained a chloro-derivative by the action of potassium cyanide on diazoacetophenone and subsequent treatment with acid. The phen-α-triazines are more numerous, and are obtained either by the action of concentrated acids on the formazyl compounds (E. Bamberger, *Ber.*, 1893, 26, p. 2786):—



by the reduction of symmetrical acyl-ortho-nitrophenyl hydrazines (*e.g.* $NO_2\cdot C_6H_4\cdot NH\cdot NH\cdot CHO$); or in the form of dihydro derivatives by the condensation of aldehydes with ortho-aminoazo compounds (H. Goldschmidt and Y. Rosell, *Ber.*, 1890, 23, p. 487), or from the aminoazo compound and a mustard oil, the resulting thiocarbanilido derivative being heated with acetic acid (M. Busch, *Ber.*, 1899, 32, p. 2960):—

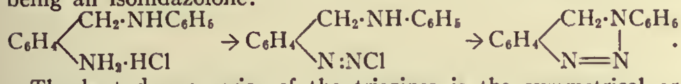


C. Harries (*Ber.*, 1895, 28, p. 1223) has also shown that *as*-phenylhydrazino-acetic esters, when heated with formamide and substituted formamides under pressure, yield dihydrotriazines:—

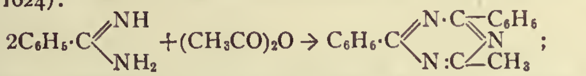


The phen-α-triazines are yellow-coloured crystalline compounds of a somewhat basic character.

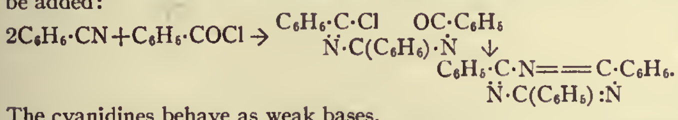
Derivatives of β-triazines are formed by the action of nitrous acid on ortho-aminobenzylamines (M. Busch, *Ber.*, 1892, 25, p. 445), or in small quantity by the action of nitrous acid on ortho-aminobenzoylphenylhydrazines (A. Konig and A. Reissert, *Ber.*, 1899, 32, p. 782), the chief product in this latter reaction being an isoindazolone:



The best drawn series of the triazines is the symmetrical or cyanidine series, members of which result from the condensation of acid anhydrides with aromatic amidines (A. Pinner, *Ber.*, 1892, 25, p. 1624):

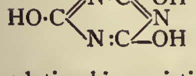


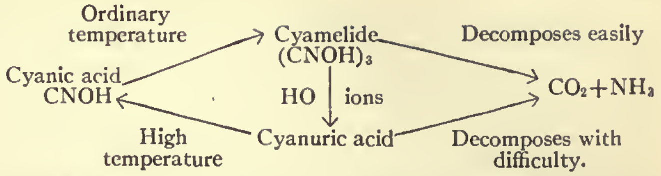
or by the condensation of aromatic nitriles with acid chlorides in the presence of aluminium chloride (Eitner and Krafft, *Ber.*, 1892, 25, p. 2263). In using benzoyl chloride in this reaction the condensation is found to proceed better if a little ammonium chloride be added:



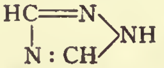
The cyanidines behave as weak bases.

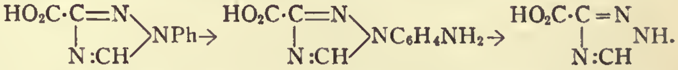
Mention may be made here of cyanuric acid, $H_3C_3N_3O_3$, which contains the same ring system as the cyanidines. It was first prepared by C. Scheele and is formed when urea is strongly heated or when cyanuric chloride is treated with water. It is usually represented by the inset formula and is closely related to cyanic acid and cyamelide, the relationships existing between the three compounds being shown in the diagram (see also A. Hantzsch, *Ber.*, 1906, 39, p. 139):





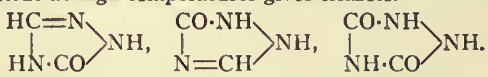
TRIAZOLES (pyrro-α and β′-diazoles), in organic chemistry, a series of heterocyclic compounds containing the ring complex (annexed formula). Derivatives were obtained by J. A. Bladin (*Ber.*, 1892, 25, p. 183) by the action of acetic anhydride on dicyanophenylhydrazine (formed from cyanogen and phenylhydrazine), the resulting acetyl derivative losing water and yielding phenylmethylcyanotriazole, which, on hydrolysis, gives the free acid. By eliminating carbon dioxide, phenylmethyltriazole results. In a similar manner, formic acid and dicyanophenylhydrazine yields a phenyl-triazole carboxylic acid, in which the phenyl group may be nitrated, the nitro group reduced to the amino group, and the product oxidized to a triazole carboxylic acid, which, by elimination of carbon dioxide, yields the free triazole:





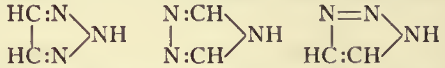
They also result when the acidylthiosemicarbazides are strongly heated, the mercapto-triazoles so formed being converted into triazoles on oxidation with hydrogen peroxide (M. Freund, *Ber.*, 1896, 29, p. 2483); by the condensation of hydrazides with acid amides; and by the distillation of the triazolones (see below) with phosphorus pentasulphide. The triazoles behave as weak bases, the imido-hydrogen being replaceable by metal.

The keto-dihydrotriazoles or triazolones are obtained by the action of hydrazines on acetyl urethane (A. Andreocci, *Ber.*, 1892, 25, p. 225). These compounds may be considered as 5-triazolones, a series of isomeric 3-triazolones resulting from the condensation of phenylsemicarbazide with aromatic aldehydes in the presence of an oxidant. The diketotetrahydrotriazoles, or urazoles, are formed by condensing urea derivatives with hydrazine salts, urazole itself resulting by the action of urea or biuret on hydrazine or its salts. It behaves as a strong acid and on treatment with phosphorus pentachloride at high temperatures gives triazole.



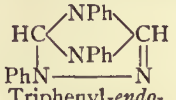
5-Triazolone. 3-Triazolone. Urazole.

Isomeric triazoles of the following constitutions are known:—



Osotriazole (αα′). Iminotriazole (ββ′). αβ-Triazole.

The osotriazoles are obtained by heating the osazones of orthodiketones with mineral acids; by the action of acetic anhydride on the hydrazoximes of orthodiketones, or by condensing diazo-methane with cyanogen derivatives (A. Peratones and E. Azzarello, *R. Acad. Lincei*, 1907 [v.], 16, pp. 237, 318). They are feeble bases which distil unchanged. The ring is very stable to most reagents. The iminobiazoles are formed by conversion of diacylhydrazines into iminochlorides which with ammonia or bases yield the required triazoles (R. Stollé, *Journ. prak. Chem.*, 1906 [ii.], 74, pp. 1, 13). M. Busch (*Ber.*, 1905, 38, pp. 856, 4049) has isolated a series of bridged ring compounds which he describes as *endo*-iminodihydrotriazoles, the triphenyl derivative (annexed formula) being prepared by condensing triphenylaminoguanidine with formic acid. The nitrate of this base (known as *nitron*) is so insoluble that nitrates may be gravimetrically estimated with its help. These bases combine with the alkyl iodides to yield quaternary ammonium salts.



Triphenyl-*endo*-iminodihydro-triazole.

TRIBALLI, in ancient geography, a Thracian people whose earliest home was near the junction of the Angrus and Brongus (the east and west Morava), and included towards the south "the Triballian plain" (Herodotus iv. 49), which corresponds to the plain of Kossovo in Turkey. In 424 B.C. they were attacked by Sitalces, king of the Odrysae, who was defeated and lost his life in the engagement. On the other hand, they were overcome by the Autariatae, an Illyrian tribe; the date of this event is uncertain (Strabo vii. 317). In 376 a large band of Triballi crossed Mt Haemus and advanced as far as Abdera; they were preparing to besiege the city, when Chabrias appeared off the coast with the Athenian fleet and compelled them to retire. In 339, when Philip II. of Macedon was returning from his expedition against the Scythians, the Triballi refused to allow him to pass the Haemus unless they received a share of the booty. Hostilities took place, in which Philip was defeated and nearly lost his life (Justin ix. 3), but the Triballi appear to have been subsequently subdued by him. After the death of Philip, the Triballi having taken up arms again, Alexander the Great in 334 crossed the Haemus and drove them to the junction of the Lyginus with the Danube. Their king Syrmus took refuge in Peuce (Peukē, an island in the Danube), whither Alexander was unable to follow him. The punishment inflicted by him upon the Getae, however, induced the Triballi to sue for peace (Arrian, *Anabasis*, i. 1, 4; 2, 2–4; 4, 6). About 280 a host of Gauls under Cerethrius defeated the Getae and Triballi (Justin xxv. 1; Pausanias x. 19, 7). Nevertheless, the latter for some fifty years (135–84) caused trouble to the Roman governors of Macedonia. In the time of Ptolemy their territory is limited to the district between the Ciabrus (Tzibritza) and Utus (Vid), in the modern Bulgaria, their chief town being Oescus (Οἶσκος Τριβαλλῶν). Under Tiberius mention is made of Treballia in Moesia, and the Emperor Maximin (235–237) had been commander of a squadron of Triballi. The name occurs for the last time during the reign of Diocletian, who dates a letter from Triballis. The Triballi are described as a wild and warlike people (Isocrates, *Panathenaicus*, 227), and in Aristophanes (*Birds*, 1565–1693) a Triballian is introduced as a specimen of an uncivilized barbarian.

See W. Tomaschek, "Die alten Thraker" in *Sitzungsberichte der k. Akad. der Wissenschaften*, cxxviii. (Vienna, 1893).

TRIBE (Lat. *tribus*, from *tres*, three), a word which is believed to have originally meant a "third part" of the people, in reference to the three patrician orders or political divisions of the people of Ancient Rome, the Ramnes, Tities and Luceres, representing the Latin, Sabine and Etruscan settlements. Its ethnological meaning has come to be any aggregate of families or small communities which are grouped together under one chief or leader, observing similar customs and social rules, and tracing their descent from one common ancestor. Examples of such "enlarged families" are the twelve tribes of Israel. In general the tribe is the earliest form of political organization, nations being gradually constituted by tribal amalgamation. (See FAMILY.)

TRIBERG, a town and health resort of Germany, in the grand duchy of Baden, in the Black Forest, pleasantly situated on the Gutach and surrounded by well-wooded hills, 2250 ft. above the sea, 35 m. by rail S.E. of Offenburg. Pop. (1905), 3717. It has four churches, one of them Anglican. Triberg is one of the chief centres of the Black Forest clock-making industry. Straw-plaiting, saw-milling, brewing, and the manufacture of wooden wares are also carried on, and the town has a permanent industrial exhibition. Triberg is what is called a *Luftkurort*, a place to which convalescents resort after a course of baths elsewhere. Near the town is the fine waterfall formed by the Gutach. Triberg came into the possession of Austria in 1654 and into that of Baden in 1806.

TRIBONIAN, the famous jurist and minister of Justinian, was born in Pamphylia in the latter part of the 5th century. Adopting the profession of an advocate, he came to Constantinople and practised in the prefectural courts there, reaching such eminence as to attract the notice of the emperor Justinian, who appointed him in 528 one of the ten commissioners directed to prepare the first *Codex* of imperial constitutions. In the edict creating this commission (known as *Haec quae*) Tribonian is named sixth, and is called "virum magnificum, magisteria dignitate inter agentes decoratum" (see *Haec quae* and *Summa reipublicae*, prefixed to the *Codex*.) When the commission of sixteen eminent lawyers was created in 530 for the far more laborious and difficult duty of compiling a collection of extracts from the writings of the great jurists of the earlier empire, Tribonian was made president and no doubt general director of this board. He had already been raised to the office of quaestor, which at that time was a sort of ministry of law and justice, its holder being the assessor of the emperor and his organ for judicial purposes, something like the English lord chancellor of the later middle ages. The instructions given to these sixteen commissioners may be found in the constitution *Deo auctore* (*Cod.* i. 17, 1), and the method in which the work was dealt with in the constitution *Tanta* (*Cod.* i. 17, 2), great praise being awarded to Tribonian, who is therein called ex-quaestor and ex-consul, and also as magister officiorum. This last constitution was issued in December 533, when the *Digest* was promulgated as a law-book. During the progress of the work, in January 532, there broke out in Constantinople a disturbance in the hippodrome, which speedily turned to a terrible insurrection, that which goes in history by the name of Nika, the watchword of the insurgents. Tribonian was accused of having prostituted his office for the purposes of gain, and the mob searched for him to put him to death (Procop. *Pers.* i. 24–26). Justinian, yielding for the moment, removed him from office, and appointed a certain Basilides in his place. After the suppression of the insurrection the work of codification was resumed. A little earlier than the publication of the *Digest*, or *Pandects*, there had been published another but much smaller law-book, the *Institutes*, prepared under Justinian's orders by Tribonian, with Theophilus and Dorotheus, professors of law (see Preface to *Institutes*). About the same time the emperor placed Tribonian at the head of a fourth commission, consisting of himself as chief and four others—Dorotheus, professor at Beyrut, and three practising advocates, who were directed to revise and re-edit the first *Codex* of imperial constitutions. The new *Codex* was published in November 534 (see constitution *Cordi nobis* prefixed to the *Codex*). With it Tribonian's work of codification was completed. But he remained Justinian's chief legal minister. He was reinstated as quaestor some time after 534 (Procop. *Pers.* i. 25; *Anecd.* 20) and seems to have held the office as long as he lived. He was evidently the prime mover in the various changes effected in the law by the novels of Justinian (*Novellae constitutiones*), which became much less frequent and less important after death had removed the great jurist. The date of his death has been variously assigned to 545, 546 and 547. Procopius says (*Anecd.* 20) that, although he left a son and many grandchildren, Justinian confiscated part of the inheritance.

The above facts, which are all that we know about Tribonian, rest on the authority of his contemporary Procopius and of the various imperial constitutions already cited. There are, however, two articles in the *Lexicon* of Suidas under the name "Tribonianos." They appear to be different articles, purporting to refer to different persons, and have been generally so received by the editors of Suidas and by modern legal historians. Some authorities, however, as for instance Gibbon, have supposed them to refer to the same person. The first article is unquestionably meant for the jurist. It is based on Procopius, whose very words are to some extent copied, and indeed it adds nothing to what the latter tells us, except the statement that Tribonian was the son of Macedonianus, was ἀπὸ δικηγόρων τῶν ὑπάρχων, and was a heathen and atheist, wholly averse to the Christian faith. The second article says that the Tribonian to whom it refers was of Side (in Pamphylia), was also ἀπὸ δικηγόρων τῶν ὑπάρχων, was a man of learning and wrote various books, among which are mentioned certain astronomical treatises, a dialogue *On Happiness*, and two addresses to Justinian. None of these books relate to law; and the better opinion seems to be that there were two Tribonians, apparently contemporaries, though possibly some of the attributes of the jurist have been, by a mistake of the compilers or transcribers of the *Lexicon* of Suidas, extended to the man of letters of the same name.

The character which Procopius gives to the jurist, even if touched by personal spite, is entitled to some credence, because it is contained in the *Histories* and not in the scandalous and secret *Anecdota.* It is as follows: "Tribonian was a man of great natural powers, and had attained as high a culture as any one of his time; but he was greedy of money, capable of selling justice for gain, and every day he repealed or enacted some law at the instance of people who purchased this from him according to their several needs. . . . He was pleasant in manner and generally agreeable, and able by the abundance of his accomplishments to cast into shade his faults of avarice" (*Pers.* i. 24, 25). In the *Anecdota* Procopius adds as an illustration of Justinian's vanity the story that he took in good faith an observation made to him by Tribonian, while sitting as assessor, that he (Tribonian) greatly feared that the emperor might some day, on account of his piety, be suddenly carried up into heaven. This agrees with the character for flattery which the minister seems to have enjoyed. The charge of heathenism we find in Suidas is probable enough; that is to say, Tribonian may well have been a crypto-pagan, like many other eminent courtiers and litterateurs of the time (including Procopius himself), a person who, while professing Christianity, was at least indifferent to its dogmas and rites, cherishing a sentimental recollection of the older and more glorious days of the empire.

In modern times Tribonian has been, as the master workman of Justinian's codification and legislation, charged with three offences—bad Latinity, a defective arrangement of the legal matter in the *Code* and *Digest*, and a too free handling of the extracts from the older jurists included in the latter compilation. The first of these charges cannot be denied; but it is hard to see why a lawyer of the 6th century, himself born in a Greek-speaking part of the empire, should be expected to write Latin as pure as that of the age of Cicero, or even of the age of Gaius and the Antonines. To the second charge also a plea of guilty must be entered. The *Code* and *Digest* are badly arranged according to our notions of scientific arrangement. These, however, are modern notions. The ancients generally cared but little for what we call a philosophic distribution of topics, and Tribonian seems to have merely followed the order of the Perpetual Edict which custom had already established, and from which custom would perhaps have refused to permit him to depart. He may more fairly be blamed for not having arranged the extracts in each title of the *Digest* according to some rational principle; for this would have been easy, and would have spared much trouble to students and practitioners ever since. As to the third complaint, that the compilers of the *Digest* altered the extracts they collected, cutting out and inserting words and sentences at their own pleasure, this was a process absolutely necessary according to the instructions given them, which were to prepare a compilation representing the existing law, and to be used for the actual administration of justice in the tribunals. The so-called *Emblemata* (insertions) of Tribonian were therefore indispensable, though, of course, we cannot say whether they were always made in the best way. Upon the whole subject of the codification and legislation in which Tribonian bore a part, see JUSTINIAN.

Tribonian, from the little we know of him, would seem to have been a remarkable man, and in the front rank of the great ones of his time. There is nothing to show that he was a profound and philosophical jurist, like Papinian or Ulpian. But he was an energetic, clear-headed man, of great practical force and skill, cultivated, accomplished, agreeable, flexible, possibly unscrupulous, just the sort of person whom a restless despot like Justinian finds useful. His interest in legal learning is proved by the fact that he had collected a vast legal library, which the compilers of the *Digest* found valuable (see const. *Tanta*).

The usual criticisms on Tribonian may be found in the *Anti-Tribonianus* (1567) of Francis Hotman, the aim of which is shown by its alternative title, *Sive discursus in quo jurisprudentiae Tribonianeae sterilitas et legum patriarum excellentia exhibetur*; and an answer to them in J. P. von Ludewig, *Vita Justiniani et Theodorae, nec non Triboniani.* (J. BR.)

TRIBUNE (Lat. *tribunus*, connected with *tribus*, tribe), a name assigned to officers of several different descriptions in the constitution of ancient Rome. The original tribunes were no doubt the commanders of the several contingents of cavalry and infantry which were supplied to the Roman army by the early gentilician tribes—the Tities, the Ramnes and the Luceres. In the historical period the infantry in each legion were commanded by six tribunes, and the number six is probably to be traced to the doubling of the three tribes by the incorporation of the new elements which received the names of *Tities secundi, Ramnes secundi, Luceres secundi.* The *tribuni celerum* or commanders of the horsemen no longer existed in the later times of the republic, having died out with the decay of the genuine Roman cavalry.[1] So long as the monarchy lasted these tribunes were doubtless nominated by the commander-in-chief, the king; and the nomination passed over on the establishment of the republic to his successors, the consuls. But, as the army increased, the popular assembly insisted on having a voice in the appointments, and from 362 B.C. six tribunes were annually nominated by popular vote, while in 311 the number was raised to sixteen, and in 207 to twenty-four, at which figure it remained. The tribunes thus elected sufficed for four legions and ranked as magistrates of the Roman people, and were designated *tribuni militum a populo*, while those who owed their office to the consuls bore the curious title of *tribuni rufuli.* The name was traced to a commander Rutilius Rufus (Liv. 7, 5; and Fest. *Ep.* 260), but was more probably derived from the dress (Mommsen, *Staatsrecht*, 1, 434). The rights of the assembly passed on to the emperors, and "the military tribunes of Augustus" were still contrasted with those nominated in the camp by the actual commanders. The obscure designation *tribunus aerarius* (tribune of the treasury) had also, in all probability, a connexion with the early organization of the army. The officer thus designated may have been the levier of the *tributum*, the original property tax, and was at any rate the paymaster of the troops. The soldier who was defrauded of his pay was allowed to exact it from this tribune by a very summary process. There was still another and important class of tribunes who owed their existence to the army. In the long struggle between the patrician and plebeian sections of the population, the first distinctions in the public service to which the plebeians forced their way were military, and the contest for admission to the consulate was, in large part, a contest for admission to the supreme command of the national forces. In 445 B.C., the year in which mixed marriages of patricians and plebeians were for the first time permitted, power was given to the senate (then wholly patrician) of determining from year to year whether consuls or military tribunes with consular authority (*tribuni militares consulari potestate* or *imperio*) should be appointed. But, even when the senate decided in favour of electing tribunes, no election was valid without the express sanction of the senate superadded to the vote of the centuriate assembly. If it happened to be too invidious for the senate openly to cancel the election, it was possible for the patricians to obtain a decision from the sacred authorities to the effect that some religious practice had not been duly observed, and that in consequence the appointment was invalid. According to tradition, recourse was had to this device at the first election, a plebeian having been successful. Forty-five years elapsed after the creation of the office before any plebeian was permitted to fill it, and it was held by very few down to the time at which it was abolished (367 B.C.) and the plebeians were fully admitted to the consulate. The number of consular tribunes elected on each occasion varied from three to six; there was no year without a patrician, and to the patrician members were probably confined the most highly esteemed duties, those relating to the administration of the law and to religion.

But by far the most important tribunes who ever existed in the Roman community were the tribunes of the commons (*tribuni plebis*). These were the most characteristic outcome of the long struggle between the two orders, the patrician and the plebeian. When in 494 B.C. the plebeian legionaries met on the Sacred Mount and bound themselves to stand by each other to the end, it was determined that the plebeians should by themselves annually appoint executive officers to stand over against the patrician officers—two tribunes (the very name commemorated the military nature of the revolt) to confront the two consuls, and two helpers called aediles to balance the two patrician helpers, the quaestors. The ancient traditions concerning the revolution are extremely confused and contradictory, and have caused endless discussions. The commonest story is that the masses assembled on the Sacred Mount bound themselves by a solemn oath to regard the persons of their tribunes and aediles as inviolable, and to treat as forfeited to Diana and Ceres, the plebeian divinities, the lives and property of those who offered them insult. That this purely plebeian oath was the real ultimate basis of the sanctity which attached to the tribunate during the whole time of its existence can hardly be believed. The revolution must have ended in something which was deemed by both the contending bodies to be a binding compact, although the lapse of time has blotted out its terms. The historian Dionysius may have been only technically wrong in supposing

[1] In the legends of the foundation of the republic Brutus is represented as having exercised authority, when the king was banished, merely by virtue of holding the office of *tribunus celerum.*

that peace was concluded between the two parties by the fetial priests, with the forms adopted by Rome in making treaties with a foreign state. If this were fact, the "sacrosanctity" of the tribunes would be adequately explained, because all such formal *foedera* were "sacrosanct." But, notwithstanding that the plebeians may safely be assumed to have been conscious of having to a large extent sprung from another race than the patricians and their retainers, it is not likely that the feeling was sufficiently strong to permit of the compact taking the form of a treaty between alien powers. Yet there must have been a formal acceptance by the patricians of the plebeian conditions; and most probably the oath which was first sworn by the insurgents was afterwards taken by the whole community, and the "sacrosanctity" of the plebeian officials became a part of the constitution. There must also have been some constitutional definition of the powers of the tribunes. These rested at first on an extension of the power of veto which the republic had introduced. Just as one consul could invalidate an order of his colleague, so a tribune could invalidate an order of a consul, or of any officer inferior to him. There was no doubt a vague understanding that only orders which sinned against the just and established practice of the constitution should be annulled, and then only in cases affecting definite individuals. This was technically called *auxilium*. The cases which arose most commonly concerned the administration of justice and the levying of troops.

Although the revolution of 494 gave the tribunes a foothold in the constitution, it left them with no very definite resources against breaches of compact by the patricians. The traditional history of the tribunate from 494 to 451 B.C. is obscure, and, so far as details are concerned, nearly worthless; but there is a thread running through it which may well be truth. We hear of attacks by patricians on the newly won privileges, even of the assassination of a tribune, and of attempts on the part of the plebeians to bring patrician offenders to justice. The assembled plebeians attempt to set up a criminal jurisdiction for their own assembly parallel to that practised by the older centuriate assembly, in which the nobles possess a preponderating influence. Nay, more, the plebs attempts something like legislation; it passes resolutions which it hopes to force the patrician body to accept as valid. As to details, only a few are worth notice. In the first place, the number of tribunes is raised to ten, how we do not know; but apparently some constitutional recognition of the increase is obtained. Then an alteration is made in the mode of election. As to the original mode, the ancient authorities are hopelessly at variance. Some of them gravely assert that the appointment lay with the assembly of the curiae—the most ancient and certainly the most patrician in Rome, even if we allow the view, which, in spite of great names, is more than doubtful, that the plebeians were members of it at any time when it still possessed political importance. The opinion of Mommsen about the method of election is more plausible than the others. It was in accordance with the Roman spirit of order that the tribunes, in summoning their assemblies, should not ask the plebeians to come *en masse* as individuals, and vote by heads, but should organize their supporters in bands. The *curia* was certainly a territorial district, and the tribunes may have originally used it as the basis of their organization. If tribunes were elected by plebeians massed *curiatim*, such a meeting would easily be mistaken in later times for the *comitia curiata*. At any rate, a change was introduced in 471 by the Publilian Law of Volero, which directed that the tribunes should be chosen in an assembly organized on the basis of the Servian or local tribe, instead of the *curia*. This assembly was the germ of the *comitia tributa*. The question by what authority the Law of Volero was sanctioned is difficult to answer. Possibly the law was a mere resolution of the plebeians with which the patricians did not interfere, because they did not consider that the mode of election was any concern of theirs. In the first period of the tribunate the tribunes almost certainly agitated to obtain for their supporters a share in the benefits of the state domain. And, whatever view may be taken of the movement which led to the decemvirate, an important element in it was of a certainty the agitation carried on by the tribunes for the reduction of the law of Rome to a written code. Until they obtained this it was impossible for them effectually to protect those who appealed against harsh treatment by the consuls in their capacity of judges.

During the decemvirate the tribunate was in abeyance. It was called into life again by the revolution of 449, which gave the tribunes a considerably stronger position. Their personal privileges and those of the aediles were renewed, while sacrosanctity was attached to a body of men called *judices decemviri*, who seem to have been the legal assistants of the tribunes. The road was opened up to valid legislation by the tribunes through an assembly summoned by them on the tribe-basis (*concilium plebis*), but in this respect they were submitted to the control of the senate. The growth of the influence of this assembly over legislation belongs rather to the history of the comitia (*q.v.*) than to that of the tribunate. After the Hortensian Law of 287 B.C. down to the end of the republic the legislation of Rome was mainly in the hands of the tribunes. The details of the history of the tribunate in its second period, from 449 to 367 B.C., are hardly less obscure than those which belong to the earlier time. There was, however, on the whole, undoubtedly an advance in dignity and importance. Gradually a right was acquired of watching and interfering with the proceedings of the senate, and even with legislation. Whether the absolute right of veto had been achieved before 367 may well be doubted. But the original *auxilium*, or right of protecting individuals, was, during this period, undergoing a very remarkable expansion. From forbidding a single act of a magistrate in relation to a single person, the tribunes advanced to forbidding by anticipation all acts of a certain class, whoever the persons affected by them might prove to be. It therefore became useless for the senate or the comitia to pass ordinances if a tribune was ready to forbid the magistrates to carry them out. Ultimately the mere announcement of such an intention by a tribune was sufficient to cause the obnoxious project to drop; that is to say, the tribunes acquired a right to stop all business alike in the deliberative assembly, the senate, and in the legislative assemblies, the comitia. The technical name for this right of veto is *intercessio*. To what extent the tribunes during the time from 449 to 367 took part in criminal prosecutions is matter of doubt. The XII. Tables had settled that offenders could only be punished in person by the centuries, but tradition speaks of prosecutions by tribunes before the tribes where the penalty sought was pecuniary. The two main objects of the tribunes, however, at the time of which we are speaking were the opening of the consulate to plebeians and the regulation of the state domain in the interests of the whole community. Both were attained by the Licinio-Sextian Laws of 367.

Then a considerable change came over the tribunate. From being an opposition weapon it became an important wheel in the regular machine of state. The senate became more and more plebeian, and a new body of nobility was evolved which comprised both orders in the state. The tribunes at first belonged to the same notable plebeian families which attained to the consulate. The old friction between senate and tribunes disappeared. It was found that the tribunate served to fill some gaps in the constitution, and its power was placed by common consent on a solid constitutional basis. From 367 to 134 B.C. (when Tiberius Gracchus became tribune) the tribunate was for the most part a mere organ of senatorial government. As the change made by the Gracchi was rather in the practice than in the theory of the tribunate, it will be convenient at this point to give a definite sketch of the conditions and privileges attaching to the office.

Even after the difference between patrician and plebeian birth had ceased to be of much practical consequence in other directions, the plebeian character was a necessity for the tribune. When the patricians P. Sulpicius Rufus and, later, P. Clodius (the antagonist of Cicero) desired to enter on a demagogic course, they were compelled to divest themselves of their patrician quality by a peculiar legal process. Even the patricians who became so by mere fiat of the emperors were excluded from the tribunate. The other necessary qualifications were for the most part such as attached to the other Roman magistracies—complete citizenship, absence of certain conditions regarded as disgraceful, fulfilment of military duties. The minimum age required for the office was, as in the case of the quaestorship, twenty-seven. The tribunate, however, stood outside the round of magistracies, the conditions of which were regulated by the Villian Law of 180 B.C. The election took place in a purely plebeian assembly, ranged by tribes, under the presidency of a tribune selected by lot. The tribune was bound by law to see a complete set of ten tribunes appointed. Technically, the tribunes were reckoned, not as magistrates of the Roman people, but as magistrates of the Roman plebs; they therefore had no special robe of office, no lictors, but only messengers (*viatores*), no official chair, like the curule seat, but only benches (*subsellia*). Their right to summon the plebs together, whether for the purpose of listening to a speech (in which case the meeting was a *contio*) or for passing ordinances (*comitia tributa*), was rendered absolute by the "laws under sacred sanction" (*leges sacratae*), which had been incorporated with the constitution on the abolition of the decemvirate. The right to summon the senate and to lay business before it was acquired soon after 367, but was seldom exercised, as the tribunes had abundant means of securing what they wanted by pressure applied to the ordinary presidents—the consuls or the praetor. When an *interregnum* came about and there were no "magistrates of the Roman people," the plebeian tribunes became the proper presidents of the senate and conductors of ordinary state business. At the end of the republic there were *interregna* of several months' duration, when the tribunes held a position of more than usual importance. A tenure of the tribunate did not, until a comparatively late period (probably about the time of the Second Punic War), confer a claim to a permanent seat in the senate. The candidates for the office were mainly young men of good family who were at the beginning of their political career, but the office was often filled by older men of ambition who were struggling upwards with few advantages. The plebeian aediles very soon after 367 became dissociated from the tribunes and associated with the curule aediles, so that in the political hierarchy they really ranked higher than those who were originally their superior officers.

The real kernel of the tribune's power consisted in his *intercessio*, or right of invalidating ordinances, whether framed by the senate or proposed by a magistrate to the *comitia*, or issued by a magistrate in pursuance of his office. From 367 B.C. down to the time of the Gracchi the power of veto in public matters was, on the whole, used in the interests of the aristocratic governing families to check opposition arising in their own ranks. A recalcitrant consul was most readily brought to obedience by an exercise of tribunician power. But, although modern readers of the ancient historians are apt to carry away the idea that the tribunate was an intensely political office, it is safe to say that the occasions on which tribunes found it possible to play a prominent part in politics were extremely few, even in the late republic. On the other hand, the tribunes found a field for constant activity in watching the administration of justice and in rendering assistance to those who had received harsh treatment from the magistrates. The tribunes were, in fact, primarily legal functionaries, and constituted in a way the only court of appeal in republican Rome. It was to this end that they were forbidden to pass a whole night away from the city, except during the Latin festival on the Alban Mount, and that they were expected to keep their doors open to suppliants by night as well as by day. They held court by day in the Forum close by the Porcian basilica, and frequently made elaborate legal inquiries into cases where their help was sought. Naturally this ordinary humdrum work of the tribunes has left little mark on the pages of the historians, but we hear of it not infrequently in Cicero's speeches and in other writings which deal with legal matters. According to the general principle of the constitution, magistrates could forbid the acts of magistrates equal to or inferior to themselves. For this purpose the tribunes were deemed superior to all other officers. If a tribune exercised his veto no other tribune could annul it, for the veto could not be itself vetoed, but it was possible for another tribune to protect a definite individual from the consequences of disobedience. The number of the tribunes (ten) made it always possible that one might balk the action of another, except at times when popular feeling was strongly roused. In any case it was of little use for a tribune to move in any important matter unless he had secured the co-operation or at least the neutrality of all his colleagues. The veto was not, however, absolute in all directions. In some it was limited by statute; thus the law passed by Gaius Gracchus about the consular provinces did not permit a tribune to veto the annual decree of the senate concerning them. When there was a dictator at the head of the state, the veto was of no avail against him. One of the important political functions of the tribunes was to conduct prosecutions of state offenders, particularly ex-magistrates. These prosecutions began with a sentence pronounced by the tribune upon the culprit, whereupon, exercising the right given him by the XII. Tables, the culprit appealed. If the tribune sought to inflict punishment on the culprit's person, the appeal was to the assembly of the centuries; if he wished for a large fine, the appeal was to the assembly of the tribes. As the tribune had no right to summon the centuries, he had to obtain the necessary meetings through the urban praetor. In the other event he himself called together the tribute assembly and proposed a bill for fining the culprit. But the forms of trial gone through were very similar in both cases.

It is commonly stated that a great change passed over the tribunate at the time of the Gracchi, and that from their day to the end of the republic it was used as an instrument for setting on foot political agitation and for inducing revolutionary changes. This view is an inversion of the facts. The tribunate did not create the agitation and the revolutions, but these found vent through the tribunate, which gave to the democratic leaders the hope that acknowledged evils might be cured by constitutional means, and in the desperate struggle to realize it the best democratic tribunes strained the theoretic powers of their office to their ruin. For the bad tribunes did not hesitate to use for bad ends the powers which had been strained in the attempt to secure what was good. But herein the tribunate only fared like all other parts of the republican constitution in its last period. The consuls and the senate were at least as guilty as the tribunes. After a severe restriction of its powers by Sulla and a restoration by Pompey, which gave a twenty years' respite, the essential force of the tribunate was merged into the imperial constitution, of which indeed it became the principal constituent on the civil side. The ten tribunes remained, with very restricted functions. The emperors did not become tribunes, but took up into their privileges the essence of the office, the "tribunician authority." This distinction between the principle of the office and the actual tenure of the office was a creation of the late republic. Pompey, for example, when he went to the East, was not made proconsul of all the Eastern provinces, but he exercised in them a "proconsular authority" which was equal to that of the actual proconsuls—an authority which was the germ of the imperial authority on its military side. Similarly the emperor, as civil governor, without being tribune, exercised powers of like quality with the powers of the tribune, though of superior force. By virtue of his tribunician authority he acquired a veto on legislation, he became the supreme court of appeal for the empire, and to his person was attached the ancient sacrosanctity. Augustus showed the highest statesmanship in founding his power upon a metamorphosed tribunate rather than upon a metamorphosed dictatorship, upon traditions which were democratic rather than upon traditions which were patrician and optimate. The tribunes continued to exist till a late period, with gradually vanishing dignity and rights; but it is not necessary here to trace their decay in detail.

The name "tribune" was once again illuminated by a passing glory when assumed by Cola di Rienzi. The movement which he headed was in many respects extremely like the early movements of the plebeians against the patricians, and his scheme for uniting Italy in one free republic was strangely parallel with the greatest dream of the Gracchi.

The history of the tribunate is interwoven with that of Rome, and must, to a large extent, be sought for in the same sources. The principles attaching to the office are profoundly analysed by Mommsen in his *Staatsrecht*, and are clearly set forth by E. Herzog in his *Geschichte u. System der römischen Staatsverfassung* (Leipzig, 1884). (J. S. R.)

TRIBUNE (med. Lat. *tribuna*, from classical Lat. *tribunal*), in architecture, the term given to the semicircular apse of the Roman basilica, with a raised platform, where the presiding magistrate sat; subsequently applied generally to any raised structure from which speeches were delivered and to the private box of the emperor at the Circus Maximus. In Christian basilicas the term is retained for the semicircular recess behind the choir, as at S. Clemente in Rome, S. Apollinare in Classe, Ravenna, S. Zeno at Verona, S. Miniato near Florence, and other churches. The term is also loosely applied to various other raised spaces in secular as well as ecclesiastical buildings, in the latter sometimes in the place of "pulpit," as in that of the refectory of St Martin des Champs at Paris. It is also given to the celebrated octagon room of the Uffizi at Florence, and sometimes to a gallery or triforium.

TRIBUTE (Lat. *tributum*, a stated payment, contribution), a sum of money or other valuable thing paid by one state or person to another state or person, either as an acknowledgment of submission, or as the price of peace or protection. Hence, in a secondary sense, an offering to mark respect or gratitude. Revenue by means of tribute was one of the most characteristic forms of the financial systems of ancient states. In imperial Athens large revenues were derived from the states of the Delian league (*q.v.*), while in both Carthage and Rome inferior or dependent districts and races were laid under contribution to a very considerable extent (see FINANCE).

The word tribute was also applied in the Roman republic to (1) certain extraordinary taxes, as opposed to the ordinary vectigalia. Such, in particular, were certain property taxes, raised to meet the expenses of war. They were levied on all citizens alike, in proportion to the extent of a man's fortune, and varied according to the total amount of revenue to be raised. (2) To the ordinary *stipendium* or tax of fixed amount paid either in money or in kind, on property, trades, or as a poll-tax, raised in the Roman provinces (see PROVINCE).

TRICHINOPOLY, a city and district of British India, in the Madras presidency. The city is on the right bank of the river Cauvery, 250 m. by rail S.W. from Madras. Pop. (1901), 104,721. The fort which forms the nucleus of the city measures about 1 m. by ½ m.; its defences have been removed. Within it rises the Rock of Trichinopoly, 273 ft. above the city, and so completely isolated as to provide a remarkable view over the surrounding plains. It is ascended by a covered stone staircase, entered by a carved gateway, and profusely ornamented. At intervals up this stair are chambers connected with the temple on the rock. Buddhist inscriptions and carvings in some of them are attributed to the 5th or 6th century. Near the foot of the rock is a fine masonry tank called the Teppakulam, and the palace of the nawab, of which the fine domed audience hall is now used as a town-hall. In Trichinopoly is St Joseph's first-grade college, maintained by the Jesuit mission and occupying, among other buildings, a house formerly the residence of Clive. Another first-grade college is maintained by the Society for the Propagation of the Gospel; it has grown out of schools founded by the missionary Schwarz. The Roman Catholics have a fine cathedral. Trichinopoly is important as a trading centre, especially as being a railway junction. It has special industries in goldsmiths' work and modelling in pith; the well-known Trichinopoly cigars are chiefly manufactured from tobacco grown outside the district at Dindigul. Trichinopoly and its neighbourhood was the scene of much hard fighting between the English and the French during the Carnatic wars between 1749 and 1761.

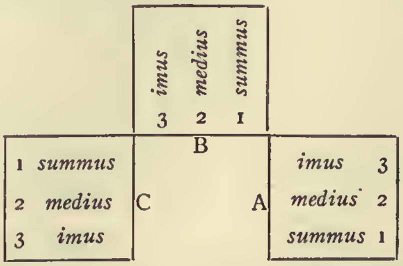
The District of Trichinopoly has an area of 3632 sq. m. The surface is generally flat, though diversified by masses of crystalline rock, of which the Trichinopoly Rock in the fort is a well-known example. The only mountains are the Pachamalais, which rise to 2500 ft. and extend into Salem district. The Cauvery and its branch, the Coleroon, are the only rivers of any importance. The climate is very hot and not liable to great variations; the annual average rainfall is about 34 in. The principal crops are rice, millets, other food-grains and oil-seeds, with a little cotton and tobacco. The main line of the South Indian railway traverses the district, with a branch to Erode. In 1901 the population was 1,444,770, showing an increase of 5% in the decade. The district came into the hands of the British along with the rest of the Carnatic in 1801.

See *Trichinopoly District Gazetteer* (Madras, 1907).

TRICHINOSIS, or Trichiniasis, a disease, in man and other animals, caused by infection by the parasite *trichina* or *trichinella spiralis*. The presence of encysted trichinae in the muscles was discovered by Sir James Paget (*q.v.*) in 1835, and they were named by Sir R. Owen; but it was not until some years after that the clinical characters of the acute disease caused by the invasion of the parasite were discovered. This discovery was made in 1860 by Friedrich von Zenker (1825–1898) on examining the abdominal muscles of a patient who died at Dresden with symptoms taken to be those of typhoid fever, the case being afterwards accounted one of trichinosis on the post mortem evidence. Epidemics of this disease occur from time to time, especially in north Germany, from the eating of uncooked swine's flesh, in which trichinae are not uncommon. Out of 6329 cases in Germany during the years 1881 to 1898, 5456 occurred in states where raw pork is a common article of food. And, from the point of view of public health, the hog is the animal which is the main source of infection, others—except rats—being only rarely infested with the parasite. The greatest care is now taken to examine the carcases of swine for trichinae, a piece of the diaphragm of every animal being searched with the microscope by an inspector specially appointed, and the trichinous hogs being condemned. But it has not been found that this microscopic examination serves as an effective check; indeed it is apt to create a false feeling of security. Over 32% of the German cases of trichinosis between 1881 and 1898 were traced to meat so inspected and passed as free from trichinae. In America accordingly microscopic examination is not considered to give any guarantee of soundness from trichinae, in spite of a government mark "inspected and passed" (see B. H. Ransom, Circular 108 of U.S. Dep. of Agriculture, 1907). The symptoms in man are occasioned by the presence of the free parasites in the intestine, by the development of young trichinae from the eggs, and most of all by the migration of the parasites from the intestinal canal to the muscles, where they become quiescent. This cycle occupies from four to six weeks. Lime-salts become deposited in the capsule, the calcification rendering the cyst visible, and this change usually takes five or six months. When consumed in small quantity, the parasites may give rise to no marked symptoms, and they are sometimes found accidentally in muscular fibre in the bodies of those who had probably experienced no definite symptoms from their invasion. In the more acute and serious cases, sometimes ending fatally, the early symptoms are nausea, failure of appetite, diarrhoea and fever; later, when the migration to the muscles begins, there is more fever, stiffness, pain and swelling in the limbs, swelling of the eyelids, continued exhausting diarrhoea, perspirations and sometimes delirium. During convalescence there is desquamation of the cuticle. The discovery by T. R. Brown of a marked leucocytosis with an extraordinary increase of eosinophiles now enables a diagnosis to be made in cases where the symptoms are obscure. If the diagnosis be made early in the case, brisk purgatives, particularly calomel, are the best treatment; if the parasites are already on their way to the muscles, the only thing left to do is to support the patient's strength. There need, however, be no fear of infection at all if the meat be thoroughly cooked and cured before eaten. This is the only effective precaution.

TRICK, a crafty or fraudulent device, deceitful artifice or stratagem, hence an exhibition of skill, especially in sleight of hand or jugglery, the term being also used of a peculiar trait or manner of speech, character or physical habit. A specific use is that for the cards played at a single round, which are taken up and count towards the winning of the game. The origin of the word is ultimately to be found in Lat. *tricae*, trifles, hindrances, wiles, whence *tricari*, to delay, shuffle, play tricks, which has also given "intricate," "extricate," "intrigue." The M. Eng. *trichen*, to cheat or trick, was adapted from the O. Fr. *trichier*, *trechier*, whence came *trecherie*, Eng. "treachery," a betrayal of faith, perfidy or trickery of the grossest kind. There has been also a confusion, which has influenced the meaning and form of "trick," with the Dutch *trekken*, to pull, draw, cf. the South African Dutch *trek*, a journey, migration, properly the action of drawing a vehicle or travelling by ox-wagon. "Trick" or "tricking" is thus used, in heraldry, as the technical term for the drawing of a coat of arms in monochrome, giving the tinctures by the conventions of vertical, horizontal or diagonal lines, &c.

TRICLINIUM, in Roman antiquities, a set of three couches (*lecti*) arranged round a four-sided dining table, one side of which was left open to provide free access for the attendant slaves. These couches were distinguished as the highest (A, *lectus summus*), the middle (B, *lectus medius*) and the lowest (C, *lectus imus*); the guests who reclined on B had A on their left and C on their right. Each couch was usually occupied by three persons, whose left arm rested on a cushion, the right hand being thus disengaged for purposes of eating. The nine places were allotted in accordance with strict etiquette. A and B were reserved for the guests (B for the most distinguished), C for the host and his family. In A and C the chief place was 1; in B it was 3, which



was consequently the place of honour at the banquet. It was called *locus consularis* (ὑπατικός), probably as being next to the host. Another explanation is that, since it was on the open and unsupported side of the couch, it was chosen in order that, if a consul happened to be present among the guests, he might be able to receive communications, sign documents or transact business with the least inconvenience. It the *locus classicus* in Horace (*Satires*, ii. 8, 20–23), which describes the banquet given by Nasidienus in honour of Maecenas, the host appears to have resigned his place to Nomentanus, as being more capable of entertaining the guest of the evening. In later republican times, after the introduction of round tables of citrus wood, the three couches were replaced by one of crescent shape (called *sigma* from the form C of the Greek letter; also *stibadium* and *accubitum*), which as a rule was only intended to hold five persons. The two corner seats (*cornua*) were the places of honour, that on the right being considered superior. The remaining seats were reckoned from left to right, so that the least important seat was on the left side of the most important. The use of the *sigma* continued till the middle ages. The dining-room itself was also called *triclinium*, and in the houses of wealthy Romans there were several *triclinia* suited to the different seasons of the year.

See Marquardt, *Das Privatleben der Römer* (1886), p. 302.

TRICOUPIS (or Tricoupi), **CHARILAOS** (1832–1896), Greek statesman, was born at Nauplia in 1832. After studying law and literature in Athens and in Paris, he was sent to London in 1852 as an attaché of the Greek legation. By 1863 he had risen to be chargé d'affaires, but he aimed rather at a political than a diplomatic career. In 1865, therefore, after he had concluded the negotiations for the cession by Great Britain to Greece of the Ionian Islands, he entered the Greek chamber of deputies, and in the following year was made foreign minister, at the early age of thirty-four. In 1875 he became prime minister for a few months, but had no opportunity even to begin carrying out the policy which he had in mind. This policy was to develop the resources of his country so as to create an army and a fleet, and thus to give Greece the power to acquire a leading place among the nations of south-eastern Europe. It was not until 1882 that he was able to take measures to this end. In that year he became prime minister for the third time (his second period of office, two years earlier, had lasted only for a few months), and at once set about the task of putting Greek finance upon a firmer basis, and of increasing the prosperity of the country by making roads, railways and harbours. He was defeated at the general election in 1885, but in the following year he resumed office, and again took up the labour of economic and financial reform. His difficulties were now increased by the large expenditure which had been incurred for military preparations while he had been out of office as the result of the union effected between Bulgaria and eastern Rumelia. The Greeks had demanded from Turkey a compensation for this shifting of the balance of power, and had prepared to enforce their demand by an appeal to arms. The Great Powers, however, had interfered, and by blockading the Piraeus had compelled Greece to remain quiet. Tricoupis, nevertheless, believed that he could in a few years raise the value of Greek paper currency to par, and upon that assumption all his calculations were based. Unfortunately for himself and his country, he was not able to make his belief good. His dexterity in finance called forth general admiration, and his schemes for the construction of roads and railways met with a certain amount of success. But at last he was obliged to recognize that the warnings offered to him had been sound. Greece could not meet her obligations. Tricoupis tried to make terms with the creditors of his nation, but he failed in this also. The first taxation which he proposed aroused great hostility, and in January 1895 he resigned. At the general election, four months later, he and his party were defeated. He at once retired from public life, and soon afterwards the disease declared itself which eventually proved fatal. He died at Cannes on the 11th of April 1896. The faults of excessive ambition and of a far too sanguine optimism, which marked Tricoupis' character, could not prevent him from being regarded, even during his lifetime, as the foremost Greek statesman of his time. He was not a favourite with the populace, nor was he beloved so much as respected by his followers. By nature he was reserved—his nickname was " the Englishman " —and he had no sympathy with the arts of the demagogue. But, both in the ranks of his own party and by the nation at large, his abilities and his force of character were unquestioned. It was his misfortune that the circumstances of the time did not allow his wide schemes for the benefit of his country to be carried into effect. (H. H. F.)

TRICOUPIS, SPYRIDION (1788–1873), Greek author and statesman, son of the primate of Missolonghi, was born on the 20th of April 1788. After studying in Paris and London he became private secretary to the fifth earl of Guilford, who resided in the Ionian Islands. He was a friend of Lord Byron, and pronounced his funeral oration in the cathedral of Missolonghi (1824). During the Greek War of Independence he occupied several important administrative and diplomatic posts, being a member of the provisional government in 1826 and of the national convention at Troezen in 1827, and president of the council and minister of foreign affairs in 1832. He was thrice Greek minister in London (1835–1838, 1841–1843 and 1850–1861), and in 1850 envoy-extraordinary to Paris. After the Revolution he became minister of foreign affairs and of public instruction, and held portfolios in several subsequent short-lived ministries. He died on the 24th of February 1873.

A collection of his earlier religious and political orations was published in Paris in 1836. His chief work is a history of the Greek insurrection, *Ἱστορία τῆς ἑλληνικῆς ἐπαναστάσεως* (4 vols., London, 1853–1857; 2nd ed., 1862). He also wrote a martial poem, *Ὁ δῆμος. Ποίημα κλεπτικόν* (Paris, 1821).

TRICYCLE (from prefix *tri*, three, and Gr. *κύκλος*, circle, wheel). The tricycle, as a machine for pleasure riding, has steadily diminished in relative importance since the advent of the safety bicycle (see Cycling). In its modern form it is a chain-driven rear-driver. The driving axle is provided with a differential gear, which allows of both wheels being driven whether the tricycle is moving in a straight or in a curved path. There are four rows of balls, two near the middle resisting the pull of the driving chain and two near the road wheels supporting the vertical load. Two types of driving axle are in use. In one the axle is supported from a parallel frame tube by four short brackets. In the other type, the Starley-Abingdon axle, the frame tube is concentric with the axle, and the middle portion is enlarged to form a casing for the chain-wheel, with two apertures for the chain to pass through. The other mechanical details are nearly all similar to those on a bicycle.

Carrier tricycles, for tradesmen's delivery purposes, are made in two types, one with an extended wheel base and the carrier behind the rider, the other with a single rear driving wheel, the two steering wheels and the carrier being mounted in front on a transverse tube or frame which is jointed to the rear frame at the steering head. The second arrangement gives the simplest possible form of tricycle, but it is unsuited for touring purposes.

Tricars.—The tricar or motor tricycle was first made by removing the front wheel of a motor bicycle and replacing it by a frame carrying two side steering wheels and a seat. With a powerful engine this arrangement gives a light vehicle from which good performances are obtained on roads with easy gradients. On steeper gradients the power must be increased, and the belt drive with only one speed is inadequate. The modern tricar is on different lines, resembling a small motor car on three wheels. The engine is 6 to 10 h.p., preferably with two cylinders, air or water cooled, with clutch and gear-box giving two or three speeds, sometimes also a " reverse " speed. The transmission is usually by a chain from the engine shaft to the gear-box, thence by another chain to the rear road wheel. The frame or chassis is supported on the three road wheels by springs. The steering gear is on the same general lines as that of a motor car. The weight of a tricar of 7 to 10 h.p. is between 700 and 1000 lb. It is a much faster vehicle, especially uphill, than a small car of equal price. The rear tire, however, is subject to severer working conditions than the two driving wheel tires of a small car, and must be of adequate strength, or trouble will be frequent.

The tricar cannot be said to have attained to the same degree of trustworthiness and freedom from breakdown as the motor bicycle or motor car. The rear tire is difficult to remove, in case of puncture. The chain drive, direct from a small chain-wheel on the engine shaft, is faulty in principle. The engine shaft running often at 2000 revolutions per minute, the chain is necessarily noisy, and is subject to continual gradual stretching, necessitating frequent readjustment. In all respects, except speed, the tricar is inferior to the small car. (A. Sp.)

TRIDENT (Lat. *tridens*, *tri-*, *tres*, three and *dens*, tooth), a three-toothed or three-pronged fork or spear. It is and has been from primitive times the typical instrument for spearing fish, the Scottish "leister" (Norw. *ljoster*), and was thus taken as the badge or emblem of the Greek Poseidon, the god of the sea. In Homer (cf. *Il.* xii. 27; *Od.* lv. 506 seq.) Poseidon is armed with the *τρίαινα* (another word is *τριόδους*, cf. Pind. *Ol.* ix. 45). The trident as the symbol of the sovereignty of the sea is found as early as Archilochus (*c.* 700 B.C.); a more familiar example is to be found in Aristophanes (*Eq.* 839). The emblematical figure of Britannia holds the trident as mistress of the sea. In the gladiatorial shows of ancient Rome the *retiarius* was armed with a trident as a weapon.

TRIDYMITE, a mineral consisting of silicon oxide or silica, SiO_2, but differing from quartz in crystalline form. The crystals are small, thin hexagonal plates or scales, which are usually twinned together in groups of three; hence the name of the mineral, from Greek *τρίδυμος*, triplet. The apparent hexagonal plates are themselves pseudo-symmetric twins of optically biaxial material, and the exact crystalline form is doubtful. The plates are colourless and transparent and have a vitreous lustre. The hardness is 7 and the specific gravity 2·3 (that of quartz being 2·65). Unlike quartz, it is soluble in a boiling solution of sodium carbonate. Tridymite occurs in the cavities of acid volcanic rocks (rhyolite, trachyte and andesite); the best-known localities are Cerro San Cristobal near Pachuca in Mexico, the Euganean Hills near Padua, and the Siebengebirge on the Rhine. Probably identical with tridymite is the form of silica known as asmanite, found in the meteorite which fell at Breitenbach in the Erzgebirge, Bohemia. (L. J. S.)

TRIER (French *Trèves*), an ancient city of Germany, formerly the capital of an archbishopric and electorate of the empire, and now the seat of a Roman Catholic bishop and the chief town of a governmental department in the Prussian province of the Rhine. Pop. (1885) 33,019, (1905) 46,709 (86% Roman Catholics). It is situated on the right bank of the Moselle, about 6 m. from the frontier of Luxemburg and 69 m. S.W. of Coblenz, on the main lines of railway from Coblenz to Metz and from Cologne to Saarbrücken. The city lies in a fertile valley shut in by vine-clad hills, and the picturesque red sandstone buildings of the old town are interspersed with orchards and gardens. On the north, east and south boulevards with gardens follow the line of the medieval walls, which have mostly disappeared. The Roman city extended much farther south and east.

Trier contains more important Roman remains than any other place in northern Europe. Perhaps the oldest remains are some of the piers and buttresses of the bridge over the Moselle, which may date from about 28 B.C. The well-preserved amphitheatre just outside the modern town to the south-east was probably built in the reign of Trajan or Hadrian. Its eastern side is built into the hill, its longer diameter is 76 yds., and it accommodated seven or eight thousand spectators. In 306 the emperor Constantine the Great caused multitudes of Frankish prisoners to be thrown to the beasts here, and in 313 made a similar spectacle of the captive Bructeri. The most remarkable Roman building in Trier is the *Porta Nigra*, the north gate of the city, a huge fortified gateway, 115 ft. long, 75 to 93 ft. high and 29 ft. deep, built of sandstone blocks blackened with age (whence the name), and held together with iron clamps. The age of this building is very uncertain; it has been assigned to dates ranging from the 1st to the 4th century A.D. It is also called the *Simeonstor*, after a Greek hermit who inhabited it. On his death in 1035 Archbishop Poppo converted the gate into two churches, one above the other, but all the additions except the apse have now been removed. In the south-east corner of the city are the picturesque ruins of the Roman imperial palace, and near the bridge are the extensive substructures of the 4th-century Roman baths, 660 ft. in length. On the Constantinsplatz stands the magnificent brick basilica, probably of the age of Constantine, though the south and east walls are modern. Having been converted into a palace for the Frankish kings and their deputies, it passed in 1197 to the archbishops, and was restored (1846–1856) and turned into a Protestant church. The adjoining barracks were formerly the elector's palace. Another Roman basilica forms the nucleus of the cathedral. Built under the emperors Valentinian I. and Gratian as a quadrilateral hall with four huge granite columns (now removed) in the centre, it was converted into a church about the close of the 4th century, and restored by Bishop Nicetius about 550. It is the most important pre-Carolingian church in Germany. Archbishop Poppo and his successors in the 11th and 12th centuries extended the cathedral westwards and added an apse at each end. The vaulting of the nave and aisles and the beautiful cloisters were added in the 13th century. In the vaults are buried twenty-six archbishops and electors. Among the monuments are those of the electors Richard von Greiffenklau (d. 1531) and Johann von Metzenhausen (d. 1540), fine examples of German Renaissance work. The most famous of the relics preserved in the cathedral is the "Holy Coat of Trier," believed by the devout to be the seamless robe of the Saviour, and said to have been discovered and presented to the city by the empress Helena. Since 1512 it has been periodically exhibited. The exhibition of 1844, which was attended by more than a million pilgrims, aroused protests, resulting in the formation of the sect of German Catholics (*q.v.*). In 1891 nearly two million pilgrims viewed the coat, and eleven miraculous cures were claimed.

The cloisters connect the cathedral with the church of Our Lady (*Liebfrauenkirche*), a beautiful building in the form of a circle intersected by a cross, with a lofty vault, built 1127–1143, and said to be the oldest Gothic church in Germany.

The earliest churches were without the walls. Of these St Matthias in the south, now represented by a 12th-century building, has a Christian cemetery of the Roman age.

In the market-place is the market cross, said to date from 958, and a beautiful Renaissance fountain, the *Petersbrunnen*, erected in 1595. Close by are the *Steipe* or *Rotes Haus*, formerly the town hall, of the 15th century, and the *Frankenturm* or *propugnaculum*, of the 10th century, said to be the oldest stone domestic building in Germany.

The Provincial Museum (1885–1889) contains many Roman and medieval antiquities. The town library contains about 100,000 volumes, including some valuable examples of early printing. Among its most treasured MSS. are the *codex aureus*, a copy of the gospels presented to the abbey of St Maximin by Ada, a reputed sister of Charlemagne, and the *codex Egberti* of the 10th century.

At Igel near Trier is a very remarkable Roman column, 83 ft. high, adorned with sculptures. It dates from the 2nd century, and was the family monument of the Secundini. At Nennig is a fine Roman mosaic pavement.

The industries of Trier include iron-founding, dyeing and the manufacture of machinery. There is a school of viticulture and a very considerable trade in Moselle wines, especially during the annual auctions.

History.—Trier had had two periods of greatness, firstly as the favourite residence of Constantine the Great and his successors in the west, and secondly as the capital of a powerful spiritual electorate.

The Treveri or Treviri, from whom the city derived its name, were one of the most powerful tribes among the Belgae, and according to Julius Caesar, who conquered them in 56 B.C., possessed the best cavalry in Gaul. Attempts have been made to show that they were of German origin (see BELGAE), but although they were doubtless subject to Germanic influences, they spoke a Celtic language. Their chiefs, Indutiomarus, who raised a rebellion against the Romans in 54 B.C., and his successor Cingetorix have Celtic names, and St Jerome, who had lived in Trier, declares that their language in his day (*c.* 370) resembled that of the Galatians. An insurrection under Julius

Florus in A.D. 21 was soon quelled. The Roman city, Augusta Treverorum, was probably fortified by Augustus about 14 B.C., and organized as a colony about A.D. 50 in the reign of Claudius, but is not mentioned before the war of Civilis in 69 (Tacitus, *Hist.* iv.). At first the Treveri resisted the appeal of Civilis and his Batavi to join the revolt, and built a defensive wall from Trier to Andernach, but soon after the two Treverans, Tutor and Classicus, led their fellow tribesmen, aided by the Lingones (Langres), in the attempt to set up a "Gallic empire." After a brief struggle the rebels were overthrown at Trier by Cerealis, and 113 senators emigrated to Germany (70). Towards the end of the 3rd century, the inroads of the Franks having been repelled by the emperor Probus, the city rapidly acquired wealth and importance. Mainly on account of its strategic position, Diocletian on his reorganization of the empire made Trier the capital not only of *Belgica Prima*, but of the whole "diocese" of Gaul. For a century, from Maximian to Maximus (286–388), it was (except under Julian, who preferred to reside in Paris) the administrative centre from which Gaul, Britain and Spain were ruled, so that the poet Ausonius could describe it as the second metropolis of the empire, or "Rome beyond the Alps." Constantine the Great, who generally resided here from 306 to 331, and his successors also, beautified the city with public works, and villas arose upon the hill-sides.

The Church added a lustre of a different kind. Legend associated Trier with the martyrdom of part of the Theban legion (*c.* 286) and with the relics found by St Helena in the Holy Land. St Agritius (d. 332) is the first historical bishop. Four great saints of the 4th century are connected with the city. It was the scene of the first banishment of St Athanasius in 336. A baseless legend relates that he composed the *Quicunque Vult* while hiding here in a cistern. St Ambrose, one of the greatest sons of Trier, was born here about 340. St Jerome's mind was first seriously directed to religion while studying at Trier about 370, and St Martin of Tours came in 385 to plead with the tryant Maximus for the lives of the heretic Priscillian and his followers.

The Franks, who had thrice previously sacked the city, gained permanent possession of it about 455. Although some Frankish kings resided here, it gradually yielded place to Metz as a Frankish capital. The great bishop St Nicetius (528–566), who was banished for rebuking the vices of king Clotaire I. and eulogized by the poet Venantius Fortunatus, repaired the cathedral, and built a splendid castle for himself. The city passed to Lorraine in 843, and to the East Frankish kingdom in 870. It was sacked by the Northmen in 881. Hetti, who occupied the see from 814 to 847, is said to have been the first archbishop of Trier, and Radbod acquired the rights of the counts of Trier in 898, thus founding the temporal power of the see. Robert claimed in vain the right to crown the German king Otto I. in 936, on the ground of the priority of his see, and in the 10th century Archbishop Dietrich I. obtained the primacy over Gaul and Germany.

The temporal power of the archbishops was not gained without opposition. The German kings Otto IV. and Conrad IV. granted charters to the city, which however admitted the jurisdiction of its archbishop, Baldwin of Luxemburg, in 1308. This prince, a brother of the emperor Henry VII., ruled from 1307 to 1354, and was the real founder of the power of Trier. His predecessor Diether III. of Nassau had left his lands heavily encumbered with debt. Baldwin raised them to great prosperity by his energy and foresight, and chiefly as a result of the active political and military support he rendered to the emperors Henry VII., Louis the Bavarian and Charles IV. enlarged his dominions almost to their ultimate extent. He assumed the title of archchancellor of Gaul and Arles (or Burgundy), and in 1315 admitted the claim of the archbishop of Cologne to the highest place after the archbishop of Mainz among the spiritual princes of the empire. Thenceforward the elector of Trier held the third place in the electoral college. After Baldwin's death the prosperity of Trier was checked by wars and disputes between rival claimants to the see, and in 1456 the estates united for the purpose of restoring order, and secured the right of electing their archbishops.

Throughout the middle ages the *sancta civitas Trevirorum* abounded in religious foundations and was a great seat of monastic learning. The university, founded in 1473, existed until 1797. The elector Richard von Greiffenklau (1467–1531) successfully opposed the Reformation, and inaugurated the exhibitions of the holy coat, which called forth the denunciations of Luther, but have continued since his day to bring wealth and celebrity to the city. In the latter half of the 16th century the direction of education fell into the hands of the Jesuits.

During the Thirty Years' War the elector Philip Christopher von Sötern favoured France, and accepted French protection in 1631. The French in the following year expelled both Spaniards and Swedes from his territories, but in March 1635 the Spaniards recaptured Trier and took the elector prisoner. He remained in captivity for ten years, but was reinstated by the French in 1645 and confirmed in his possessions by the peace of Westphalia. The French again temporarily took Trier in 1674 and 1688.

The last elector and archbishop, Clement Wenceslaus (1768–1802), granted toleration to the Protestants in 1782, established his residence at Coblenz in 1786, and fled from the French in 1794. By the peace of Lunéville in 1801 France annexed all the territories of Trier on the left bank of the Rhine, and in 1802 the elector abdicated. A new bishopric was created for the French department of the Sarre, of which Trier was the capital. The Treveran territories on the right bank of the Rhine were secularized and given to Nassau-Weilburg in 1803, and in 1814 nearly the whole of the former electoral dominions were given to Prussia. A bishopric was again founded in 1821, with nearly the same boundaries as the old archbishopric, but it was placed under Cologne. The area of the former electoral principality was 3210 sq. m., and its population in the 18th century was from 250,000 to 300,000. Roughly speaking, it was a broad strip of territory along the lower Saar and the Moselle from its confluence with that river to the Rhine, with a district on the right bank of the Rhine behind Ehrenbreitstein. The chief towns in addition to Trier were Coblenz, Cochem, Beilstein, Oberwesel, Lahnstein and Sayn. Far more extensive was the territory under the spiritual authority of the archbishop which included the bishoprics of Metz, Toul and Verdun, and after 1777 also those of Nancy and St Dié.

TRIESTE (Ger. *Triest*; Slav. *Trst*; the Roman *Tergeste*, *q.v.*), the principal seaport of Austria. 367 m. S.W. of Vienna by rail. Pop. (1900), 132,879, of which three-fourths are Italians, the remainder being composed of Germans, Jews, Greeks, English and French. Trieste is situated at the north-east angle of the Adriatic Sea, on the Gulf of Trieste, and is picturesquely built on terraces at the foot of the Karst hills. The aspect of the town is Italian rather than German. It is divided into the old and the new town, which are connected by the broad and handsome Via del Corso, the busiest street in the town. The old town, nestling round the Schlossberg, the hill on which the castle stands, consists of narrow, steep and irregular streets. The castle, built in 1680, is believed to occupy the site of the Roman capitol. The new town, which lies on the flat expanse adjoining the crescent-shaped bay, partly on ground that has been reclaimed from the sea, has large and regularly built streets, and several large squares adorned with artistic monuments. The cathedral of San Giusto was formed as it now stands by the union in the 14th century of three adjacent early Christian buildings of the 6th century;

the tower incorporates portions of a Roman temple. The church of Santa Maria Maggiore, built in 1627–1682, is a characteristic specimen of Jesuit architecture; the church of Sant' Antonio Nuovo, built in 1827–1849, is in the Greek style, as also the Greek Orthodox church, built in 1782, which is one of the handsomest Byzantine structures in the whole of Austria. Among the most prominent secular buildings are: the Tergesteo, a huge edifice containing a cruciform arcade roofed with glass, where the exchange is established, besides numerous shops and offices; the town-hall, rebuilt in 1874, with the handsome hall of the local Diet; the imposing old exchange, now the seat of the chamber of commerce; the palatial offices of the Austrian Lloyd, the principal shipping company; the commercial and nautical academy, with its natural history museum, containing the complete fauna of the Adriatic Sea; and finally the municipal museum, Revoltella, are all worth mentioning. The Museo Lapidario contains a collection of Roman antiquities found in or near the town. It is an open-air museum, installed in a disused burial-ground, and is situated near the castle. The Arco di Riccardo, which derives its name from a popular delusion that it was connected with Richard Coeur-de-Lion, is believed by some to be a Roman triumphal arch, but is probably an arch of a Roman aqueduct.

At the head of the industrial establishments of Trieste stand the two ship-building yards of the Austrian Lloyd and of the Stabilimento Tecnico Triestino, which are the largest of their kind in Austria. The Stabilimento Tecnico is also fitted up for the construction of war-ships. They are equipped with all the latest technical innovations, and employ over 5000 workmen. Petroleum refineries, iron-foundries, chemicals, soap-boiling, silk-spinning and the production of ships' fittings, as marine steam boilers, anchors, chains, cables, are the other principal branches of industry. Several marble quarries are worked in the neighbourhood, and there are some large cement factories. Good wine, fruit and olive oil are the most important natural products of the country round Trieste.

The great importance of Trieste lies in its trade. It is the first port of Austria, and the principal outlet for the over-sea trade of the monarchy. It may be said nearly to monopolize the trade of the Adriatic, and has long eclipsed its ancient rival Venice. It owes its development to its geographical situation in the north-east angle of the Adriatic Sea at the end of the deeply indented gulf, and to its harbour, which was more accessible to large vessels than that of Venice. Besides, it was declared a free imperial port in 1719, and was therefore released from the obstructions to trade contained in the hampering legislation of the period. It was deprived of this privilege in 1891, when only the harbour was declared to be outside the customs limit. But during the last thirty years of the 19th century the increase in its trade was the lowest in comparison with the increase in the other great European ports. This was due in the first place to the lack of adequate railway communication with the interior of Austria, to the loss of part of the Levant trade through the development of the Oriental railway system, to the diversion of traffic towards the Italian and German ports, and finally to the growing rivalry of the neighbouring port of Fiume, whose interests were vigorously promoted by the Hungarian government. But in the 20th century a more active policy was inaugurated. New and direct services were started to East Africa, Central America and Mexico; the service to India and the Far East, as well as that to the Mediterranean ports, was much improved; and lastly, Trieste was made the centre of the large emigration from Austria to America by the inauguration (June 1904) of a direct emigrant service to New York. But the most important measure, designed to give a great impetus to the trade of Trieste, and to the over-sea trade of Austria generally, was the construction of the so-called second railway connexion with Trieste, begun in 1901. This measure provided for the construction of a railway over the Tauern Mountains between Schwarzach in Salzburg and Möllbrücken in Carinthia; and of a railway over the Karawanken between Trieste and Klagenfurt, with a branch to Villach. The total length of both lines is 100 m. The Karawanken railway, a direct connexion with Bohemia and the northern industrial provinces of Austria, is calculated to counteract the gravitation of traffic towards the German ports; while the Tauern railway constitutes the shortest route to the interior of Austria and to the south of Germany. By the new line the distance between Salzburg, for instance, and Trieste, is lessened by 160 m.

In order to accommodate the increase in traffic resulting from the above improvements, important works for the extension and development of the harbour were undertaken, and part of them were completed in 1910. The capacious harbour, consisting of two parts, the old and the new, is protected by extensive moles and breakwaters. The new harbour was constructed in 1867–1883, at a cost of £1,500,000. The new additions to the harbour, which are situated at the south end, were designed to give more than double the receiving capacity of the port, and were estimated to cost £3,625,000. The bulk of the over-sea trade of Trieste is done with the Levant, Egypt, India and the Far East, Italy, Great Britain and North and South America. Its most important trade by land, besides Austria, is done with Germany, Trieste being the entrepôt for Germany's commerce with India and the Mediterranean countries. The principal articles imported are cotton and cotton goods, coffee, coal, cereals, hides, fruit and tobacco; the principal articles exported are wool and woollen goods, sugar, paper, timber, machinery and various manufactured goods.

About 4 m. north-west of Trieste on the very edge of the sea is the famous castle of Miramar, built in 1854–1856 in the Norman style, for the archduke Maximilian, the ill-fated emperor of Mexico. It belongs now to the emperor of Austria, and its beautiful gardens are open to the public. About 4 m. north-east of Trieste is the village of Opčina, which possesses an obelisk 1146 ft. high, from which a beautiful view is obtained.

The town of Trieste, with its adjoining territory of a total area of 36 sq. m., forms a separate Austrian crown land. It had in 1900 a population of 178,672, of which 77% were Italians, 18% Slovenes and 5% Germans. The municipal council of Trieste constitutes at the same time the local Diet of the crown land, and is composed of 54 members. To the Reichsrat Trieste sends five deputies. Trieste is the seat of a Roman Catholic bishop, and the seat of the administration for the Küstenland or littoral, composed of the crown lands of Trieste, Görz and Gradisca, and Istria.

History.—At the time of the foundation of Aquileia by the Romans, the district which now includes Trieste was occupied by Celtic and Illyrian tribes; and the Roman colony of Tergeste (*q.v.*) does not seem to have been established till the reign of Vespasian. After the break-up of the Roman dominion Trieste shared the general fortunes of Istria and passed through various hands. From the emperor Lothair it received an independent existence under its count-bishops, and it maintained this position down to its capture by Venice in 1203. For the next 180 years its history consists chiefly of a series of conflicts with this city, which were finally put an end to by Trieste placing itself in 1382 under the protection of Leopold III. of Austria. The overlordship thus established insensibly developed into actual possession; and except in the Napoleonic period (1797–1805 and 1809–1813) Trieste has since remained an integral part of the Austrian dominions. It was an imperial free port from 1719 until 1891. The harbour was blockaded by an Italian fleet from May until August 1848. During the Italian and Hungarian revolutions Trieste remained faithful to Austria, and received the title of *Citta Fedelissima*. In 1867 Trieste and the adjoining territory was constituted into a separate crown land. In 1888 a monument was erected in commemoration of the 500th anniversary of the connexion of the town with Austria.

TRIFORIUM, an architectural term, the origin of which is unknown but probably derived from "thoroughfarum," as it was used as a passage from one end of the building to the other. The derivation from Lat. *tres*, *tri*, three, and *foris*, door, entrance, does not seem appropriate. The earliest examples are those in the pagan basilicas, where it constituted an upper galley for conversation and business; in the early Christian basilicas it was usually reserved for women, and the same applied to those in the Greek Byzantine Church. In Romanesque and Gothic buildings it is either a spacious gallery over the side aisles or is reduced to a simple passage in the thickness of the walls; in either case it forms an important architectural division in the nave of the cathedral or church, and being of less height gives more importance to the ground storey or nave arcade. In consequence of its less height it was usually divided into two arches, which were again subdivided into two smaller arches and these subdivisions increased the scale. On account of the richness of its mouldings and carved ornament in the sculpture introduced in the spandrils, it became the most highly decorated feature of the interior, the triforium at Lincoln being one of the most beautiful compositions of Gothic architecture. Even when reduced to a simple passage it was always a highly enriched feature. In the 15th-century churches in England, when the roof over the aisles was comparatively flat, more height being required for the clerestory windows, the triforium was dispensed with altogether. In the great cathedrals and abbeys the triforium was often occupied by persons who came to witness various ceremonies, and in early days was probably utilized by the monks and clergy for work connected with the church.

From the constructive point of view, the triforium sometimes served very important functions, as under its roof exist arches and vaults carried from the nave to the outer wall, to which they transmitted the thrust of the nave vault; even when the flying buttress was frankly adopted by the Gothic architect and emphasized by its architectural design as an important feature, other cross arches were introduced under the roof to strengthen it.

TRIGLYPH (Gr. τρεῖς, three, and γλυφή, an incision or carving), an architectural term for the vertically channelled tablets of the Doric frieze, so called because of the angular channels in them, two perfect and one divided—the two chamfered angles or hemiglyphs being reckoned as one. The square sunk spaces between the triglyphs on a frieze are called metopes.

TRIGONOMETRY (from Gr. τρίγωνον, a triangle, μέτρον, measure), the branch of mathematics which is concerned with the measurement of plane and spherical triangles, that is, with the determination of three of the parts of such triangles when the numerical values of the other three parts are given. Since any plane triangle can be divided into right-angled triangles, the solution of all plane triangles can be reduced to that of right-angled triangles; moreover, according to the theory of similar triangles, the ratios between pairs of sides of a right-angled triangle depend only upon the magnitude of the acute angles of the triangle, and may therefore be regarded as functions of either of these angles. The primary object of trigonometry, therefore, requires a classification and numerical tabulation of these functions of an angular magnitude; the science is, however, now understood to include the complete investigation not only of such of the properties of these functions as are necessary for the theoretical and practical solution of triangles but also of all their analytical properties. It appears that the solution of spherical triangles is effected by means of the same functions as are required in the case of plane triangles. The trigonometrical functions are employed in many branches of mathematical and physical science not directly concerned with the measurement of angles, and hence arises the importance of analytical trigonometry. The solution of triangles of which the sides are geodesic lines on a spheroidal surface requires the introduction of other functions than those required for the solution of triangles on a plane or spherical surface, and therefore gives rise to a new branch of science, which is from analogy frequently called spheroidal trigonometry. Every new class of surfaces which may be considered would have in this extended sense a trigonometry of its own, which would consist in an investigation of the nature and properties of the functions necessary for the measurement of the sides and angles of triangles bounded by geodesics drawn on such surfaces.

History

Trigonometry, in its essential form of showing how to deduce the values of the angles and sides of a triangle when other angles and sides are given, is an invention of the Greeks. It found its origin in the computations demanded for the reduction of astronomical observations and in other problems connected with astronomical science; and since spherical triangles specially occur, it happened that spherical trigonometry was developed before the simpler plane trigonometry. Certain theorems were invented and utilized by Hipparchus, but material progress was not recorded until Ptolemy collated, amended and developed the work of his predecessors. In book xi. of the *Almagest* the principles of spherical trigonometry are stated in the form of a few simple and useful lemmas; plane trigonometry does not receive systematic treatment although several theorems and problems are stated incidentally. The solution of triangles necessitated the construction of tables of chords—the equivalent of our modern tables of sines; Ptolemy treats this subject in book i., stating several theorems relating to multiple angles, and by ingenious methods successfully deducing approximate results. He did not invent the idea of tables of chords, for, on the authority of Theon, the principle had been stated by Hipparchus (see PTOLEMY).

The Indians, who were much more apt calculators than the Greeks, availed themselves of the Greek geometry which came from Alexandria, and made it the basis of trigonometrical calculations. The principal improvement which they introduced consists in the formation of tables of half-chords or sines instead of chords. Like the Greeks, they divided the circumference of the circle into 360 degrees or 21,600 minutes, and they found the length in minutes of the arc which can be straightened out into the radius to be 3438. The value of the ratio of the circumference of the circle to the diameter used to make this determination is 62832:20000, or $\pi=3\cdot1416$, which value was given by the astronomer Aryabhata (476–550) in a work called *Aryabhaiya*, written in verse, which was republished [1] in Sanskrit by Dr Kern at Leiden in 1874. The relations between the sines and cosines of the same and of complementary arcs were known, and the formula $\sin\frac{1}{2}a=\sqrt{\{1719(3438-\cos a)\}}$ was applied to the determination of the sine of a half angle when the sine and cosine of the whole angle were known. In the *Sūrya-Siddhānta*, an astronomical treatise which has been translated by Ebenezer Bourgess in vol. vi. of the *Journal* of the American Oriental Society (New Haven, 1860), the sines of angles at an interval of $3^\circ\,45'$ up to 90° are given; these were probably obtained from the sines of 60° and 45° by continual application of the dimidiary formula given above and by the use of the complementary angle. The values $\sin 15^\circ=890'$, $\sin 7^\circ\,30'=449'$, $\sin 3^\circ\,45'=225'$ were thus obtained. Now the angle $3^\circ\,45'$ is itself $225'$; thus the arc and the sine of $\frac{1}{96}$ of the circumference were found to be the same, and consequently special importance was attached to this arc, which was called the right sine. From the tables of sines of angles at intervals of $3^\circ\,45'$ the law expressed by the equation

$$\sin(n+1.225')-\sin(n.225')=\sin(n.225')-\sin(n-1.225')-\sin\frac{(n.225')}{225}$$

was discovered empirically, and used for the purpose of recalculation. Bhaskara (*fl.* 1150) used the method, to which we have now returned, of expressing sines and cosines as fractions of the radius; he obtained the more correct values $\sin 3^\circ\,45'=100/1529$, $\cos 3^\circ\,45'=466/467$, and showed how to form a table, according to degrees, from the values $\sin 1^\circ=10/573$, $\cos 1^\circ=6568/6569$, which are much more accurate than Ptolemy's values. The Indians did not apply their trigonometrical knowledge to the solution of triangles; for astronomical purposes they solved right-angled plane and spherical triangles by geometry.

The Arabs were acquainted with Ptolemy's *Almagest*, and they probably learned from the Indians the use of the sine. The celebrated astronomer of Batnae, Albategnius (*q.v.*), who died in A.D. 929–930, and whose *Tables* were translated in the 12th century by Plato of Tivoli into Latin, under the title *De scientia stellarum*, employed the sine regularly, and was fully conscious of the advantage of the sine over the chord; indeed, he remarks that the continual doubling is saved by the use of the former. He was the first to calculate $\sin\phi$ from the equation $\sin\phi/\cos\phi=k$, and he also made a table of the length of shadows of a vertical object of height 12 for altitudes $1^\circ, 2^\circ, \ldots$ of the sun; this is a sort of cotangent table. He was acquainted not only with the triangle formulae in the *Almagest*, but also with the formula $\cos a=\cos b\cos c+\sin b\sin c\cos A$ for a spherical triangle ABC. Abū'l-Wafā of Bagdad (b. 940) was the first to introduce the tangent as an independent function: his "umbra" is the half of the tangent of the double arc, and the secant he defines as the "diameter umbrae." He employed the umbra to find the angle from a table and not merely as an abbreviation for sin/cos; this improvement was, however, afterwards forgotten, and the tangent was reinvented in the 15th century. Ibn Yūnos of Cairo, who died in 1008, showed even more skill than Albategnius in the solution of problems in spherical trigonometry and gave improved approximate formulae for the calculation of sines. Among the West Arabs, Geber (*q.v.*), who lived

[1] See also vol. ii. of the *Asiatic Researches* (Calcutta).

at Seville in the 11th century, wrote an astronomy in nine books, which was translated into Latin in the 12th century by Gerard of Cremona and was published in 1534. The first book contains a trigonometry which is a considerable improvement on that in the *Almagest.* He gave proofs of the formulae for right-angled spherical triangles, depending on a rule of four quantities, instead of Ptolemy's rule of six quantities. The formulae $\cos B = \cos b \sin A$, $\cos c = \cot A \cot B$, in a triangle of which C is a right angle had escaped the notice of Ptolemy and were given for the first time by Geber. Strangely enough, he made no progress in plane trigonometry. Arrachel, a Spanish Arab who lived in the 12th century, wrote a work of which we have an analysis by Purbach, in which, like the Indians, he made the sine and the arc for the value $3° 45'$ coincide.

Georg Purbach (1423–1461), professor of mathematics at Vienna, wrote a work entitled *Tractatus super propositiones Ptolemaei de sinubus et chordis* (Nuremberg, 1541). This treatise consists of a development of Arrachel's method of interpolation for the calculation of tables of sines, and was published by Regiomontanus at the end of one of his works. Johannes Müller (1436–1476), known as Regiomontanus, was a pupil of Purbach and taught astronomy at Padua; he wrote an exposition of the *Almagest,* and a more important work, *De triangulis planis et sphericis cum tabulis sinuum,* which was published in 1533, a later edition appearing in 1561. He reinvented the tangent and calculated a table of tangents for each degree, but did not make any practical applications of this table, and did not use formulae involving the tangent. His work was the first complete European treatise on trigonometry, and contains a number of interesting problems; but his methods were in some respects behind those of the Arabs. Copernicus (1473–1543) gave the first simple demonstration of the fundamental formula of spherical trigonometry; the *Trigonometria Copernici* was published by Rheticus in 1542. George Joachim (1514–1576), known as Rheticus, wrote *Opus palatinum de triangulis* (see TABLES, MATHEMATICAL), which contains tables of sines, tangents and secants of arcs at intervals of $10''$ from $0°$ to $90°$. His method of calculation depends upon the formulae which give $\sin n\alpha$ and $\cos n\alpha$ in terms of the sines and cosines of $(n-1)\alpha$ and $(n-2)\alpha$; thus these formulae may be regarded as due to him. Rheticus found the formulae for the sines of the half and third of an angle in terms of the sine of the whole angle. In 1599 there appeared an important work by Bartholomew Pitiscus (1561–1613), entitled *Trigonometriae seu De dimensione triangulorum*; this contained several important theorems on the trigonometrical functions of two angles, some of which had been given before by Finck, Landsberg (or Lansberghe de Meuleblecke) and Adriaan van Roomen. François Viète or Vieta (1540–1603) employed the equation $(2 \cos \frac{1}{3}\phi)^3 - 3(2 \cos \frac{1}{3}\phi) = 2 \cos \phi$ to solve the cubic $x^3 - 3a^2x = a^2b (a > \frac{1}{2}b)$; he obtained, however, only one root of the cubic. In 1593 Van Roomen proposed, as a problem for all mathematicians, to solve the equation

$$45y - 3795y^3 + 95634y^5 - \ldots + 945y^{41} - 45y^{43} + y^{45} = C.$$

Vieta gave $y = 2 \sin \frac{1}{45}\phi$, where $C = 2 \sin \phi$, as a solution, and also twenty-two of the other solutions, but he failed to obtain the negative roots. In his work *Ad angulares sectiones* Vieta gave formulae for the chords of multiples of a given arc in terms of the chord of the simple arc.

A new stage in the development of the science was commenced after John Napier's invention of logarithms in 1614. Napier also simplified the solution of spherical triangles by his well-known analogies and by his rules for the solution of right-angled triangles. The first tables of logarithmic sines and tangents were constructed by Edmund Gunter (1581–1626), professor of astronomy at Gresham College, London; he was also the first to employ the expressions cosine, cotangent and cosecant for the sine, tangent and secant of the complement of an arc. A treatise by Albert Girard (1590–1634), published at the Hague in 1626, contains the theorems which give areas of spherical triangles and polygons, and applications of the properties of the supplementary triangles to the reduction of the number of different cases in the solution of spherical triangles. He used the notation sin, tan, sec for the sine, tangent and secant of an arc. In the second half of the 17th century the theory of infinite series was developed by John Wallis, Gregory, Mercator, and afterwards by Newton and Leibnitz. In the *Analysis per aequationes numero terminorum infinitas,* which was written before 1669, Newton gave the series for the arc in powers of its sine; from this he obtained the series for the sine and cosine in powers of the arc; but these series were given in such a form that the law of the formation of the coefficients was hidden. James Gregory discovered in 1670 the series for the arc in powers of the tangent and for the tangent and secant in powers of the arc. The first of these series was also discovered independently by Leibnitz in 1673, and published without proof in the *Acta eruditorum* for 1682. The series for the sine in powers of the arc he published in 1693; this he obtained by differentiation of a series with undetermined coefficients.

In the 18th century the science began to take a more analytical form; evidence of this is given in the works of Kresa in 1720 and Mayer in 1727. Friedrich Wilhelm v. Oppel's *Analysis triangulorum* (1746) was the first complete work on analytical trigonometry. None of these mathematicians used the notation sin, cos, tan, which is the more surprising in the case of Oppel, since Leonhard Euler had in 1744 employed it in a memoir in the *Acta eruditorum.* Jean Bernoulli was the first to obtain real results by the use of the symbol $\sqrt{-1}$; he published in 1712 the general formula for $\tan n\phi$ in terms of $\tan \phi$, which he obtained by means of transformation of the arc into imaginary logarithms. The greatest advance was, however, made by Euler, who brought the science in all essential respects into the state in which it is at present. He introduced the present notation into general use, whereas until his time the trigonometrical functions had been, except by Girard, indicated by special letters, and had been regarded as certain straight lines the absolute lengths of which depended on the radius of the circle in which they were drawn. Euler's great improvement consisted in his regarding the sine, cosine, &c., as functions of the angle only, thereby giving to equations connecting these functions a purely analytical interpretation, instead of a geometrical one as heretofore. The exponential values of the sine and cosine, De Moivre's theorem, and a great number of other analytical properties of the trigonometrical functions, are due to Euler, most of whose writings are to be found in the *Memoirs* of the St Petersburg Academy.

Plane Trigonometry.

Conception of Angles of any Magnitude.

1. Imagine a straight line terminated at a fixed point O, and initially coincident with a fixed straight line OA, to revolve round O, and finally to take up any position OB. We shall suppose that, when this revolving straight line is turning in one direction, say that opposite to that in which the hands of a clock turn, it is describing a positive angle, and when it is turning in the other direction it is describing a negative angle. Before finally taking up the position OB the straight line may have passed any number of times through the position OB, making any number of complete revolutions round O in either direction. Each time that the straight line makes a complete revolution round O we consider it to have described four right angles, taken with the positive or negative sign, according to the direction in which it has revolved; thus, when it stops in the position OB, it may have revolved through any one of an infinite number of positive or negative angles any two of which differ from one another by a positive or negative multiple of four right angles, and all of which have the same bounding lines OA and OB. If OB' is the final position of the revolving line, the smallest positive angle which can have been described is that described by the revolving line making more than one-half and less than the whole of a complete revolution, so that in this case we have a positive angle greater than two and less than four right angles. We have thus shown how we may conceive an angle not restricted to be less than two right angles, but of any positive or negative magnitude, to be generated.

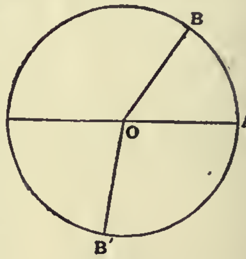

FIG. 1.

Numerical Measurement of Angular Magnitudes.

2. Two systems of numerical measurement of angular magnitudes are in ordinary use. For practical measurements the sexagesimal system is the one employed: the ninetieth part of a right angle is taken as the unit and is called a degree; the degree is divided into sixty equal parts called minutes; and the minute into sixty equal parts called seconds; angles smaller than a second are usually measured as decimals of a second, the "thirds," "fourths," &c., not being in ordinary use. In the common notation an angle, for example, of 120 degrees, 17 minutes and 14·36 seconds is written $120° \ 17' \ 14{\cdot}36''$. The decimal system measurement of angles has never come into ordinary use. In analytical trigonometry the circular measure of an angle is employed. In this system the unit angle or radian is the angle subtended at the centre of a circle by an arc equal in length to the radius. The constancy of this angle follows from the geometrical propositions—(1) the circumferences of different circles vary as their radii; (2) in the same circle angles at the centre are proportional to the arcs which subtend them. It thus follows that the radian is an angle independent of the particular circle used in defining it. The constant ratio of the circumference of a circle to its diameter is a number incommensurable with unity, usually denoted by π. We shall indicate later on some of the methods which have been employed to approximate to the value of this number. Its value to 20 places is 3·14159265358979323846; its reciprocal to the same number of places is 0·31830988618379067153. In circular measure every angle is measured by the ratio which it bears to the unit angle. Two right angles are measured by the number π, and, since the same angle is $180°$, we see that the number of degrees in an angle of circular measure θ is obtained from the formula $180 \times \theta/\pi$. The value of the radian has been found to 41 places of decimals by Glaisher (*Proc. London Math. Soc.* vol. iv.); the value of $1/\pi$, from which the unit can easily be calculated, is given to 140 places of decimals in *Grunerts Archiv* (1841), vol. i. To 10 decimal places the value of the unit angle is $57° \ 17' \ 44{\cdot}8062470964''$. The unit of circular measure is too large to be convenient for practical purposes, but its use introduces a simplification into the series in analytical trigonometry, owing to the fact that the size of

an angle and the angle itself in this measure, when the magnitude of the angle is indefinitely diminished, are ultimately in a ratio of equality.

Sign of Portions of an Infinite Straight Line.

3. If a point moves from a position A to another position B on a straight line, it has described a length AB of the straight line. It is convenient to have a simple mode of indicating in which direction on the straight line the length AB has been described; this may be done by supposing that a point moving in one specified direction is describing a positive length, and when moving in the opposite direction a negative length. Thus, if a point moving from A to B is moving in the positive direction, we consider the length AB as positive; and, since a point moving from B to A is moving in the negative direction, we consider the length BA as negative. Hence any portion of an infinite straight line is considered to be positive or negative according to the direction in which we suppose this portion to be described by a moving point; which direction is the positive one is, of course, a matter of convention.

Projections of Straight Lines on each other.

If perpendiculars AL, BM be drawn from two points, A, B on any straight line, not necessarily in the same plane with AB, the length LM, taken with the positive or negative sign according to the convention as stated above, is called the projection of AB on the given straight line; the projection of BA being ML has the opposite sign to the projection of AB. If two points A, B be joined by a number of lines in any manner, the algebraical sum of the projections of all these lines is LM—that is, the same as the projection of AB. Hence the sum of the projections of all the sides, taken in order, of any closed polygon, not necessarily plane, on any straight line, is zero. This principle of projections we shall apply below to obtain some of the most important propositions in trigonometry.

Definition of Trigonometrical Functions.

4. Let us now return to the conception of the generation of an angle as in fig. 1. Draw BOB' at right angles to and equal to AA'. We shall suppose that the direction from A' to A is the positive one for the straight line AOA', and that from B' to B for BOB'. Suppose OP of fixed length, equal to OA, and let PM, PN be drawn perpendicular to $A'A$, $B'B$ respectively; then OM and ON, taken with their proper signs, are the projections of OP on $A'A$ and $B'B$. The ratio of the projection of OP on $B'B$ to the absolute length of OP is dependent only on the magnitude of the angle POA, and is called the *sine* of that angle; the ratio of the projection of OP on $A'A$ to the length OP is called the *cosine* of the angle POA. The ratio of the sine of an angle to its cosine is called the *tangent* of the angle, and that of the cosine to the sine the *cotangent* of the angle; the reciprocal of the cosine is called the *secant*, and that of sine the *cosecant* of the angle. These functions of an angle of magnitude α are denoted by $\sin\alpha$, $\cos\alpha$, $\tan\alpha$, $\cot\alpha$, $\sec\alpha$, $\operatorname{cosec}\alpha$ respectively. If any straight line RS be drawn parallel to OP, the projection of RS on either of the straight lines $A'A$, $B'B$ can be easily seen to bear to RS the same ratios which the corresponding projections of OP bear to OP; thus, if α be the angle which RS makes with $A'A$, the projections of RS on $A'A$, $B'B$ are $RS\cos\alpha$ and $RS\sin\alpha$ respectively, where RS denotes the absolute length RS. It must be observed that the line SR is to be considered as parallel not to OP but to OP'', and therefore makes an angle $\pi+\alpha$ with $A'A$; this is consistent with the fact that the projections of SR are of opposite sign to those of RS. By observing the signs of the projections of OP for the positions P, P', P'', P''' of P we see that the sine and cosine of the angle POA are both positive; the sine of the angle $P'OA$ is positive and its cosine is negative; both the sine and the cosine of the angle $P''OA$ are negative; and the sine of the angle $P'''OA$ is negative and its cosine positive. If α be the numerical value of the smallest angle of which OP and OA are boundaries, we see that, since these straight lines also bound all the angles $2n\pi+\alpha$, where n is any positive or negative integer, the sines and cosines of all these angles are the same as the sine and cosine of α. Hence the sine of any angle $2n\pi+\alpha$ is positive if α is between 0 and π and negative if α is between π and 2π, and the cosine of the same angle is positive if α is between 0 and $\frac{1}{2}\pi$ or $\frac{3}{2}\pi$ and 2π and negative if α is between $\frac{1}{2}\pi$ and $\frac{3}{2}\pi$.

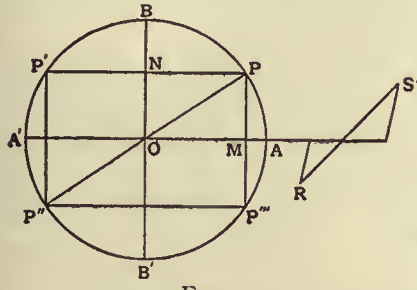

FIG. 2.

In fig. 2 the angle POA is α, the angle $P'''OA$ is $-\alpha$, $P'OA$ is $\pi-\alpha$, $P''OA$ is $\pi+\alpha$, POB is $\frac{1}{2}\pi-\alpha$. By observing the signs of the projections we see that

$$\sin(-\alpha)=-\sin\alpha,\ \sin(\pi-\alpha)=\sin\alpha,\ \sin(\pi+\alpha)=-\sin\alpha,$$
$$\cos(-\alpha)=\cos\alpha,\ \cos(\pi-\alpha)=-\cos\alpha,\ \cos(\pi+\alpha)=-\cos\alpha,$$
$$\sin(\tfrac{1}{2}\pi-\alpha)=\cos\alpha,\ \cos(\tfrac{1}{2}\pi-\alpha)=\sin\alpha.$$

Also $\sin(\frac{1}{2}\pi+\alpha)=\sin(\pi-\frac{1}{2}\pi-\alpha)=\ \sin(\frac{1}{2}\pi-\alpha)=\ \cos\alpha$,
$\cos(\frac{1}{2}\pi+\alpha)=-\cos(\pi-\frac{1}{2}\pi-\alpha)=-\cos(\frac{1}{2}\pi-\alpha)=-\sin\alpha$.

From these equations we have $\tan(-\alpha)=-\tan\alpha$, $\tan(\pi-\alpha)=-\tan\alpha$, $\tan(+\alpha)=-\tan\alpha$, $\tan(\frac{1}{2}\pi-\alpha)=\cot\alpha$, $\tan(\frac{1}{2}\pi+\alpha)=-\cot\alpha$, with corresponding equations for the cotangent.

The only angles for which the projection of OP on $B'B$ is the same as for the given angle $POA(=\alpha)$ are the two sets of angles bounded by OP, OA and OP', OA; these angles are $2n\pi+\alpha$ and $2n\pi+(\pi-\alpha)$, and are all included in the formula $r\pi+(-1)^r\alpha$, where r is any integer; this therefore is the formula for all angles having the same sine as α. The only angles which have the same cosine as α are those bounded by OA, OP and OA, OP''', and these are all included in the formula $2n\pi\pm\alpha$. Similarly it can be shown that $n\pi+\alpha$ includes all the angles which have the same tangent as α.

Relations between Trigonometrical Functions.

From the Pythagorean theorem, the sum of the squares of the projections of any straight line upon two straight lines at right angles to one another is equal to the square on the projected line, we get $\sin^2\alpha+\cos^2\alpha=1$, and from this by the help of the definitions of the other functions we deduce the relations $1+\tan^2\alpha=\sec^2\alpha$, $1+\cot^2\alpha=\operatorname{cosec}^2\alpha$. We have now six relations between the six functions; these enable us to express any five of these functions in terms of the sixth. The following table shows the values of the trigonometrical functions of the angles 0, $\frac{1}{2}\pi$, π, $\frac{3}{2}\pi$, 2π, and the signs of the functions of angles between these values; I denotes numerical increase and D numerical decrease:—

Angle . .	0	$0\ldots\frac{1}{2}\pi$	$\frac{1}{2}\pi$	$\frac{1}{2}\pi\ldots\pi$	π	$\pi\ldots\frac{3}{2}\pi$	$\frac{3}{2}\pi$	$\frac{3}{2}\pi\ldots2\pi$	2π
Sine . .	0	$+I$	1	$+D$	0	$-I$	-1	$-D$	0
Cosine .	1	$+D$	0	$-I$	-1	$-D$	0	$+I$	1
Tangent .	0	$+I$	$\pm\infty$	$-D$	$\cdot 0$	$+I$	$\pm\infty$	$-D$	0
Cotangent	$\pm\infty$	$+D$	0	$-I$	$\pm\infty$	$+D$	0	$-I$	± 8
Secant .	1	$+I$	$\pm\infty$	$-D$	-1	$-I$	$\pm\infty$	$+D$	1
Cosecant .	$\pm\infty$	$+D$	1	$+I$	$\pm\infty$	$-D$	-1	$-I$	± 8

The correctness of the table may be verified from the figure by considering the magnitudes of the projections of OP for different positions.

The following table shows the sine and cosine of some angles for which the values of the functions may be obtained geometrically:—

		sine	cosine		
$\frac{\pi}{12}$	15°	$\frac{\sqrt{6}-\sqrt{2}}{4}$	$\frac{\sqrt{6}+\sqrt{2}}{4}$	75°	$\frac{5}{12}\pi$
$\frac{\pi}{10}$	18°	$\frac{\sqrt{5}-1}{4}$	$\frac{\sqrt{10+2\sqrt{5}}}{4}$	72°	$\frac{2}{5}\pi$
$\frac{\pi}{6}$	30°	$\frac{1}{2}$	$\frac{\sqrt{3}}{2}$	60°	$\frac{1}{3}\pi$
$\frac{\pi}{5}$	36°	$\frac{\sqrt{10-2\sqrt{5}}}{4}$	$\frac{\sqrt{5}+1}{4}$	54°	$\frac{3}{10}\pi$
$\frac{\pi}{4}$	45°	$\frac{1}{\sqrt{2}}$	$\frac{1}{\sqrt{2}}$	45°	$\frac{1}{4}\pi$
		cosine	sine		

Values of Trigonometrical Functions for some Angles.

These are obtained as follows. (1) $\frac{1}{4}\pi$. The sine and cosine of this angle are equal to one another, since $\sin\frac{1}{4}\pi=\cos(\frac{1}{2}\pi-\frac{1}{4}\pi)$; and since the sum of the squares of the sine and cosine is unity each is $1/\sqrt{2}$. (2) $\frac{1}{6}\pi$ and $\frac{1}{3}\pi$. Consider an equilateral triangle; the projection of one side on another is obviously half a side; hence the cosine of an angle of the triangle is $\frac{1}{2}$ or $\cos\frac{1}{3}\pi=\frac{1}{2}$, and from this the sine is found. (3) $\pi/10$, $\pi/5$, $2\pi/5$, $3\pi/10$. In the triangle constructed in Euc. iv. 10 each angle at the base is $\frac{2}{5}\pi$, and the vertical angle is $\frac{1}{5}\pi$. If a be a side and b the base, we have by the construction $a(a-b)=b^2$; hence $2b=a(\sqrt{5}-1)$; the sine of $\pi/10$ is $b/2a$ or $\frac{1}{4}(\sqrt{5}-1)$, and $\cos\frac{1}{5}\pi$ is $a/2b=\frac{1}{4}(\sqrt{5}+1)$. (4) $\frac{1}{12}\pi$, $\frac{5}{12}\pi$. Consider a right-angled triangle, having an angle $\frac{1}{6}\pi$. Bisect this angle, then the opposite side is cut by the bisector in the ratio of $\sqrt{3}$ to 2; hence the length of the smaller segment is to that of the whole in the ratio of $\sqrt{3}$ to $\sqrt{3}+2$, therefore $\tan\frac{1}{12}\pi=\{\sqrt{3}/(\sqrt{3}+2)\}\tan\frac{1}{6}\pi$ or $\tan\frac{1}{12}\pi=2-\sqrt{3}$, and from this we can obtain $\sin\frac{1}{12}\pi$ and $\cos\frac{1}{12}\pi$.

Formulae for Sine and Cosine of Sum and Difference of Two Angles.

5. Draw a straight line OD making any angle A with a fixed straight line OA, and draw OF making an angle B with OD, this angle being measured positively in the same direction as A; draw FE a perpendicular on DO (produced if necessary). The projection of OF on OA is the sum of the projections of OE and EF on OA. Now OE is the projection of OF on DO, and is therefore equal to $OF\cos B$, and EF is the projection of OF

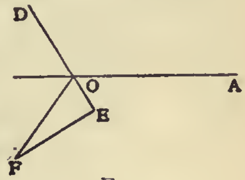

FIG. 3.

on a straight line making an angle $+\frac{1}{2}\pi$ with OD, and is therefore equal to $OF \sin B$; hence

$$OF \cos(A+B) = OE \cos A + EF \cos(\tfrac{1}{2}\pi + A) = OF(\cos A \cos B - \sin A \sin B),$$

or $$\cos(A+B) = \cos A \cos B - \sin A \sin B.$$

The angles A, B are absolutely unrestricted in magnitude, and thus this formula is perfectly general. We may change the sign of B, thus

$$\cos(A-B) = \cos A \cos(-B) - \sin A \sin(-B),$$

or $$\cos(A-B) = \cos A \cos B + \sin A \sin B.$$

If we projected the sides of the triangle OEF on a straight line making an angle $+\frac{1}{2}\pi$ with OA we should obtain the formulae

$$\sin(A \pm B) = \sin A \cos B \pm \cos A \sin B,$$

which are really contained in the cosine formula, since we may put $\frac{1}{2}\pi - B$ for B. The formulae

$$\tan(A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B}, \quad \cot(A \pm B) = \frac{\cot A \cot B \mp 1}{\cot B \pm \cot A}$$

are immediately deducible from the above formulae. The equations

$$\sin C + \sin D = 2 \sin \tfrac{1}{2}(C+D) \cos \tfrac{1}{2}(C-D),$$
$$\sin C - \sin D = 2 \sin \tfrac{1}{2}(C-D) \cos \tfrac{1}{2}(C+D),$$
$$\cos D + \cos C = 2 \cos \tfrac{1}{2}(C+D) \cos \tfrac{1}{2}(C-D),$$
$$\cos D - \cos C = 2 \sin \tfrac{1}{2}(C+D) \sin \tfrac{1}{2}(C-D),$$

may be obtained directly by the method of projections. Take two equal straight lines OC, OD, making angles C, D, with OA, and draw OE perpendicular to CD. The angle which OE makes with OA is $\frac{1}{2}(C+D)$ and that which DC makes is $\frac{1}{2}(\pi+C+D)$; the angle COE is $\frac{1}{2}(C-D)$. The sum of the projections of OD and DE on OA is equal to that of OE, and the sum of the projections of OC and CE is equal to that of OE; hence the sum of the projections of OC and OD is twice that of OE, or $\cos C + \cos D = 2 \cos \frac{1}{2}(C+D) \cos \frac{1}{2}(C-D)$. The difference of the projections of OD and OC an OA is equal to twice that of ED, hence we have the formula $\cos D - \cos C = 2 \sin \frac{1}{2}(C+D) \sin \frac{1}{2}(C-D)$. The other two formulae will be obtained by projecting on a straight line inclined at an angle $+\frac{1}{2}\pi$ to OA.

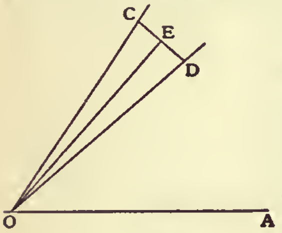

FIG. 4.

As another example of the use of projections, we will find the sum of the series $\cos\alpha + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots + \cos(\alpha+\overline{n-1}\beta)$.

Sum of Series of Cosines in Arithmetical Progression.

Suppose an unclosed polygon each angle of which is $\pi-\beta$ to be inscribed in a circle, and let A, A_1, A_2, A_3, …, A_n be $n+1$ consecutive angular points; let D be the diameter of the circle; and suppose a straight line drawn making an angle α with AA_1, then $\alpha+\beta$, $\alpha+2\beta$, … are the angles it makes with A_1A_2, A_2A_3, …; we have by projections

$$AA_n \cos(\alpha + \tfrac{1}{2}\overline{n-1}\beta) = AA_1\{\cos\alpha + \cos\overline{\alpha+\beta} + \ldots + \cos\alpha + \overline{(n-1)}\beta\},$$

also $$AA_1 = D \sin \tfrac{1}{2}\beta, \quad AA_n = D \sin \tfrac{1}{2}n\beta;$$

hence the sum of the series of cosines is

$$\cos(\alpha + \tfrac{1}{2}\overline{n-1}\,\beta) \sin \tfrac{1}{2}n\beta \operatorname{cosec} \tfrac{1}{2}\beta.$$

By a double application of the addition formulae we may obtain the formulae

Formulae for Sine and Cosine of Sum of Angles.

$$\sin(A_1+A_2+A_3) = \sin A_1 \cos A_2 \cos A_3 + \cos A_1 \sin A_2 \cos A_3 + \cos A_1 \cos A_2 \sin A_3 - \sin A_1 \sin A_2 \sin A_3;$$
$$\cos(A_1+A_2+A_3) = \cos A_1 \cos A_2 \cos A_3 - \cos A_1 \sin A_2 \sin A_3 - \sin A_1 \cos A_2 \sin A_3 - \sin A_1 \sin A_2 \cos A_3.$$

We can by induction extend these formulae to the case of n angles. Assume

$$\sin(A_1+A_2+\ldots+A_n) = S_1 - S_3 + S_5 - \ldots$$
$$\cos(A_1+A_2+\ldots+A_n) = S_0 - S_2 + S_4 - \ldots$$

where S_r denotes the sum of the products of the sines of r of the angles and the cosines of the remaining $n-r$ angles; then we have

$$\sin(A_1+A_2+\ldots+A_n+A_{n+1}) = \cos A_{n+1}(S_1 - S_3 + S_5 - \ldots) + \sin A_{n+1}(S_0 - S_2 + S_4 - \ldots).$$

The right-hand side of this equation may be written

$$(S_1 \cos A_{n+1} + S_0 \sin A_{n+1}) - (S_3 \cos A_{n+1} + S_2 \sin A_{n+1}) + \ldots,$$

or $$S'_1 - S'_3 + \ldots$$

where S'_r denotes the quantity which corresponds for $n+1$ angles to S_r for n angles; similarly we may proceed with the cosine formula. The theorems are true for $n=2$ and $n=3$; thus they are true generally. The formulae

Formulae for Multiple and Sub-Multiple Angles.

$$\cos 2A = \cos^2 A - \sin^2 A = 2\cos^2 A - 1 = 1 - 2\sin^2 A,$$
$$\sin 2A = 2 \sin A \cos A, \qquad \tan 2A = \frac{2 \tan A}{1 - \tan^2 A},$$
$$\sin 3A = 3 \sin A - 4 \sin^3 A, \quad \cos 3A = 4 \cos^3 A - 3 \cos A,$$
$$\sin nA = n \cos^{n-1} A \sin A - \frac{n(n-1)(n-2)}{3!} \cos^{n-3} A \sin^3 A + \ldots + (-)^r \frac{n(n-1)\ldots(n-2r)}{(2r+1)!} \cos^{n-2r-1} A \sin^{2r+1} A,$$
$$\cos nA = \cos^n A - \frac{n(n-1)}{2!} \cos^{n-2} A \sin^2 A + \ldots + (-)^r \frac{n(n-1)\ldots(n-2r+1)}{2r!} \cos^{n-2r} A \sin^{2r} A + \ldots$$

may all be deduced from the addition formulae by making the angles all equal. From the last two formulae we obtain by division

$$\tan nA = \frac{n \tan A - \frac{n(n-1)(n-2)}{3!} \tan^3 A + \ldots + (-1)^r \frac{n(n-1)\ldots(n-2r)}{(2r+1)!} \tan^{2r+1} A + \ldots}{1 - \frac{n(n-1)}{2!} \tan^2 A + \ldots + (-1)^r \frac{n(n-1)\ldots(n-2r+1)}{2r!} \tan^{2r} A + \ldots}$$

In the particular case of $n=3$ we have $\tan 3A = \dfrac{3 \tan A - \tan^3 A}{1 - 3\tan^2 A}$.

The values of $\sin \frac{1}{2}A$, $\cos \frac{1}{2}A$, $\tan \frac{1}{2}A$ are given in terms of $\cos A$ by the formulae

$$\sin \tfrac{1}{2}A = (-1)^p \left(\frac{1-\cos A}{2}\right)^{\frac{1}{2}}, \quad \cos \tfrac{1}{2}A = (-1)^q \left(\frac{1+\cos A}{2}\right)^{\frac{1}{2}},$$
$$\tan \tfrac{1}{2}A = (-1)^r \left(\frac{1-\cos A}{1+\cos A}\right)^{\frac{1}{2}},$$

where p is the integral part of $A/2\pi$, q the integral part of $A/2\pi + \frac{1}{2}$, and r the integral part of A/π.

Sin $\frac{1}{2}A$, $\cos \frac{1}{2}A$ are given in terms of $\sin A$ by the formulae

$$2 \sin \tfrac{1}{2}A = (-1)^{p'}(1+\sin A)^{\frac{1}{2}} + (-1)^{q'}(1-\sin A)^{\frac{1}{2}},$$
$$2 \cos \tfrac{1}{2}A = (-1)^{p'}(1+\sin A)^{\frac{1}{2}} - (-1)^{q'}(1-\sin A)^{\frac{1}{2}},$$

where p' is the integral part of $A/2\pi + \frac{1}{4}$ and q' the integral part of $A/2\pi - \frac{1}{4}$.

Properties of Triangles.

6. In any plane triangle ABC we will denote the lengths of the sides BC, CA, AB by a, b, c respectively, and the angles BAC, ABC, ACB by A, B, C respectively. The fact that the projections of b and c on a straight line perpendicular to the side a are equal to one another is expressed by the equation $b \sin C = c \sin B$; this equation and the one obtained by projecting c and a on a straight line perpendicular to a may be written $a/\sin A = b/\sin B = c/\sin C$. The equation $a = b \cos C + c \cos B$ expresses the fact that the side a is equal to the sum of the projections of the sides b and c on itself; thus we obtain the equations

$$\left.\begin{aligned} a &= b \cos C + c \cos B \\ b &= c \cos A + a \cos C \\ c &= a \cos B + b \cos A \end{aligned}\right\}.$$

If we multiply the first of these equations by $-a$, the second by b, and the third by c, and add the resulting equations, we obtain the formula $b^2+c^2-a^2 = 2bc \cos A$ or $\cos A = (b^2+c^2-a^2)/2bc$, which gives the cosine of an angle in terms of the sides. From this expression for $\cos A$ the formulae

$$\sin \tfrac{1}{2}A = \left\{\frac{(s-b)(s-c)}{bc}\right\}^{\frac{1}{2}}, \quad \cos \tfrac{1}{2}A = \left\{\frac{s(s-a)}{bc}\right\}^{\frac{1}{2}},$$
$$\tan \tfrac{1}{2}A = \left\{\frac{(s-b)(s-c)}{s(s-a)}\right\}^{\frac{1}{2}}, \quad \sin A = \frac{2}{bc}\{s(s-a)(s-b)(s-c)\}^{\frac{1}{2}},$$

where s denotes $\frac{1}{2}(a+b+c)$, can be deduced by means of the dimidiary formula.

From any general relation between the sides and angles of a triangle other relations may be deduced by various methods of transformation, of which we give two examples.

α. In any general relation between the sines and cosines of the angles A, B, C of a triangle we may substitute $pA+qB+rC$, $rA+pB+qC$, $qA+rB+pC$ for A, B, C respectively, where p, q, r are any quantities such that $p+q+r+1$ is a positive or negative multiple of 6, provided that we change the signs of all the sines. Suppose $p+q+r+1 = 6n$, then the sum of the three angles $2n\pi - (pA+qB+rC)$, $2n\pi - (rA+pB+qC)$, $2n\pi - (qA+rB+pC)$ is π; and, since the given relation follows from the condition $A+B+C = \pi$, we may substitute for A, B, C respectively any angles of which the sum is π; thus the transformation is admissible.

β. It may easily be shown that the sides and angles of the triangle formed by joining the feet of the perpendiculars from the angular points A, B, C on the opposite sides of the triangle ABC are respectively $a \cos A$, $b \cos B$, $c \cos C$, $\pi-2A$, $\pi-2B$, $\pi-2C$; we may therefore substitute these expressions for a, b, c, A, B, C respectively in any general formula. By drawing the perpendiculars of this second triangle and joining their feet as before, we obtain a triangle of which the sides are $-a \cos A \cos 2A$, $-b \cos B \cos 2B$, $-c \cos C \cos 2C$ and the angles are $4A-\pi$, $4B-\pi$, $4C-\pi$; we may therefore substitute these expressions for the sides and angles of the original triangle; for example, we obtain thus the formula

$$\cos 4A = \frac{a^2 \cos^2 A \cos^2 2A - b^2 \cos^2 B \cos^2 2B - c^2 \cos^2 C \cos^2 2C}{2bc \cos B \cos C \cos 2B \cos 2C}.$$

This transformation obviously admits of further extension.

Solution of Triangles.

(1) The three sides of a triangle ABC being given, the angles can be determined by the formula

$$L \tan \tfrac{1}{2}A = 10 + \tfrac{1}{2}\log(s-b) + \tfrac{1}{2}\log(s-c) - \tfrac{1}{2}\log s - \tfrac{1}{2}\log(s-a)$$

and two corresponding formulae for the other angles.

(2) The two sides a, b and the included angle C being given, the angles A, B can be determined from the formulae

$$A+B=\pi-C,$$
$$L\tan\tfrac{1}{2}(A-B)=\log(a-b)-\log(a+b)+L\cot\tfrac{1}{2}C,$$

and the side c is then obtained from the formula

$$\log c=\log a+L\sin C-L\sin A.$$

(3) The two sides a, b and the angle A being given, the value of $\sin B$ may be found by means of the formula

$$L\sin B=L\sin A+\log b-\log a;$$

this gives two supplementary values of the angle B, if $b\sin A<a$. If $b\sin A>a$ there is no solution, and if $b\sin A=a$ there is one solution. In the case $b\sin A<a$, both values of B give solutions provided $b>a$, but the acute value only of B is admissible if $b<a$. The other side c can be then determined as in case (2).

(4) If two angles A, B and a side a are given, the angle C is determined from the formula $C=\pi-A-B$ and the side b from the formula $\log b=\log a+L\sin B-L\sin A$.

Areas of Triangles and Quadrilaterals. The area of a triangle is half the product of a side into the perpendicular from the opposite angle on that side; thus we obtain the expressions $\frac{1}{2}bc\sin A$, $\{s(s-a)\ (s-b)(s-c)\}^{\frac{1}{2}}$ for the area of a triangle. A large collection of formulae for the area of a triangle are given in the *Annals of Mathematics* for 1885 by M. Baker.

Let a, b, c, d denote the lengths of the sides AB, BC, CD, DA respectively of any plane quadrilateral and $A+C=2\alpha$; we may obtain an expression for the area S of the quadrilateral in terms of the sides and the angle α.

We have $\quad 2S=ad\sin A+bc\sin(2\alpha-A)$

and $\quad \frac{1}{2}(a^2+d^2-b^2-c^2)=ad\cos A-bc\cos(2\alpha-A)$;

hence $4S^2+\frac{1}{4}(a^2+d^2-b^2-c^2)^2=a^2d^2+b^2c^2-2abcd\cos 2\alpha$.

If $2s=a+b+c+d$, the value of S may be written in the form

$$S=\{s(s-a)(s-b)(s-c)(s-d)-abcd\cos^2\alpha\}^{\frac{1}{2}}.$$

Radii of Circumscribed, Inscribed and Escribed Circles of a Triangle. Let R denote the radius of the circumscribed circle, r of the inscribed, and r_1, r_2, r_3 of the escribed circles of a triangle ABC; the values of these radii are given by the following formulae:—

$$R=abc/4S=a/2\sin A,$$
$$r=S/s=(s-a)\tan\tfrac{1}{2}A=4R\sin\tfrac{1}{2}A\ \sin\tfrac{1}{2}B\ \sin\tfrac{1}{2}C,$$
$$r_1=S/(s-a)=s\ \tan\tfrac{1}{2}A=4R\sin\tfrac{1}{2}A\ \cos\tfrac{1}{2}B\ \cos\tfrac{1}{2}C.$$

Spherical Trigonometry.

7. We shall throughout assume such elementary propositions in spherical geometry as are required for the purpose of the investigation of formulae given below.

Definition of Spherical Triangle. A spherical triangle is the portion of the surface of a sphere bounded by three arcs of great circles of the sphere. If BC, CA, AB denote these arcs, the circular measure of the angles subtended by these arcs respectively at the centre of the sphere are the sides a, b, c of the spherical triangle ABC; and, if the portions of planes passing through these arcs and the centre of the sphere be drawn, the angles between the portions of planes intersecting at A, B, C respectively are the angles A, B, C of the spherical triangle. It is not necessary to consider triangles in which a side is greater than π, since we may replace such a side by the remaining arc of the great circle to which it belongs.

Associated Triangles. Since two great circles intersect each other in two points, there are eight triangles of which the sides are arcs of the same three great circles. If we consider one of these triangles ABC as the fundamental one, then one of the others is equal in all respects to ABC, and the remaining six have each one side equal to, or common with, a side of the triangle ABC, the opposite angle equal to the corresponding angle of ABC, and the other sides and angles supplementary to the corresponding sides and angles of ABC. These triangles may be called the associated triangles of the fundamental one ABC. It follows that from any general formula containing the sides and angles of a spherical triangle we may obtain other formulae by replacing two sides and the two angles opposite to them by their supplements, the remaining side and the remaining angle being unaltered, for such formulae are obtained by applying the given formulae to the associated triangles.

If A', B', C' are those poles of the arcs BC, CA, AB respectively which lie upon the same sides of them as the opposite angles A, B, C, then the triangle $A'B'C'$ is called the polar triangle of the triangle ABC. The sides of the polar triangle are $\pi-A$, $\pi-B$, $\pi-C$, and the angles $\pi-a$, $\pi-b$, $\pi-c$. Hence from any general formula connecting the sides and angles of a spherical triangle we may obtain another formula by changing each side into the supplement of the opposite angle and each angle into the supplement of the opposite side.

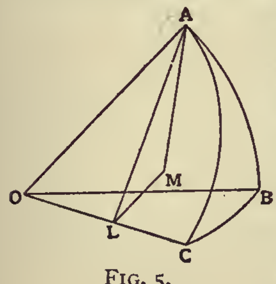

FIG. 5.

8. Let O be the centre of the sphere on which is the spherical triangle ABC. Draw AL perpendicular to OC and AM perpendicular to the plane OBC. Then the projection of OA on OB is the sum of the projections of OL, LM, MA on the same straight line. Since AM has no projection on any straight line in the plane OBC, this gives angles.

Fundamental Equations between Sides and Angles.

$$OA\cos c=OL\cos a+LM\sin a.$$

Now $OL=OA\cos b$, $LM=AL\cos C=OA\sin b\cos C$; therefore $\cos c=\cos a\cos b+\sin a\sin b\cos C$. We may obtain similar formulae by interchanging the letters a, b, c, thus

$$\left.\begin{array}{l}\cos a=\cos b\cos c+\sin b\sin c\cos A\\ \cos b=\cos c\cos a+\sin c\sin a\cos B\\ \cos c=\cos a\cos b+\sin a\sin b\cos C\end{array}\right\}\qquad(1)$$

These formulae (1) may be regarded as the fundamental equations connecting the sides and angles of a spherical triangle; all the other relations which we shall give below may be deduced analytically from them; we shall, however, in most cases give independent proofs. By using the polar triangle transformation we have the formulae

$$\left.\begin{array}{l}\cos A=-\cos B\cos C+\sin B\sin C\cos a\\ \cos B=-\cos C\cos A+\sin C\sin A\cos b\\ \cos C=-\cos A\cos B+\sin A\sin B\cos c\end{array}\right\}\qquad(2)$$

In the figures we have $AM=AL\sin C=r\sin b\sin C$, where r denotes the radius of the sphere. By drawing a perpendicular from A on OB, we may in a similar manner show that $AM=r\sin c\sin B$,

therefore $\quad \sin B\sin c=\sin C\sin b$.

By interchanging the sides we have the equation

$$\frac{\sin A}{\sin a}=\frac{\sin B}{\sin b}=\frac{\sin C}{\sin c}=k\qquad(3)$$

we shall find below a symmetrical form for k. If we eliminate $\cos b$ between the first two formulae of (1) we have

$$\cos a\sin^2c=\sin b\sin c\cos A+\sin c\cos c\sin a\cos B;$$

therefore $\cot a\sin c=(\sin b/\sin a)\cos A+\cos c\cos B$
$\qquad=\sin B\cot A+\cos c\cos B$.

We thus have the six equations

$$\left.\begin{array}{l}\cot a\sin b=\cot A\sin C+\cos b\cos C\\ \cot b\sin a=\cot B\sin C+\cos a\cos C\\ \cot b\sin c=\cot B\sin A+\cos c\cos A\\ \cot c\sin b=\cot C\sin A+\cos b\cos A\\ \cot c\sin a=\cot C\sin B+\cos a\cos B\\ \cot a\sin c=\cot A\sin B+\cos c\cos B\end{array}\right\}\qquad(4)$$

When $C=\frac{1}{2}\pi$ formula (1) gives

$$\cos c=\cos a\cos b\qquad(\alpha)$$

and (3) gives
$$\left.\begin{array}{l}\sin b=\sin B\sin c\\ \sin a=\sin A\sin c\end{array}\right\}\qquad(\beta)$$

from (4) we get
$$\left.\begin{array}{l}\tan a=\tan A\sin b=\tan c\cos B\\ \tan b=\tan B\sin a=\tan c\cos A\end{array}\right\}\qquad(\gamma)$$

The formulae
$$\cos c=\cot A\cot B\qquad(\epsilon)$$

and
$$\left.\begin{array}{l}\cos A=\cos A\sin B\\ \cos B=\cos b\sin A\end{array}\right\}\qquad(\zeta)$$

follow at once from (α), (β), (γ). These are the formulae which are used for the solution of right-angled triangles. Napier gave mnemonical rules for remembering them.

The following proposition follows easily from the theorem in equation (3): If AD, BE, CF are three arcs drawn through A, B, C to meet the opposite sides in D, E, F respectively, and if these arcs pass through a point, the segments of the sides satisfy the relation $\sin BD\sin CE\sin AF=\sin CD\sin AE\sin BF$; and conversely if this relation is satisfied the arcs pass through a point. From this theorem it follows that the three perpendiculars from the angles on the opposite sides, the three bisectors of the angles, and the three arcs from the angles to the middle points of the opposite sides, each pass through a point.

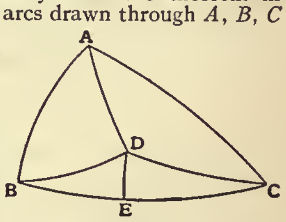

FIG. 6.

Formulæ for Sine and Cosine of Half Angles. 9. If D be the point of intersection of the three bisectors of the angles A, B, C, and if DE be drawn perpendicular to BC, it may be shown that $BE=\frac{1}{2}(a+c-b)$ and $CE=\frac{1}{2}(a+b-c)$, and that the angles BDE, ADC are supplementary. We have also $\dfrac{\sin c}{\sin BD}=\dfrac{\sin ADB}{\sin\frac{1}{2}A}$, $\dfrac{\sin b}{\sin CD}=\dfrac{\sin ADC}{\sin\frac{1}{2}A}$; therefore $\sin^2\frac{1}{2}A$ $=\dfrac{\sin BD\sin CD\sin CDE\sin BDE}{\sin b\sin c}$. But $\sin BD\sin BDE=\sin BE$ $=\sin\frac{1}{2}(a+c-b)$, and $\sin CD\sin CDE=\sin CE=\sin\frac{1}{2}(a+b-c)$;

therefore
$$\sin\frac{A}{2}=\left\{\frac{\sin\frac{1}{2}(a+c-b)\sin\frac{1}{2}(a+b-c)}{\sin b\sin c}\right\}^{\frac{1}{2}}\qquad(5)$$

Apply this formula to the associated triangle of which $\pi-A$, $\pi-B$, C are the angles and $\pi-a$, $\pi-b$, c are the sides; we obtain the formula

$$\cos\frac{A}{2}=\left\{\frac{\sin\frac{1}{2}(b+c-a)\sin\frac{1}{2}(a+b+c)}{\sin b\sin c}\right\}^{\frac{1}{2}}\qquad(6)$$

By division we have

$$\tan\frac{A}{2} = \left\{\frac{\sin\frac{1}{2}(a+c-b)\sin\frac{1}{2}(a+b-c)}{\sin\frac{1}{2}(b+c-a)\sin\frac{1}{2}(a+b+c)}\right\}^{\frac{1}{2}} \qquad (7)$$

and by multiplication

$$\sin A = 2\{\sin(a+b+c)\sin\tfrac{1}{2}(b+c-a)\sin\tfrac{1}{2}(c+a-b)\sin\tfrac{1}{2}(a+b-c)\}^{\frac{1}{2}}$$

$$\sin b\sin c = \{1-\cos^2 a-\cos^2 b-\cos^2 c+2\cos a\cos b\cos c\}^{\frac{1}{2}}\sin b\sin c.$$

Hence the quantity k in (3) is

$$\{1-\cos^2 a-\cos^2 b-\cos^2 c+2\cos a\cos b\cos c\}^{\frac{1}{2}}/\sin a\sin b\sin c. \qquad (8)$$

Of Half-sides. Apply the polar triangle transformation to the formulae (5), (6), (7) (8) and we obtain

$$\cos\frac{a}{2} = \left\{\frac{\cos\frac{1}{2}(A+C-B)\cos\frac{1}{2}(A+B-C)}{\sin B\sin C}\right\}^{\frac{1}{2}} \qquad (9)$$

$$\sin\frac{a}{2} = \left\{\frac{-\cos\frac{1}{2}(B+C-A)\cos\frac{1}{2}(A+B+C)}{\sin B\sin C}\right\}^{\frac{1}{2}} \qquad (10)$$

$$\tan\frac{a}{2} = \left\{\frac{-\cos\frac{1}{2}(B+C-A)\cos\frac{1}{2}(A+B+C)}{\cos\frac{1}{2}(A+C-B)\cos\frac{1}{2}(A+B-C)}\right\}^{\frac{1}{2}} \qquad (11)$$

If $k'=\{1-\cos^2 A-\cos^2 B-\cos^2 C-2\cos A\cos B\cos C\}^{\frac{1}{2}}/\sin A\sin B\sin C$, we have. $kk'=1$ (12)

10. Let E be the middle point of AB; draw ED at right angles to AB to meet AC in D; then DE bisects the angle ADB. **Delambre's Formulae.** Let CF bisect the angle DCB and draw FG perpendicular to BC, then

$$CG=\tfrac{1}{2}(a-b, \angle FBE=\tfrac{1}{2}(A+B),$$
$$\angle FCG=90°-\tfrac{1}{2}C.$$

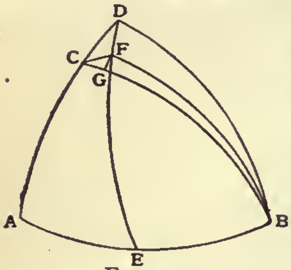

FIG. 7.

From the triangle CFG we have $\cos CFG=\cos CG\sin FCG$, and from the triangle FEB $\cos EFB=\cos EB\sin FBE$. Now the angles CFG, EFB are each supplementary to the angle DFB, therefore

$$\cos\tfrac{1}{2}(a-b)\cos\tfrac{1}{2}C=\sin\tfrac{1}{2}(A+B)\cos\tfrac{1}{2}c. \qquad (13)$$

Also $\sin CG=\sin CF\sin CFG$ and $\sin EB=\sin BF\sin EFB$; therefore $\sin\frac{1}{2}(a-b)\cos\frac{1}{2}C=\sin\frac{1}{2}(A-B)\sin\frac{1}{2}c.$ (14)

Apply the formulae (13), (14) to the associated triangle of which a, $\pi-b$, $\pi-c$, A, $\pi-B$, $\pi-C$ are the sides and angles, we then have

$$\sin\tfrac{1}{2}(a+b)\sin\tfrac{1}{2}C=\cos\tfrac{1}{2}(A-B)\sin\tfrac{1}{2}c \qquad (15)$$
$$\cos\tfrac{1}{2}(a+b)\sin\tfrac{1}{2}C=\cos\tfrac{1}{2}(A+B)\cos\tfrac{1}{2}c. \qquad (16)$$

The four formulae (13), (14), (15) (16) were first given by Delambre in the *Connaissance des Temps* for 1808. Formulae equivalent to these were given by Mollweide in Zach's *Monatliche Correspondenz* for November 1808. They were also given by Gauss (*Theoria motus*, 1809), and are usually called after him.

11. From the same figure we have **Napier's Analogies.** $\tan FG=\tan FCG\sin CG=\tan FBG\sin BG$; therefore $\cot\frac{1}{2}C\sin\frac{1}{2}(a-b)\tan\frac{1}{2}(A-B)\sin\frac{1}{2}(a+b)$,

or
$$\tan\tfrac{1}{2}(A-B)=\frac{\sin\frac{1}{2}(a-b)}{\sin\frac{1}{2}(a+b)}\cot\tfrac{1}{2}C. \qquad (17)$$

Apply this formulae to the associated triangle ($\pi-a$, b, $\pi-c$, $\pi-A$, B, $\pi-C$), and we have

$$\cot\tfrac{1}{2}(A+B)=\frac{\cos\frac{1}{2}(a+b)}{\cos\frac{1}{2}(a-b)}\tan\tfrac{1}{2}C,$$

or
$$\tan\tfrac{1}{2}(A+B)=\frac{\cos\frac{1}{2}(a-b)}{\cos\frac{1}{2}(a+b)}\cot\tfrac{1}{2}C. \qquad (18)$$

If we apply these formulae (17), (18) to the polar triangle, we have

$$\tan\tfrac{1}{2}(a-b)=\frac{\sin\frac{1}{2}(A-B)}{\sin\frac{1}{2}(A+B)}\tan\tfrac{1}{2}c \qquad (19)$$

$$\tan\tfrac{1}{2}(A+B)=\frac{\cos\frac{1}{2}(A-B)}{\cos\frac{1}{2}(A+B)}\tan\tfrac{1}{2}c. \qquad (20)$$

The formulae (17), (18), (19), (20) are called Napier's "Analogies"; they were given in the *Mirif. logar. canonis descriptio.*

12. If we use the values of $\sin\frac{1}{2}a$, $\sin\frac{1}{2}b$, $\sin\frac{1}{2}c$, $\cos\frac{1}{2}a$, $\cos\frac{1}{2}b$, $\cos\frac{1}{2}c$, given by (9), (10) and the analogous formulae obtained by interchanging the letters we obtain by multiplication **Schmeisser's Formulae.**

$$\left.\begin{aligned}\sin\tfrac{1}{2}a\cos\tfrac{1}{2}b\sin C&=\sin\tfrac{1}{2}c\cos\tfrac{1}{2}(B+C-A)\\ \cos\tfrac{1}{2}a\cos\tfrac{1}{2}b\sin C&=\cos\tfrac{1}{2}c\cos\tfrac{1}{2}(A+B-C)\\ \sin\tfrac{1}{2}a\sin\tfrac{1}{2}b\sin C&=\cos\tfrac{1}{2}c\cos\tfrac{1}{2}(A+B+C)\end{aligned}\right\}.$$

These formulae were given by Schmiesser in *Crelle's Journ.*, vol. x.

The relation $\sin b\sin c+\cos b\cos c\cos A=\sin B\sin C-\cos B\cos C\cos a$ was given by Cagnoli in his *Trigonometry* (1786), **Cagnoli's Formulae.** and was rediscovered by Cayley (*Phil. Mag.*, 1859). It follows from (1), (2) and (3) thus: the right-hand side of the equation equals $\sin B\sin C+\cos a(\cos A-\sin B\sin C\cos a)=\sin B\sin C\sin^2 a+\cos a\cos A$, and this is equal to $\sin b\sin c+\cos A(\cos a-\sin b\sin c\cos A)$ or $\sin b\sin c+\cos b\cos c\cos A$.

13. The formulae we have given are sufficient to determine three parts of a triangle when the other three parts are given; moreover such formulae may always be chosen as are adapted to logarithmic calculation. **Solution of Triangles.** The solutions will be unique except in the two cases (1) where two sides and the angle opposite one of them are the given parts, and (2) where two angles and the side opposite one of them are given.

Suppose a, b, A are the given parts. We determine B from the formula $\sin B=\sin b\sin A/\sin a$; this gives two supplementary values of B, one acute and the other obtuse. **Ambiguous Cases.** Then C and c are determined from the equations

$$\tan\tfrac{1}{2}C=\frac{\sin\frac{1}{2}(a-b)}{\sin\frac{1}{2}(a+b)}\cot\tfrac{1}{2}(A-B),\ \tan\tfrac{1}{2}c=\frac{\sin\frac{1}{2}(A+B)}{\sin\frac{1}{2}(A-B)}\tan\tfrac{1}{2}(a-b).$$

Now $\tan\frac{1}{2}C$, $\tan\frac{1}{2}c$, must both be positive; hence $A-B$ and $a-b$ must have the same sign. We shall distinguish three cases. First, suppose $\sin b<\sin a$; then we have $\sin B<\sin A$. Hence A lies between the two values of B, and therefore only one of these values is admissible, the acute or the obtuse value according as a is greater or less than b; there is therefore in this case always one solution. Secondly, if $\sin b>\sin a$, there is no solution when $\sin b\sin A>\sin a$; but if $\sin b\sin A<\sin a$ there are two values of B, both greater or both less than A. If a is acute, $a-b$, and therefore $A-B$, is negative; hence there are two solutions if A is acute and none if A is obtuse. These two solutions fall together if $\sin b\sin A=\sin a$. If a is obtuse there is no solution unless A is obtuse, and in that case there are two, which coincide as before if $\sin b\sin A=\sin a$. Hence in this case there are two solutions if $\sin b\sin A\leq\sin a$ and the two parts A, a are both acute or both obtuse, these being coincident in case $\sin b\sin A=\sin a$; and there is no solution if one of the two A, a, is acute and the other obtuse, or if $\sin b\sin A>\sin a$. Thirdly, if $\sin b=\sin a$ then $B=A$ or $\pi=A$. If a is acute, $a-b$ is zero or negative, hence $A-B$ is zero or negative; thus there is no solution unless A is acute, and then there is one. Similarly, if a is obtuse, A must be so too in order that there may be a solution. If $a=b=\frac{1}{2}\pi$, there is no solution unless $A=\frac{1}{2}\pi$, and then there are an infinite number of solutions, since the values of C and c become indeterminate.

The other case of ambiguity may be discussed in a similar manner, or the different cases may be deduced from the above by the use of the polar triangle transformation. The method of classification according to the three cases $\sin b\gtreqless\sin a$ was given by Professor Lloyd Tanner (*Messenger of Math.*, vol. xiv.).

14. If r is the angular radius of the small circle inscribed in the triangle ABC, we have at once $r=\tan\frac{1}{2}A\sin(s-a)$, where $2s=a+b+c$; from this we can derive the formulae **Radii of Circles Related to Triangles.**

$$\tan r=n\operatorname{cosec}s=\tfrac{1}{2}N\sec\tfrac{1}{2}A\sec\tfrac{1}{2}B\sec\tfrac{1}{2}C=$$
$$\sin a\sin\tfrac{1}{2}B\sin\tfrac{1}{2}C\sec\tfrac{1}{2}A \qquad (21)$$

where n, N denote the expressions

$$\{\sin s\sin(s-a)\sin(s-b)\sin(s-c)\}^{\frac{1}{2}},$$
$$\{-\cos S\cos(S-A)\cos(S-B)\cos(S-C)\}^{\frac{1}{2}}.$$

The escribed circles are the small circles inscribed in three of the associated triangles; thus, applying the above formulae to the triangle (a, $\pi-b$, $\pi-c$, A, $\pi-B$, $\pi-C$), we have for r_1, the radius of the escribed circle opposite to the angle A, the following formulae

$$\tan r_1=\tan\tfrac{1}{2}A\sin s=n\operatorname{cosec}(s-a)=\tfrac{1}{2}N\sec\tfrac{1}{2}A\operatorname{cosec}\tfrac{1}{2}B\operatorname{cosec}\tfrac{1}{2}C$$
$$=\sin a\cos\tfrac{1}{2}B\cos\tfrac{1}{2}C\sec\tfrac{1}{2}A. \qquad (22)$$

The pole of the circle circumscribing a triangle is that of the circle inscribed in the polar triangle, and the radii of the two circles are complementary; hence, if R be the radius of the circumscribed circle of the triangle, and R_1, R_2, R the radii of the circles circumscribing the associated triangles, we have by writing $\frac{1}{2}\pi-R$ for r, $\frac{1}{2}\pi-R_1$ for r_1, $\pi-a$ for A, &c., in the above formulae

$$\cot R=\cot\tfrac{1}{2}a\cos(S-A)=\tfrac{1}{2}n\operatorname{cosec}\tfrac{1}{2}a\operatorname{cosec}\tfrac{1}{2}b\operatorname{cosec}\tfrac{1}{2}c=-N\sec S$$
$$=\sin A\cos\tfrac{1}{2}b\cos\tfrac{1}{2}c\operatorname{cosec}\tfrac{1}{2}a \qquad (23)$$
$$\cot R_1=-\cot\tfrac{1}{2}a\cos S=\tfrac{1}{2}n\operatorname{cosec}\tfrac{1}{2}a\sec\tfrac{1}{2}b\sec\tfrac{1}{2}c=N\sec(S-A)$$
$$=\sin A\sin\tfrac{1}{2}b\sin\tfrac{1}{2}c\operatorname{cosec}\tfrac{1}{2}a. \qquad (24)$$

The following relations follow from the formulae just given:—

$$2\tan R=\cot r_1+\cot r_2+\cot r_3-\cot r,$$
$$2\tan R_1=\cot r+\cot r_2+\cot r_3-\cot r_1,$$
$$\tan r\tan r_1\tan r_2\tan r_3=n^2,\ \sin^2 s=\cot r\tan r_1\tan r_2\tan r_3,$$
$$\sin^2(s-a)=\tan r\cot r_1\tan r_2\tan r_3.$$

15. If $E=A+B+C-\pi$, it may be shown that E multiplied by the square of the radius is the area of the triangle. **Formulae for Spherical Excess.** We give some of the more important expressions for the quantity E, which is called the spherical excess.

We have

$$\frac{\cos\frac{1}{2}(A+B)}{\sin\frac{1}{2}C}=\frac{\cos\frac{1}{2}(a+b)}{\cos\frac{1}{2}c}\ \text{and}\ \frac{\sin\frac{1}{2}(A+B)}{\cos\frac{1}{2}C}=\frac{\cos\frac{1}{2}(a-b)}{\cos\frac{1}{2}c},$$

or
$$\frac{\sin\frac{1}{2}(C-E)}{\sin\frac{1}{2}C}=\frac{\cos\frac{1}{2}(a+b)}{\cos\frac{1}{2}c}\ \text{and}\ \frac{\cos\frac{1}{2}(C-E)}{\cos\frac{1}{2}C}=\frac{\cos\frac{1}{2}(a-b)}{\cos\frac{1}{2}c};$$

hence
$$\frac{\sin\frac{1}{2}C-\sin\frac{1}{2}(C-E)}{\sin\frac{1}{2}C+\sin\frac{1}{2}(C-E)}=\frac{\cos\frac{1}{2}c-\cos\frac{1}{2}(a+b)}{\cos\frac{1}{2}c+\cos\frac{1}{2}(a+b)};$$

therefore $\dfrac{\tan \frac{1}{4}E}{\tan^2 \frac{1}{4}(C-E)} = \tan \frac{1}{2}s \tan \frac{1}{2}(s-c)$.

Similarly $\tan \frac{1}{4}E \tan^2 \frac{1}{4}(C-E) = \tan \frac{1}{2}(s-a) \tan \frac{1}{2}(s-b)$;
therefore

$$\tan \tfrac{1}{4}E = \{\tan \tfrac{1}{2}s \tan \tfrac{1}{2}(s-a) \tan \tfrac{1}{2}(s-b) \tan \tfrac{1}{2}(s-c)\}^{\frac{1}{2}} \quad (25)$$

This formula was given by J. Lhuilier.

Also $\sin \frac{1}{2}C \cos \frac{1}{2}E - \cos \frac{1}{2}C \sin \frac{1}{2}E = \dfrac{\cos \frac{1}{2}(a+b)}{\cos \frac{1}{2}c} \sin \frac{1}{2}C$;

$$\cos \tfrac{1}{2}C \cos \tfrac{1}{2}E + \sin \tfrac{1}{2}C \sin \tfrac{1}{2}E = \frac{\cos \frac{1}{2}(a-b)}{\cos \frac{1}{2}c} \cos \tfrac{1}{2}C;$$

whence, solving for $\cos \frac{1}{2}E$, we get

$$\cos \tfrac{1}{2}E = \frac{1 + \cos a + \cos b + \cos c}{4 \cos \frac{1}{2}a \cos \frac{1}{2}b \cos \frac{1}{2}c} \quad (26)$$

This formula was given by Euler (*Nova acra*, vol. x.). If we find $\sin \frac{1}{2}E$ from this formula, we obtain after reduction

$$\sin \tfrac{1}{2}E = \frac{n}{2 \cos \frac{1}{2}a \cos \frac{1}{2}b \cos \frac{1}{2}c},$$

a formula given by Lexell (*Acta Petrop.*, 1782).

From the equations (21), (22), (23), (24) we obtain the following formulae for the spherical excess:—

$$\sin^2 \tfrac{1}{2}E = \tan R \cot R_1 \cot R_2 \cot R_3$$

$$= \frac{4(\cot r_1 + \cot r_2 + \cot r_3)}{(\cot r - \cot r_1 + \cot r_2 + \cot r_3)\ (\cot r + \cot r_1 - \cot r_2 + \cot r_3) \times (\cot r + \cot r_1 + \cot r_2 + \cot r_3)}.$$

The formula (26) may be expressed geometrically. Let M, N be the middle points of the sides AB, AC. Then we find $\cos MN$

$$= \frac{1 + \cos a + \cos b + \cos c}{4 \cos \frac{1}{2}b \cos \frac{1}{2}c}; \text{ hence } \cos \tfrac{1}{2}E = \cos MN \sec \tfrac{1}{2}a.$$

A geometrical construction has been given for E by Gudermann (in *Crelle's Journ.*, vi. and viii.). It has been shown by Cornelius Keogh that the volume of the parallelepiped of which the radii of the sphere passing through the middle points of the sides of the triangle are edges is $\sin \frac{1}{2} E$.

Properties of Spherical Quadrilateral inscribed in Small Circle.

16. Let $ABCD$ be a spherical quadrilateral inscribed in a small circle; let a, b, c, d denote the sides AB, BC, CD, DA respectively, and x, y the diagonals AC, BD. It can easily be shown by joining the angular points of the quadrilateral to the pole of the circle that $A+C=B+D$. If we use the last expression in (23) for the radii of the circles circumscribing the triangles BAD, BCD, we have

$$\sin A \cos \tfrac{1}{2}a \cos \tfrac{1}{2}d \operatorname{cosec} \tfrac{1}{2}y = \sin C \cos \tfrac{1}{2}b \cos \tfrac{1}{2}C \operatorname{cosec} \tfrac{1}{2}y;$$

whence $\dfrac{\sin A}{\cos \frac{1}{2}b \cos \frac{1}{2}c} = \dfrac{\sin C}{\cos \frac{1}{2}a \cos \frac{1}{2}d}$.

This is the proposition corresponding to the relation $A+C=\pi$ for a plane quadrilateral. Also we obtain in a similar manner the theorem

$$\frac{\sin \frac{1}{2}x}{\sin B \cos \frac{1}{2}b} = \frac{\sin \frac{1}{2}y}{\sin A \cos \frac{1}{2}d},$$

analogous to the theorem for a plane quadrilateral, thac the diagonals are proportional to the sines of the angles opposite to them. Also the chords AB, BC, CD, DA are equal to $2 \sin \frac{1}{2}a$, $2 \sin \frac{1}{2}b$, $2 \sin \frac{1}{2}c$, $2 \sin \frac{1}{2}d$ respectively, and the plane quadrilateral formed by these chords is inscribed in the same circle as the spherical quadrilateral; hence by Ptolemy's theorem for a plane quadrilateral we obtain the analogous theorem for a spherical one

$$\sin \tfrac{1}{2}x \sin \tfrac{1}{2}y = \sin \tfrac{1}{2}a \sin \tfrac{1}{2}c + \sin \tfrac{1}{2}b \sin \tfrac{1}{2}d.$$

It has been shown by Remy (in *Crelle's Journ.*, vol. iii.) that for any quadrilateral, if z be the spherical distance between the middle points of the diagonals,

$$\cos a + \cos b + \cos c + \cos d = 4 \cos \tfrac{1}{2}x \cos \tfrac{1}{2}y \cos \tfrac{1}{2}z.$$

This theorem is analogous to the theorem for any plane quadrilateral, that the sum of the squares of the sides is equal to the sum of the squares of the diagonals, together with twice the square on the straight line joining the middle points of the diagonals.

A theorem for a right-angled spherical triangle, analogous to the Pythagorean theorem, has been given by Gudermann (in *Crelle's Journ.*, vol. xlii.).

Analytical Trigonometry.

Periodicity of Functions.

17. Analytical trigonometry is that branch of mathematical analysis in which the analytical properties of the trigonometrical functions are investigated. These functions derive their importance in analysis from the fact that they are the simplest singly periodic functions, and are therefore adapted to the representation of undulating magnitude. The sine, cosine, secant and cosecant have the single real period 2π; *i.e.* each is unaltered in value by the addition of 2π to the variable. The tangent and cotangent have the period π. The sine, tangent, cosecant and cotangent belong to the class of odd functions; that is, they change sign when the sign of the variable is changed. The cosine and secant are even functions, since they remain unaltered when the sign of the variable is reversed.

Connexion with Theory of Complex Quantities.

The theory of the trigonometrical functions is intimately connected with that of complex numbers—that is, of numbers of the form $x+\iota y (\iota = \sqrt{-1})$. Suppose we multiply together, by the rules of ordinary algebra, two such numbers we have

$$(x_1 + \iota y_1)(x_2 + \iota y_2) = (x_1x_2 - y_1y_2) + \iota(x_1y_2 + x_2y_1).$$

We observe that the real part and the real factor of the imaginary part of the expression on the right-hand side of this equation are similar in form to the expressions which occur in the addition formulae for the cosine and sine of the sum of two angles; in fact, if we put $x_1 = r_1 \cos \theta_1$, $y_1 = r_1 \sin \theta_1$, $x_2 = r_2 \cos \theta_2$, $y_2 = r_2 \sin \theta_2$, the above equations becomes

$$r_1(\cos \theta_1 + \iota \sin \theta_1) \times r_2(\cos \theta_2 + \iota \sin \theta_2) = r_1 r_2(\cos \overline{\theta_1 + \theta_2} + \iota \sin \overline{\theta_1 + \theta_2}).$$

We may now, in accordance with the usual mode of representing complex numbers, give a geometrical interpretation of the meaning of this equation. Let P_1 be the point whose co-ordinates referred to rectangular axes Ox, Oy are x_1, y_1; then the point P_1 is employed to represent the number $x_1+\iota y_1$. In this mode or representation real numbers are measured along the axis of x and imaginary ones along the axis of y, additions being performed according to the parallelogram law. The points A, A_1 represent the numbers ± 1, the points a, a_1 the numbers $\pm \iota$. Let P_2 represent the expression $x_2+\iota y_2$ and P the expression $(x_1+\iota y_1)(x_2+\iota y_2)$. The quantities r_1, θ_1, r_2, θ_2 are the polar coordinates of P_1 and P_2 respectively, referred to O as origin and Ox as initial line; the above equation shows that $r_1\ r_2$ and $\theta_1+\theta_2$ are the polar co-ordinates of P; hence $OA : OP_1 :: OP_2 : OP$ and the angle POP_2 is equal to the angle P_1OA. Thus we have the following geometrical construction for the determination of the point P. On OP_2 draw a triangle similar to the triangle OAP_1 so that the sides OP_2, OP are homologous to the sides OA, OP_1, and so that the angle POP_2 is positive; then the vertex P represents the product of the numbers represented by P_1, P_2. If $x_2+\iota y_2$ were to be divided by $x_1+\iota y_1$ the triangle $OP'P_2$ would be drawn on the negative side of P_2, similar to the triangle OAP_1 and having the sides OP', OP_2 homologous to OA, OP_1, and P' would represent the quotient.

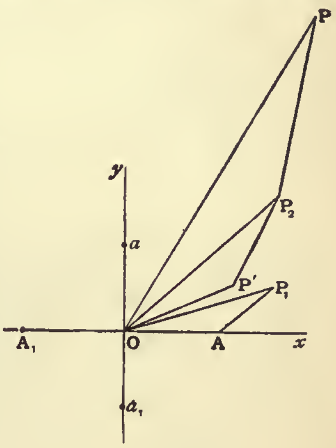

FIG. 8.

De Moivre's Theorem.

18. If we extend the above to n complex numbers by continual repetition of a similar operation, we have—

$$(\cos \theta_1 + \iota \sin \theta_1)(\cos \theta_2 + \iota \sin \theta_2) \ldots (\cos \theta_n + \iota \sin \theta_n) = \cos (\theta_1 = \theta_2 + \ldots + \theta_n) + \iota \sin (\theta_1 + \theta_2 + \ldots + \theta_n).$$

If $\theta_1 = \theta_2 = \ldots = \theta_n = \theta_1$, this equation becomes $(\cos \theta + \iota \sin \theta)^n = \cos n\theta + \iota \sin n\theta$; this shows that $\cos \theta + \iota \sin \theta$ is a value of $(\cos n\theta + \iota \sin n\theta)^{\frac{1}{n}}$. If now we change θ into θ/n, we see that $\cos \theta/n + \iota \sin \theta/n$ is a value of $(\cos \theta + \iota \sin \theta)^{\frac{1}{n}}$; raising each of these quantities to any positive integral power m, $\cos m\theta/n + \iota \sin m\theta/n$ is one value of $(\cos \theta + \iota \sin \theta)^{\frac{m}{n}}$. Also

$$\cos (-m\theta/n) + \iota \sin (-m\theta/n) = \frac{1}{\cos m\theta/n + \iota \sin m\theta/n};$$

hence the expression of the left-hand side is one value of $(\cos \theta + \iota \sin \theta)^{-m/n}$. We have thus De Moivre's theorem that $\cos k\theta + \iota \sin k\theta$ is always one value of $(\cos \theta + \iota \sin \theta)^k$, where k is any rational number. This theorem can be extended to the case in which k is irrational, if we postulate that a value of $(\cos \theta + \iota \sin \theta)^k$ denotes the limit of a sequence of corresponding values of $(\cos \theta + \iota \sin \theta)^{k_s}$, where $k_1, k_2 \ldots k_s \ldots$ is a sequence of rational numbers of which k is the limit, and further observe that as $\cos k\theta + \iota \sin k\theta$ is the limit of $\cos k_s\theta + \iota \sin k_s\theta$.

The n Roots of a Complex Quantity.

The principal object of De Moivre's theorem is to enable us to find all the values of an expression of the form $(a+\iota b)^{m/n}$, where m and n are positive integers prime to each other. If $a = r \cos \theta$, $b = r \sin \theta$, we require the values of $r^{m/n} (\cos \theta + \iota \sin \theta)^{m/n}$. One value is immediately furnished by the theorem; but we observe that since the expression $\cos \theta + \iota \sin \theta$ is unaltered by adding any multiple of 2π to θ, the n/mth power of $r^{m/n} (\cos \overline{m.\theta + 2s\pi}/n + \iota \sin \overline{m.\theta + 2s\pi}/n)$ is $a+\iota b$, if s is any integer; hence this expression is one of the values required. Suppose that for two values s_1 and s_2 of s the values of this expression are the same; then we must have $\overline{m.\theta + 2s_1\pi}/n - \overline{m.\theta + 2s_2\pi}/n$; a multiple of 2π, or $s_1 - s_2$ must be a multiple of n. Therefore, if we give s the values $0, 1, 2, \ldots n-1$ successively, we shall get n different values of $(a+\iota b)^{m/n}$, and these will be repeated if we give s other values; hence all the values of

$(a+\iota b)^{m/n}$ are obtained by giving s the values 0, 1, 2, ... $n-1$ in the expression $r^{m/n}$ $(\cos\ \overline{m.\theta+2s\pi/n}+\iota\sin\ \overline{m.\theta+2s\pi/n})$, where $r=(a^2+b^2)^{\frac{1}{2}}$ and $\theta=$arc tan b/a.

We now return to the geometrical representation of the complex numbers. If the points $B_1, B_2, B_3, \ldots B_n$ represent the expression $x+\iota y$, $(x+\iota y)^2$, $(x+\iota y)^3$, $\ldots(x+\iota y)^n$ respectively, the triangles OAB_1, OB_1B_2, ... $OB_{n-1}B_n$ are all similar. Let $(x+\iota y)^n=a+\iota b$, then the converse problem of finding the nth root of $a+\iota b$ is equivalent to the geometrical problem of describing such a series of triangles that OA is the first side of the first triangle and OB_n the second side of the nth. Now it is obvious that this geometrical problem has more solutions than one, since any number of complete revolutions round O may be made in travelling from B_1 to B_n. The first solution is that in which the vertical angle of each triangle is B_nOA/n; the second is that in which each is $(B_nOA+2\pi)/n$, in this case one complete revolution being made round O; the third has $(B_nOA+4\pi)/n$ for the vertical angle of each triangle; and so on. There are n sets of triangles which satisfy the required conditions.

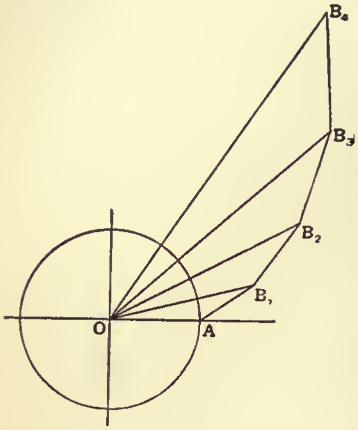

FIG. 9.

For simplicity we will take the case of the determination of the values of $(\cos\theta+\iota\sin\theta)^{\frac{1}{3}}$. Suppose B to represent the expression $\cos\theta+\iota\sin\theta$. If the angle AOP_1 is $\frac{1}{3}\theta$, P_1 represent the root $\cos\frac{1}{3}\theta+\iota\sin\frac{1}{3}\theta$; the angle AOB is filled up by the angles of the three similar triangles AOP_1, P_1Op_1, p_1OB. Also, if P_2, P_3 be such that the angles P_1OP_2 P_1OP_3 are $\frac{2}{3}\pi$, $\frac{4}{3}\pi$ respectively, the two sets of triangles AOP_2, P_2Op_3, p_3OB and AOP_3, P_3Op_2, p_2OB satisfy the conditions of similarity and of having OA, OB for the bounding sides; thus P_2, P_3 represent the roots $\cos\frac{1}{3}(\theta+2\pi)+\iota\sin\frac{1}{3}(\theta+2\pi)$, $\cos\frac{1}{3}(\theta+4\pi)+\iota\sin\frac{1}{3}(\theta+4\pi)$ respectively. If B coincides with A, the problem is reduced to that of finding the three cube roots of unity. One will be represented by A and the others by the two angular points of an equilateral triangle, with A as one angular point, inscribed in the circle.

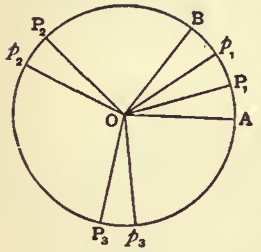

FIG. 10.

The problem of determining the values of the nth roots of unity is equivalent to the geometrical problem of inscribing a regular polygon of n sides in a circle. Gauss has shown in his *Disquisitiones arithmeticae* that this can always be done by the compass and ruler only when n is a prime of the form 2^p+1. The determination of the nth root of any complex number requires in addition, for its geometrical solution, the division of an angle into n equal parts.

The nth Roots of Unity.

19. We are now in a position to factorize an expression of the form $x^n-(a+\iota b)$. Using the values which we have obtained above for $(a+\iota b)^{1/n}$, we have

Factorizations.

$$x^n-(a+\iota b)=\underset{s=0}{\overset{s=n-1}{P}}\left[x-r^{\frac{1}{n}}\left(\cos\frac{\theta+2s\pi}{n}+\iota\sin\frac{\theta+2s\pi}{n}\right)\right]. \qquad (1)$$

If $b=0$, $a=1$, this becomes

$$x^n-1=\underset{s=0}{\overset{s=n-1}{P}}\left[x-\cos\frac{2s\pi}{n}-\iota\sin\frac{2s\pi}{n}\right]$$

$$=(x-1)(x+1)\underset{s=1}{\overset{s=\frac{1}{2}n-1}{P}}\left(x-\cos\frac{2s\pi}{n}\pm\iota\sin\frac{2s\pi}{n}\right)$$

$$=(x-1)(x+1)\underset{s=1}{\overset{s=\frac{1}{2}n-1}{P}}\left(x^2-2x\cos\frac{2s\pi}{n}+1\right)\ (n\text{ even}). \qquad (2)$$

$$x^n-1=(x-1)\underset{s=1}{\overset{s=\frac{1}{2}(n-1)}{P}}\left(x^2-2x\cos\frac{2s\pi}{n}+1\right) \qquad (n\text{ odd}). \qquad (3)$$

If in (1) we put $a=-1$, $b=0$, and therefore $\theta=\pi$, we have

$$x^n+1=\underset{s=0}{\overset{s=n-1}{P}}\left[x-\cos\frac{\overline{2s+1\pi}}{n}-\iota\sin\frac{\overline{2s+1\pi}}{n}\right]$$

$$=\underset{s=0}{\overset{s=\frac{1}{2}(n-2)}{P}}\left[x^2-2x\cos\frac{\overline{2s+1\pi}}{n}+1\right] \quad (n\text{ even}). \qquad (4)$$

$$x^n+1=(x+1)\underset{s=0}{\overset{s=\frac{1}{2}(n-3)}{P}}\left[x^2-2x\cos\frac{\overline{2s+1\pi}}{n}+1\right] \quad (n\text{ odd}). \qquad (5)$$

Also $x^{2n}-2x^ny^n\cos n\theta+y^{2n}$

$$=(x^n-y^n\,\overline{\cos n\theta+\iota\sin n\theta})(x^n-y^n\,\overline{\cos n\theta-\iota\sin n\theta})$$

$$=\underset{s=0}{\overset{s=n-1}{P}}\left(x-y\cos\frac{\theta+2s\pi}{n}\pm\iota\sin\frac{\theta+2s\pi}{n}\right)$$

$$=\underset{s=0}{\overset{s=n-1}{P}}\left[x^2-2xy\cos\theta+\frac{2s\pi}{n}+y^2\right]. \qquad (6)$$

Airy and Adams have given proofs of this theorem which do not involve the use of the symbol ι (see *Camb. Phil. Trans.*, vol. xi).

A large number of interesting theorems may be derived from De Moivre's theorem and the factorizations which we have deduced from it; we shall notice one of them.

Example of De Moivre's Theorem.

In equation (6) put $y=1/x$, take logarithms, and then differentiate each side with respect to x, and we get

$$\frac{2n(x^{2n-1}-x^{-2n-1})}{x^{2n}-2\cos n\theta+x^{-2n}}=\sum_{s=0}^{s=n-1}\frac{2(x-x^{-3})}{x^2-2\cos\theta+\frac{2s\pi}{n}+x^{-2}}.$$

Put $x^2=a/b$, then we have the expression

$$\frac{n(a^{2n}-b^{2n})}{(a^2-b^2)(a^{2n}-2a^nb^n\cos n\theta+b^{2n})}$$

for the sum of the series

$$\sum_{s=0}^{s=n-1}\frac{1}{a^2-2ab\cos\theta+\frac{2s\pi}{n}+b^2}.$$

20. Denoting the complex number $x+iy$ by z, let us consider the series $1+z+z^2/2!+\ldots+z^n/n!+\ldots$ This series converges uniformly and absolutely for all values of z whose moduli do not exceed an arbitrarily chosen positive number R. Consequently the function $E(z)$, defined as the limiting sum of the above series, is continuous in every finite domain. The two series representing $E(z_1)$ and $E(z_2)$, when multiplied together give the series represented by $E(z_1+z_2)$. In accordance with a known theorem, since the series for $E(z_1)$ $E(z_2)$ are absolutely convergent, we have $E(z_1)\times E(z_2)=E(z_1+z_2)$. From this fundamental relation, we deduce at once that $\{E(z)\}^n=E(nz)$, where n is any positive integer. The number $E(1)$, the sum of the convergent series $1+1+1/2!+1/3!\ldots$, is usually denoted by e; its value can be shown to be 2·718281828459.... It is known to be a transcendental number, *i.e.* it cannot be the root of any algebraical equation with rational coefficients; this was first established by Hermite. Writing $z=1$, we have $E(n)=e^n$, where n is a positive integer. If z has as a value a positive fraction p/q, we find that $\{E(p/q)\}^q=E(p)=e^p$; hence $E(p/q)$ is the real positive value of $e^{p/q}$. Again $E(-p/q)\times E(p/q)=E(0)=1$, hence $E(-p/q)$ is the real positive value of $e^{-p/q}$. It has been thus shown that for any real and rational number x, the value of $E(x)$ is the principal value of e^x. This result can be extended to irrational values of x, if we assume that e^x is for such a value of x defined as the limit of the sequence $e^{x_1}, e^{x_2}, \ldots$, where $x_1, x_2, \ldots$ is a sequence of rational numbers of which x is the limit, since $E(x_1)$, $E(x_2)$ ..., then converges to $E(x)$.

The Exponential Series.

Next consider $(1+z/m)^m$, where m is a positive integer. We have by the binomial theorem,

$$\left(1+\frac{z}{m}\right)^m=1+z+\left(1-\frac{1}{m}\right)\frac{z^2}{2!}+.+\left(1-\frac{1}{m}\right)\left(1-\frac{2}{m}\right)\ldots$$

$$\left(1-\frac{s-1}{m}\right)\frac{z^s}{s!}+\ldots+\left(\frac{z}{m}\right)^m.$$

Also $\left(1-\frac{1}{m}\right)\left(1-\frac{2}{m}\right)\ldots\left(1-\frac{s-1}{m}\right)$

lies between 1 and $1+\left(\frac{1}{m}+\frac{2}{m}+\ldots+\frac{s-1}{m}\right)$;

hence the product equals $1-\theta_s s.s-1/2m$ where θ_s is such that $0<\theta_s<1$.

We have now

$$\left(1+\frac{z}{m}\right)^m=1+z+\left(1-\frac{1}{m}\right)\frac{z^2}{2!}+\ldots+\left[1-\theta_s\frac{s.s-1}{2m}\right]\frac{z_s}{s!}+\ldots$$

$$+\left[1-\theta_m\frac{m-1}{2}\right]\frac{z^m}{m!}$$

$$=1+z+z^2/2!+\ldots+z^s/s!+R_s,$$

where

$$R_s=\frac{z^{s+1}}{(s+1)!}+\ldots+\frac{z^m}{m!}-\frac{z^2}{2m}\left\{1+\theta_3\frac{z}{1}+\ldots\right.$$

$$\left.+\theta_s\frac{z^{s-2}}{(s-2)!}+\ldots+\theta_m\frac{z^{m-2}}{(m-2)!}\right\}.$$

Since the series for $E(z)$ converges, s can be fixed so that for all values of $m>s$ the modulus of $z^{s+1}/(s+1)!+\ldots+z^m/m!$ is less than an arbitrarily chosen number $\frac{1}{2}\epsilon$. Also the modulus of $1+\theta_3z/1+\ldots+\theta_mz^{m-2}/(m-2)!$ is less than that of $1+1\,|z|/1!+|z|^2/2!+\ldots$, or of $e^{\text{mod}\,z}$, hence mod $R_s<\frac{1}{2}\epsilon+(1/2m)$. mod $(z^2e^s)<\epsilon$, if m be chosen sufficiently great. It follows that $\lim_{m=\infty}(1+z/m)^m=E(z)$, where z is any complex number. To evaluate $E(z)$, write $1+x/m=\rho\cos\phi$, $y/m=\rho\sin\phi$, then

$E(z)=\lim_{m=\infty}\{\rho^m(\cos m\phi+i\sin m\phi)\}$, by De Moivre's theorem. Since $\rho^m=\left(1+\frac{x}{m}\right)^m\left\{1+\frac{y^2}{m(\sqrt{m}+x/\sqrt{m})^2}\right\}^{\frac12 m}$, we have $\lim_{m=\infty}\rho^m =e^x.\lim_{m=\infty}\left\{1+\frac{y^2}{m(\sqrt m+x/\sqrt m)^2}\right\}^{\frac12 m}$. Let r be a fixed number less than $\sqrt m+x/\sqrt m$, then $\lim_{m=\infty}\left\{1+\frac{y^2}{m(\sqrt m+x\sqrt m)^2}\right\}^{\frac12 m}$ lies between 1 and $\lim_{m=\infty}\left\{1+\frac{y^2}{mr^2}\right\}^{\frac12 m}$, or between 1 and $e^{y^2/2r^2}$; hence since r can be taken arbitrarily large, the limit is 1. The limit of $m\phi$ or $m\tan^{-1}\{y/(x+m)\}$ is the same as that of $my/(x+m)$ which is y. Hence we have shown that $E(z)=e^x(\cos y+i\sin y)$.

Exponential Values of Trigonometrical Functions.

21. Since $E(x+iy)=i^x(\cos y+\sin y$, we have $\cos y+i\sin y=E(iy)$, and $\cos y-i\sin y=E(-iy)$. Therefore $\cos y=\frac12\{E(iy)+E(-iy)\}$, $\sin y=\frac12 i\{E(iy)-E(-iy)\}$; and using the series defined by $E(iy)$ and $E(-iy)$, we find that $\cos y=1-y^2/2!+y^4/4!-\ldots$, $\sin y=y-y^3/3!+y^5/5!-\ldots$, where y is any real number. These are the well-known expansions of $\cos y$, $\sin y$ in powers of the circular measure y. Where z is a complex number, the symbol e^z may be defined to be such that its *principal value* is $E(z)$; thus the principal values of e^{iy}, e^{-iy} are $E(iy)$, $E(-iy)$. The above expressions for $\cos y$, $\sin y$ may then be written $\cos y=\frac12(e^{iy}+e^{-iy})$, $\sin y=\frac12 i(e^{iy}-e^{-iy})$. These are known as the exponential values of the cosine and sine. It can be shown that the symbol e^z as defined here satisfies the usual laws of combination for exponents.

Analytical Definitions of Trigonometrical Functions.

22. The two functions $\cos z$, $\sin z$ may be defined for all complex or real values of z by means of the equations $\cos y=\frac12\{E(z)+E(-z)\}$, $\sin z=(\frac{1}{2i})\{E(z)-E(-z)\}$, where $E(z)$ represents the sum-function of $1+z+z^2/2!+\ldots+z^n/n!+\ldots$ For real values of z this is in accordance with the ordinary definitions, as appears from the series obtained above for $\cos y$, $\sin y$. The fundamental properties of $\cos z$, $\sin z$ can be deduced from this definition. Thus $\cos z+i\sin z=E(z)$, $\cos z-i\sin z=E(-iz)$; therefore $\cos^2 z+\sin^2 z=E(iz).E(-iz)=1$. Again $\cos(z_1+z_2)$ is given by $\frac12\{E(iz_1+iz_2)+E(-iz_1-iz_2)\}=\frac12\{E(iz_1)E(iz_2)+E(-iz_1)E(-iz_2)\}$ or $\frac14\{E(iz_1)+E(-iz_1)\}\{E(iz_2)+E(-iz_2)\}+\frac14\{E(iz_1)-E(-iz_1)\}\{E(iz_2)-E(-iz_2)\}$, whence we have $\cos(z_1+z_2)=\cos z_1\cos z_2-\sin z_1\sin z_2$. Similarly, we find that $\sin(z_1+z_2)=\sin z_1\cos z_2+\cos z_1\sin z_2$. Again the equation $E(z)=1$ has no real roots except $z=0$, for $e^y>1$, if z is real and >0. Also $E(z)=1$ has no complex root $\alpha+i\beta$, for $\alpha-i\beta$ would then also be a root, and $E(2\alpha)=E(\alpha+i\beta)E(\alpha-i\beta)=1$, which is impossible unless $\alpha=0$. The roots of $E(z)=1$ are therefore purely imaginary (except $z=0$); the smallest numerically we denote by $2i\pi$, so that $E(2i\pi)=1$. We have then $E(2i\pi r)=\{E(2i\pi)\}^r=1$, if r is any integer; therefore $2i\pi r$ is a root. It can be shown that no root lies between $2i\pi r$ and $2(r+1)i\pi$; and thus that all the roots are given by $z=\pm 2i\pi r$. Since $E(y+2i\pi)=E(z)E(2i\pi)=E(z)$, we see that $E(z)$ is periodic, of period $2i\pi$. It follows that $\cos z$, $\sin z$ are periodic, of periods 2π. The number here introduced may be identified with the ratio of the circumference to the diameter of a circle by considering the case of real values of z.

Expansion of Powers of Sines and Cosines in Series of Sines and Cosines of Multiple Arc.

23. Consider the binomial theorem

$$(a+b)^n=a^n+na^{n-1}b+\frac{n(n-1)}{2!}a^{n-2}b^2+\ldots+\frac{n(n-1)\ldots(n-r+1)}{r!}a^{n-r}b^r+\ldots+b^n.$$

Putting $a=e^{i\theta}$, $b=e^{-i\theta}$, we obtain

$$(2\cos\theta)^n=2\cos n\theta+n2\cos\overline{n-2\theta}+\frac{n(n-1)}{2!}2\cos\overline{n-4\theta}+\ldots+\frac{n(n-1)\ldots(n-r+1)}{r!}2\cos(n-2r)\theta+\ldots$$

When n is odd the last term is $2\frac{n(n-1)\ldots\frac12(n+3)}{\frac12(n-1)!}\cos\theta$, and when n is even it is $\frac{n(n-1)\ldots(\frac12 n+1)}{\frac12 n!}$.

If we put $a=e^{i\theta}$, $b=-e^{-i\theta}$, we obtain the formula

$$(-1)^{\frac12 n}(2\sin\theta)^n=2\cos n\theta-2n\cos(n-2)\theta+\frac{n(n-1)}{1.2}2\cos(n-4)\theta-\ldots+(-1)^{n-r}\frac{n(n-1)\ldots(n-r+1)}{r!}2\cos(n-2r)\theta\ldots+(-1)^{\frac n2}\frac{n(n-1)\ldots(\frac12 n+1)}{\frac12 n!}$$

when n is even, and

$$(-1)^{\frac12(n-1)}(2\sin\theta)^n=2\sin n\theta-n.2\sin(n-2)\theta+\frac{n(n-1)}{1.2}2\sin(n-4)\theta\ldots+(-)^{\frac{n-1}{2}}\frac{n(n-1)\ldots\frac12(n+3)}{\frac12(n-1)!}\sin\theta$$

when n is odd. These formulae enable us to express any positive integral power of the sine or cosine in terms of sines or cosines of multiples of the argument. There are corresponding formulae when n is not a positive integer.

Expansion of Sines and Cosines of Multiple Arcs in Powers of Sines and Cosines of Arc.

Consider the identity $\log(1-px)+\log(1-qx)=\log(1-\overline{p+q}x+pqx^2)$. Expand both sides of this equation in powers of x, and equate the coefficients of x^n, we then get

$$p^n+q^n=(p+q)^n-n(p+q)^{n-2}pq+\frac{n(n-3)}{2!}(p+q)^{n-4}p^2q^2+\ldots+(-1)^r\frac{n(n-r-1)(n-r-2)\ldots(n-2r+1)}{r!}(p+q)^{n-2r}p^rq^r+\ldots$$

If we write this series in the reverse order, we have

$$p^n+q^n=2(-1)^{\frac n2}\left[(pq)^{\frac n2}-\frac{n^2}{2!}(pq)^{\frac n2-1}\left(\frac{p+q}{2}\right)^2+\frac{n^2(n^2-2^2)}{4!}(pq)^{\frac n2-2}\left(\frac{p+q}{2}\right)^4-\frac{n^2(n^2-2^2)(n^2-4^2)}{6!}(pq)^{\frac n2-3}\left(\frac{p+q}{2}\right)^6+\ldots+(-1)^{\frac n2}\tfrac12(p+q)^n\right]$$

when n is even, and

$$p^n+q^n=2(-1)^{\frac{n-1}{2}}\left[n(pq)^{\frac{n-1}{2}}\left(\frac{p+q}{2}\right)-\frac{n(n^2-1^2)}{3!}(pq)^{\frac{n-3}{2}}\left(\frac{p+q}{2}\right)^3+\frac{n(n^2-1^2)(n^2-3^2)}{5!}(pq)^{\frac{n-5}{2}}\left(\frac{p+q}{2}\right)^5+\ldots+(-1)^{\frac{n-1}{2}}\tfrac12(p+q)^n\right]$$

when n is odd. If in these three formulae we put $p=e^{i\theta}$, $q=e^{-i\theta}$, we obtain the following series for $\cos n\theta$:—

$$2\cos n\theta=(2\cos\theta)^n-n(2\cos\theta)^{n-2}+\frac{n(n-3)}{2!}(2\cos\theta)^{n-4}-\ldots+(-1)^r\frac{n(n-r-1)(n-r-2)\ldots(n-2r+1)}{r!}(2\cos\theta)^{n-2r}+\ldots \quad (7)$$

when n is any positive integer;

$$(-1)^{\frac n2}\cos u\theta=1-\frac{n^2}{2!}\cos^2\theta+\frac{n^2(n^2-2^2)}{4!}\cos^4\theta-\frac{n^2(n^2-2^2)(n^2-4^2)}{6!}\cos^6\theta+\ldots+(-1)^{\frac n2}2^{n-1}\cos^n\theta \quad (8)$$

when n is an even positive integer;

$$(-1)^{\frac{n-1}{2}}\cos n\theta=n\cos n\theta-\frac{n(n^2-1^2)}{3!}\cos^3\theta+\frac{n(n^2-1^2)(n^2-3^2)}{5!}\cos^5\theta-\ldots+(-1)^{\frac{n-1}{2}}2^{n-1}\cos^n\theta \quad (9)$$

when n is odd. If in the same three formulae we put $p=e^{i\theta}$, $q=-e^{-i\theta}$, we obtain the following four formulae:—

$$(-1)^{\frac n2}2\cos n\theta=(2\sin\theta)^n-n(2\sin\theta)^{n-2}+\frac{n(n-3)}{2!}(2\sin\theta)^{n-4}-\ldots+(-1)^r\frac{n(n-r-1)\ldots(n-2r-1)}{r!}(2\sin\theta)^{n-2r}+\ldots(n\text{ even}); \quad (10)$$

$$(-1)^{\frac{n-1}{2}}2\sin n\theta=\text{the same series }(n\text{ odd}); \quad (11)$$

$$\cos n\theta=1-\frac{n^2}{2!}\sin^2\theta+\frac{n^2(n^2-2^2)}{4!}\sin^4\theta-\frac{n^2(n^2-2^2)(n^2-4^2)}{6!}\sin^6\theta+\ldots+2^{n-1}\sin^n\theta\ (n\text{ even}); \quad (12)$$

$$\sin n\theta=n\sin\theta-\frac{n(n^2-1^2)}{3!}\sin^3\theta+\frac{n(n^2-1^2)(n^2-3^2)}{5!}\sin^5\theta-\ldots+(-1)^{\frac{n-1}{2}}2^{n-1}\sin^n\theta\ (n\text{ odd}). \quad (13)$$

Next consider the identity $\frac{p}{1-px}-\frac{q}{1-qx}=\frac{p-q}{1-(p+q)x+pqx^2}$.

Expand both sides of this equation in powers of x, and equate the coefficients of x^{n-1}, then we obtain the equation

$$\frac{p^n-q^n}{p-q}=(p+q)^{n-1}-(n-2)(p+q)^{n-3}pq+\frac{(n-3)(n-4)}{2!}(p+q)^{n-5}p^2q^2-\ldots\because(-1)^r\frac{(n-r-1)(n-r-2)\ldots(n-2r)}{r!}(p+q)^{n-2r-1}p^rq^r+\ldots$$

If, as before, we write this in the reverse order, we have the series

$$(-1)^{\frac n2-1}\left[n\left(\frac{p+q}{2}\right)(pq)^{\frac n2-1}-\frac{n(n^2-2^2)}{3!}\left(\frac{p+q}{2}\right)^3(pq)^{\frac n2-3}+\frac{n(n^2-2^2)(n^2-4^2)}{5!}\left(\frac{p+q}{2}\right)^5(pq)^{\frac n2-5}+\ldots+(-1)^{\frac n2-1}(p+q)^{n-1}\right]$$

when n is even, and

$$(-1)^{\frac{n-1}{2}}\left[(pq)^{\frac{n-1}{2}} - \frac{n^2-1^2}{2!}\left(\frac{p+q}{2}\right)^2 (pq)^{\frac{n-3}{2}} + \frac{(n^2-1^2)(n^2-3^2)}{4!}\left(\frac{p+q}{2}\right)^4 (pq)^{\frac{n-5}{2}} + \dots + (-1)^{\frac{n-1}{2}} (p+q)^{n-1}\right]$$

when n is odd. If we put $p=e^{\iota\theta}$, $q=e-{}^{\iota\theta}$, we obtain the formulae

$$\sin n\theta = \sin\theta\left\{(2\cos\theta)^{n-1} - (n-2)(2\cos\theta)^{n-3} + \frac{(n-3)(n-4)}{2!}(2\cos\theta)^{n-5} + (-1)^r \frac{(n-r-1)(n-r-2\ \dots\ (n-2r)}{r!}(2\cos\theta)^{n-2r-1} + \dots\right\} \quad (14)$$

where n is any positive integer;

$$(-1)^{\frac{n}{2}-1}\sin n\theta = \sin\theta\left\{n\cos\theta - \frac{n(n^2-2^2)}{3!}\cos^3\theta + \frac{n(n^2-2^2)(n^2-4^2)}{5!}\cos^5 - \dots + (-1)^{\frac{n}{2}-1}(2\cos\theta)^{n-1}\right\} (n \text{ even}); \quad (15)$$

$$(-1)^{\frac{n-1}{2}}\sin n\theta = \sin\theta\left\{1 - \frac{n^2-1^2}{2!}\cos^2\theta + \frac{(n^2-1^2)(n^2-3^2)}{4!}\cos^4\theta - \dots + (-1)^{\frac{n}{2}-1}(2\cos\theta)^{n-1}\right\} (n \text{ odd}). \quad (16)$$

If we put in the same three formulae $p=e^{\iota\theta}$, $q=-e^{-\iota\theta}$, we obtain the series

$$(-1)^{\frac{n-2}{2}}\sin n\theta = \cos\theta\left[\sin^{n-1}\theta - (n-2)\sin^{n-3}\theta + \frac{(n-3)(n-4)}{2!}\sin^{n-5}\theta - \dots + (-1)^r\frac{(n-r-1)(n-r-2)\dots(n-2r)}{r!}\sin^{n-2r-1}\theta + \dots\right] (n \text{ even}); \quad (17)$$

$$(-1)^{\frac{n-1}{2}}\cos n\theta = \text{the same series } (n \text{ odd}); \quad (18)$$

$$\sin n\theta = \cos\theta\left\{n\sin\theta - \frac{n(n^2-2^2)}{3!}\sin^3\theta + \frac{n(n^2-2^2)(n^2-4^2)}{5!}\sin^5\theta + \dots + (-1)^{\frac{n}{2}-1}(2\sin\theta)^{n-1}\right\} (n \text{ even}); \quad (19)$$

$$\cos n\theta = \cos\theta\left\{1 - \frac{n^2-1^2}{2!}\sin^2\theta + \frac{(n^2-1^2)(n^2-3^2)}{4!}\sin^4\theta - \dots + (2\sin\theta)^{n-1}\right\} (n \text{ odd}). \quad (20)$$

We have thus obtained formulae for $\cos n\theta$ and $\sin n\theta$ both in ascending and in descending powers of $\cos\theta$ and $\sin\theta$. Vieta obtained formulae for chords of multiple arcs in powers of chords of the simple or complementary arcs equivalent to the formulae (13) and (19) above. These are contained in his work *Theoremata ad angulares sectiones.* Jacques Bernoulli found formulae equivalent to (12) and (13) (*Mém. de l' Académie des Sciences*, 1702), and transformed these series into a form equivalent to (10) and (11). Jean Bernoulli published in the *Acta eruditorum* for 1701, among other formulae already found by Vieta, one equivalent to (17). These formulae have been extended to cases in which n is fractional, negative or irrational; see a paper by D. F. Gregory in *Camb. Math. Journ.* vol. iv., in which the series for $\cos n\theta$, $\sin n\theta$ in ascending powers of $\cos\theta$ and $\sin\theta$ are extended to the case of a fractional value of n. These series have been considered by Euler in a memoir in the *Nova acta*, vol. ix., by Lagrange in his *Calcul des fonctions* (1806), and by Poinsot in *Recherches sur l'analyse des sections angulaires* (1825).

Theory of Logarithms.

24. The general definition of Napierian logarithms is that, if $e^{x+\iota y}=a+\iota b$, then $x+\iota y=\log(a+\iota b)$. Now we know that $e^{x+\iota y}=e^x\cos y+\iota e^x\sin y$; hence $e^x\cos y=a$, $e^x\sin y=b$, or $e^x=(a^2+b^2)^{\frac{1}{2}}$, $y=\text{arc tan } b/a\pm m\pi$, where m is an integer. If $b=0$, then m must be even or odd according as a is positive or negative; hence

$$\log_e(a+\iota b)=\log_e(a^2+b^2)^{\frac{1}{2}}+\iota\,(\text{arc tan } b/a\pm 2n\pi)$$

or

$$\log_e(a+\iota b)=\log_e(a^2+b^2)^{\frac{1}{2}}+\iota\,(\text{arc tan } b/a\pm\overline{2n+\pi}),$$

according as a is positive or negative. Thus the logarithm of any complex or real quantity is a multiple-valued function, the difference between successive values being $2\pi\iota$; in particular, the most general form of the logarithm of a real positive quantity is obtained by adding positive or negative multiples of $2\pi\iota$ to the arithmetical logarithm. On this subject, see De Morgan's *Trigonometry and Double Algebra*, ch. iv., and a paper by Professor Cayley in vol. ii. of *Proc. London Math. Soc.*

Hyperbolic Trigonometry.

25. We have from the definitions given in § 21, $\cos\iota y=\frac{1}{2}(e^y+e^{-y})$ and $\sin\iota y=\frac{1}{2}i(e^y-e^{-y})$. The expressions, $\frac{1}{2}(e^y+e^{-y})$, $\frac{1}{2}(e^y-e^{-y})$ are said to define the hyperbolic cosine and sine of y and are written $\cosh y$, $\sinh y$; thus $\cosh y=\cos\iota y$, $\sinh y=-\iota\sin\iota y$. The functions $\cosh y$, $\sinh y$ are connected with the rectangular hyperbola in a manner analogous to that in which the cosine and sine are connected with the circle. We may easily show from the definitions that

$$\cos^2(x+\iota y)+\sin^2(x+\iota y)=1,$$
$$\cosh^2 y-\sinh^2 y=1;$$
$$\cos(x+\iota y)=\cos x\cosh y-i\sin x\sinh y,$$
$$\sin(x+\iota y)=\sin x\cosh y+\iota\cos x\sinh y,$$
$$\cosh(\alpha+\beta)=\cosh\alpha\cosh\beta+\sinh\alpha\sinh\beta,$$
$$\sinh(\alpha+\beta)=\sinh\alpha\cosh\beta+\cosh\alpha\sinh\beta.$$

These formulae are the basis of a complete hyperbolic trigonometry. The connexion of these functions with the hyperbola was first pointed out by Lambert.

Expansion of an Angle in Powers of its Sine.

26. If we equate the coefficients of n on both sides of equation (13), this process requiring, however, a justification of its validity, we get

$$\theta=\sin\theta+\frac{1}{2}\,\frac{\sin^3\theta}{3}+\frac{1.3}{2.4}\,\frac{\sin^5\theta}{5}+\frac{1.3.5}{2.4.6}\,\frac{\sin^7\theta}{7}+\dots; \quad (21)$$

θ must lie between the values $\pm\frac{1}{2}\pi$. This equation may also be written in the form

$$\text{arc sin } x=x+\frac{1}{2}\,\frac{x^3}{3}+\frac{1.3}{2.4}\,\frac{x^5}{5}+\frac{1.3.5}{2.4.6}\,\frac{x^7}{7}+\dots$$

when x lies between ± 1.

By equating the coefficients of n^2 on both sides of equation (12) we get

$$\theta^2=\sin^2\theta+\frac{2}{3}\,\frac{\sin^4\theta}{2}+\frac{2.4}{3.5}\,\frac{\sin^6\theta}{3}+\frac{2.4.6}{3.5.7}\,\frac{\sin^8\theta}{4}+\dots, \quad (22)$$

which may also be written in the form

$$(\text{arc sin } x)^2=x^2+\frac{2}{3}\,\frac{x^4}{2}+\frac{2.4}{3.5}\,\frac{x^6}{3}+\frac{2.4.6}{3.5.7}\,\frac{x^8}{4}+\dots$$

when x is between ± 1. Differentiating this equation with regard to x, we get

$$\frac{\text{arc sin } x}{\sqrt{1-x^2}}=x+\frac{2}{3}x^3+\frac{2.4}{3.5}x^5+\frac{2.4.6}{3.5.7}x^7+\dots;$$

if we put $\text{arc sin } x=\text{arc tan } y$, this equation becomes

$$\text{arc tan } y=\frac{y}{1+y^2}\left\{1+\frac{2}{3}\,\frac{y^2}{1+y^2}+\frac{2.4}{3.5}\left(\frac{y^2}{1+y^2}\right)^2+\dots\right\}. \quad (23)$$

This equation was given with two proofs by Euler in the *Nova acta* for 1793.

It can be shown that if mod $x<1$, then for any such real or complex value of x, a value of $\log_e(1+x)$ is given by the sum of the series $x^1-x^2/2+x^3/3-\dots$

We then have

$$\frac{1}{2}\log\frac{1+x}{1-x}=x+\frac{x^3}{3}+\frac{x^5}{5}+\frac{x^7}{7}+\dots;$$

Gregory's Series.

put ιy for x, the left side then becomes $\frac{1}{2}\{\log(1+\iota y)-\log(1-\iota y)\}$ or ι arc tan $y\pm\iota n\pi$;

hence
$$\text{arc tan } y\pm n\pi=y-\frac{y^3}{3}+\frac{y^5}{5}-\frac{y^7}{7}+\dots$$

The series is convergent if y lies between ± 1; if we suppose arc tan y restricted to values between $\pm\frac{1}{4}\pi$, we have

$$\text{arc tan } y=y-\frac{y^3}{3}+\frac{y^5}{5}-\dots, \quad (24)$$

which is Gregory's series.

Series for Calculation of π.

Various series derived from (24) have been employed to calculate the value of π. At the end of the 17th century π was calculated to 72 places of decimals by Abraham Sharp, by means of the series obtained by putting arc tan $y=\pi/6$, $y=1/\sqrt{3}$ in (24). The calculation is to be found in Sherwin's *Mathematical Tables* (1742). About the same time J. Machin employed the series obtained from the equation 4 arc tan $\frac{1}{5}$ $-$ arc tan $\frac{1}{239}=\frac{1}{4}\pi$ to calculate π to 100 decimal places. Long afterwards Euler employed the series obtained from $\frac{1}{4}\pi=$ arc tan $\frac{1}{2}+$ arc tan $\frac{1}{3}$, which, however, gives less rapidly converging series (Introd., *Anal. infin.* vol. i.). T. F. de Lagny employed the formula arc tan $1/\sqrt{3}=\pi/6$ to calculate π to 127 places; the result was communicated to the Paris Academy in 1719. G. Vega calculated π to 140 decimal places by means of the series obtained from the equation $\frac{1}{4}\pi=5$ arc tan $\frac{1}{7}+2$ arc tan $\frac{3}{79}$. The formula $\frac{1}{4}\pi=$ arc tan $\frac{1}{2}+$arc tan $\frac{1}{5}+$arc tan $\frac{1}{8}$ was used by J. M. Z. Dase to calculate π to 200 decimal places. W. Rutherford used the equation $\pi=4$ arc tan $\frac{1}{5}$ $-$ arc tan $\frac{1}{70}$ $+$ arc tan $\frac{1}{99}$.

If in (23) we put $y=\frac{1}{3}$ and $\frac{1}{7}$, we have

$$\pi=8\text{ arc tan }\tfrac{1}{3}+4\text{ arc tan }\tfrac{1}{7}=2{\cdot}4\left\{1+\frac{2}{3}\cdot\frac{1}{10}+\frac{2.4}{3.5}\,\frac{1}{10^2}+\dots\right\}+{\cdot}56\left\{1+\frac{2}{3}\cdot\frac{2}{100}+\frac{2.4}{3.5}\left(\frac{2}{100}\right)^2+\dots\right\},$$

a rapidly convergent series for π which was first given by Hutton in *Phil. Trans.* for 1776, and afterwards by Euler in *Nova acta* for 1793. Euler gives an equation deduced in the same manner from the identity $\pi=20$ arc tan $\frac{1}{7}+8$ arc tan $\frac{3}{79}$. The calculation of π has been carried out to 707 places of decimals; see *Proc. Roy. Soc.* vols. xxi. and xxii.; also CIRCLE.

27. We shall now obtain expressions for sin x and cos x as infinite products of rational factors. We have

Factorization of Sine and Cosine.

$$\sin x = 2\sin\frac{x}{2}\sin\frac{x+\pi}{2} = 2^3\sin\frac{x}{4}\sin\frac{x+\pi}{4}\sin\frac{x+2\pi}{4}\sin\frac{x+3\pi}{4};$$

proceeding continually in this way with each factor, we obtain

$$\sin x = 2^{n-1}\sin\frac{x}{n}\sin\frac{x+\pi}{n}\sin\frac{x+2\pi}{n}\ldots\sin\frac{x+\overline{n-1}\pi}{n},$$

where n is any positive integral power of 2. Now

$$\sin\frac{x+r\pi}{n}\sin\frac{x+n-r\pi}{n} = \sin\frac{x+r\pi}{n}\sin\frac{\overline{r\pi-x}}{n} = \sin^2\frac{r\pi}{n} - \sin^2\frac{x}{n},$$

and
$$\sin\frac{x+\frac{1}{2}n\pi}{n} = \cos\frac{x}{n}.$$

Hence the above may be written

$$\sin x = 2^{n-1}\sin\frac{x}{n}\left(\sin^2\frac{\pi}{n} - \sin^2\frac{x}{n}\right)\left(\sin^2\frac{2\pi}{n} - \sin^2\frac{x}{n}\right)\ldots\left(\sin^2\frac{k\pi}{n} - \sin^2\frac{x}{n}\right)\cos\frac{x}{n},$$

where $k = \frac{1}{2}n = 1$. Let x be indefinitely small, then we have

$$1 = \frac{2^{n-1}}{n}\sin^2\frac{\pi}{n}\sin^2\frac{2\pi}{n}\ldots\sin^2\frac{k\pi}{n};$$

hence

$$\sin x = n\sin\frac{x}{n}\cos\frac{x}{n}\left(1-\frac{\sin^2 x/n}{\sin^2\pi/n}\right)\left(1-\frac{\sin^2 x/n}{\sin^2 2\pi/n}\right)\ldots\left(1-\frac{\sin^2 x/n}{\sin^2 k\pi/n}\right).$$

We may write this

$$\sin x = n\sin\frac{x}{n}\cos\frac{x}{n}\left(1-\frac{\sin^2 x/n}{\sin^2\pi/n}\right)\ldots\left(1-\frac{\sin^2 x/n}{\sin^2 m\pi/n}\right)R,$$

where R denotes the product

$$\left(1-\frac{\sin^2 x/n}{\sin^2\overline{m+1}\pi/n}\right)\left(1-\frac{\sin^2 x/n}{\sin^2\overline{m+2}\pi/n}\right)\ldots\left(1-\frac{\sin^2 x/n}{\sin^2 k\pi/n}\right),$$

and m is any fixed integer independent of n. It is necessary, when we make n infinite, to determine the limiting value of the quantity R; then, since the limit of $\frac{\sin x}{n\sin x/n\cos x/n}$ is $\frac{\sin x}{x}$, and that of $\frac{\sin m\pi/n}{m\pi/n}$ is unity, we have

$$\frac{\sin x}{x} = \left(1-\frac{x^2}{\pi^2}\right)\left(1-\frac{x^2}{2^2\pi^2}\right)\ldots\left(1-\frac{x^2}{m^2\pi^2}\right)\lim_{m=\infty} R.$$

The modulus of $R-1$ is less than

$$\left(1+\frac{\rho^2}{\sin^2\overline{m+1}\pi/n}\right)\left(1+\frac{\rho^2}{\sin^2\overline{m+2}\pi/n}\right)\ldots\left(1+\frac{\rho^2}{\sin^2 k\pi/n}\right)-1,$$

where $\rho = \text{mod. }\sin x/n$. Now $e^{A\rho^2} > 1+A\rho^2$, if A is positive; hence mod. $(R-1)$ is less than exp. $\{\rho^2(\operatorname{cosec}^2\overline{m+1}\pi/n + \ldots + \operatorname{cosec}^2 k\pi/n)-1$, or than exp. $\frac{1}{4}\rho^2 n^2\{1/(m+1)^2+\ldots+1/k^2\}-1$, or than exp. $\{\rho^2 n^2/4m^2\}-1$. Now $\rho^2 = \sin^2\alpha/n.\cosh^2\beta/n + \cos^2\alpha/n.\sinh^2\beta/n$, if $x = \alpha+i\beta$; or $\rho^2 = \sin^2\alpha/n + \sinh^2\beta/n$. Hence $\lim_{n=\infty}\rho^2 n^2 = \alpha^2+\beta^2$, $\lim_{n=\infty}\rho n = \text{mod. } x$. It follows that $\text{mod.}_{n=\infty}(R-1)$ is between 0 and exp. $\{(\text{mod. }4)^2/xm^2\}-1$, and the latter may be made arbitrarily small by taking m large enough. It has now been shown that $\sin x = x(1-x^2/\pi^2)(1-x^2/2^2\pi^2)\ldots(1-x^2/m^2\pi^2)(1+\epsilon_m)$, where mod. ϵ_m decreases indefinitely as m is increased indefinitely. When m is indefinitely increased this becomes

$$\sin x = x\left(1-\frac{x^2}{\pi^2}\right)\left(1-\frac{x^2}{2^2\pi^2}\right)\ldots = x\mathop{P}_{n=1}^{n=\infty}\left(1-\frac{x^2}{n^2\pi^2}\right). \qquad (25)$$

This has been shown to hold for any real or complex value of x. The expression for cos x in factors may be found in a similar manner by means of the equation $\cos x = 2\sin\frac{\pi-2x}{4}\cos\frac{3\pi-2x}{4}$, or may be deduced thus

$$\cos x = \frac{\sin 2x}{2\sin x} = \frac{P\left(1-\frac{4x^2}{n^2\pi^2}\right)}{P\left(1-\frac{x^2}{n^2\pi^2}\right)} = \left(1-\frac{4x^2}{\pi^2}\right)\left(1-\frac{4x^2}{3^2\pi^2}\right)\left(1-\frac{4x^2}{5^2\pi^2}\right)\ldots$$

$$= \mathop{P}_{n=0}^{n=\infty}\left(1-\frac{4x^2}{(2n+1)^2\pi^2}\right). \qquad (26)$$

If we change x into ιx, we have the formulae for sinh x, cosh x as infinite products—

$$\sinh x = x\mathop{P}_{n=0}^{n=\infty}\left(1+\frac{x^2}{n^2\pi^2}\right),\ \cosh x = \mathop{P}_{n=0}^{n=\infty}\left(1+\frac{4x^2}{(2n+1)^2\pi^2}\right).$$

In the formula for sin x as an infinite product put $x = \frac{1}{2}\pi$, we then get $1 = \frac{\pi}{2}\cdot\frac{1.3.3.5.5\ldots}{2.2.4.4.6\ldots}$; if we stop after $2n$ factors in the numerator and denominator, we obtain the approximate equation

$$1 = \frac{\pi}{2}\frac{1^2.3^2.5^2\ldots(2n-1)^2}{2^2.4^2.6^2\ldots\ (2n)^2}.(2n+1)$$

or $\frac{2.4.6\ldots2n}{1.3.5\ldots2n-1} = \sqrt{n\pi}$, where n is a large integer. This expression was obtained in a quite different manner by Wallis (*Arithmetica infinitorum*, vol. i. of *Opp.*).

28. We have

Series for Cot, Cosec, Tan and Sec.

$$\frac{\sin(x+y)}{\sin x} = \frac{(x+y)P\left(1+\frac{x+y}{n\pi}\right)}{xP\left(1+\frac{x}{n\pi}\right)},$$

or $\cos y + \sin y\cot x$

$$= \left(1+\frac{y}{x}\right)\left(1+\frac{y}{x+\pi}\right)\left(1+\frac{y}{x-\pi}\right)\left(1+\frac{y}{x+2\pi}\right)\left(1+\frac{y}{x-2\pi}\right)\ldots$$

Equating the coefficients of the first power of y on both sides we obtain the series

$$\cot x = \frac{1}{x}+\frac{1}{x+\pi}+\frac{1}{x-\pi}+\frac{1}{x+2\pi}+\frac{1}{x-2\pi}+\ldots \qquad (27)$$

From this we may deduce a corresponding series for cosec x, for, since $\operatorname{cosec} x = \cot\frac{1}{2}x - \cot x$, we obtain

$$\operatorname{cosec} x = \frac{1}{x}-\frac{1}{x+\pi}-\frac{1}{x-\pi}+\frac{1}{x+2\pi}+\frac{1}{x-2\pi}-\frac{1}{x+3\pi}-\frac{1}{x-3\pi}+\ldots \qquad (28)$$

By resolving $\frac{\cos(x+y)}{\cos x}$ into factors we should obtain in a similar manner the series

$$\tan x = \frac{2}{\pi-2x}-\frac{2}{\pi+2x}+\frac{2}{3\pi-2x}-\frac{2}{3\pi+2x}+\frac{2}{5\pi-2x}-\frac{2}{5\pi+2x}+\ldots, \qquad (29)$$

and thence

$$\sec x = \tan\left(\frac{\pi}{4}+\frac{x}{2}\right)-\tan x = \frac{2}{\pi-2x}+\frac{2}{\pi+2x}-\frac{2}{3\pi-2x}-\frac{2}{3\pi+2x}+\ldots \qquad (30)$$

These four formulae may also be derived from the product formulae for sin x and cos x by taking logarithms and then differentiating. Glaisher has proved them by resolving the expressions for cos x/sin x and 1/sin x ... as products into partial fractions (see *Quart. Journ. Math.*, vol. xvii.). The series for cot x may also be obtained by a continued use of the equation $\cot x = \frac{1}{2}\{\cot\frac{1}{2}x + \cot\frac{1}{2}(x+\pi)\}$ (see a paper by Dr Schröter in Schlömilch's *Zeitschrift*, vol. xiii.).

Various series for π may be derived from the series (27), (28), (29), (30), and from the series obtained by differentiating them one or more times. For example, in the formulae (27) and (28), by putting $x = \pi/n$ we get

Series for π derived from Series for Cot and Cosec.

$$\pi = n\tan\frac{\pi}{n}\left\{1-\frac{1}{n-1}+\frac{1}{n+1}-\frac{1}{2n-1}+\frac{1}{2n+1}\ldots\right\},$$

$$\pi = n\sin\frac{\pi}{n}\left\{1+\frac{1}{n-1}-\frac{1}{n+1}-\frac{1}{2n-1}+\frac{1}{2n+1}\ldots\right\};$$

If we put $n = 3$, these become

$$\pi = 3\sqrt{3}\left(1-\frac{1}{2}+\frac{1}{4}-\frac{1}{5}+\frac{1}{7}-\frac{1}{8}+\ldots\right),$$

$$\pi = \frac{3\sqrt{3}}{2}\left(1+\frac{1}{2}-\frac{1}{4}-\frac{1}{5}+\frac{1}{7}+\frac{1}{8}\ldots\right).$$

By differentiating (27) we get

$$\operatorname{cosec}^2 x = \frac{1}{x^2}+\frac{1}{(x+\pi)^2}+\frac{1}{(x-\pi)^2}+\frac{1}{(x+2\pi)^2}+\frac{1}{(x-2\pi)^2}+\ldots;$$

put $x = \frac{\pi}{6}$, and we get $\pi^2 = 9\left\{1+\frac{1}{5^2}+\frac{1}{7^2}+\frac{1}{11^2}+\ldots\right\}$.

These series, among others, were given by Glaisher (*Quart. Journ. Math.* vol. xii.).

29. We have $\sinh\pi x = \pi x P\left(1+\frac{x^2}{n^2}\right)$, $\cosh\pi x = P\left(1+\frac{x^2}{(2n+1)^2}\right)$; if we differentiate these formulae after taking logarithms we obtain the series

Sums of Certain Series.

$$\frac{\pi}{2x}\coth\pi x - \frac{1}{2x^2} = \frac{1}{1^2+x^2}+\frac{1}{2^2+x^2}+\frac{1}{3^2+x^2}+\ldots,$$

$$\frac{\pi}{2x}\tanh\pi x = \frac{1}{1^2+x^2}+\frac{1}{3^2+x^2}+\frac{1}{5^2+x^2}+\ldots$$

These series were given by Kummer (in *Crelle's Journ.* vol. xvii.) The sum of the more general series $\frac{1}{1^{2n}+x^{2n}}+\frac{1}{2^{2n}+x^{2n}}+\frac{1}{3^{2n}+x^{2n}}+\ldots$, has been found by Glaisher (*Proc. Lond. Math. Soc.*, vol. vii.)

If U^m denotes the sum of the series $\frac{1}{1^m}+\frac{1}{2^m}+\frac{1}{3^m}+\ldots$, V^m that of the series $\frac{1}{1^m}+\frac{1}{3^m}+\frac{1}{5^m}+\ldots$, and W^m that of the series $\frac{1}{1^m}-\frac{1}{3^m}+\frac{1}{5^m}-\frac{1}{7^m}+\ldots$, we obtain by taking logarithms in the formulae (25) and (26)

Sums of Powers of Reciprocals of Natural Numbers.

$$\log\ (x \operatorname{cosec} x) = U_2\left(\frac{x}{\pi}\right)^2+\frac{1}{2}U_4\left(\frac{x}{\pi}\right)^4+\frac{1}{3}U_6\left(\frac{x}{\pi}\right)^6+\ldots,$$

$$\log\ (\sec x) = V_2\left(\frac{2x}{\pi}\right)^2+\frac{1}{2}V_4\left(\frac{2x}{\pi}\right)^4+\frac{1}{3}V_6\left(\frac{2x}{\pi}\right)^6+\ldots;$$

and differentiating these series we get

$$\frac{1}{2}\cot x=\frac{1}{2x}-\frac{U_2}{\pi^2}x-\frac{U_4}{\pi^4}x^3-\frac{U_6}{\pi^6}x^5-\ldots, \tag{31}$$

$$\frac{1}{2}\tan x=\frac{V_2}{\pi^2}2^2x+\frac{V_4}{\pi^4}2^4x^3+\frac{V^6}{\pi_6}2^6x^5+\ldots. \tag{32}$$

In (31) x must lie between $\pm\pi$ and in (32) between $\pm\frac{1}{2}\pi$. Write equation (30) in the form

$$\sec x=\Sigma(-1)^n\frac{(2n+1)\pi}{(2n+1\cdot\frac{1}{2}\pi)^2-x^2},$$

and expand each term of this series in powers of x^2, then we get

$$\sec x=\frac{2^2W_1}{\pi}+\frac{2^4W_3x^2}{\pi^3}+\frac{2^6W_5x^4}{\pi^5}+\ldots \tag{33}$$

where x must lie between $\pm\frac{1}{2}\pi$. By comparing the series (31), (32), (33) with the expansions of cot x, tan x, sec x obtained otherwise, we can calculate the values of $U_2, U_4\ldots V_2, V_4\ldots$ and $W_1, W_3\ldots$. When U_n has been found, V_n may be obtained from the formula $2^nV^n=(2^n-1)U_n$.

Continued Factors for π.

For Lord Brounker's series of π, see CIRCLE. It can be got at once by putting $a=1$, $b=3$, $c=5\ldots$. in Euler's

$$\text{theorem}=\frac{1}{a}-\frac{1}{b}+\frac{1}{c}-\ldots=\frac{1}{a+}\frac{a^2}{b-a+}\frac{b^2}{c-b+}\ldots$$

Sylvester gave (*Phil. Mag.*, 1869) the continued fraction

$$\frac{\pi}{2}=1+\frac{1}{1+}\frac{1.2}{1+}\frac{2.3}{1+}\frac{3.4}{1+}\ldots;$$

which is equivalent to Wallis's formula for π. This fraction was originally given by Euler (*Comm. Acad. Petropol.* vol. xi.); it is also given by Stern (in *Crelle's Journ.* vol. x.).

Continued Fractions for Trigonometrical Functions.

30. It may be shown by means of a transformation of the series for cos x and $\frac{\sin x}{x}$ that $\tan x=\frac{x}{1-}\frac{x^2}{3-}\frac{x^2}{5-}\frac{x^3}{7-}\ldots$ This may be also easily shown as follows. Let $y=\cos\sqrt{x}$, and let $y', y''\ldots$ denote the differential coefficients of y with regard to x, then by forming these we can show that $4xy''+2y'+y=0$, and thence by Leibnitz's theorem we have

$$4xy^{(n+2)}+(4n+2)y^{(n+1)}+y^{(n)}=0.$$

$$\text{Therefore}\ \frac{y}{y'}=-2-\frac{4x}{y'/y''},\ \frac{y^n}{y^{(n+1)}}=-2(2n+1)-\frac{4x}{y^{(n+1)}/y^{(n+2)}};$$

$$\text{hence}\quad -2\sqrt{x}\cot\sqrt{x}=-2-\frac{4x}{-6-}\frac{4x}{-10-}\frac{4x}{-14-}\ldots$$

Replacing $\sqrt{x}$ by x we have $\tan x=\frac{x}{1-}\frac{x^2}{3-}\frac{x^2}{5-}\ldots$

Euler gave the continued fraction

$$\tan nx=\frac{n\tan x}{1-}\frac{(n^2-1)\tan^2x}{3-}\frac{(n^2-4)\tan^2x}{5-}\frac{(n^2-9)\tan^2x}{7-}\ldots;$$

this was published in *Mém. de l'acad. de St Pétersb.* vol. vi. Glaisher has remarked (*Mess. of Math.* vols. iv.) that this may be derived by forming the differential equation

$$(1-x^2)y^{(m+2)}-(2m+1)xy^{(m+1)}+(n^2-m^2)y^{(m)}=0,$$

where $y=\cos(n\ \text{arc}\cos x)$, then replacing x by cos x, and proceeding as in the former case. If we put $n=0$, this becomes

$$x=\frac{\tan x}{1+}\frac{\tan^2x}{3+}\frac{4\tan^2x}{5+}\frac{9\tan^2x}{7+}\ldots;$$

whence we have

$$\text{arc}\tan x=\frac{x}{1+}\frac{x^2}{3+}\frac{4x^2}{5+}\frac{9x^2}{7+}\ldots+\frac{n^2x^2}{2n+1+}\ldots$$

Purely Analytical Treatment of Circular Functions.

31. It is possible to make the investigation of the properties of the simple circular functions rest on a purely analytical basis other than the one indicated in § 22. The sine of x would be defined as a function such that, if $x=\int_0^y\frac{dy}{\sqrt{(1-y^2)}}$, then $y=\sin x$; the quantity $\frac{\pi}{2}$ would be defined to be the complete integral $\int_0^1\frac{dy}{\sqrt{(1-y^2)}}$. We should then have $\frac{\pi}{2}-x=\int_y^1\frac{dy}{y\sqrt{(1-y^2)}}$. Now change the variable in the integral to z, where $y^2+z^2=1$, we then have $\frac{\pi}{2}-x=\int_0^z\frac{dy}{\sqrt{(1-z^2)}}$, and z must be defined as the cosine of x, and is thus equal to $\sin(\frac{1}{2}\pi-x)$, satisfying the equation $\sin^2 x+\cos^2 x=1$.

Next consider the differential equation

$$\frac{dy}{\sqrt{(1-y^2)}}+\frac{dz}{\sqrt{(1-z^2)}}=0.$$

This is equivalent to

$$d\{y\sqrt{(1-z^2)}+z\sqrt{(1-y^2)}\}=0;$$

hence the integral is

$$y\sqrt{(1-z^2)}+z\sqrt{(1-y^2)}=\text{ a constant.}$$

The constant will be equal to the value u of y when $z=0$; whence $\quad y\sqrt{(1-z^2)}+z\sqrt{(1-y^2)}=u.$

The integral may also be obtained in the form

$$yz-\sqrt{(1-y^2)}\sqrt{(1-z^2)}=\sqrt{(1-u^2)}.$$

$$\text{Let}\ \alpha=\int_0^y\frac{dy}{\sqrt{(1-y^2)}},\quad \beta=\int_0^z\frac{dz}{\sqrt{(1-z^2)}},\quad \gamma=\int_0^u\frac{du}{\sqrt{(1-u^2)}};$$

we have $\alpha+\beta=\gamma$, and $\sin\gamma=\sin\alpha\cos\beta+\cos\alpha\sin\beta$,
$\cos\gamma=\cos\alpha\cos\beta-\sin\alpha\sin\beta$,
the addition theorems. By means of the addition theorems and the values $\sin\frac{1}{2}\pi=1$, $\cos\frac{1}{2}\pi=0$ we can prove that $\sin(\frac{1}{2}\pi+x)=\cos x$, $\cos(\frac{1}{2}\pi+x)=-\sin x$; and thence, by another use of the addition theorems, that $\sin(\pi+x)=-\sin x$ $\cos(\pi+x)=-\cos x$, from which the periodicity of the functions sin x, cos x follows:—

$$\text{We have also}\quad \int\frac{dy}{\sqrt{(1-y^2)}}=-\iota\log_e\{\sqrt{(1-y^2)}+\iota y\};$$

whence $\log_e\{\sqrt{(1-y^2)}+\iota y\}+\log_e\{\sqrt{(1-z^2)}+\iota z\}=$ a constant.
Therefore $\{\sqrt{(1-y^2)}\}+\iota y\{\sqrt{(1-z^2)}+\iota z\}=\sqrt{(1-u^2)}+\iota u$,
since $u=y$ when $z=0$; whence we have the equation

$$(\cos\alpha+\iota\sin\alpha)(\cos\beta+\iota\sin\beta)=\cos(\alpha+\beta)+\iota\sin(\alpha+\beta),$$

from which De Moivre's theorem follows.

REFERENCES.—Further information will be found in Hobson's *Plane Trigonometry*, and in Chrystal's *Algebra*, vol. ii. For further information on the history of the subject, see Braunmühl's *Vorlesungen über Geschichte der Trigonometrie* (Leipzig, 1900). (E. W. H.)

TRIGONON, a small triangular harp, occasionally used by the ancient Greeks and probably derived from Assyria or Egypt. The trigonon is thought to be either a variety of the sambuca or identical with it. A trigonon is represented on one of the Athenian red-figured vases from Cameiros in the island of Rhodes, dating from the 5th century B.C., which are preserved in the British Museum. The triangle is here an irregular one, consisting of a narrow base to which one end of the string was fixed, while the second side, forming a slightly obtuse angle with the base, consisted of a wide and slightly curved sound-board pierced with holes through which the other end of the strings passed, being either knotted or wound round pegs. The third side of the triangle was formed by the strings themselves, the front pillar, which in modern European harps plays such an important part, being always absent in these early Oriental instruments. A small harp of this kind having 20 strings was discovered at Thebes in 1823. (K. S.)

TRIKKALA (anc. *Trika*), a town of Greece, capital of the department of Trikkala, and the see of an archbishop, 38 m. W. of Larissa. In winter, when great numbers of Vlach herdsmen take up their quarters in the town, its population exceeds that of Larissa. It has the appearance of a Mussulman town on account of its mosques (only two of which are in use) and it is a centre of trade in wheat, maize, tobacco and cocoons. The town was in ancient times a celebrated seat of the worship of Aesculapius. Pop. (1889), 14,820; (1907) 17,809; of the department, 90,548.

TRILEMMA (Gr. τρεῖς, three, λῆμμα, something taken), in logic, an argument akin to the dilemma (*q.v.*), in which there are three possibilities. By getting rid of two, the third is proved, provided the original three exhaust the number. The terms "tetralemma" (four possibilities) and "polylemma" (many) have also been used.

TRILOBITES, extinct Arthropoda, formerly classified with the Crustacea, but of late years relegated to the Arachnida (*q.v.*), which occurred abundantly in seas of the Cambrian and Silurian periods, but disappeared entirely at the close of the Palaeozoic epoch. Both their origin and the causes which led to their extinction are quite unknown. Widely divergent forms make their appearance suddenly in the Cambrian period amongst the earliest known fossils; and the high perfection of structure to which they had at that time attained implies the antecedent existence of much simpler types, and refers the origin of life to a date immeasurably distant from that at which we have actual proof of the existence of animal and vegetable organisms.

However different in structure Trilobites may be, they all agree in possessing a head-shield usually semi-circular in shape, which results from the fusion of apparently five segments, and bears, except in some blind forms, a pair of large reniform compound eyes like those of the king-crab (*Xiphosura*). This head-shield is succeeded by a varying number of free segments, each of which consists of a medium convex tergal piece and a pair of arched lateral plates, the pleura, of which there is one on each side. The terga and pleura of each individual segment overlap those of the segment that serially succeeds it. The mid-region of the body, composed of jointed segments, is followed by a larger or smaller region consisting of fused segments and termed the *pygidium* or caudal shield, which in some cases is as large as the head-shield itself, in other cases much smaller. When the pygidium is large and composed of many segments, the number of free body segments is correspondingly reduced, and vice versa. It is with respect to this number of segments that respectively constitute the pygidium and the mid-region of the body that Trilobites differ most markedly from each other; and it is a singular fact that the extremes in structural organization in this particular to be met with in the Trilobita are found side by side in strata of Cambrian age. In *Paradoxides*, for example, there are about twenty freely movable segments followed by a very short and small pygidium, whereas in *Agnostus* the freely movable segments are reduced to two and the pygidium is as large as the cephalic shield. In this genus the number of segments composing the pygidium is obscured, as also it is in the genus *Illaenus*, which has as many as ten movable segments preceding the large semi-circular pygidium; but in such forms as *Ogygia* and *Asaphus*, which have about eight free segments, the sutural lines on the pygidium indicate that it is composed of about a dozen or more segments. Somewhat resembling *Agnostus* is *Microdiscus*, with four movable segments and a large pygidium consisting of about five fused segments, the lines of union between the latter being clearly indicated.

The tergal and pleural elements of the pygidium are generally well marked. They are also well marked on the cephalic shield, the tergal elements being represented by a median axial elevated area showing indistinct signs of segmentation, and a lateral unsegmented plate, the *gena*, which carries the eyes. The postero-lateral angles of the gena are commonly produced into spiniform processes, which may project backwards beyond the middle of the body as in *Paradoxides*, or considerably beyond its posterior termination as in *Trinucleus* or *Ampyx*. The latter is further remarkable for having the median area of the head-shield, the *flabellum*, produced into an anteriorly directed spike.

For many years only the dorsal surface of Trilobites was known, nothing having been ascertained of the ventral surface and appendages. Comparatively recently, however, specimens have been obtained with the ventral surface exposed, revealing the number and structure of the limbs. A pair of the latter was articulated to the sides of a moderately wide dorsal plate on each segment of the body, and similar limbs were attached to the ventral surface of the head-shield behind the mouth. Each of these limbs was two-branched, the external branch consisting of a slender fringed flagellum possibly respiratory in function, and the inner of a normal jointed ambulatory leg. These two branches arose from a common basal segment or coxa, the inner surface of which was produced into a strong process underlying the external area. In the region of the mouth the basal segments were armed with teeth and subserved the purpose of mastication. As in all Arachnida there is only a single pair of appendages in front of the mouth, and these were one-branched, long and filiform and acted as antennae. Under the pygidium or caudal shield the appendages were much shortened, and their main branch consisted of broader and flatter segments than those of the preceding limbs.

Such was the structure of the appendages in Trilobites belonging to the genus *Triarthrus*; but considering the great structural differences that obtain between *Triarthrus* and many other genera, it would be rash to assume that there were not corresponding differences in the structure of the limbs. It must not indeed be assumed that those of the first pair were in all cases antenniform.

It is probable that no satisfactory classification of the Trilobites will be proposed until the limbs of most of the genera have been examined. Up to the present time all attempts to arrange the genera in natural and definable groups have failed to meet with general approval; and this criticism must be extended to Beecher's subdivision of the class into three orders, named Hypoparia, Proparia and Opisthoparia, based upon the form and position of a groove, the so-called *genal suture*, which marks the lateral portion of the head-shield. In the majority of Trilobites this groove passes backwards from the anterior or anterolateral edge of this plate to its posterior or postero-lateral border, dividing it into an inner portion continuous with the flabellum and fused tergal regions, and an outer portion bearing the eye. Those genera, like *Paradoxides*, *Olenus*, *Asaphus*, *Phillipsia* and others, in which this groove cuts the posterior edge of the head-shield on the inner side of its angle are referred to the Opisthoparia; those, like *Dalmanites* and *Phacops*, in which it cuts the lateral border in front of the posterior angle, belong to the Proparia. But in certain genera, like *Conocoryphe*, *Calymmene* and *Triarthrus*, it cuts the margin of the head-shield so close to the posterior angle that the distinction between the two groups practically breaks down. To the Hypoparia belongs a comparatively small number of genera, like *Trinucleus* and *Aquastus*, in which this groove or genal suture is beneath the margin of the head-shield and does not appear upon its upper surface.

In external form Trilobites are not unlike Isopod Crustaceans, especially the terrestrial species commonly called "woodlice"; and until the nature of their appendages was known, it was thought by some authorities that the two groups might be related. Like the woodlice they were capable of rolling themselves up into a ball, many specimens having been found fossilized in this state, with the pygidium pressed tightly against the head-shield. There is very little doubt that they lived at the bottom of the sea, feeding upon worms or other soft marine organisms, crawling slowly about the sandy or muddy bottom and burying themselves beneath its surface when danger threatened. That these animals were widely distributed in former times is proved by their occurrence at the present day in palaeozoic fossiliferous strata both of the northern hemisphere and of Australia; and despite the fact that their remains have not been found in rocks of the Mesozoic or Kainozoic epochs, it was conceived to be possible that living specimens might be dredged from the sea-floor during the exploration of the ocean depths undertaken by the "Challenger" expedition. Needless to say this faint hope was not borne out by results. (R. I. P.)

TRIM, a market town and the county town of Co. Meath, Ireland, on the upper waters of the Boyne, 30 m. N.W. by W. from Dublin on a branch of the Midland Great Western railway. Pop. (1901), 1513. The county buildings are here; monthly fairs are held, and there is considerable trade in corn and flour; but the chief interest of the town lies in its historical associations and remains, enhanced by a beautiful situation. It was the seat of a very early bishopric. A Norman tower, called the Yellow Steeple, is supposed to mark the site of St Patrick's Abbey of St Mary. Two gates remain from the old town walls. King John's Castle (incorrectly so called, as this monarch only resided here on the occasion of a visit) was originally founded by Hugh de Lacy in 1173, but a later date is assignable to the greater part of the magnificent moated building, of which the keep, flanking turrets, drawbridge, portcullis and barbican, still testify to its former strength, which was augmented by its frontage to the river. Other smaller fortified buildings are Talbot's and Scurlogstown Castles; the former erected by Sir John Talbot, lord lieutenant of Ireland in 1415—afterwards earl of Shrewsbury, the latter dating from 1180. About a mile east of the town, the ruins of the abbey of St Peter and St Paul occupy both banks of the river. These include the transitional-Norman cathedral on the north bank, and a castle, guarding the crossing of the river, on the south, together with a chapel and other remains. North of the town ruins may be seen of a Dominican friary of the 13th century. The tower of the old parish church dates from 1449. In the annals of Trim many famous names have a place; Humphrey of Gloucester and Henry of Lancaster were imprisoned here by Richard II. before Henry came to the throne; and Richard, duke of York, and father of Edward IV. held court at the castle, where also several Irish parliaments met until the middle of the 15th century, and a mint was established in 1469. The residence in a house in Dublingate Street of the famous duke of Wellington is commemorated by a Corinthian column and statue. Trim is governed by an urban district council. It was incorporated by Edward III., and returned two members to the Irish parliament until the Union in 1800.

TRIMMER, JOSHUA (1795–1857), English geologist, was born at North Cray in Kent, on the 11th of July 1795. He was son of Joshua Kirby Trimmer of Brentford, and grandson of Mrs Sarah Trimmer (1741–1810), authoress of the *Story of the Robins* (1786). At the age of nineteen he was sent to North Wales to manage a copper-mine for his father; subsequently he was placed in charge of a farm in Middlesex, where he acquired a knowledge of and an interest in soils; in 1825 he became manager (for his father) of slate quarries near Bangor and Carnarvon, and in this district he remained for many years. He discovered the marine shells in the drift of Moel Tryfaen. During the years 1850–1854 he was engaged on the Geological Survey, and surveyed parts of the New Forest in Hampshire. He died in London on the 16th of September 1857.

He published memoirs on the *Origin of the Soils which cover the Chalk of Kent; On the Geology of Norfolk, as Illustrating the Laws of the Distribution of Soils* (1847); and *Proposals for a Geological Survey, specially directed to Agricultural Objects* (1850); in this respect he was a pioneer in agricultural geology. He was author also of a useful work *Practical Geology and Mineralogy* (1841). Obituary by J. E. Portlock, in *Quart. Journ. Geol. Soc.* (1858).

TRIMONTIUM, the name of a Roman fort at Newstead, near Melrose, Scotland, close under the three Eildon Hills (whence the name *trium montium*). It was an advanced post of the Romans towards Scotland both about 80 A.D. and after, and again (after an interval of evacuation) from about A.D. 140–180. Excavations during the last four years have yielded finds of almost unique importance. These include the foundations of several successive forts, one above the other, which throw much light on the character of the Roman military post; an unparalleled collection of Roman armour, including ornate helmets, and a good series of coins and datable pottery. The whole illustrate the history of the Roman army and that of Roman Scotland very remarkably and to an extent equalled by no Scottish site as yet explored.

See the report published for the Society of Antiquaries of Scotland by the excavator Mr James Curle. (F. J. H.)

TRINCOMALEE, a town and former naval station on the north-east coast of Ceylon, 100 m. N.E. by N. of Kandy. Pop. (1901), 11,295. It is built on the north side of the bay of Trincomalee, on the neck of a bold peninsula separating the inner from the outer harbour. There is a lighthouse on the extremity of Foul Point at the southern side of the bay, and another on the summit of Round Island. The inner harbour is landlocked, with a safe anchorage and deep water close to the principal wharves; the outer harbour has an area of about 4 sq. m. with a depth of about 70 fathoms. With its magnificent harbour—one of the five or six greatest natural harbours in the world—it used to be the headquarters of the admiral commanding on the East Indian station, with a garrison of infantry and British artillery. The breadth of the streets and esplanades somewhat atones for the mean appearance of the houses, but the town generally has a gloomy and impoverished aspect. Pearl oysters are found in the lagoon of Tambalagam to the west of the bay. A steamer from Colombo calls weekly with and for passengers and cargo. Average annual rainfall, 62¾ in.; average temperature, 81·2° F. Some tobacco, rice, and palm are grown in the district.

Attention was directed to the importance of Trincomalee as a naval base in 1896, when a commission of officers recommended its being turned into a modern fortress. The work was commenced in 1898 and finished in 1904. All the batteries were rebuilt and fitted with modern appliances. The whole area was connected with cable and telephone communication, and armed with the latest type of guns; and the fortress was supposed to be impregnable; but in the following year the station was abandoned, the naval yard closed, and the military garrison withdrawn. A man-of-war is still kept in Trincomalee Harbour, to work the defences.

The town was one of the first settlements of the Tamil race in Ceylon, who at a very early period erected on a height at the extremity of the peninsula, now crowned by Fort Frederick, a temple dedicated to Konatha, or Konasir, named the "temple of a thousand columns." The building was desecrated and destroyed in 1622, when the town was taken by the Portuguese, who made use of the materials for the erection of the fort. The town was successively held by the Dutch (1639), the French (1673), the Dutch (1674), the French (1782), and the Dutch (1783). After a siege of three weeks it surrendered to the British fleet in 1795, and with other Dutch possessions in Ceylon was formally ceded to Great Britain by the Treaty of Amiens in 1802.

TRING, a market town in the Watford parliamentary division of Hertfordshire, England, 31½ m. N.W. by W. from London by the London and North Western railway. Pop. of urban district (1901), 4349. It lies on the western slope of the Chiltern Hills, close to the entrance to a narrow valley which pierces them, and forms one of the highways through them to London, carrying the railway, the Grand Junction Canal, and a main road. The church of St Peter and St Paul shows fine Perpendicular work, especially in the ornate interior of the nave. Industries include straw-plaiting and the weaving of canvas and silk. The Rothschild Museum, erected in 1889, contains an extensive natural history collection. Living wild animals are also kept in a neighbouring paddock and cages. The road which passes through Tring and along the face of the hills represents the ancient Icknield Way, and there may have been a Romano-British village on the site of Tring.

TRINIDAD, the most southerly and, with the exception of Jamaica, the largest of the British West Indian Islands. Pop. (1901), 236,397. It is situated 6 m. E. of the coast of Venezuela, between 10° 3′ and 10° 50′ N. and 60° 39′ and 62° W. Its average length is 48 m., its breadth 35 m. and its area 1754 sq. m. In shape it is almost square, but it throws off two peninsulas westward from its north and south corners. Corozal Point projecting from its north-western and Icacos Point from its south-western extremity enclose the Gulf of Paria. To the west of Corozal Point lie several islands, of which Chacachacare, Huevos Monos and Monos Gaspar Grande are the most important. The surface is level or undulating, excepting in the north and south where there are ranges of hills, with eastern and western axes, prolongations of the Venezuelan coast ranges. Of these the northern is the more elevated ridge, its highest point being Tucuche Peak (3100 ft.). The southern hills attain an elevation of 600 ft. A small ridge runs east to west by south through the centre of the island, from Manzanilla Point to San Fernando, having an isolated elevation in Mt Tamana (1028). The hills of the northern and southern ranges are furrowed by innumerable ravines, and are clad to their summits with dense forests. There are numerous small streams, none navigable, and all flowing either east or west.

In its geology, as well as in its flora and fauna, Trinidad differs little from the mainland, with which it was probably at one time connected. There are four mineral springs and several mud volcanoes, but the two most striking natural features are the Maracas Falls, and the Pitch Lake. The Maracas Falls are situated at the head of a valley of the same name, to the north-east of Port of Spain, where the river leaps in a foaming torrent over a sheer wall of rock, 312 ft. high. The Pitch Lake lies some 38 m. by water south-east of the capital, in the ward of La Brea. It is circular in form, about 3 m. in circumference, and 104 acres in extent. Underground forces acting on the pitch cause it to rise in unequal masses, which are rounded off like huge mushrooms, separated from one another by narrow fissures, in which the rainwater collects and forms pools. Near the centre of the lake the pitch is always soft and can be observed bubbling up in a liquid state. When the sun is hot the lightest footfall leaves an impression and the pitch emits an unpleasant odour. The soil of the surrounding district is charged with asphalt, but is very fertile, while the road to the neighbouring port of La Brea, running on a bed of asphalt, moves slowly towards the sea like a glacier. The lake is worked by a company which exports the asphalt to the United States; paying royalty to the local government on every ton exported.

The mountain range which runs along the north coast is formed of clay-slates, micaceous and talcose schists, and crystalline and compact limestones, constituting the group called the Caribbean series, the age of which is unknown. The rest of the island is composed of Cretaceous, Tertiary and Quaternary strata. The Cretaceous beds rise to the surface in the centre and are flanked to north and south by the later deposits. Owing to the rarity of satisfactory sections the relations of the various divisions of the Tertiary formation are still somewhat obscure; but they are grouped by J. B. Harrison into (1) Nariva and San Fernando beds, = Eocene and Oligocene; (2) Naparima marls = Miocene and (3) Moruga series = Pliocene and Pleistocene. The Naparima marls consist of a lower division containing *Globigerina* and an upper division with Radiolaria and diatoms and are clearly of deep-sea origin. The bitumen of the Pliocene and Pleistocene deposits appears to have been formed by the decomposition of vegetable matter. Salses or mud volcanoes occur upon the island, but there is no evidence of true volcanic action in Tertiary or recent times, except the presence of occasional bands of pumiceous earth in some of the Tertiary deposits, and the pumice in these cases was probably derived from a distance.

The presence of oil in large quantities in Trinidad had been suspected for many years, and early in the 20th century the government undertook a geological survey to determine the probabilities of an industry. This survey revealed the presence of a series of anticlines at payable depths in the southern division of the island, and experimental borings by three companies at La Brea and Point Fortin in the south-west and Guayaguayare in the south-east proved the presence of oil in large quantities. In 1910 the commercial exploitation of Trinidad oil was being rapidly pushed forward.

The soil of the island is exceedingly rich, and well adapted to the growth of tropical products, especially of sugar and cocoa, which are its staples. The planting of new lands is rapidly progressing, the greater part of the unsold crown lands (various blocks of which have been formed into forest or water reserves) being covered with forests, containing a valuable supply of timber. Poisonous and medicinal herbs grow everywhere. Owing to the variety of its resources, Trinidad has suffered less from general depression than the other islands in the British West Indies. It exports cocoa, sugar, rum, molasses, coffee, tobacco, coco-nuts, fruit, timber, dye-woods, balata gum, india-rubber and asphalt. Large quantities of tonga-beans, the produce of the mainland, are cured in bond at Port of Spain. The manufacture of bitters (Angostura and others) is an important industry, as is also the raising of stock. In addition Trinidad has a large carrying trade with the neighbouring republics, and rivals St Thomas (*q.v.*) as a centre of distribution for British and American merchandise through the West Indies and Venezuela.

Lying in the tract of the trade winds and being practically a part of the mainland, Trinidad is immune from the vicissitudes of climate to which the other Antilles are exposed. It is never visited by hurricanes and its seasons are regular, wet from May to January, with a short dry season in October known as the Indian summer and lasting usually about four weeks, and dry from end of January to middle of May. The average annual rainfall is 66·26 in. and the mean temperature is 78·6° F. A volunteer force was established in 1879, and now consists of infantry, garrison artillery and three companies of Light Horse stationed in Port of Spain, San Fernando and St Joseph. Elementary education is given chiefly in the state-aided schools of the different denominations, but there are a number of entirely secular schools managed by the government. The Presbyterian schools are conducted by a Canadian mission. Instruction is free, but in some few schools fees are paid. Agriculture is a compulsory subject in all the primary schools. Higher education is provided by the Queen's Royal College, a secular institution, to which the Presbyterian Naparima College and the Roman Catholic St Mary's College are affiliated. Attached to these colleges are four scholarships of the annual value of £150 for four years, tenable at any British university. The religious bodies, both Christian and pagan are exceedingly numerous. The Roman Catholics (with an archbishop at Port of Spain) and the Anglicans, with the bishop of Trinidad at their head, are the more powerful bodies. Of the inhabitants of the island, one-third are East Indians. Immigration from India is conducted under government control, and the prosperity of Trinidad is largely due to the contract labour obtained under this system. Of the rest the upper classes are creoles of British, French and Spanish blood, while the lower classes are of pure or mixed negro origin, with a few Chinese. English is spoken in the towns and in some of the country districts, but in the north and generally in the cocoa-growing areas a French *patois* prevails, and in several districts Spanish is still in use. English money is legal tender, as also is the United States gold currency. Accounts are kept in dollars by the general public, but in sterling by the government. There is a complete system of main and local roads constructed or under construction; there are about 90 m. of railways, and practically all the towns of any size can be reached from Port of Spain by rail. Steamers ply daily between Port of Spain and the islands at the northern entrance to the Gulf of Paria and between San Fernando (the southern terminus of the railway) and the south-western ports of the island, while two steamers of the Royal Mail Company under contract connect Port of Spain with the other parts of Trinidad and Tobago. Port of Spain is also in direct communication with Southampton.

The colony (Trinidad and Tobago) is administered by a governor assisted by an executive council and a legislative council of twenty members of whom ten are officials sitting by virtue of office and ten are unofficials nominated by the Crown. Port of Spain, the capital, is situated on the west coast on the shores of the Gulf of Paria. It is considered one of the finest towns in the West Indies, its streets are regular and well shaded, its water supply abundant, and an excellent service of tramways connects the various quarters of the town. It has two cathedrals, a fine block of public buildings containing the principal government departments, the courts of justice and the legislative council chamber, many other large government buildings, a public library, and many good shops, while one of its most beautiful features is its botanical garden, in which the residence of the governor is situated. The harbour is an open roadstead, safe and sheltered, but so shallow that large ships have to lie at anchor half a mile from the jetties. It is, nevertheless, the place of shipment not only for the produce of the entire island but also for that of the Orinoco region. The population is about 55,000. The other towns are San Fernando (pop. 7613), also on the Gulf of Paria, about 30 m. south of the capital; and Arima (pop. 4076), an inland town 16 m. by rail east of Port of Spain.

Trinidad was discovered by Columbus in 1496. It remained in Spanish possession (although its then capital, San José de Oruna, was burned by Sir Walter Raleigh in 1595) until 1797, when a British expedition from Martinique caused its capitulation. It was finally ceded to Great Britain by the Treaty of Amiens in 1802.

See F. Eversley, *The Trinidad Reviewer* (London, 1900); Stark's *Guide-book and History of Trinidad* (London); the *Journal of the Royal Colonial Institute*, passim; and for geology, G. P. Wall and J. G. Sawkins, *Report on the Geology of Trinidad* (London, 1860); J. B. Harrison and A. J. Jukes-Browne, "The Oceanic Deposits of Trinidad" (British West Indies), *Quart. Journ. Geol. Soc.* (London, 1899), lv. 177–189; R. J. L. Guppy, "The Growth of Trinidad," *Trans. Canadian Inst.* (1905), viii. 137–149, with plate. The last paper gives a list of all the more important works and papers on the geology of the island.

TRINIDAD, an uninhabited island in the South Atlantic, 680 m. E. of the coast of Espirito Santo, Brazil, in 20° 30′ S. 29° 30′ W., 4 m. long by 2 broad. It is of volcanic formation, and has springs of fresh water. As a possible coaling and telegraph station in mid-ocean, it formed a subject of contention between Brazil and Great Britain in 1895. The dispute was settled in favour of Brazil, which claimed on the ground of its discovery by Tristan da Cunha early in the 16th century, while Great Britain relied on its occupation by the astronomer Halley in the name of England in the year 1700. About 30 m. east are the three islets of Martin Vaz so named from the Portuguese mariner who discovered them about 1510.

TRINIDAD, a city and the county-seat of Las Animas county, Colorado, U.S.A., in the south part of the state, about 100 m. S. of Pueblo. Pop. (1890) 5523; (1900) 5345 (659 foreign-born); (1910) 10,204. Trinidad is served by the Denver & Rio Grande, the Colorado & Southern, the Colorado & Wyoming, and the Atchison, Topeka & Santa Fé railways and by electric railways to the neighbouring coal-mining towns. The city is regularly laid out on a hilly site, on both sides of the Purgatory (or Las Animas) river, near a picturesque canyon and mountain district, including the Stonewall Valley, and at the foot of the Raton Mountains, of which the highest peak, Fisher's (or Raton) Peak (9586 ft.), is 10 m. south of Trinidad. The city has a Carnegie library, a Federal building, an opera house, an amusement park, and the San Rafael hospital, under the charge of the Sisters of Charity. A steam heating plant pipes heat to many shops, offices and residences. Trinidad is in a coal and coke and stock-raising region, and alfalfa, frijole and sugar beets are produced in large quantities in the surrounding region, much of which is irrigated. Dry farming has been successfully carried on at an experiment farm, established in 1906, 12 m. north of the city. Trinidad has railway shops, foundry and machine shops, and coking ovens, ships large quantities of coal, has a wool-scouring mill, and various manufactures. The municipality owns and operates the waterworks. Trinidad was incorporated as a town in 1876, and in 1879 became a city of the second class.

TRINIDAD, a town near the southern coast of Cuba, in Santa Clara Province, about 45 m. south-east of Cienfuegos, and 3 m. from its seaport, Casilda, which lies due south.

Pop. (1907), 11,197. There is a small local railway, not connected (in 1909) with the central trunk line of the island. The city lies on the slope of La Vigia hill (900 ft.) amid higher mountains, and on the banks of the Jayoba (San Juan) river. The streets are narrow, broken and tortuous, and the general aspect of the town is medieval. There are some attractive buildings and a very fine market square. The fine scenery in the neighbourhood, and the climate, which is possibly the healthiest in Cuba, make the place a favourite resort for natives and foreigners. Casilda (pop. in 1907, 1246) has a land-locked, shallow harbour; but Masio Bay, a trifle farther distant, accommodates larger craft; and there are excellent deep-water anchorages among the quays off the coast. The Manati river is navigable for about 7 m. inland, and is used as an outlet for sugar and molasses crops. These and honey are the chief exports; tobacco and various vegetables and fruits are of minor importance. Trinidad is one of the seven original cities of Cuba established by Diego Velasquez. It was founded in 1514 on the coast, but after being attacked by pirates was removed inland. It was thrice sacked by English buccaneers—in 1642, 1654 and 1702; and in the following years, up to and for a time after the peace of Utrecht (1713), it maintained ships and soldiers. Indeed, throughout the first half of the 18th century it was on a continuous war footing against English corsairs, making reprisals on British ships and thriving at the same time on a large contraband trade with Jamaica and other foreign colonies. In 1818 Casilda was opened to legal commerce under the national and foreign flags.

TRINITARIANS, a religious order founded in 1198 by St John of Matha and St Felix of Valois, for the liberation of Christian prisoners and slaves from captivity under the Moors and Saracens. The two founders went to Rome and there obtained the approbation of Innocent III., 1198. The rule was the Augustinian, supplemented by regulations of an austere character. The habit was white, with a red and blue cross on the breast. The Trinitarians are canons regular, but in England they were often spoken of as friars. The first monastery and head house of the order was at Cerfroy near Soissons. Among the earliest recruits were some Englishmen, and the first to go on the special mission of the order were two Englishmen, who in 1200 went to Morocco and returned thence to France with 186 liberated Christian captives. This success excited great enthusiasm and led to the diffusion of the order all over Western Christendom. At the beginning of the 18th century there were still 250 houses, and it is stated that there had been 800; this, however, includes 43 in England, where Dugdale says he could find traces only of a dozen: so that the high figures are probably apocryphal. The first house in England was at Mottenden, in Kent, founded in 1224. The ordinary method of freeing captives was by paying their ransom and for this purpose vast sums of money were collected by the Trinitarians; but they were called upon, if other means failed, to offer themselves in exchange for Christian captives. Many thousands were liberated by their efforts. In the 17th century a reform called the Barefooted Trinitarians was initiated, which became a distinct order and is the only one that survives. There are now less than 500 members. Their headquarters are at San Crisogono in Rome. They devote themselves to the ransoming of negro slaves, especially children, and a great district in Somaliland has been since 1904 entrusted to them as a field for missionary work. There were Trinitarian nuns and a Third Order.

The chief modern book on the Trinitarians is Deslandres, *L'Ordre français des Trinitaires* (2 vols. 1903). Sufficient information will be found in Helyot, *Histoire des ordres religieux* (1714), vol. ii. chs. 45-50; and in Max Heimbucher, *Orden u. Kongregationen* (1907), ii. §57. (E. C. B.)

TRINITY HOUSE, CORPORATION OF, an association of English mariners which originally had its headquarters at Deptford in Kent. In its first charter, received from Henry VIII. in 1514, it was described as the "guild or fraternity of the most glorious and undividable Trinity of St Clement." The first master appointed was the founder of the corporation, Sir Thomas Spert, comptroller of the navy to the king, and commander of the "Harry Grace de Dieu." Deptford having been made a royal dockyard by Henry VIII., and being the station where outgoing ships were supplied with pilots, the corporation rapidly developed its influence and usefulness. By Henry VIII. it was entrusted with the direction of the new naval dockyard. From Elizabeth, who conferred on it a grant of arms in 1573, it received authority to erect beacons and other marks for the guidance of navigators along the coasts of England. In 1604 a select class, was constituted called Elder Brethren, the other members being called Younger Brethren. By the charter of 1609 the sole management of affairs was conferred on the Elder Brethren; the Younger Brethren, however, having a vote in the election of master and wardens. The practical duties of the fraternity are discharged by the acting Elder Brethren, 13 in number, of whom 2 are elected from the royal navy and 11 from the merchant service; but as a mark of honour persons of rank and eminence are admitted as honorary Elder Brethren. In 1647 the corporation was dissolved by parliament, but it was reconstructed in 1660, and the charter was renewed by James II. in 1685. In 1687 a by-law of the Trinity House for the first time required an agreement in writing between the master and crew of a ship. A new hall and almshouses were erected at Deptford in 1765; but for some time the offices of the corporation had been transferred to London, where for a while they had a house in Water Lane, Lower Thames Street, and in 1795 their headquarters were removed to Trinity House, Tower Hill, built from the designs of Samuel Wyatt. By an act of 1836 they received powers to purchase from the Crown, as well as from private proprietors, all interests in coast lights. For the maintenance of lights, buoys, &c., they had power to raise money by tolls, the surplus being devoted to the relief of old and indigent mariners or their near relatives. In 1853 the control of the funds collected by the corporation was transferred to the board of trade, and the money over which the brethren were allowed independent control was ultimately reduced to the private income derived from funded and trust property. Their practical duties in erection and maintenance of lighthouses, buoys and beacons remain as important as ever. Similar functions are carried out by the Northern Lighthouse Board and the Irish Lighthouse Board, for Scotland and Ireland respectively. They have also the care and supervision of pilots. Other Trinity Houses established under charter or act of parliament for the appointment and control of pilots are at Hull and Newcastle. The Elder Brethren of Trinity Masters also act as nautical assessors in the high court of admiralty. The corporation has a large wharf and repair shop at the mouth of the river Lea, where most of the work in connexion with buoying the Thames is carried out.

See W. H. Mayo, *Trinity House, London, Past and Present* (London, 1905); C. R. B. Barrett, *The Trinity House of Deptford Strond* (1893).

TRINITY SUNDAY, the Sunday next after Whitsunday. A festival in honour of the Trinity had been celebrated locally at various dates before Pope John XXII. in 1334 ordered its general observance on the octave of Whitsunday. According to Gervase of Canterbury, it had been introduced into England by Thomas Becket, archbishop of Canterbury, in 1162. It has, however, never been reckoned among the great festivals of the Church. From Trinity Sunday onwards all Sundays until the close of the ecclesiastical year are reckoned as "after Trinity." In the Roman Church these Sundays are also reckoned as "after Pentecost." In the latter case they are described as *dominicae trinitatis*, not to be confused with *dominicae post trinitatis*; e.g. *Dominica sexta post trinitatis* is the same as *Dominica septima trinitatis*.

TRINODA NECESSITAS, the name used by modern historians to describe the threefold obligation of serving in the host (*fyrd*), repairing and constructing bridges (*bryc-geweorc*), and the construction and maintenance of fortresses (*burhbot*), to which all freeholders were subject in Anglo-Saxon times. The obligations are usually mentioned in charters as the sole exceptions to grants of immunities; sometimes, however, a fourth obligation (*singulare praetium contra alium*) is reserved, as in the charter granted by Wiglaf of Mercia on the 28th of December 831 (*Cod. dip.* i. 294). Ceolwulf's charter of 822 to Archbishop Wilfred is remarkable, as the military service is there restricted to *expeditiones contra paganos ostes* (ibid. i. 272). The threefold obligation is first mentioned in a Latin charter (*expeditione pontis arcisue constructione*) of doubtful authenticity, which professes to have been granted by Eadbald of Kent in A.D. 616 (*Cod. dip.* v. 2), but it is not until the 8th century that it appears in documents which are generally admitted to be genuine. Although there were corresponding obligations in the Frankish Empire which were called by Charles the Bald (*antiquam et aliarum gentium consuetudinem*), Stubbs held that the arguments which refer them to a Roman origin want both congruity and continuity.

The phrase "trinoda necessitas" is not to be found in the Anglo-Saxon laws and charters; and Selden was probably the first historian of eminence who used it. "These three exceptions," he says, "are noted by the term of a three-knotted necessity in an old charter wherein King Cedwalla granted to Wilfrid, the first bishop of Shelsey in Sussex, the village of Paganham." This charter is an 11th-century copy of a lost original, but the words to which Selden referred are plainly written as *trimoda necessitas* not *trinoda necessitas.* Du Cange gives two examples of the word *trimoda* in medieval Latin, in which language it meant "triple"; but he cites no medieval example of trinoda; and in classical Latin the form is unknown, while *trinodis* (*ter-nodus*, "triple-knotted") occurs only rarely (Ovid. *Her.* iv. 115; *Fast.* i. 575).

See Du Cange, *Glossarium*; W. Stubbs, The *Constitutional History of England*, i. 86, 87; J. M. Kemble, *Codex anglo-saxonicus*, passim; Selden, *English Janus* (London, 1682), p. 43; Walter de Gray Birch, *Cartularium saxonicum*, passim; Facsimiles of Ancient Charters in the British Museum, pt. iv. Cotton MS. Augustus, ii. 86. (G. J. T.)

TRINOVANTES (commonly *Trinobantes*), a powerful British tribe about 50 B.C.–A.D. 50 dwelling north and north-east of London, rivals and neighbours of the Catuvellauni. When Caesar invaded Britain 54 B.C. they joined him against their domestic rivals and it is possible (though not certain) that half a century after Caesar's departure they succumbed to them. Certainly they were conquered by Rome in A.D. 43 and joined in Boadicea's revolt in 61. In the tribal division of Roman Britain given by Ptolemy their land included Camulodunum (Colchester), but nothing more is known of them. But their name plays a part in medieval legends and romances. There it was interpreted as Troy Novant, the "new Troy," and connected with the names of the Trojans Brutus and Corineus who were reputed to have given their names to Britain and Cornwall. (F. J. H.)

TRIOLET, one of the fixed forms of verse invented in medieval France, and preserved in the practice of many modern literatures. It consists of eight short lines on two rhymes, arranged a b a a a b a b, and in French usually begins on the masculine rhyme. The first line reappears as the fourth line, and the seventh and eighth lines repeat the opening couplet; the first line, therefore, is repeated three times, and hence the name. No more typical specimen of the triolet could be found than the following, by Jacques Ranchin (*c.* 1690):—

"Le premier jour du mois de mai
Fut le plus heureux de ma vie:
Le beau dessein que je formais,
Le premier jour du mois de mai!
Je vous vis et je vous aimais.
Si ce dessein vous plut, Sylvie,
Le premier jour du mois de mai
Fut le plus heureux de ma vie."

This poem was styled by Ménage "the king of triolets." The great art of the triolet consists in using the refrain-line with such naturalness and ease that it should seem inevitable, and yet in each repetition slightly altering its meaning, or at least its relation to the rest of the poem. The triolet seems to have been invented in the 13th century. The earliest example known occurs in the *Cléomadès* of Adenéz-le-Roi (1258–1297). The medieval triolet was usually written in lines of ten syllables, and the lightness of touch in the modern specimens was unknown to these perfectly serious examples. One of the best-known is that of Froissart, "Mon cœur s'ebât en odorant la rose." The rules are laid down in the *Art et Science de Rhéthorique* (1493) of Henry de Croi, who quotes a triolet written in words of one syllable. According to Sarrasin, who introduces the triolet as a mourner in his *Pompe funèbre de Voiture*, it was that writer who "remis en vogue" the ancient precise forms of verse, "par ses balades, ses triolets et ses rondeaux, qui par sa mort (1648) retournaient dans leur ancien décri." Boileau threw scorn upon the delicate art of these pieces, and mocked the memory of Clément Marot because he "tourna des triolets," but Marmontel recognized the neatness and charm of the form. They continued to be written in France, but not by poets of much pretension, until the middle of the 19th century, when there was a great revival of their use.

The earliest triolets in English are those of a devotional nature composed in 1651 by Patrick Carey, a Benedictine monk at Douai, where he probably had become acquainted with what Voiture had made a fashionable French pastime. In modern times, the triolet was re-introduced into English by Robert Bridges, in 1873, with his—

"When first we met, we did not guess
That Love would prove so hard a master;
Of more than common friendliness
When first we met we did not guess.
Who could foretell the sore distress,
This irretrievable disaster,
When first we met?—we did not guess
That Love would prove so hard a master."

Since then the triolet has been cultivated very widely in English, most successfully by Austin Dobson, whose "Rose kissed me to-day," "I intended an Ode" and "In the School of Coquettes" are masterpieces of ingenuity and easy grace. In later French literature, triolets are innumerable; perhaps the most graceful cycle of them is "Les Prunes," attached by Alphonse Daudet to his *Les Amoureuses* in 1858; and there are delightful examples by Théodore de Banville. In Germany the triolet has attracted much attention. Those which had been written before his day were collected by Friedrich Rassmann, in 1815 and 1817. But as early as 1795 an anthology of triolets had been published at Halberstadt, and another at Brunswick in 1796. Rassmann distinguished three species of triolet, the legitimate form (which has been described above), the loose triolet, which only approximately abides by the rules as to number of rhymes and lines, and single-strophe poems which more or less accidentally approach the true triolet in character. The true triolet was employed by W. Schlegel, Hagedorn, Rückert, Platen and other romantic poets of the early 19th century. In many languages the triolet has come into very frequent use to give point and brightness to a brief stroke of satire; the French newspapers are full of examples of this. The triolet always, or at least since medieval times, has laboured under a suspicion of frivolity, and Rivarol, in 1788, found no more cutting thing to say of Conjon de Bayeux than that he was "si recherché pour le triolet." But in the hands of a genuine poet who desires to record and to repeat a mood of graceful reverie or pathetic humour, the triolet possesses a very delicate charm.

See Friedrich Rassmann, *Sammlung triolettischer Spiele* (Leipzig, 1817). (E. G.)

TRIPHENYLMETHANE, $(C_6H_5)_3CH$, a hydrocarbon, important as being the parent substance of several series of exceedingly valuable dyestuffs, *e.g.* rosanilines and malachite greens derived from aminotriphenylmethanes, and aurins and phthaleins derived from oxytriphenylmethanes. It is obtained by condensing benzal chloride with mercury diphenyl (Kekulé and Franchimont, *Ber.*, 1872, 5, p. 907); from benzal chloride or benzotrichloride and zinc dust or aluminium chloride; from chloroform or carbon tetrachloride and benzene in the presence of aluminium chloride; and deamidating di- and tri-aminotriphenylmethane with nitrous acid and alcohol (O. and E. Fischer, *Ann.*, 1881, 206, p. 152). The last reaction is most important, for it established the connexion between this hydrocarbon and the rosanilines. Triphenylmethane is a white crystalline solid, melting at 92° and boiling at 358°. It separates from benzene and thiophene with one molecule of the "solvent of crystallization." On oxidation it gives triphenylcarbinol, $(C_6H_5)_3C{\cdot}OH$, and reduction with hydriodic acid and red phosphorus gives benzene and toluene. It combines with potassium to give $(C_6H_5)_3CK$, which with carbon dioxide gives potassium triphenylacetate, $(C_6H_5)_3C{\cdot}CO_2K$. Fuming nitric acid gives a paratrinitro substitution derivative which on reduction gives paraleucaniline; the salt of the carbinol formed on oxidizing this substance is the valuable dye rosaniline.

Considerable interest is attached to the remarkable series of hydrocarbons obtained by Gomberg (*Ber.*, 1900, 33, p. 3150, et seq.) by acting on triphenylmethane chloride (from triphenylmethane carbinol and phosphorus pentachloride, or from carbon tetrachloride and benzene in the presence of aluminium chloride) and its homologues with zinc, silver or mercury. Triphenylmethane chloride yields triphenylmethyl; ditolylphenylmethyl and tritolylmethyl have also been prepared. They behave as unsaturated compounds, combining with oxygen to form peroxides and with the halogens to form triarylmethane halides. Triphenylmethyl also combines with ethers and esters, but the compounds so formed are unsaturated. In the solid state triphenyl is colourless, crystalline and bimolecular. It was thought that it might be identical with hexaphenylethane, but the supposed synthesis of this substance by Ullmann and Borsum (*Ber.*, 1902, 35, p. 2877) appeared to disprove this, although it showed that triphenylmethyl readily isomerized into their product, under the influence of catalysts. A.E. Tschitschibabin (*Ber.*, 1908, 41, p. 2421), however, has shown that Ullmann and Borsum's preparation was para-benzhydroltetraphenylmethane $(C_6H_5)_2CH{\cdot}C_6H_4{\cdot}C(C_6H_5)_3$; and the view that solid triphenylmethyl is hexaphenylethane has much in its favour. Another remarkable fact is that these substances yield coloured solutions in organic solvents; triphenylmethyl gives a yellow solution, whilst ditolylphenyl and tritolylmethyls give orange solutions which on warming turn to a violet and to a magenta, the changes being reversed on cooling. Several views have been published to explain this fact. A summary is given by Tschitschibabin (*Journ. prak. Chem.*, 1907 (ii.), 74, p. 340). It appears probable that the solutions contain a quinonoid modification (see Gomberg and Cone, *Ann.*, 1909, 370, p. 142).

TRIPOD (Gr. *τρίπους*, Lat. *tripus*), in classical antiquities, any "three-footed" utensil or article of furniture. The name is specially applied to the following: (1) A seat or table with three legs. (2) A stand for holding the caldron used for boiling water or cooking meat; when caldron and stand were made in one piece, the name was given to the complete apparatus. (3) A sacrificial tripod, or altar, the most famous of which was the Delphic tripod, on which the Pythian priestess took her seat to deliver the oracles of the god, the seat being formed by a circular slab on the top, on which a branch of laurel was deposited when it was unoccupied by the priestess. Another well-known tripod was the "Plataean," made from a tenth part of the spoils taken from the Persian army after the battle of Plataea. This consisted of a golden basin, supported by a bronze serpent with three heads (or three serpents intertwined), with a list of the states that had taken part in the war inscribed on the coils of the serpent. The golden bowl was carried off by the Phocians during the Sacred War; the stand was removed by the emperor Constantine to Constantinople, where it is still to be seen in the Atmeidan (hippodrome), but in a damaged condition, the heads of the serpents having disappeared. The inscription, however, has been almost entirely restored (see Frazer on Pausanias, v. 299 seq.). Such tripods were usually of bronze and had three "ears" (rings which served as handles). They also frequently had a central upright as support in addition to the three legs. Tripods are frequently mentioned in Homer as prizes in athletic games and as complimentary gifts, and in later times, highly decorated and bearing inscriptions, they served the same purpose. They were also used as dedicatory offerings to the gods, and in the dramatic contests at the Dionysia the victorious *choregus* (a wealthy citizen who bore the expense of equipping and training the chorus) received a crown and a tripod, which he either dedicated to some god or set upon the top of a marble structure erected in the form of a small circular temple in a street in Athens, called the "street of tripods," from the large number of memorials of this kind. One of these, the "monument of Lysicrates," erected by him to commemorate his victory in a dramatic contest in 335 B.C. is still in existence (see Frazer, ii. 207).

See C. O. Müller, *De tripode delphico* (1820); F. Wieseler, *Ueber den delphischen Dreifuss* (1871); E. Reisch, *Griechische Weihgeschenke* (1890), and his article "Dreifuss" in Pauly-Wissowa, *Realencyclopädie der classischen Altertumswissenschaft*, v. pt. 2 (1905).

TRIPOLI, a Turkish vilayet (regency) of North Africa. It is bounded N. by the Mediterranean (between 11° 40′ and 25° 12′ E.) and has a coast-line of over 1100 m. Tripoli comprises at least five distinct regions—Tripoli proper, the Barca plateau (*Cyrenaica*), the Aujila oases, Fezzan (*q.v.*) and the oases of Ghadames and Ghat—which with the intervening sandy and stony wastes occupy the space between Tunisia and Egypt, extend from the Mediterranean southwards to the Tropic of Cancer, and have a collective area of about 400,000 sq. m., with a population estimated at from 800,000 to 1,300,000. Towards the south and east the frontiers are undefined. But on the west side the conventional line laid down by agreement with France in 1886 was more accurately determined in 1892, when the terminal point on the Mediterranean was shifted from Borj-el-Biban to Ras Ajir, 18 m. to the south-east, in 33° 12′ N. 11° 40′ E. From this point the line passes along the Wad Magla and across the Erg (sand) dunes in such a way as to leave Ghadames to Turkey. In consequence of frontier collisions the boundary as far as Ghadames was precisely defined in 1910. South of that point the rival claims of France and Turkey remained in dispute.

Physical Features.

For some distance east of Tunisia the seaboard is low and sandy, and is often regarded as a part of the Sahara, which, however, begins only some 80 m. farther south, beyond the Jebels Nefusi, Yefren and Ghurian (Gharian). The "Jebel," as this system is locally called, terminates eastwards in the Tarhona heights of the Homs (Khoms) coast district, has a mean altitude of about 2000 ft. and culminates in the Takut (Tekuk) volcano (2800 ft.) nearly due south of the capital. It is not a true mountain range, but rather the steep scarp of the Saharan plateau, which encloses southwards the Jefara coast plains, and probably represents the original coast-line. The Ghurian section is scored in places by the beds of intermittent coast streams, and on its lower slopes is clothed with a rich sub-tropical vegetation. South of these escarpments, the vast Hammada el-Homra, the "Red Hammada," an interminable stony table-land covering some 40,000 sq. m., occupies the whole space between Tripoli proper and the Fezzan depression. The now uninhabited and waterless Hammada formerly drained through several large rivers, such as the Wadis Targelat (Uani, Kseia), Terrgurt, Sofejin, Zemzem and Bel, north-eastwards to the Gulf of Sidra (*Syrtis major*). Southwards the table-land is skirted by the Jebel Welad Hassan, the Jebel es-Suda, the Jebel Morai-Yeh, and other detached ranges, which have a normal west to east trend in the direction of the Aujila oases, rising a little above the level of the plateau, but falling precipitously towards Fezzan. The Jebel es-Suda (Black Mountains), most conspicuous of these ranges, with a mean altitude of 2800 ft., takes its name from the blackened aspect of its limestone and sandstone rocks, which have been subjected to volcanic action, giving them the appearance of basalt. Eastwards this range ramifies into the two crescent-shaped chains of the Harūj el-Aswad and Harūj el-Abiad ("Black" and "White" Harūj), which rise some 700 ft. above the Red Hammada, and enclose an extensive Cretaceous plateau. Rocks of Cretaceous age cover, indeed, an immense area of the northern part of the vilayet, recent eruptive rocks being represented by the lavas and ashes of the craters of Takut and Manterus. The later palaeozoic formations occur in Fezzan.

Beyond the barren Ghadama district in the north of the Hammada the dreary aspect of the wilderness is broken by several tracts under grass, corn and date-palms, and containing some permanent reservoirs in the beds of the Wadis Sofejin and Zemzem, where the plateau falls from a mean height of 2000 ft. to 1000 and 530 ft. respectively. But it again rises rapidly southwards to a somewhat uniform level of 1600 or 1700 ft., and here the main caravan route from Tripoli to Murzuk and Lake Chad traverses for a distance of fully 130 m. a monotonous region of sandstone, underlying clays, marls, gypsum and fossiliferous silicious deposits. In its northern section this part of the Hammada, as it is locally called in a pre-eminent sense, is relieved by a few patches of herbage, scrub and brushwood, with a little water left in the rocky cavities by the heavy showers which occasionally fall.

The Aujila Depression. North-eastwards the Neddik pass over the Jebel Morai-Yeh leads down to the remarkable chain of low-lying oases, which, from the chief member of the group, is commonly called the Aujila depression. Collectively the oases present the aspect of a long winding valley, which is enclosed on the north side by the southern escarpments of the Barca plateau, expands at intervals into patches of perennial verdure and shallow saline basins, and extends from the Wadi el-Fareg, near the Gulf of Sidra, through the Bir Rassam, Aujila, Jalo, Faredgha, and Siwa oases, to the Natron lakes and the dried-up branch of the Nile delta known as the Bahr bilā-Mā (waterless river). The whole region presents the aspect of a silted-up marine inlet, which perhaps in Pliocene times penetrated some 300 m. south-eastwards in the direction of the Nile. Nearly all the fossil shells found in its sands belong to the fauna now living in the Mediterranean, and Siwa is 98 ft. below sea-level. This is true also of its eastern extensions, Sittra (80) and the Birket el-Kerun in the Fayum (141). But Aujila and Jalo stand 130 and 296 ft. respectively above sea-level, so that the idea entertained by the explorer Gerhard Rohlfs of transforming the chain of oases into a marine gulf, and thus converting the Barca plateau into an island or peninsula in the midst of the Mediterranean waters, and in fact flooding the Libyan desert, must share the fate of Colonel François Roudaire's equally visionary scheme in respect of the Western Sahara.

The Barca Plateau. The Barca plateau, which consists largely of strata of tertiary formation, falls in terraces down to the Aujila depression, and presents an unbroken rampart of steep cliffs towards the Mediterranean, is by far the most favoured region of the vilayet. Its many natural advantages of climate, soil and vegetation led to the establishment of several Greek colonies, the oldest and most famous of which was that of *Cyrene* (*q.v.*), dating from about 630 B.C. From this place the whole region took the name of Cyrenaica (*q.v.*) and was also known as *Pentapolis*, from its "five cities" of Cyrene, Apollonia, Arsinoe, Berenice and Barca. The elevated plateau of Cyrenaica, which encloses the Gulf of Sidra on the west, is separated southwards by the Aujila depression from the Libyan desert, and projects northwards far into the Mediterranean, might seem, like the Atlas region in the west, to belong geologically rather to the European than to the African mainland. It has a mean altitude of considerably over 2000 ft., and in the Jebel Akhdar (Green Mountains) attains a height of nearly 3500 ft. Eastwards the Barca uplands merge gradually in the less elevated Marmarica plateau, which nowhere rises more than 1800 ft. above sea-level, and disappears altogether in the direction of the Nile delta. The most easterly spot on the coast belonging to Tripoli is the head of the Gulf of Solum; from this point the frontier line separating the regency from the Egyptian dominions runs south so as to leave the Siwa oasis on the Egyptian side of the line.

The Kufra Oases. South of the Aujila depression the land rises steadily to a height of nearly 1200 feet in the *Kufra* oases, which lie between 21° and 24° E., north of the Tropic of Cancer and due east of Fezzan. The group consists of five distinct oases in the heart of the Libyan desert—Taizerbo, Zighen, Bu-Zeima, Erbena and Kebabo—which extend for a distance of 200 m. north-west and south-east, and have a collective area of 7000 sq. m. and a population of 6000 or 7000 Arabo-Berber nomads. Good water is obtained in abundance from the underground reservoirs, which lie within a few feet of the surface, and support over a million date-palms. Kufra, that is, "Infidels" (in reference to the now extinct pagan Tibu aborigines), is a centre of the Senūssite brotherhood, whose *zawya* (convent) at Jof, in Kebabo, ranks in importance with that of Jarabub, their chief station in Cyrenaica. This circumstance, together with the great fertility of the group and its position midway on the caravan route between Cyrenaica and Wadai, imparts exceptional importance to these oases. Formerly the Turks did not exercise authority in Kufra, the influence of the Senussi being paramount. Kufra, moreover, is outside the limits usually assigned to Tripoli. But in 1910 Ottoman troops were in occupation of the oases.

Ghat. *Ghat* stands 2400 feet above the sea, on the Wadi Aghelad in the Igharghar basin, and consequently belongs, not to the Fezzan depression, but to the Saharan plateau. The Aghelad, or "Passage," trends north to the Iasawan valley along the east foot of the Tasili plateau, that is, the divide between the waters which formerly flowed north to the Mediterranean, west to the Atlantic, and south to the Niger and Chad basins. Ghat, which is skirted eastwards by the Akakus range, is a sandy plain dotted over with clumps or groves of date-palms. In the centre is an open space where is held a great annual fair, and to this, combined with its position on one of the caravan routes across the desert, the oasis owes all its importance. For several years, at the end of the 19th and beginning of the 20th centuries, the only caravan route used from the Niger countries to Tripoli was by way of Ghat, disturbances in Bornu and raids by Tuareg having closed all other routes. There is, in the oasis, a population of perhaps 10,000, nearly all Ihajenen Tuareg, about half of whom live in the town of Ghat (350 m. south of Ghadames and 250 south-west of Murzuk), which appears to be a relatively modern place, successor to *Rapsa*, a great commercial centre and military station under the Roman Empire.

Ghadames. *Ghadames*, on the contrary, is ancient, being the *Cydamus* of the Garamantes, the capture of which by L. Cornelius Balbus Minor led to the overthrow of their empire. The oasis, which stands on the cretaceous Tinghert plateau 300 m. south-west of Tripoli, and 1200 ft. above the sea, is enclosed by a circular rampart over 3 m. in circumference. The town, which occupies the south-west corner of the enclosure, has a population of about 7000. Owing to its perennial springs and artesian wells, the oasis yields an abundance of dates, figs, apricots and vegetables, besides some wheat, barley and millet. It occupies a highly advantageous position at the converging-point of several caravan routes, and has extensive trading relations with the markets of Tripoli, Tunisia and the Sudan.

Climate.—The climate of Tripoli is very variable; cold nights often succeed warm days. The rainfall in the northern regions varies from 5 in. to 15 in. a year—December, January and February being the rainy season. The mean temperature on the coast lands is 68°; it is very much higher in the Hammada, where rain seldom falls.

Flora and Fauna.—The flora in the greater part of the regency is Saharan, the date-palm being the characteristic tree. The gum-yielding acacia, the tamarisk, sapan, mastic and pistachio are found in the wadis, and *shi* (wormwood) grows in clusters on the stony plateaus. In the Barca plateau and in parts of the coast belt the flora is more varied, resembling that of the Mediterranean countries generally. In these regions the laurel, myrtle and other evergreens are fairly common, and the oak, cypress, pine, carob and other trees occur, notably the olive, found also in the oases. Other fruit trees are the almond, fig, pomegranate, quince and apricot. Vines flourish in a few districts.

The larger wild animals are scarcely represented in Tripoli. The wild boar is found in Jebel Akhdar, the hyena, fox and jackal in the deserts. The mouflon, gazelle, hares, rabbits and marmots are among the commoner animals. Reptiles include the horned viper and the gecko. The characteristic animal is the camel, found only in the domesticated state. Horses and cattle are bred, but the horses are not numerous; goats and a fat-tailed variety of sheep are kept in large numbers. Birds include the ostrich, vultures, hoopoes, wood pigeons and doves. Bees are numerous and honey forms an article of export.

Inhabitants. The explorations of Henri Duveyrier, Victor Largeau, Erwin von Bary and H. S. Cowper during the second half of the 19th century showed that Tripoli was not only inhabited by primitive man, but was the seat of a flourishing Neolithic culture, comparable to and in many respects resembling that of Iberia, Brittany and the British Isles. As in other parts of Mauretania, many now arid and uninhabitable wastes are strewn with monolithic and other remains, which occur in great variety of form and in vast numbers, as many as 10,000, chiefly of the menhir type, having been enumerated in the Mejana steppe alone. All kinds of megalithic structures are found—dolmens and circles like Stonehenge, cairns, underground cells excavated in the live rock, barrows topped with huge slabs, cup stones, mounds in the form of step pyramids, and sacrificial altars. Most remarkable are the "Senams," or trilithons of the Jebel Msīd and other districts, some still standing, some in ruins, the purpose of which has not been determined. They occur either singly or in rows, and consist of two square uprights 10 ft. high standing on a common pedestal and supporting a huge transverse beam. In the Terrgurt valley "there had been originally no less than eighteen or twenty megalithic trilithons, in a line, each with its massive altar placed before it" (Cowper). There is reason to believe that the builders of these prehistoric monuments are represented by the Berber people, who still form the substratum, and in some places the bulk, of the inhabitants of Tripoli proper. But even here the Berbers have for the most part been driven to the Ghurian and Tarhona uplands by the Arab nomads, who now occupy the Jefara flats about the capital, and are in almost exclusive possession of Cyrenaica, Marmarica, and the Aujila oases. In Fezzan the Saharan Berbers (Tinylkum Tuareg) are dominant, but are here largely intermingled with Negro or Negroid intruders from the Sudan. But even in the uplands many of the Berbers have been Arabized, and Cowper describes the people of the Tarhona heights as "pure-bred Arabs." Other early intruders are the Jews, some of whom arrived from Egypt in the time of the Ptolemies, and still lead the life of troglodytes in the limestone caves of the Ghurian escarpments. They are also numerous in the large towns, where there are also colonies of Turks, and Maltese, Italian, Cretan and other South European traders and artisans.

On the other hand, no trace can be now detected either of the Greeks who colonized Cyrenaica in the 7th century B.C., or of the Phoenicians who at a still earlier date founded the three great cities of Oea, Sabrata and Leptis Magna (*q.v.*), from which the western region projecting seawards between the two Syrtes took the name of Tripolitana. Later, when Oea, which stood between the two others, was made the capital of the province it was called Tripolis, the "Three Cities," as it were, rolled into one, and this name it has retained since Roman times, being now distinguished from the Tripolis of Syria as West Tripolis, the *Tarabulus el-Gharb* of the Turks and Arabs. Tripoli (*q.v.*), the capital of the province, is thus one of the oldest places in the world, and no doubt owes its stability in large measure to its position over against Sicily at the northern terminus of three great historic caravan routes, one of which runs due south to Lake Chad through Fezzan and Bilma, that is, across the narrowest part of the Sahara; another runs south-west through Ghadames and Ghat to Timbuktu and Kano, and the third south by east through Sokna to Wadai and Darfur. East of Tripoli are the small seaports of Homs (Khoms) and Lebda.

Tripoli and other Towns.

In Barca the largest town is Bengazi (*q.v.*), the ancient Berenice, at the southern extremity of a headland which formerly enclosed a spacious natural haven on the north-east side of the Gulf of Sidra. But the harbour has been partly filled up by the ruins of a large fortress, and is inaccessible to vessels drawing over 6 or 7 ft. East of Bengazi are Merj, the ancient Barca (*q.v.*), and the exposed roadstead of Derna (*q.v.*). Marsa-Susa, the ancient Apollonia, lies under the Ras Sem headland, and was the emporium of the neighbouring city of Cyrene (Ain Shahat-Grenna). The Turkish government displayed much activity in this fertile and healthy district in the period 1897–1903. To it were removed many of the Moslem inhabitants of Crete dissatisfied with the autonomous régime established in that island in 1898.

Agriculture and Trade.—Tripoli proper is purely an agricultural and trading country; it possesses no manufactures of importance, nor exploited mineral wealth save salt. The uncertainty of the rainfall, the apparent increasing poverty of the soil and the heavy taxation of the peasants reduced agriculture at the close of the 19th century to a lower point than theretofore recorded. The cultivation of wheat was largely supplanted by that of barley—the staple food of the peasantry, whilst esparto grass, a fibre growing wild in the rural districts within the cereal zone, acquired the chief place among local exports. The importation of foreign flour, begun in 1881, assumed large dimensions in providing for the deficiencies occasioned by ever-recurring failures of the wheat and barley harvests. Besides wheat and barley the principal products of the country are esparto grass, olives, saffron, figs and dates—these last being perhaps the finest in North Africa. Fruit also is abundant in certain parts, including oranges and lemons, and so are many kinds of vegetables. There is a lucrative sponge fishery, a monopoly of Greek traders, over 100 barques being engaged in the industry.

Trade, before the suppression of the oversea slave traffic, was largely in negroes, brought across the Sahara with other Sudan produce, for the Turkish market. It now consists chiefly in the export of esparto, barley in years of plenty, eggs, cattle, sponges, mats and henna, all articles of local production, and, from Central Africa, ivory, ostrich feathers, tanned goat-skins and a little gold dust. The cattle go mainly to Malta, the esparto, barley, eggs and ivory mostly to England, the feathers to Paris and London, and the skins to New York. The henna and mats are sent to Turkey, Egypt, Tunis and Malta. The exports of esparto grass vary with the success or failure of the cereal crops; thus in 1903 the value of barley exported was £70,800, and of esparto £76,400. In 1904 the exports of barley fell to £3,200 and those of esparto rose to £126,000. From Bengazi hundreds of thousands of sheep are exported to Egypt, Malta and Crete. With Egypt there is an overland as well as sea trade. The caravan trade, which in the forty years ending 1901 had an annual average value of £114,000, is so costly that only articles yielding considerable profit can be carried; the desert trade is, moreover, being deflected to the Niger and the Guinea coast. Tripoli imports, chiefly, food-stuffs (flour, rice, sugar, tea) cotton goods, tobacco, metals and hardware About two-thirds of the imports are from Great Britain. Exclusive of Bengazi the value of trade, imports and exports combined, was for the last thirty years of the 19th century some £770,000 per annum. The trade of Bengazi and Derna, chiefly with Great Britain and Malta, largely increased at the beginning of the 20th century. For the five years 1902–1906 the average annual value of imports was £214,000, of exports £455,700. From these ports the chief exports are sheep and goats, oxen, wool and skins, barley and camels—the last sent overland to Alexandria. Food-stuffs, tea, olive oil and cotton goods are the chief imports. There is an active contraband trade with Greece and Malta in firearms and gunpowder.

Barley is the chief food of the people both in Tripoli proper and in Bengazi. The nomad Arabs possess thousands of camels, cattle and sheep. They weave rough woollen garments, make reed matting, carpets of alternative strips of woven goat and woven camel hair, and manufacture butter. Olive and date-palm trees are cultivated in large numbers. Tea has become a favourite beverage both in the regency and with the Sudanese. Tea, sugar and cottons form the staple articles of exchange with the Sudanese for their produce.

Communications.—The town of Tripoli is connected by telegraph cable with Malta, and telegraph lines run inland from that town to Murzuk, Bengazi, Derna and other towns in the regency, and to Gabes in Tunisia. A wireless telegraphic apparatus connects Derna and Rhodes. There are regular sailings between Malta and Tripoli and between Tunis and Tripoli. Italian vessels also call regularly at Bengazi and Derna. The shipping trade is mostly in the hands of Italians—who have more than half the total tonnage—and French, British shipping coming third. Inland communication is almost entirely by camel caravans.

Administration.—The *vali* or governor-general, who exercises chief authority both civil and military, is appointed by the sultan of Turkey and holds office at his majesty's pleasure. The system of government, executive and judicial, resembles that of other Turkish provinces, but with some modifications in the direction of local autonomy. Bengazi or Barca is a separate sub-province with an administration responsible direct to Constantinople. Revenue is derived chiefly from customs, tithes and a poll tax called *verghi*. Owing to expenditure on the army, some 10,000 Turkish troops being stationed in the regency, the receipts from revenue are generally below the cost of administration. The receipts in the period 1900–1905 averaged about £150,000 a year and the expenditure £170,000, of which amount some £100,000 was on military requirements.

History.—The early history of Cyrenaica and Tripoli is distinct though similar. Cyrenaica was first colonized by Greeks, afterwards it fell under the sway of the Ptolemies and from them passed to the Romans (see CYRENAICA). Tripoli, on the other hand, was originally a Phoenician colony (*vide ante, Towns*). Later it was dependent on Carthage and followed its fortunes. From the Romans the province received its present name. In the 5th century both Tripoli and Cyrenaica were conquered by the Vandals, whose power was destroyed by the Byzantine general Belisarius in the following century. In the middle of the 7th century the whole country was overrun by the Arabs, and Christianity gave place to Islam. From this period, for many centuries, Tripoli was subject to the successive rulers of Tunisia. It was pillaged in 1146 by the Normans of Sicily. In 1321 the Beni Ammar established an independent dynasty, which lasted with an interval (1354–1369), during which two sovereigns of the Beni Mekki reigned, until 1401 when Tripoli was reconquered by the Tunisians. In 1510 Ferdinand the Catholic of Spain took Tripoli, and in 1528 it was given to the knights of St John, who were expelled in 1553 by the Turkish corsairs Dragut and Sinan. Dragut, who afterwards fell in Malta, lies buried in a much venerated *kubba* close to one of the mosques. After his decease the connexion between Tripoli and Constantinople seems to have been considerably weakened. But the Tripolitan pirates soon became the terror and scourge of the Mediterranean; half the states of Europe seem at one time or other to have sent their fleets to bombard the capital. In 1714 Ahmed Pasha Caramanli achieved practical independence and he and his descendants governed Tripoli as a regency, the claims of the Porte being recognized by the payment of tribute, or "presents." In the early part of the 19th century the regency, owing to its piratical practices, was twice involved in war with the United States. In May 1801 the pasha demanded from America an increase in the tribute ($83,000) which the government of that country had paid since 1796 for the protection of their commerce from piracy. The demand was refused and a naval force was sent from America to blockade Tripoli. The war dragged on for four years, the Americans in 1803 losing the frigate "Philadelphia," the commander (Captain William Bainbridge) and the whole crew being made prisoners. The most picturesque incident in the war was the expedition undertaken by William Eaton (*q.v.*), with the object of replacing upon the Tripolitan throne an exiled pasha, elder brother of the reigning sovereign, who had promised to accede to all the wishes of the United States. Eaton at the head of a motley assembly of 500 men marched across the desert from Alexandria, and with the aid of American ships succeeded in capturing Derna. Soon afterwards (June 3, 1805) peace was concluded, the reigning pasha relinquishing his demands but receiving $60,000 (about £12,000) as ransom for the "Philadelphia" prisoners. In 1815, in consequence of further outrages, Captains Bainbridge and Stephen Decatur, at the head of an American squadron, again visited Tripoli and forced the pasha to comply with the demands of America. In 1835 the Turks took advantage of a civil war to reassert their direct authority, and since that date Tripoli has been an integral part of the Ottoman Empire, rebellions in 1842 and 1844 being unsuccessful. After the occupation of Tunisia by the French (1881) the Turks increased their garrison in Tripoli considerably. After the Anglo-French agreement of 1889 recognizing the central Sahara as within the French sphere, various disputes arose as to the extent of the Tripolitan hinterland, which the French endeavoured to circumscribe (see TUNISIA). The French, on their part, believed that their opponents in Wadai and elsewhere in the central Sudan received support from the Turks.

The *khouan* (*ikhwân*) or semi-religious semi-political Moslem fraternities are powerful in Tripoli. The most remarkable is that of the Senussites. The explorers Rohlfs, Nachtigal and Duveyrier found their passage barred by Senussite agents. (See SENUSSI.)

TRIPOLI (*Tarabulus el-Gharb, i.e.* Tripoli of the West), capital of the Turkish vilayet of Tripoli, North Africa, situated in 32° 53′ 40″ N. and 13° 11′ 32″ E. on a promontory stretching out into the Mediterranean and forming a small crescent-shaped bay which shelters the harbour from the north winds. Its crenellated enceinte wall has the form of an irregular pentagon. A line of small ancient forts is supposed to protect one side of the harbour, and the citadel the other. This citadel, dating from the time of the Spanish occupation, now serves as the residence of the governor. The harbour has a depth of water varying from 15 to 24 ft.; steamers drawing 21 ft. can anchor inside, but shoals render the entry difficult. At the quayside the depth of water is from 2 to 5 ft. only. The desert almost touches the western side of the city, while on the east is the verdant oasis of Meshia, where are still to be seen the tombs of the Caramanlian sultanas and the twelve-domed *kubba* of Sidi Hamonda. The aspect of the city is picturesque; the houses (many possessing beautiful gardens) rise in terraces from the seashore. The Turkish quarter contains numerous mosques whose minarets and cupolas break the monotony of the flat-roofed and whitewashed houses. The Grand mosque and the Pasha mosque (originally a church built by the Spaniards) both have octagonal minarets. By the harbour are several houses built in European style, but the general aspect of the city is Oriental. Many of the streets are arcaded; the *suks* or markets are the scene of much animation. Near the port stands a Roman triumphal arch. This arch, quadrifrontal in form, is made entirely of white marble, the blocks being held together with cramps, and is richly embellished with sculpture. It was begun in the reign of the emperor Antoninus, according to a still unmutilated dedicatory inscription, and finished in that of Marcus Aurelius. In the arch, now partly buried in débris, a cabaret has been installed.

A few small manufactures of carpets and silks as well as "Cordova leather" are carried on, but Tripoli is essentially a trading town, being the chief Mediterranean gateway to the Sahara. The population, about 60,000, is very mixed—Berber, Arab, Turk, Jew, Maltese, Italian and Negro. The Maltese inhabitants number about 4000, the Italians 1000 and the Jews 8000. The local trade is almost entirely in the hands of the Jews and Maltese; the shipping in the port is largely Italian.

See H. M. de Mathuisieulx, *A travers la Tripolitaine* (Paris, 1903).

TRIPOLI, or TARABULUS (anc. *Tripolis*), the chief town of a sanjak of the same name in the Beirut vilayet of Syria, situated about 2 m. inland from its port, al-Mina. The ancient Phoenician city, which we know only by its Greek name of Tripolis, was the seat in Persian times of the federal council of Sidon, Tyre and Aradus, each of which cities had its separate quarter in the "triple town." In the 2nd and 1st centuries B.C., under Seleucid and Roman influences successively, it struck autonomous coins. These are succeeded by imperial coins ranging from 32 B.C. to A.D. 221. About 450, and again in 550, it was destroyed by earthquake. The Arabs took it in 638 after a prolonged siege, the inhabitants withdrawing by sea. Moawiya recruited the population by a colony of Jews and gave it fortifications and a garrison against the naval attacks of the Greeks, who, notwithstanding, retook it for a brief space in the time of Abdalmalik. It was again taken by the Greeks in the war of 966–69 and was besieged by Basil II. in 995, after which date it was held by a garrison in the pay of the Fatimite caliphs of Egypt, who treated the city with favour and maintained in it a trading fleet. At this time, according to the description of Nāsir Khosrau, who visited it in 1047, it lay on the peninsula of Al-Mīnā, bathed on three sides by the sea, and had about 20,000 inhabitants and important industries of sugar and paper-making. Of the great sea-walls and towers there are still imposing remains. From this date till it was taken by the crusaders, after a five years' siege, in 1109, the ruling family was that of 'Ammār, which founded a library of over 100,000 volumes. Under the crusaders Tripoli continued to flourish, exported glass to Venice, and had 4000 looms. In 1289 it was taken and destroyed by the sultan Kolā'ūn of Egypt, and a new city was begun on the present site, which rapidly rose to importance. Its medieval prosperity has obliterated most relics of remoter antiquity. Tripoli had a troubled existence during the period of Ottoman weakness (the 18th and early 19th centuries), being frequently in dispute between the pasha of Aleppo and the rebel pashas of Acre. After the Egyptian conquest of Syria it was made the capital of a province in 1834; but in 1840 it reverted to the minor position which it now holds. It is connected by a carriage road with Homs and by a steam tramway with Beirut, and is the natural outlet of the upper Orontes valley; but its inland trade has been greatly damaged by the Homs-Aleppo railway. From its own district, however, it exports silk, tobacco, oil, soap, sponges, eggs and fruit, and is a prosperous and growing place with a large Christian element in its population (about 30,000, the port-town included). It is served regularly by the Levantine lines of steamers. (D. G. H.)

TRIPOLITSA, officially *Tripolis*, a town of Greece, capital of the nomarchy of Arcadia, and the seat of an archbishop, situated in a plain over 2,000 ft. above sea-level, 22 m. S.W. of Argos. The name has reference to the three ancient cities of Mantineia, Pallantium and Tegea, of which Tripolitsa is the modern representative. It does not stand on any ancient site. Before the war of independence it was the capital of the Morea and the seat of a pasha, with about 20,000 inhabitants; but in 1821 it was taken and sacked by the insurgents, and in 1825 its ruin was completed by Ibrahim Pasha. The town has since been rebuilt, and contains 10,789 inhabitants (1907).

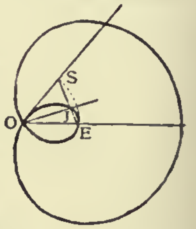
TRIPTOLEMUS, in Greek mythology, the inventor of agriculture, first priest of Demeter, and founder of the Eleusinian mysteries. His name is probably connected with the "triple ploughing" (τρὶς, πολεῖν), recommended in Hesiod's *Works and Days* and celebrated at an annual festival. It may be noted that in some traditions he is called the son of Dysaules (possibly identical with *diaulos*, the "double furrow" traced by the ox), and that, according to the Latin poets (*e.g.* Virgil, *Georgics*, i. 19), he is the inventor of the plough.[1] Later, as the god of ploughing, he is confounded with Osiris, and on a vase-painting at St Petersburg he is represented leaving Egypt in his dragon-drawn chariot on his journey round the world. According to the best known Attic legend (Apollodorus, i. 5, 2) Triptolemus was the son of Celeus, king of Eleusis, and Metaneira. Demeter, during her search for her daughter Persephone, arrived at Eleusis in the form of an old woman. Here she was hospitably received by Celeus, and out of gratitude would have made his son Demophon immortal by anointing him with ambrosia and destroying his mortal parts by fire; but Metaneira, happening to see what was going on, screamed out and disturbed the goddess. Demophon was burnt to death, and Demeter, to console his parents, took upon herself the care of Triptolemus, instructed him in everything connected with agriculture, and presented him with a wonderful chariot, in which he travelled all over the world, spreading the knowledge of the precious art and the blessings of civilization. In another account (Hyginus, *Fab.* 147) Triptolemus is the son of Eleusinus, and takes the place of Demophon in the above narrative. Celeus endeavoured to kill him on his return, but Demeter intervened and forced him to surrender his country to Triptolemus, who named it Eleusis after his father and instituted the festival of Demeter called Thesmophoria. In the Homeric hymn to Demeter, Triptolemus is simply one of the nobles of Eleusis, who was instructed by the goddess in her rites and ceremonies. The Attic legend of Eleusis also represented him as one of the judges of the underworld. His adventures on his world-wide mission formed the subject of a play of the same name by Sophocles. In works of art Triptolemus appears mounted on a chariot (winged or drawn by dragons, symbols of the fruitfulness of the earth), with Demeter and Persephone handing him the implements of agriculture. His attributes were a sceptre of ears of corn, sometimes a drinking-cup, which is being filled by Demeter. His altar and threshing-floor were shown on the Rarian plain near Eleusis; hence he is sometimes called the son of Rarus.

See the Homeric hymn to Demeter, 153, 474; Ovid, *Metam.* v. 642–661; Virgil, *Georgics.* i. 19, and Servius *ad loc.*; Hyginus, *Astronom.* ii. 14; Dion Halic. i. 12; Preller, *Griechische Mythologie* (4th ed., 1894).

TRIPTYCH (Gr. τρίπτυχος, three-fold, made in three layers, τρι-, τρεῖς, three; πτυχή, a fold; πτύσσειν, to fold, double over), a painting, carving or other decorative design, executed on three compartments or panels, so constructed that the two wings may fold on hinges over the centre-piece; the backs of the wing-pieces are often also painted, carved or otherwise decorated. The subject of the side-pieces are usually appropriate and subsidiary to that of the centre. The triptych is most frequently designed as an altar-piece. An earlier use of the term is for a set of three wooden or ivory writing-tablets, hinged or otherwise fastened together, the central tablet being waxed on both sides for the impression of the *stilus* or writing implement, the outer tablets only on the inside. The three tablets thus formed a small book.

[1] Other suggested derivations are from τρίβω, αὖλαι (ὅλαι), the "grain crusher," or from πόλεμος (= "triple fighter," see DEMETER).

TRISECTRIX, a curve which is a variety of the limaçon (*q.v.*) of Pascal, and named from its property of trisecting an angle. The polar equation is $r = 1 + 2 \cos \theta$ and the form of the curve is shown in the figure. To trisect an angle by means of this curve, describe a circle with centre O and radius OE, and let the given angle which is to be trisected be laid off from OE and cut the circle at S; let the chord ES cut the trisectrix in J. Then OJ trisects the given angle.



TRISTAN, or TRISTRAM, one of the most famous heroes of medieval romance. In the earlier versions of his story he is the son of Rivalîn, a prince of North West Britain, and Blancheflor, sister to King Mark of Cornwall. Rivalîn is killed in battle, and Blancheflor, after giving birth to a son, dies of grief. The boy is brought up as his own by Roâld, or Rual, seneschal of the kingdom, who has him carefully trained in all chivalric and courtly arts. With the possible exception of Horn, Tristan is by far the most accomplished hero in the whole range of knightly romance; a finished musician, linguist and chess-player, no one can rival him in more knightly arts, in horsemanship or fencing. He has, besides, the whole science of "venérie" at his finger-tips; in fact Tristan is the "Admirable Crichton" of medieval romance, there is nothing he cannot do, and that superlatively well—it must be regretfully admitted that he is also a most accomplished liar! Attracted by his gifts, pirates from the North Sea kidnap the boy, but terrified by the storms which subsequently beset them, put him ashore on the coast of Cornwall, whence he finds his way to the court of his uncle King Mark. Here we have a first proof of his talent for romancing; for alike to two pilgrims who show him the road and to the huntsmen of Mark's court (whom he instructs in the rightful method of cutting up and disposing the quarry), Tristan invents different, and most detailed, fictions of his land and parentage. He becomes a great favourite at court, and when Roâld, who has sought his young lord far and wide, at last reaches Tintagel, Mark welcomes the revelation of Tristan's identity with joy. Cornwall is at this time in subjection to the king of Ireland, Gormond, and every third year must pay tribute; the Irish champion, Morôlt, brother to the queen, arrives to claim his toll of thirty youths and as many maidens. The Cornish knights (who in Arthurian romance are always represented as hopeless cowards), dare not contest his claim but Tristan challenges him to single combat, slays him and frees Cornwall from tribute. Unfortunately he himself has been wounded in the fight, and that by a poisoned weapon; and none but the queen of Ireland, Isôlt, or Iseult, possessed the secret of healing. Tristan causes himself to be placed in a boat with his harp, and committed to the waves, which carry him to the shores of Ireland. There he gives himself out for a minstrel, Tantris, and as such is tended and healed by Queen Iseult and her daughter of the same name. When recovered he makes a plausible excuse for leaving Ireland (pretending he has left a wife in his native land) and returns to Cornwall. His uncle receives him with joy, but the barons of the court are bitterly jealous and plot his destruction. They persuade Mark that he should marry, and Tristan, who has sung the praises of the princess Iseult, is despatched to Ireland to demand her hand, a most dangerous errand, as Gormond, incensed at the death of Morôlt, has sworn to slay any Cornish knight who sets foot in Ireland. Tristan undertakes the mission, though he stipulates that he shall be accompanied by twenty of the barons, greatly to their disgust. His good fortune, however, does not forsake him; he lands in Ireland just as a fierce dragon is devastating the country, and the king has promised the hand of the princess to the slayer of the monster. Tristan achieves this feat, but, overcome by the venom exhaled from the dragon's tongue, which he has cut out, falls in a swoon. The seneschal of the court, a coward who has been watching for such an opportunity, cuts off the dragon's head, and, presenting it to the king, claims the reward, much to the dismay of Iseult and her mother. Suspecting that the seneschal is not really the slayer of the dragon, mother and daughter go secretly to the scene of the combat, find Tristan, whom they recognize as the minstrel, Tantris, and bring him back to the palace. They tend him in secret, but one day, through the medium of a splinter from his sword, which had remained fixed in Morôlt's skull, and been preserved by the queen, the identity of Tantris and Tristan is made clear. The princess would slay him, but is withheld by her mother, who sees they have need of Tristan's aid to unmask the seneschal. This is done in the presence of the court; Tristan is pardoned, formally declares his errand, and receives the hand of Iseult for his uncle King Mark.

Tristan and Iseult set sail for Cornwall, Iseult accompanied by her waiting-woman, Brangaene (who, in some versions, is also a kinswoman), to whose care the queen, skilled in magic arts, confides a love-potion. This is intended to be drunk by king and queen on their bridal night and will ensure their undying love for each other. Unhappily, on the voyage, by some mistake (accounted for in different ways), Tristan and Iseult drink the love drink, and are forthwith seized with a fatal passion each for the other. From this moment begins a long-drawn-out series of tricks and subterfuges, undertaken with the view of deceiving Mark, whose suspicions, excited by sundry of his courtiers, from time to time get beyond his control, and are as often laid to rest by some clever ruse on the part of his nephew, or his wife, ably seconded by Brangaene. In the poems, Mark is, as a rule, represented in a favourable light, a gentle, kindly man, deeply attached to both Tristan and Iseult, and only too ready to allow his suspicions to be dispelled by any plausible explanation they may choose to offer. At the same time the fact that the lovers are the helpless victims of the fatal force of a magic spell is insisted upon, in order that their career of falsehood and deception may not deprive them of sympathy.

One episode, in especial, has been most charmingly treated by the poets. Mark, in one of his fits of jealousy, banishes Tristan and Iseult from the court; the two fly to the woods, where they lead an idyllic life, blissfully happy in each other's company. Mark, hunting in the forest, comes upon them sleeping in a cave, and as Tristan, who knows that the king is in the neighbourhood, has placed his sword between them, is convinced of their innocence. Through a cleft in the rock a ray of light falls upon Iseult's face, Mark stops up the crevice with his glove (or with grass and flowers), and goes his way, determined to recall his wife and nephew. He does so, and the same drama of plot and counter-plot is resumed. Eventually Mark surprises the two under circumstances which leave no possible room for doubt as to their mutual relation; Tristan flies for his life and takes refuge with Hoel, duke of Britanny. After some time, hearing nothing of Queen Iseult, and believing himself forgotten, he weds the duke's daughter, Iseult of the white hand, but weds her only in name, remaining otherwise faithful to Iseult of Ireland. Later on he returns to Cornwall in disguise, and has more than one interview with his mistress. Ultimately, while assisting his brother-in-law in an intrigue with the wife of a neighbouring knight, Tristan is wounded by a poisoned arrow; unable to find healing, and being near to death, he sends a messenger to bring Queen Iseult to his aid; if successful the ship which brings her is to have a white sail, if she refuses to come, a black. Iseult of the white hand overhears this, and when the ship returns, bringing Iseult to her lover's aid, either through jealousy or by pure inadvertence (both versions are given), she tells Tristan that the sail is black, whereon, despairing of seeing his love again, the hero turns his face to the wall and dies. Iseult of Ireland lands to find the city in mourning for its lord; hastening to the bier, she lays herself down beside Tristan, and with one last embrace expires. (One dramatic version represents her as finding the wife seated by the bier, and ordering her away, "Why sit ye there, ye who have slain him? Arise, and begone!") The bodies are sent to Cornwall, and Mark, learning the truth, has a fair chapel erected and lays them in tombs, one at each side of the building, when a sapling springs from the heart of Tristan, and reaching its boughs across the chapel, makes its way into the grave of Iseult. However often the tree may be cut down it never fails to grow again. (In some versions it is respectively a vine and a rose which grow from either tomb and interlace midway.)

We need have little wonder that this beautiful love-story was extremely popular throughout the middle ages. Medieval literature abounds in references to Tristan and Iseult, and their adventures were translated into many tongues and are found depicted in carvings and tapestries. Probably the story was first told in the form of short *lais*, each recounting some special episode, such as the *lai* known as the *chèvrefeuille;* how old these may be it is impossible to say. Professor Zimmer, in his examination of the story, sees reason to believe that the main incidents may repose on a genuine historic tradition, dating back to the 9th or 10th century, the period of Viking rule in Ireland. The name of Iseult's father, Gormond, is distinctly Scandinavian; she, herself, is always noted for her golden hair, and it is quite a misrendering of the tradition to speak of her as a dark-haired Irish princess. In the German tradition she is *die lichte*, Iseult of Britanny *die schwarze* Isôlt; it is this latter who is the Celtic princess. The name Tristan is now generally admitted to be the equivalent of the Pictish Drôstan, and on the whole, the story is now very generally allowed to be of insular, probably of British, origin.

Some time in the 12th century the story was wrought into consecutive poems. The latest theory, championed with great skill by M. Bédier, is that there was one poem, and one only, at the root of the various versions preserved to us, and that that poem, composed in England, probably by an Anglo-Norman, was a work of such force and genius that it determined for all time the form of the *Tristan* story. The obvious objection to this view is that a work of such importance, composed at so comparatively late a date, is scarcely likely to have perished so completely as to leave no trace; if there were one poet held as an authority, the name of that poet would surely have been mentioned. Moreover the evidence of the author of the principal *Tristan* poem preserved to us points in another direction. This poet was an Anglo-Norman named Thomas; and, although little over 3000 lines of his poem have been preserved, we have three translations; a German, by Gottfried von Strassburg; a Scandinavian, by a certain Brother Robert; and an English, by Thomas, sometimes identified with Thomas of Ercildoune, though this is doubtful. With the help of the extant fragments and these translations we can form a very good idea of the character and content of Thomas's work, a task now rendered far more easy by M. Bédier's skilful reconstruction (cf. vol. i. of his edition of Thomas). It was certainly a work of great merit and charm. As authority Thomas cites a certain Bréri, who has now been identified with the Bleheris quoted as authority for the *Grail* and *Gawain* stories, and the Bledhericus referred to by Giraldus Cambrensis as *famosus ille fabulator*. This is what Thomas says:—

"Seignurs, cest cunte est mult divers,
E pur ço l'uni par mes vers
E di en tant cum est mester
E le surplus voil relesser.
Ne vol pas trop en uni dire!
Ici diverse la matyre.

Entre ceus qui solent cunter
E del cunte Tristran parler,
Il en cuntent diversement:
Oï en ai de plusur gent.
Asez sai que chescun en dit
E co qu'il unt mis en escrit,
Mes sulun ço que j'ai oï
Nel dient pas sulun Bréri
Ky solt les gestes e les cuntes
De tuz les reis, de tuz les cuntes,
Ki orent este en Bretaingne."
(Thomas, i. 377).

These are not the words of a man who is following a complete and authoritative poem; judging from the context of the other references to Bleheris he was rather a collector and versifier of short episodic tales, and it seems far more natural to understand Thomas as having wrought into one complete and consecutive form the various poems with which the name of Bréri was associated, than to hold that that, or a similar, work had already been achieved by another.

Thomas's work, fortunately, fell into the hands of a true poet in the person of Gottfried von Strassburg, whose *Tristan und Isolde* is, from a literary point of view, the gem of medieval German literature. Gottfried is a far greater master of style than Wolfram von Eschenbach, and his treatment of some of the episodes, notably the sojourn in the woods, is most exquisite. He did not live to complete his poem, but happily he carried it up to the point where the original fragments begin, so that we can judge very fairly what must have been the effect of the whole, the style of the two poets being very similar. Inspiring as the Tristan story is, it seems improbable that it should have been handled, and that within a comparatively short period, by *three* writers of genius, and that of these three the first, and greatest, should have utterly disappeared! The translators of Thomas do not fail to quote him as their source, why then has no one quoted the original poet?

Besides the version of Thomas, we have a fragment by a certain Béroul, also an Anglo-Norman, and a German poem by Eilhart von Oberge, both of which derive from a common source. There also exists in two manuscripts a short poem, *La Folie Tristan*, relating how Tristan, disguised as a fool, visits the court of King Mark. This poem is valuable, as, presuming upon the sufficiency of his disguise, Tristan audaciously gives a resumé of his feats and of his relations with Iseult, in this agreeing with the version of Thomas. The "Gerbert" continuation of the *Perceval* contains the working over of one of two short Tristan poems, called by him the *Luite Tristran*; the latter part, probably a distinct poem, shows Tristan, in the disguise of a minstrel, visiting the court of Mark. Here the tradition is more in accordance with Béroul.

Besides the poems, we possess the prose *Tristan*, an enormous compilation, akin to the prose *Lancelot*, where the original story, though still to be traced, is obscured by a mass of later Arthurian adventures. The interest here centres in the rivalry between Tristan and Lancelot, alike as knights and lovers, and in the later redaction, ascribed to Hélie de Borron, the story is spun out to an interminable length.

Certain points of difference between the poetical and the prose versions should be noted. Tristan is here the son of Meliadus, king of Loonois; his father does not die, but is decoyed away by an enchantress, and the mother, searching for her husband, gives birth to her child in the forest and dies. Meliadus marries again, and the second wife, jealous of Tristan, tries to kill him. Mark has another nephew, Andret, who is Tristan's enemy throughout the romance. Mark himself is a cowardly, treacherous and vindictive character. Some of the early printed editions follow the original version of Tristan's death, now found in one manuscript only (B.N. 103), the majority represent him as having been stabbed in the back by Mark in the presence of the queen, as we find in Malory, who drew the larger portion of his compilation from the prose *Tristan*. It should be noted that Tristan is never more than superficially connected with Arthur, an occasional visitor at his court; though in its later form ranked among the Arthurian romances, the *Tristan* is really an independent story, and does not form a part of the ordinary cyclic redaction.

The Italian prose text, *La Travola ritonda* differs from the French in adhering to the original version, and is classed by N. Bédier among the derivatives from Thomas. Like the story of Perceval that of Tristan has been made familiar to the present generation by Richard Wagner's noble music drama, *Tristan und Isolde*, founded upon the poem of Gottfried von Strassburg; though, being a drama of feeling rather than of action, the story is reduced to its simple elements; the drinking of the love-potion, the passion of the lovers, their discovery by Mark and finally their death.

Bibliography.—Thomas, *Roman de Tristan*, ed. J. Bédier (2 vols., *Société des anciens textes français*, 1902, 1905); Béroul, *Roman de Tristan* (ed. E. Muret, same series, 1903); E. Kölbing, *Die nordische und die englische Version der Tristansaga* (1877, 1883), pt. i., *Tristrams Saga*, pt. ii., *Sir Tristrem*. "La Folie Tristan" was published by F. Michel in his *Tristan* (1835), a collection of all the extant fragments of Tristan poems; "Tristan Menestrel" from the *Perceval*, ed. J. L. Weston and J. Bédier (*Romania*, vol. xxxv., Oct. 1906). Gottfried's *Tristan und Isolde* has been several times published; the best editions are those of Bechstein (1890) and Golther (1889); modern German versions by Kurz, Simrock and Hertz; English prose rendering, J. L. Weston, 2 vols. (*Arthurian Romances*, No. ii.). Cf. also Piquet, *L'Originalité de Gottfried de Strassburg* (1905). Eilhart von Oberge, *Tristan*, ed. Lichtenstein (1877); *La Tavola ritonda*, ed. Polidori, (3 vols., 1864–1865). There is no modern edition of the prose romance, but a detailed analysis of the contents, compiled from the numerous manuscripts in the Paris Library, was published by E. Löseth in *Le Roman en prose de Tristan* (1890). The general reader will find Gaston Paris's study of the legend in *Poèmes et légendes du moyen âge* most interesting; also Joseph Bédier's popular retelling of the tale *Tristan et Iseult*. For Wagner's version cf. J. L. Weston, *Legends of the Wagner Drama*. For an exhaustive study of the Tristan legend and literature, see the recent work by Professor Golther; also an examination of the Welsh fragments by Ivor John in the Grimm Library. (J. L. W.)

TRISTAN DA CUNHA, the general name for a group of three small volcanic islands belonging to Great Britain, situated in the South Atlantic, the summit of the largest being in 37° 5′ 50″ S., 12° 16′ 40″ W. They are about 2000 m. W. of the Cape of Good Hope and about 4000 m. N.E. of Cape Horn and lie somewhat north of a line drawn between the two capes. St Helena lies about 1500 m. N.N.E. of the group. The islands rise from the submarine elevation which runs down the centre of the Atlantic and on which are likewise situated Ascension, St Paul's Rocks and the Azores; the average depth on this ridge is from 1600 to 1700 fathoms, while depths of 3000 fathoms are found on each side of it. The depth between the islands is in some places over 1000 fathoms.

Tristan, the largest and northernmost island, has an area of 16 sq. m., is nearly circular in form, about 7 m. in diameter, and has a volcanic cone (7640 ft.), usually capped with snow, in the centre. Precipitous cliffs, 1000 to 2000 ft. in height, rise directly from the ocean on all sides, except on the north-west, where there is an irregular plain, 100 ft. above the sea, and 2½ m. in length and ½ m. in breadth. A stream crosses the northern end of the plateau, falling over the cliff edge in a fine cascade. The crater of the central cone contains a fresh-water lake about 150 yds. in diameter. This and other crater lakes are said never to be frozen over.

Inaccessible Island, the westernmost of the group, is about 20 m. from Tristan. It is quadrilateral in form, the sides being about 2 m. long, and its area is about 4 sq. m. The highest point (1840 ft.) is on the west side; all round there are perpendicular cliffs about 1000 ft. in height. At the base of the cliffs in some places are narrow fringes of beach a few feet above the sea-level.

Nightingale Island, the smallest and most southern of the group, is 10 m. from Inaccessible Island. Its area is not more than 1 sq.m. Its coasts, unlike those of the other two islands, are surrounded by low cliffs, from which there is a gentle slope up to two peaks, the one 1100 ft., the other 960 ft. high. There are two small islets—Stoltenkoff (325 ft.) and Middle (150 ft.)—and several rocks adjacent to the coast.

The rocks of Tristan da Cunha are felspathic basalt, dolerite, augite-andesite, sideromelane and palagonite; some specimens of the basalt have porphyritic augite.[1] The caves in Nightingale Island indicate that it has been elevated several feet. On almost

[1] On the occurrence in Tristan da Cunha of rock of continental type (gneiss) see E. H. L. Schwarz of the Geological Survey, Cape Colony, in the *Transactions South African Philosoph. Soc*,. No. 16 of 1905.

all sides the islands are surrounded by a broad belt of kelp, the gigantic southern seaweed (*Macrocystis pyrifera*), through which a boat may approach the rocky shores even in stormy weather. There is no good anchorage in rough weather.

The beaches and lower lands are covered with a dense growth of tussock grass (*Spartina arundinacea*), 8 to 10 ft. in height. It shelters vast numbers of penguins (*Eudyptes chrysocoma*), which there form their rookeries. There is one small tree (*Phylica nitida*), which grows in detached patches on the lower grounds. Independently of introduced plants, fifty-five species have been collected in the group, twenty-nine being flowering plants and twenty-six ferns and lycopods. A majority of the species are characteristic of the present general flora of the south temperate zone rather than any particular part of it: botanically the group is generally classed with the islands of the Southern Ocean. A finch (*Nesospiza acunhae*), a thrush (*Nesocichla eremita*), and a water-hen (*Gallinula nesiotis*) are the only land birds—the first two being peculiar to the islands. In addition to the penguins numerous other sea birds nest on the islands, as petrels, albatrosses, terns, skuas and prions. One or two land shells, a few spiders, several *Coleoptera*, a small lepidopter and a few other insects are recorded, but no *Orthoptera* or *Hymenoptera*. There appear to have been no indigenous mammals or reptiles. Seals frequent Nightingale and Inaccessible Islands, and the whale (*Balaena australis*) is found in the adjacent waters.

The prevailing winds are westerly. December to March is the fine season. The climate is mild and on the whole healthy, the temperature averaging 68° Fahr. In summer, 55° in winter—sometimes falling to 40°. Rain is frequent; hail and snow fall occasionally on the lower grounds. The sky is usually cloudy. The islands have a cold and barren appearance. The tide rises and falls about 4 ft.

History.—The islands were discovered in 1506 by the Portuguese admiral Tristan, or more correctly Tristão da Cunha,[1] after whom they are named, during a voyage to India. Thereafter the islands (which were uninhabited) were occasionally visited by outward bound ships to the Indies. Dutch vessels brought back reports on the islands in 1643, and in 1656 Van Riebeek, the founder of Cape Town, sent a ship from Table Bay to Tristan to see if it was suitable for a military station, but the absence of a harbour led to the project being abandoned. Later in the 17th century ships were sent from St Helena by the English East India Company to Tristan to report on a proposed settlement there, but that project also came to naught. A British naval officer who visited the group in 1760 gave his name to Nightingale Island. John Patten, the master of an English merchant ship, and part of his crew lived on Tristan from August 1790 to April 1791, during which time they captured 5600 seals; but the first permanent inhabitant was one Thomas Currie, who landed on the island in 1810. At this time American whalers frequented the neighbouring waters and, in the same year, an American named Lambert "late of Salem, mariner and citizen thereof" and a man named Williams made Tristan their home. Lambert declared himself sovereign and sole possessor of the group (which he renamed Islands of Refreshment) "grounding my right and claim on the rational and sure ground of absolute occupancy." Lambert's sovereignty was short lived, as he and Williams were drowned while out fishing in May 1812. Currie was joined, however, by two other men and they busied themselves in growing vegetables, wheat and oats, and in breeding pigs. War having broken out in this year between the United States and Great Britain the islands were largely used as a base by American cruisers sent to prey on British merchant ships. This and other considerations urged by Lord Charles Somerset, then governor of Cape Colony, led the British government to authorize the islands being taken possession of as dependencies of the Cape. The formal proclamation of annexation was made on the 14th of August 1816. A small garrison was maintained on Tristan until November of the following year. At their own request William Glass (d. 1853), a corporal in the Royal Artillery, with his wife and two children and two masons were left behind, and thus was begun the present settlement. From time to time additional settlers arrived or shipwrecked mariners decided to remain; in 1827 five coloured women from St Helena were induced to migrate to Tristan to become the wives of the five bachelors then on the island. Later coloured women from Cape Colony married residents in the island. Other settlers are of Dutch, Italian and Asiatic origin. Thus the inhabitants are of mixed blood, but the British strain greatly predominates. Over the little community Glass (1817–1853) ruled in patriarchal fashion. Besides raising crops, the settlers possessed numbers of cattle, sheep and pigs, but their most lucrative occupation was seal fishing. The island was still frequented by American whalers, and in 1856 out of a total population of about 100 twenty-five emigrated to the United States. The next year forty-five of the inhabitants removed to Cape Colony; whither the younger or more restless members of the community have since gone—or else taken to a seafaring life. The inhabitants had of necessity made their settlement on the plain on the north-west of Tristan; here a number of substantial stone cottages and a church were built. It is named Edinburgh in memory of a visit in 1867 by the duke of Edinburgh. In October 1873 the islands were carefully surveyed by the "Challenger," which removed to Cape Town two Germans, brothers named Stoltenhoff, who had been living on Inaccessible Island since November 1871. This was the only attempt at colonization made on any save the main island of the group.

After the death of Glass the head of the community for some time was an old man-of-war's man named Cotton, who had been for three years guard over Napoleon at St Helena; Cotton was succeeded by Peter William Green, a native of Amsterdam who settled in the island in 1836. During Green's "reign" the economic condition of Tristan was considerably affected by the desertion of the neighbouring seas by the whalers; this was largely due to the depredations of the Confederate cruisers "Alabama" and "Shenandoah" during the American Civil War, many whaling boats being captured and burnt by them. As a result the number of ships calling at Tristan considerably diminished and trade languished. In 1880 the population appears to have attained its maximum—109. In 1885 a serious disaster befell the islanders, a lifeboat which went to take provisions to a ship in the offing was lost with all hands—fifteen men—and only four adult males were left on the island. At the same time a plague of rats—survivors of a shipwrecked vessel—wrought much havoc among the crops. Plans were made for the total removal of the inhabitants to the Cape, but the majority preferred to remain. Stores and provisions were sent out to them by the British government. The ravages of the rats have rendered impossible the growing of wheat; the wealth of the islanders now consists in their cattle, sheep, potatoes and apple and peach trees. The population in 1897 was only 64; in 1901 it was 74, and in 1909, 95. They manage their own affairs without any written laws, the project once entertained of providing them with a formal constitution being deemed unnecessary. The inhabitants are described as moral, religious, hospitable to strangers, well mannered and industrious, healthy and long lived. They are without intoxicating liquors and are said to commit no crimes. They are daring sailors, and in small canvas boats of their own building voyage to Nightingale and Inaccessible islands. They knit garments from the wool of their sheep; are good carpenters and make serviceable carts. From time to time ministers of the Church of England have lived on the island and to their efforts is mainly due the education of the children. In 1906 the islanders passed through a period of distress owing to great mortality among the cattle and the almost total failure of the potato crop. The majority again refused, however, to desert the island, though offered allotments of land in Cape Colony. Similar proposals had been made and declined several times since the question was first mooted in 1886. In 1905 a lease of

[1] Tristan da Cunha (*fl.* 1460–1540) was nominated first viceroy of Portuguese India in 1504, but was unable to serve owing to temporary blindness; in 1506 he was placed in command of a fleet which operated on the east coast of Africa and in the Indies, Alphonso d'Albuquerque (*q.v.*) having charge of a squadron under da Cunha. After discovering the islands which now bear his name, da Cunha landed in Madagascar, subsequently visiting Mozambique, Brava (where he reduced the Arab power) and Sokotra, which he conquered. He also distinguished himself in the Indies in various actions. In 1514 he was ambassador to Pope Leo X. to pay homage for the new conquests of Portugal, and was, later on, made a member of the Portuguese privy council.

Nightingale, Inaccessible and Gough islands, for the purpose of working the guano deposits, was granted by the British government.

Gough Island.—Gough Island or Diego Alvarez lies in the South Atlantic in 40° 20′ S., 9° 44′ W., and is 250 m. S.S.E. of Tristan da Cunha and some 1500 m. west by south of Cape Town. It is of volcanic origin, is rugged and mountainous, the highest peak rising to 4380 ft. The island is about 8 m. long by 4 m. broad and has an area of 40 sq. m. Precipitous cliffs, from 200 to 1000 ft. high, characterize the coast. They are divided by picturesque valleys, which, in some instances, have been cut down to sea-level and afford landing-places. Streams fall over the cliffs into the sea in fine cascades. The island is visited by vast numbers of penguins and contains valuable guano deposits. It is also the home of numerous seals. The rainfall is heavy and vegetation abundant. The island is believed to have been discovered by the Portuguese in the 16th century. Originally called Diego Alvarez, it derives its other name from a Captain Gough, the commander of a British ship which visited it in 1731. It has been claimed as a British possession since the annexation of Tristan da Cunha. In 1904 Gough Island was visited by the Antarctic exploring ship "Scotia" of the Bruce expedition, which discovered a rich marine fauna, two new buntings and three new species of plants. It has no permanent population.

A comprehensive account of Tristan da Cunha appeared in *The Cape Times* (January–March 1906), in a series of articles by W. Hammond Tooke, the commissioner sent to the islands by the Cape government in 1904. See also *Transactions of the Linnean Society* for 1819 (contains a report of an ascent of the summit by Captain Dugald Carmichael in 1817); A. Earle, *Narrative of a . . . Residence in New Zealand . . . together with a Journal of a Residence in Tristan d'Acunha* (London, 1832); Mrs K. M. Barrow, *Three Years in Tristan da Cunha* (London, 1910); H. N. Moseley, *Notes by a Naturalist on the "Challenger"* (new ed., London, 1892); F. and G. Stoltenhoff, "Two Years on Inaccessible," in *Cape Monthly Mag.* (December 1873). Among papers relating to Tristan da Cunha published by the British government, see especially reports issued in 1897, 1903, 1906—which gives a detailed account of the island and islanders—and 1907. For the discovery of Tristan see *The Commentaries of the Great Afonso Dalboquerque* (Hakluyt Society's Series, 1875, vol. 53). For Gough Island, see R. N. R. Brown of the "Scotia" expedition, "Diego Alvarez or Gough Island," in *Scottish Geog. Mag.* (August 1905); Brown and others, "The Botany of Gough Island," in *Journ. Linnean Soc.* (*Botany*) (1905), and *The Voyage of the "Scotia"* ch. xii. (London, 1906). *The Africa Pilot*, pt. ii. (5th ed., 1901), contains descriptions both of Tristan da Cunha and Gough Island.

TRISTAN L'HERMITE, FRANÇOIS (1601–1655), French dramatist, was born at the château de Soliers in the Haute Marche about 1601. His adventures began early, for he killed his enemy in a duel at the age of thirteen, and was obliged to flee to England. The story of his childhood and youth he embroiders in a burlesque novel, the *Page disgracié*. He was in succession poet to Gaston d'Orléans, to the duchesse de Chaulnes and the duke of Guise. He died on the 7th of September 1655. His first tragedy, *Mariamne* (1636), was also his best. It was followed by *Penthée* (1637), *La Mort de Sénèque* (1644), *La Mort de Crispe* (1645) and the *Parasite* (1653). He was also the author of some admirable lyrics. Three of his best plays are printed in the *Théâtre français* of 1737.

TRITHEMIUS, JOHANNES (1462–1516), German historian and divine, was born at Trittenheim on the Moselle, on the 1st of February 1462. His name was originally "von Heidenberg," but according to the fashion of the times he adopted the name of his birthplace. After an unhappy childhood, he studied at Heidelberg, and at the age of twenty entered the Benedictine monastery of Sponheim near Kreuznach, of which, in 1485, he became abbot. He established an excellent library, and through his strict discipline and consummate scholarship soon raised the monastery to an educational institution of a high order. In 1506 he resigned, and was appointed soon after abbot of the monastery of St Jakob at Würzburg; and in this city he died on the 13th of December 1516. Trithemius was, though an accomplished scholar, untrustworthy as a chronicler, and his *Annales hirsaugienses* (1514), *Annales de origine Francorum*, as well as his *Chronologia mystica* (1516) are, on this account, of doubtful value. More reliance can, however, be placed on his *De scriptoribus ecclesiasticis* (1494) and the *Catalogus illustrium virorum Germaniae* (1491). He also wrote a fanatical book against sorcery, *Antipalus maleficiorum* (1508).

See Silbernagel, *J. Trithemius* (1868; 2nd ed., 1885); Schneegans, *Abt Joh. Trithemius und Kloster Sponheim* (1882); and F. X. Wegele, in *Allgemeine deutsche Biographie*.

TRITON, in Greek mythology, son of Poseidon and Amphitrite, the personification of the roaring waters. According to Hesiod (*Theog.* 930), he dwelt with his parents in a golden palace in the depths of the sea. The story of the Argonauts places his home on the coast of Libya. When the Argo was driven ashore on the Lesser Syrtes the crew carried the vessel to Lake Tritonis, whence Triton, the local deity, guided them across to the Mediterranean (Apollonius Rhodius iv. 1552). He was represented as human down to the waist, with the tail of a fish. His special attribute was a twisted seashell, on which he blew to calm or raise the waves. Its sound was so terrible, when loudly blown, that it put the giants to flight, who imagined it to be the roar of a mighty wild beast (Hyginus, *Poet. astronom.* ii. 23). When Misenus, the trumpeter of Aeneas, challenged him to a contest of blowing, Triton in his jealousy flung him into the sea. In course of time Triton became the name for individuals of a class, like Pan and Silenus, and Tritons (male and female) are mentioned in the plural, usually as forming the escort of marine divinities. The beings called Centauro-Tritons or Ichthyocentaurs were of a triple nature, with the forefeet of a horse in addition to the human body and fish tail. Pausanias (ix. 21) gives a detailed description of the ordinary Triton. It is probable that the idea of Triton owes its origin to the Phoenician fish-deities.

See Preller, *Griechische Mythologie* (4th ed., 1894); F. R. Dressler, *Triton und die Tritonen* (Wurzen, 1892).

TRIUMPH (*triumphus*), amongst the ancient Romans, the highest honour bestowed upon a victorious general. Originally it was only granted on certain conditions, which were subsequently relaxed in special cases. Only those who had held the office of dictator, consul or praetor were entitled to the distinction; the war must have been brought to a definite conclusion, resulting in an extension of the boundaries of the state; at least 5000 of the enemy must have been slain; the victory must have been gained over a foreign enemy, victories in civil war or over rebels not being counted. The power of granting a triumph rested with the senate, which held a meeting outside the city walls (generally in the temple of Bellona) to consider the claims put forward by the general. If they were considered satisfactory special legislation was necessary to keep the general in possession of the *imperium* on his entry into the city. Without this, his command would have expired and he would have become a private individual the moment he was inside the city walls, and would have had no right to a triumph. Consequently he remained outside the pomoerium until the special ordinance was passed; thus Lucullus on his return from Asia waited outside Rome three years for his triumph.

The triumph consisted of a solemn procession, which, starting from the Campus Martius outside the city walls, passed through the city to the Capitol. The streets were adorned with garlands, the temples open, and the procession was greeted with shouts of *Io triumphe!* At its head were the magistrates and senate, who were followed by trumpeters and then by the spoils, which included not only arms, standards, statues, &c., but also representations of battles, and of the towns, rivers and mountains of the conquered country, models of fortresses, &c. Next came the victims destined for sacrifice, especially white oxen with gilded horns. They were followed by the prisoners who had not been sold as slaves but kept to grace the triumph; when the procession reached the Capitol they were taken off to prison and put to death. The chariot which carried the victorious general (*triumphator*) was crowned with laurel and drawn by four horses. The general was attired like the Capitoline Jupiter in robes of purple and gold borrowed from the treasury of the god; in his right hand he held a laurel branch, in his left an ivory sceptre surmounted by an eagle. Above his head the golden crown of Jupiter was held by a slave who reminded him in the midst of his glory that he was a mortal man. Last came the soldiers shouting *Io triumphe* and singing

songs both of a laudatory and scurrilous kind. On reaching the temple of Jupiter on the Capitol, the general placed the laurel branch (in later times a palm branch) on the lap of the image of the god, and then offered the thank-offerings. A feast of the magistrates and senate, and sometimes of the soldiers and people, concluded the ceremony, which in earlier times lasted one day, but in later times occupied several. Generals who were not allowed a regular triumph by the senate had a right to triumph at the temple of Jupiter Latiaris on the Alban Mount. Under the empire only the emperors celebrated a triumph, because the generals commanded under the auspices of the emperors (not under their own) merely as lieutenants (*legati*); the only honour they received was the right of wearing the triumphal insignia (the robes of purple and gold and the wreath of bay leaves) on holidays. After the time of Trajan, when all consuls were allowed to wear the triumphal dress on entering office and in festal processions, the only military reward for a successful general was a statue in some public place. The last triumph recorded is that of Diocletian (A.D. 302). A naval or maritime triumph was sometimes allowed for victories at sea, the earliest being that celebrated by C. Duilius in honour of his victory over the Carthaginians in 260 B.C.

See Mommsen, *Römisches Staatsrecht* (1887), i. 126–136; Marquardt, *Römische Staatsverwaltung* (1884), ii. 582–593; H. A. Göll, *De triumphi romani origine, permissu, apparatu, via* (1854); S. Peine, "De ornamentis triumphalibus" (1885), in C. E. Ascherson's *Berliner Studien*, ii.

TRIUMPHAL ARCH, the term given to arches erected to commemorate some special victory, but here extended to include those built as memorial arches to some benefactor of the Roman Empire, such as those at Rimini, Ancona and Benevento; arches erected as monumental entrances to towns, as at Nîmes and Autun; arches on bridges, as at Chamas in France and Alcantara in Spain; and lastly those which preceded the entrance to a forum or sacred enclosure, or formed part of a colonnaded street, as in Syria. There is every reason to suppose that in early times in Greece and Etruria temporary erections, such as those of the present day, were set up on the occasion of the public entry, after a great victory, of some emperor or general; but the Romans would seem to have been the first to erect such structures in stone or marble, to enrich them with sculpture, and to raise aloft on their summit the quadriga or four-horsed chariot with statues and trophies. The time involved in the construction of such a memorial, and more especially that which would be required for its enrichment with sculpture, rendered it impossible that they should be set up on the occasion of the triumphal entry itself, and it is known that the arch of Titus was not erected till some time after his death by his successor Domitian. There is always some difficulty in deciding between triumphal and memorial arches, as they were virtually similar in design, equally enriched with sculpture, generally surmounted with a quadriga and statues, and as a rule were isolated structures. The earlier arches were pierced with a single arch and were comparatively simple in design, being decorated by pilasters or semi-detached columns only; the existence of chariots and statues on their summit is known only from coins or gems, on which such features are always shown. The arch of Titus in Rome (fig. 4), A.D. 81, is the first one enriched with bas-relief sculpture, in this case representing the triumphs of Titus with the seven-branched candlestick and the golden table brought from Jerusalem. The next sculptural arch of triumph is that built at Benevento (fig. 2) in South Italy (A.D. 112) by Trajan, recording the Dacian victories. The triumphal arch (fig. 5) of Septimius Severus (A.D. 203) has a central and two side arches, the bas-reliefs on it representing the Parthian victories; and the last important arch in Rome is that of Constantine (fig. 6), which had also three arches, and was embellished with bas-reliefs, representing the Dacian victories, which were taken from the arch of Trajan on the Via Appia and others of Constantine's time, representing the conquest of Maxentius.

Passing to other countries, we have the triumphal arches at St Remy and at Orange (fig. 8); those at Carpentras and Cavaillon, also in France, which were probably of later date, as possibly also the triple arch at Reims. The triumphal arch with three arches at Fano in Italy is said to have been commenced by Augustus, but completed by Constantine, who probably added the two side arches and decorated it with inferior sculpture. At Timgad (Thamugada) in North Africa is a triumphal arch with central and two side arches, probably of Hadrian's time, and one with triple arches at Sbeitla (Suffetula), also in North Africa, and another example at Saintes in France, built on a bridge.

Of memorial arches the earliest are the examples of Rimini (fig. 7) and Aosta, erected to Augustus, and later the arch at Ancona (fig. 3) erected to Trajan (A.D. 112) as a record of the construction of the port there. At Pola, in Istria, is an archway erected in memory of the Sergii. Of less important examples in Rome are the arches of Dolabella (A.D. 10), Drusus (A.D. 23), Gallienus (A.D. 262), the silversmith's arch (A.D. 204); in Verona, the Porta dei Borsari and the Porta de Leoni, erected by Gallienus (A.D. 265); at Aix-les-Bains in France, an arch of late 3rd century; and at Lambessa, in North Africa, the arches of Commodus (A.D. 187) and of Septimius Severus (A.D. 200). In Spain there are two monumental arches erected by Trajan at Alcantara, in the centre of the bridge built by him (A.D. 108), and the arch of Santiago at Merida; a third example exists in the Arco di Bara at Tarragona.

Quadriportal archways are those which were built in the centre of four cross roads, such as the arch of Janus in Rome, built by Constans (A.D. 350), the arch of Caracalla at Tebesse (Thevesti) in North Africa, and many examples in Syria, of which the arch at Ladikiyah (Laodicea ad Mare) is in perfect preservation.

The colonnaded streets in Syria were entered through magnificent archways, of which the finest examples are those at Palmyra and Gerasa. As entrance gateways to towns there are many examples which were sometimes built as memorial arches, but formed part of the city walls, such as the entrance gate at Susa in Italy, erected in memory of Augustus (8 B.C.), decorated with reliefs of the Suovetaurelia (sacrifices); the Porte d'Avroux and Porte St André at Autun, and the Porte d'Auguste at Nîmes, in France; the Porte d'Auguste at Perugia in Italy and the Porta Nigra at Treves in Germany; to these should be added the three entrance gateways to the palace of Spalato (A.D. 303), one of these, the Porta Aurea, or Golden Gate, showing in its enriched design certain decadent forms which led to the Byzantine and Renaissance styles; lastly there are the arched entrances to sacred or civil enclosures, such as the example at Sbeitla (Suffetula) in North Africa, the arch of Hadrian at Athens (fig. 1), built to his memory by his successors, and the archway of the Propylaea at Damascus.

The triumphal arch found no place in medieval architecture, but in Renaissance works there are many examples, of which the triumphal entrance arch of King Alfonso at Naples (A.D. 1470) comes first. Of isolated structures, there are in Paris the Porte St Martin (1647), St Denis (1684), arch of Carrousel in the Tuileries (1808), and the Arc de l'Etoile in the Champs Élysées, completed in 1830; in Berlin the Brandenburger Thor (1790); in Munich the Siegesthor (1843) and Metzger Thor (1880); in Milan the Arch of Peace, commenced by Napoleon in 1807 and completed in 1857 by the Austrians (an interesting example, as it still preserves the chariot and horses and statues which formerly crowned all triumphal arches); and in London the Marble Arch, originally built in front of Buckingham Palace, but removed to the north-east angle of Hyde Park in 1843, and the Wellington Arch at Hyde Park Corner, without the statue of the duke on horseback, afterwards set up at Aldershot. (R. P. S.)

TRIVANDRUM, or TREVANDRUM, a city of southern India, capital of the state of Travancore, situated 2 m. from the sea-coast. Pop. (1901), 57,882. It is the residence of the maharaja, and contains an observatory and a museum, besides several other fine buildings. The chief fame of the place, however, centres upon the shrine of Sri Ananta Padmanabhaswami, a great resort of pilgrims, round which the city grew up. The best houses and chief public buildings stand on hilly terraces. The city contains the maharaja's college, a Sanskrit college, a high school, a school for girls, an industrial school of arts, and a hospital and medical school. There is little trade, but a speciality of wood-carving. Trivandrum has a small seaport, but the vessels that touch here have to anchor at some considerable distance from the shore, and the port itself is not fitted for any great commercial development.

TRIVET, a small metal tripod for holding cooking vessels near a fire. The word is also applied to a round, square or oval openwork plate, usually of steel or brass, fixed to the bars of a grate by a socket for keeping hot plates, dishes, or food.

TRIVIUM (Lat. for cross-road, *i.e.* where three roads meet, from *tres*, three, and *via*, road), in medieval educational systems, the curriculum which included grammar, rhetoric and logic. The trivium and the quadrivium (arithmetic, music, geometry and astronomy) together made up what are known as the seven liberal arts (see EDUCATION: *Schools*). From the word in its original sense is derived the adjective "trivial" (post-Aug. Lat. *trivialis*), that which can be seen at the cross-roads, *i.e.* unimportant, commonplace. In botany and zoology the "trivial" name is the adjectival name which follows the genus name in a binominal system of nomenclature, as *canina*, *perennis*, in *Rosa canina*, *Bellis perennis*.

TRNOVO, or TIRNOVO, an episcopal city and the capital of a department of Bulgaria; 124 m. E.N.E. of Sofia, on the river Yantra, and on the Sofia-Varna railway, at the junction of the branch line from Rustchuk. Pop. (1906), 12,171. The city consists of two divisions—the Christian quarter, situated chiefly on a high rocky plateau, and the so-called Turkish quarter, on the lower ground; but many of the Turkish inhabitants emigrated after 1878. On the Tsarevetz Hill above the city are the remains of the ancient citadel. The Husarjaini mosque is used as a military powder and dynamite factory. In the Christian quarter there are some interesting churches of the middle ages, notably that of the Forty Martyrs, in which the Bulgarian tsars were crowned. Numerous antiquarian remains have also been discovered. There are a gymnasium and a high-class girls' school. The city possesses large dye-works, and important manufactures of copper utensils.

Trnovo was the ancient capital of Bulgaria, and from 1186 until its capture by the Turks, 17th of July 1394, the residence of the Bulgarian tsars. From the beginning of the 13th century it was also the seat of the patriarchate of Bulgaria, until the suppression of the patriarchate in 1767. In 1877 it was taken from Turkey by the Russians, and in 1879 Prince Alexander of Battenberg was here elected prince of Bulgaria. On the 5th of October 1908 the independence of Bulgaria was proclaimed here by King Ferdinand, in the church of the Forty Martyrs.

TROCHAIC (from Gr. τροχαῖος, τροχαϊκός; Lat. *trochaeus*), the name of a metre very commonly used by the Greeks and Romans in their tragedies and comedies. Its characteristic foot is a trochee consisting of two syllables, one long, one short (–⏑). The usual form, in which the Greeks employed the measure, was the trochaic tetrameter catalectic, the scheme of which is as follows:—

–⏑	–⏑	–⏑	–⏑	–⏑	–⏑	–⏑	⏓
⏑⏑⏑	⏑⏑⏑	⏑⏑⏑	⏑⏑⏑	⏑⏑⏑	⏑⏑⏑	⏑⏑⏑	
	––		––		––	⏑⏑–	
	⏑⏑–		⏑⏑–				
–⏑⏑	–⏑⏑	–⏑⏑	–⏑⏑	–⏑⏑	–⏑⏑	–⏑⏑	

The trochaic metre is rapid in movement and breathless, and is generally used to depict strong emotions or to tell an exciting narrative. It is, however, very closely related to the ordinary iambic metre; in fact, by subtracting the first foot and a half of the longer line, we find ourselves left with a pure iambic line as used by the tragedians.

In modern times, the trochaic measure has been adopted by the prosody of England, Germany and Scandinavia. The swift and hurrying movement of it, which we see reflected in its derivation, as the Greek name is certainly to be traced back to the verb τρέχειν, to run, has made it a favourite with our lyrical poets. In the early English writers on versification the foot is called a trocheus.

TROCHU, LOUIS JULES (1815–1896), French general, was born at Palais (Belle-Ile-en-Mer) on the 12th of March 1815. Educated at St Cyr he received a commission in the Staff Corps in 1837, was promoted lieutenant in 1840, and captain in 1843. He served as a captain in Algeria under Marshal Bugeaud, who, in recognition of his gallantry in the battles of Sidi Yussuf and Isly, made him his aide-de-camp and entrusted him with important commissions. He was promoted major in 1845, and colonel in 1853. He served with distinction throughout the Crimean campaign, first as aide-de-camp to Marshal St Arnaud, and then as general of brigade, and was made a commander of the Legion of Honour and general of division. He again distinguished himself in command of a division in the Italian campaign of 1859, where he won the grand cross of the Legion of Honour. In 1866 he was employed at the ministry of war in the preparation of army reorganization schemes, and he published anonymously in the following year *L'Armée française en 1867*, a work inspired with Orleanist sentiment, which ran through ten editions in a few months and reached a twentieth in 1870. This brochure brought him into bad odour at court, and he left the war office on half-pay, and was refused a command in the field at the outbreak of the Franco-German War. After the earlier disasters in 1870, he was appointed by the emperor first commandant of the troops of Châlons camp, and soon afterwards (Aug. 17) governor of Paris and commander-in-chief of all the forces destined for the defence of the capital, including some 120,000 regular troops, 80,000 mobiles, and 330,000 National Guards. He worked energetically to put Paris in a state of defence and throughout the siege showed himself a master of the passive defensive. At the revolution of the 4th of September he became president of the government of national defence, in addition to his other offices. His "plan" for defending the city raised expectations doomed to disappointment; the successive sorties made under pressure of public opinion were unsuccessful, and having declared in one of his proclamations that the governor of Paris would never capitulate, when capitulation became inevitable he resigned the governorship of Paris on the 22nd of January 1871 to General Vinoy, retaining the presidency of the government until after the armistice in February. He was elected to the National Assembly by eight departments, and sat for Morbihan. In October he was elected president of the council general for Morbihan. In July 1872 he retired from political life, and in 1873 from the army. He published in 1873 *Pour la vérité et pour la justice*, in justification of the government of national defence, and in 1879 *L'Armée française en 1879, par un officier en retraite*, a sort of supplement to his former work of 1867. He died at Tours on the 7th of October 1896.

TROGEN, a neat and clean little town in the Ausser Rhoden half of the Swiss canton of Appenzell. By light railway it is 6 m. from St Gall, or by carriage road 7 m. from Heiden (the chief goats' whey cure resort in the canton), or 9 m. from Altstätten in the Rhine valley. It is built on the side of a steepish hill, and in 1900 had 2496 inhabitants, mostly Protestant and German-speaking. In the square before the parish church the *Landsgemeinde* or primitive democratic assembly of Ausser Rhoden meets in the even years (in other years at Hundwil, not far from Herisau) on the last Sunday in April. Like other towns in Appenzell, Trogen is engaged in the manufacture (in the houses of the workpeople) of embroidery and muslins.

TROGLODYTES (τρωγλοδύται, from τρώγλη, hole, δύω, creep), "cave-dwellers," a name applied by ancient writers to different tribes in various parts of the world. Strabo speaks of them in Moesia, south of the Danube (vii. 318), in the Caucasus (xi. 506), but especially in various parts of Africa from Libya (xvii. 828) to the Red Sea. The troglodyte Ethiopians of Herodotus (iv. 183) in inner Africa, very swift of foot, living on lizards and creeping things, and with a speech like the screech of an owl, have been identified with the Tibbus of Fezzan.

According to Aristotle (*Hist. An.* viii. 12) a dwarfish race of Troglodytes dwelt on the upper course of the Nile, who possessed horses and were in his opinion the Pygmies of fable. But the best known of these African cave-dwellers were the inhabitants of the "Troglodyte country" (Τρωγλοδυτική) on the coast of the Red Sea, as far north as the Greek port of Berenice, of whom an account has been preserved by Diodorus (iii. 31) and Photius (p. 454 Bekker) from Agatharchides of Cnidus, and by Artemidorus in Strabo (xvi. 776). They were a pastoral people, living entirely on the flesh of their herds, or, in the season of fresh pasture, on mingled milk and blood. But they killed only old or sick cattle (as indeed they killed old men who could no longer follow the flock), and the butchers were called "unclean"; nay, they gave the name of parent to no man, but only to the cattle which provided their subsistence. This last point seems to be a confused indication of totemism. They went almost naked; the women wore necklaces of shells as amulets. Marriage was unknown, except among the chiefs—a fact which agrees with the prevalence of female kinship in these regions in much later times. They practised circumcision or a mutilation of a more serious kind. Their burial rites were peculiar. The dead body, its neck and legs bound together with withies of the shrub called *paliurus*, was set up on a mound, and pelted with stones amidst the jeers of the onlookers, until its face was completely covered with them. A goat's horn was then placed above it, and the crowd dispersed with manifestations of joy. It is supposed that the Horim or Horites, the aboriginal inhabitants of Mount Seir, if their name is correctly interpreted "cave-dwellers," were a kindred people to the Troglodytes on the other side of the Red Sea.

TROGON, a word apparently first used as English[1] by G. Shaw (*Mus. Leverianum*, p. 177) in 1792, and now for many years accepted as the general name of certain birds forming the family Trogonidae of modern ornithology. The trogons are birds of moderate size: the smallest is hardly bigger than a thrush and the largest less bulky than a crow. In most of them the bill is very wide at the gape, which is invariably beset by recurved bristles. They seize most of their food, whether caterpillars or fruits, on the wing, though their alar power is not exceptionally great, their flight being described as short, rapid and spasmodic. Their feet are weak and of a unique structure, the second toe, which in most birds is the inner anterior one, being reverted, and thus the trogons stand alone, since in all other birds that have two toes before and two behind it is the outer toe that is turned backward. The plumage is very remarkable and characteristic. There is not a species which has not beauty beyond most birds, and the glory of the group culminates in the quezal (*q.v.*). But in others golden green and steely blue, rich crimson[2] and tender pink, yellow varying from primrose to amber, vie with one another in vivid coloration, or contrasted, as happens in many species, with a warm tawny or a sombre slaty grey—to say nothing of the delicate freckling of black and white, as minute as the markings of a moth's wing—the whole set off by bands of white, producing an effect hardly equalled in any group. The plumage is further remarkable for the large size of its contour-feathers, which are extremely soft and so loosely seated as to come off in scores at a touch, and there is no down. The tail is generally a very characteristic feature, the rectrices, though in some cases pointed, being often curiously squared at the tip, and when this is the case they are usually barred ladder-like with white and black.[3] According to J. Gould, they are larger and more pointed in the young than in the old, and grow squarer and have the white bands narrower at each succeeding moult. He also asserts that in the species which have the wing coverts freckled, the freckling becomes finer with age. So far as has been observed, the nidification of these birds is in holes of trees, wherein are laid without any bedding two roundish eggs, generally white, but certainly in one species (quezal) tinted with bluish green.

The trogons form a very well-marked family, belonging to the coraciiform birds, and probably to be placed in that assemblage near the colies (see MOUSE BIRD) and swifts (*q.v.*). The remains of one, *T. gallicus*, have been recognized by A. Milne-Edwards (*Ois. foss. de la France*, ii. 395, pl. 177, figs. 18–22) from the Miocene of the Allier. This fortunate discovery seems to account for the remarkable distribution of the trogons at the present day. While they chiefly abound, and have developed their climax of magnificence, in the tropical parts of the New World, they yet occur in the tropical parts of the Old. The species now inhabiting Africa, forming the group *Hapaloderma*, can hardly be separated generically from those of the Neotropical *Trogon*, and the difference between the Asiatic forms, if somewhat greater, is still comparatively slight. It is plain then that the Trogons are an exceptionally persistent type; indeed in the whole class few similar instances occur, and perhaps none that can be called parallel. The extreme development of the type in the New World just noticed also furnishes another hint. While in some of the American trogons (*Pharomacrus*, for instance) the plumage of the females is not very much less beautiful than that of the males, there are others in which the hen birds retain what may be fairly deemed a more ancient livery, while the cocks flaunt in brilliant attire. Now the plumage of both sexes in all but one[4] of the Asiatic trogons, *Harpactes*, resembles rather that of the young and of those females of the American species which are modestly clothed. The inference from this fact would seem to be that the general coloration of the Trogons prior to the establishment, by geographical estrangement, of the two types was a russet similar to that now worn by the adults of both sexes in the Indian region, and by a portion only of the females in the Neotropical. The Ethiopian type, as already said, very closely agrees with the American, and therefore would be likely to have been longer in connexion therewith. Again, while the adults of most of the American trogons (*Pharomacrus* and *Euptilotis* excepted) have the edges of the bill serrated, their young have them smooth or only with a single notch on either side near the tip, and this is observable in the Asiatic trogons at all ages. At the same time the most distinctive features of the whole group, which are easily taken in at a glance, but are difficult to express briefly in words, are equally possessed by both branches of the family, showing that they were in all likelihood—for the possibility that the peculiarities may have been evolved apart is not to be overlooked—reached before the geographical sundering of these branches (whereby they are now placed on opposite sides of the globe) was effected.

About sixty species of trogons are recognized, which J. Gould in the second edition of his *Monograph* of the family (1875) divides into seven genera. *Pharomacrus*, *Euptilotis* and *Trogon* inhabit the mainland of tropical America, no species passing to the northward of the Rio Grande nor southward of the forest district of Brazil, while none occur on the west coast of Peru or Chile. *Prionotelus* and *Tmetotrogon*, each with one species, are peculiar respectively to Cuba and Haiti. The African form *Hapaloderma* has two species, one found only on the west coast, the other of more general range. The Asiatic trogons, *Harpactes* (with eleven species according to the same authority), occur from Nepal to Malacca, in Ceylon, and in Sumatra, Java and Borneo, while one species is peculiar to some of the Philippine Islands. (A. N.)

TROGUS, GNAEUS POMPEIUS, Roman historian from the country of the Vocontii in Gallia Narbonensis, nearly contemporary with Livy, flourished during the age of Augustus. His grandfather served in the war against Sertorius with Pompey, through whose influence he obtained the Roman citizenship; hence the name Pompeius, adopted as a token of gratitude to his benefactor. His father served under Julius Caesar in the capacity of secretary and interpreter. Trogus himself seems to have been a man of encyclopaedic knowledge. He wrote, after Aristotle and Theophrastus, books on the natural history of animals and plants, frequently quoted by the elder Pliny. But his principal work was *Historiae Philippicae* in forty-four

[1] *Trogonem* (the oblique case) occurs in Pliny (*H. N.* x. 16) as the name of a bird of which he knew nothing, save that it was mentioned by Hylas, an augur, whose work is lost; but some would read *Trygonem* (turtle-dove). In 1752 Möhring (*Av. Genera*, p. 85) applied the name to the "Curucui" (pronounced "Suruquá," *vide* Bates, *Nat. Amazons*, i. 254) of Marcgrav (*Hist. nat. Brasiliae*, p. 211), who described and figured it in 1648 recognizably. In 1760 Brisson (*Ornithologie*, iv. 164) adopted *Trogon* as a generic term, and, Linnaeus having followed his example, it has since been universally accepted.

[2] Anatole Bogdanoff determined the red pigment of the feathers of *Pharomacrus auriceps* to be a substance which he called "zooxanthine" (*Comptes rendus*, Nov. 2, 1857, xlv. 690).

[3] In the trogon of Cuba, *Prionotelus*, they are most curiously scooped out, as it were, at the extremity, and the lateral pointed ends diverge in a way almost unique among birds.

[4] Or two species if *N. macloti* be more than a local form of *H. reinwardti.*

books, so called because the Macedonian empire founded by Philip is the central theme of the narrative. This was a general history of the world, or rather of those portions of it which came under the sway of Alexander and his successors. It began with Ninus, the founder of Nineveh, and ended at about the same point as Livy (A.D. 9). The last event recorded by the epitomator Justin (*q.v.*) is the recovery of the Roman standards captured by the Parthians (20 B.C.). He left untouched Roman history up to the time when Greece and the East came into contact with Rome, possibly because Livy had sufficiently treated it. The work was based upon the writings of Greek historians, such as Theopompus (also the author of a *Philippica*), Ephorus, Timaeus, Polybius. Chiefly on the ground that such a work was beyond the powers of a Roman, it is generally agreed that Trogus did not gather together the information from the leading Greek historians for himself, but that it was already combined into a single book by some Greek (very probably Timagenes of Alexandria). His idea of history was more severe and less rhetorical than that of Sallust and Livy, whom he blamed for putting elaborate speeches into the mouths of the characters of whom they wrote. Of his great work, we possess only the epitome by Justin, the *prologi* or summaries of the 44 books, and fragments in Vopiscus, Jerome, Augustine and other writers. But even in its present mutilated state it is often an important authority for the ancient history of the East. Ethnographical and geographical excursuses are a special feature of the work.

Fragments edited by A. Bielowski (1853); see also, A. H. L. Heeren, *De Trogi P. fontibus et auctoritate* (prefixed to C. H. Frotscher's edition of Justin); A. Enmann on the authorities used by Trogus for Greek and Sicilian history (1880); A. von Gutschmid, *Über die Fragmente des Pompeius Trogus* (1857); M. Schanz, *Geschichte der römischen Litteratur* (2nd ed., 1899), ii., where all that is known of Timagenes is given; Teuffel-Schwabe, *Hist. of Roman Literature*, § 258; and article JUSTIN.

TROIA, a town and episcopal see of Apulia, Italy, in the province of Foggia, situated 1440 ft. above sea-level, 7 m. N.W. of the station of Giardinetto-Troia, which is 16 m. S.W. of Foggia. Pop. (1901), 6674. Troia occupies the site of the ancient Aecae, 12 m. S. of Luceria, on the Via Traiana, a town which fell to Hannibal after the victory of Cannae, but was won back by the Romans in 214. Under the empire it appears to have become a colony. Troia was itself founded in 1017 by the Greek prefect Basilius Bugianus. The cathedral dates from 1107, but the upper part of the façade with its curious sculptures, fine rose-window and polychromatic decoration, the choir apse and the interior were restored early in the 13th century. The latter has been somewhat spoilt by recent decorations. The bronze doors, partly in relief and partly in niello, of 1119 and 1127 respectively, were cast in Beneventum by Oderisius Berardus. The small domed church of S. Basilio has an ambo of 1158.

TROÏLUS, in Greek legend, son of Priam (or Apollo) and Hecuba. His father, when upbraiding his surviving sons for their cowardice, speaks in the *Iliad* (xxiv. 257) of Troïlus as already slain before the action of the poem commences. According to a tradition drawn from other sources and adopted by Virgil (*Aen.* i. 474), when a mere boy he fell by the hand of Achilles. In another account, he was dragged to death by his own horses. His death formed the subject of a lost tragedy by Sophocles. There is no trace in classical writers of the story of Shakespeare's *Troilus and Cressida*, the materials for which were derived from Chaucer's poem of the same name, Lydgate's *History, Sege, and Destruccion of Troy*, Caxton's *Recuyell of the Historyes of Troy* (trans. from Norman French of Raoul le Fevre), Chapman's translation of Homer, and perhaps a play on the subject by Dekker and Chattle.

TROITSK, a town of eastern Russia, in the government of Orenburg, situated in a fertile steppe, 315 m. N.E. of Orenburg, and 77 m. S. of Chelyabinsk, on the Siberian highway. Pop. (1885), 18,497; (1900), 23,293. It has grown rapidly in modern times. The Troitskiy fort, erected in 1743, became a centre for trade with the Kirghiz steppe and Turkestan, and in that trade Troitsk is now second only to Orenburg. Cotton, silk, and especially horses and cattle are imported, while leather, cotton, woollen and metal wares are exported. An active trade in corn for the Ural gold mines is carried on. The place has ironworks and tanneries.

TROLLE, HERLUF (1516–1565), Danish naval hero, was born on the 14th of January 1516 at Lillö. At the age of nineteen Trolle went to *Vor Frue Skole* at Copenhagen, subsequently completing his studies at Wittenberg, where he adopted the views of Melanchthon, with whom he was in intimate correspondence for some years. His marriage with Brigitte, the daughter of Lord Treasurer Mogens Gjöe, brought him a rich inheritance, and in 1557 he took his seat in the senate. Both Christian III. and Frederick II. had a very high opinion of Trolle's trustworthiness and ability and employed him in various diplomatic missions. Trolle was, indeed, richly endowed by nature, and his handsome face and lively manners made him popular everywhere. His one enemy was his wife's nephew Peder Oxe, the subsequently distinguished finance minister, whose narrow grasping ways, especially as the two men were near neighbours, did not contribute towards family harmony. It was Trolle whom Frederick II. appointed to investigate the charges of malversation brought against Oxe. Both Trolle and his wife were far renowned for their piety and good works, and their whole household had to conform to their example or seek service elsewhere. A man of culture, moreover, he translated David's 31st Psalm into Danish verse. He also promoted literature and learning by educating poor students both at home and abroad, endowing Latin schools and encouraging historical research. In 1559 Trolle was appointed admiral and inspector of the fleet, a task which occupied all his time and energy. In 1563 he superseded the aged Peder Skram as admiral in chief. On the 10th of May he put to sea with twenty-one ships of the line and five smaller vessels and, after uniting with a Lübeck squadron of six liners, encountered, off the isle of Öland, a superior Swedish fleet of thirty-eight ships under Jacob Bagge. Supported by two other Danish ships Trolle attacked the Swedish flagship "Makalös" (Matchless), then the largest battleship in northern waters, but was beaten off at nightfall. The fight was renewed at six o'clock the following morning, when the "Makalös" was again attacked and forced to surrender, but blew up immediately afterwards, no fewer than 300 Lübeck and Danish sailors perishing with her. But the Swedish admiral was captured and the remnant of the Swedish fleet took refuge at Stockholm. Despite the damage done to his own fleet and flagship "Fortuna" by this great victory, Trolle, on the 14th of August, fought another but indecisive action with a second Swedish fleet under the famous Swedish admiral Klas Horn, and kept the sea till the 13th of October. Trolle spent the winter partly at his castle of Herlufsholm completing his long cherished plan of establishing a school for all classes, and partly at Copenhagen equipping a new fleet for the ensuing campaign. On the 1st of June 1565 he set sail with twenty-eight liners, which were reinforced off Femern by five Lübeck vessels. Klas Horn had put to sea still earlier with a superior fleet and the two admirals encountered off Fehmarn on the 4th of June. The fight was severe but indecisive, and both commanders finally separated to repair their ships. Trolle had been severely wounded in the thigh and shoulder, but he would not let the ship's surgeon see to his injuries till every one else had been attended to. This characteristic act of unselfishness was his undoing, for he died at Copenhagen on the 25th of June, seventeen days after they had put him ashore.

TROLLHÄTTAN, a town of Sweden in the district (*län*) of Elfsborg, 45 m. by rail N. by E. of Gothenburg. Pop. 6000. It lies on the left (east) bank of the Göta at the point where that river descends 108 ft. in the course of nearly a mile by the famous falls of Trollhättan (six in number) and several rapids. The scenic setting of the falls is not striking, but the great volume of water, nearly 18,000 cub. ft. per second, renders them most imposing. The narrowed river here surrounds several islands, on either side of one of which (Toppö) are the first falls of the series, Toppö and Tjuf. These are 42 ft. in height. The water-power is used in rolling-mills, a cellulose factory and other works.

Several "giant's caldrons" are seen in the exposed bed of a former channel. Below the falls are valuable salmon fisheries. To the east of the river the Berg canal, part of the Göta canal system, ascends in a series of eleven new locks (Akersvass) completed in 1844. An old series of locks (1800) is in use for small vessels. There are also ruins of an abortive attempt made to lock the falls in 1755. (See GOTA.)

TROLLOPE, ANTHONY (1815–1882), English novelist, was born in London, on the 24th of April 1815. His father, Thomas Anthony Trollope (1780–1835), a barrister who had been fellow of New College, Oxford, was reduced to poverty by unbusiness-like habits and injudicious speculation, and in 1829 Anthony's mother, FRANCES MILTON TROLLOPE (1780–1863), went with her husband to the United States to open a small fancy-goods shop in Cincinnati. The enterprise was a failure, but her three years' stay in that country resulted in a book on the *Domestic Manners of the Americans* (1832), of which she gave an unflattering account that aroused keen resentment. Returning to England her husband was compelled to flee the country in order to escape his creditors, and Mrs Trollope thereafter supported him in Bruges until his death by her incessant literary work. She published some books of travel, most of which are coloured by prejudice, and many novels, among the best known of which are *The Vicar of Wrexhill* (1837) and the *Widow Barnaby* (1839), studies in that vein of broad comedy in which lay her peculiar gift. She wrote steadily for more than twenty years, until her death, at Florence, on the 6th of October 1863. (See *Frances Trollope, her Life and Literary Work*, by her daughter-in-law 1895.) Her eldest son THOMAS ADOLPHUS TROLLOPE (1810–1892), was educated at Winchester and Oxford, and spent most of his life in Italy. He wrote a number of works on Italian subjects, among them *Homes and Haunts of Italian Poets* (1881), in collaboration with his second wife, Frances Eleanor Trollope, herself a novelist of no mean ability. He was a voluminous author, and perhaps the quantity of his work has obscured its real merit. Among his novels are *La Beata* (1861)* *Gemma* (1866), and *The Garstangs of Garstang Grange* (1869). (See his autobiography, *What I Remember* 1887.)

Anthony Trollope was the third son. By his own account few English men of letters have had an unhappier childhood and youth. He puts down his own misfortunes, at Harrow, at Winchester, at Harrow again, and elsewhere, to his father's pecuniary circumstances, which made his own appearance dirty and shabby, and subjected him to various humiliations. But it is permissible to suspect that this was not quite the truth, and that some peculiarities of temper, of which in after life he had many, contributed to his unpopularity. At any rate he seems to have reached the verge of manhood as ignorant as if he had had no education at all. After an experience as usher in a private school at Brussels he obtained, at the age of nineteen, by favour (for he could not pass even the ridiculous examination then usual) a position in the London post office. Even then his troubles were not over. He got into debt; he got into ridiculous entanglements of love affairs, which he has very candidly avowed; he was in constant hot water with the authorities; and he seems to have kept some very queer company, which long afterwards stood him in good stead as models for some of his novels. At last in August 1841 he obtained the appointment of clerk to one of the post office surveyors in a remote part of Ireland with a very small salary. This, however, was practically quadrupled by allowances; living was cheap; and the life suited Trollope exactly, being not office work, which he always hated, but a kind of travelling inspectorship. In the discharge of his duties he evinced a business capacity quite unsuspected by his former superiors. Here he began that habit of hunting which, after a manner hardly possible in later conditions of official work, he kept up for many years even in England. Within three years of his appointment he became engaged to Rose Heseltine, whom he had met in Ireland but who was of English birth. They were married in June 1844. His headquarters had previously been at Banagher; he was now transferred to Clonmel.

Trollope had always dreamt of novel-writing, and his Irish experiences seemed to supply him with promising subjects. With some assistance from his mother he got published his first two books, *The Macdermots of Ballycloran* (1847) and *The Kellys and the O'Kellys* (1848). Neither was in the least a success, though the second perhaps deserved to be, and a third, *La Vendée* (1850), besides being a much worse book than either, was equally a failure. Trollope made various literary attempts, but for a time ill fortune attended all of them. Meanwhile he was set on a new kind of post office work, which suited him even better than his former employment—a sort of roving commission to inspect rural deliveries and devise their extension, first in Ireland, then throughout the west of England and South Wales. That he did good work is undeniable; but his curious conception of official duty, on his discharge of which he prided himself immensely, is exhibited by his confessions that he "got his hunting out of it," and that he felt "the necessity of travelling miles enough"—he was paid by the mileage—"to keep his horses." It was during this work that he struck the vein which gave him fortune and fame. A visit to Salisbury Close inspired him with the idea of *The Warden* (1855). It brought him little immediate profit, nor was even *Barchester Towers*, which followed in 1857, very profitable, though it contains his freshest, his most original, and, with the exception of *The Last Chronicle of Barset*, his best work. The two made him a reputation, however, and in 1858 he was able for the first time to sell a novel, *The Three Clerks*, for a substantial sum, £250. A journey on post office business to the West Indies gave him material for a book of travel, *The West Indies and the Spanish Main* (1859), which he frankly and quite truly acknowledges to be much better than some subsequent work of his in the same line. From this time his production, mainly of novels, was incessant, and the sums which he received were very large, amounting in one case to as much as £3525 for a single book, and to nearly £70,000 in the twenty years between 1859 and 1879. All these particulars are given with great minuteness by himself, and are characteristic. The full high tide of his fortunes began when the *Cornhill Magazine* was established. He was asked at short notice to contribute a novel, and wrote in 1861 *Framley Parsonage*, which was extremely popular; two novels immediately preceding it, *The Bertrams* (1859) and *Castle Richmond* (1860) had been much less successful.

As it will be possible to notice few of his other works, the list of them, a sufficiently astonishing one, may be given here: *Doctor Thorne* (1858); *Tales of All Countries* (3rd series 1863); *Orley Farm*; *North America* (1862); *Rachael Ray* (1863); *The Small House at Allington, Can You Forgive Her?* (1864); *Miss Mackenzie* (1865); *The Belton Estate* (1866); *The Claverings, Nina Balatka, The Last Chronicle of Barset* (1867); *Linda Tressel* (1868); *Phineas Finn, He Knew He Was Right* (1869); *The Struggles of Brown, Jones and Robinson, the Vicar of Bullhampton, An Editor's Tales, The Commentaries of Caesar* (1870); *Sir Harry Hotspur of Humblethwaite, Ralph the Heir* (1871); *The Golden Lion of Granpere* (1872); *The Eustace Diamonds, Australia and New Zealand* (1873); *Phineas Redux, Harry Heathcote of Gangoil, Lady Anna* (1874); *The Way We Live Now* (1875); *The Prime Minister* (1876); *The American Senator* (1877); *Is He Popenjoy? South Africa* (1878); *John Caldigate, An Eye for an Eye, Cousin Henry, Thackeray* (1879); *The Duke's Children, Cicero* (1880); *Ayala's Angel, Dr Wortle's School* (1881); *Frau Frohmann, Lord Palmerston, The Fixed Period, Kept in the Dark, Marion Fay* (1882); *Mr Scarborough's Family, The Land Leaguers* (1883); and *An Old Man's Love* (1884), and several volumes of short stories.

How this enormous total was achieved in spite of official work (of which, lightly as he took it, he did a good deal, and which he did not give up for many years), of hunting three times a week in the season, of whist-playing, of not a little going into general society, he has explained with his usual curious minuteness. He reduced novel-writing to the conditions of regular mechanical work—so much so that latterly he turned out 250 words every quarter of an hour, and wrote at this rate three hours a day. He divided every book beforehand into so many days' work and checked off the amount as he wrote.

A life thus spent could not be very eventful, and its events may be summed up rapidly. In 1858 he went to Egypt on post office business, and at the end of 1859 he got himself transferred from Ireland to the eastern district of England. Here he took a house, at Waltham. He took an active part in the establishment of the *Fortnightly Review* in 1865; he was editor of *St Paul's* for some time after 1867; and at the end of that year he resigned his position in the post office. He stood as a parliamentary candidate for Beverley and was defeated; he received from his old department special missions to America and elsewhere—he had already gone to America during the Civil War. He went to Australia in 1871, and before going broke up his household at Waltham. When he returned he established himself in London, and lived there until 1880, when he removed to Harting, on the confines of Sussex and Hampshire. He had visited South Africa in 1877 and travelled elsewhere. He died of paralysis on the 6th of December 1882.

Of Trollope's personal character it is not necessary to say much. Strange as his conception of official duty may seem, it was evidently quite honest and sincere, and, though he is said to have been as an official popular neither with superiors nor inferiors, he no doubt did much good work. Privately he was much liked and much disliked—a great deal of real kindness being accompanied by a blustering and overbearing manner, and an egotism, not perhaps more deep than other men's, but more vociferous. None of his literary work except the novels is remarkable for merit. His *Caesar* and *Cicero* are curious examples of a man's undertaking work for which he was not in the least fitted. *Thackeray* exhibits, though Trollope appears to have both admired Thackeray as an artist and liked him as a man, grave faults of taste and judgment, and a complete lack of real criticism. The books of travel are not good, and of a kind not good. *Nina Balatka* and *Linda Tressel*—stories dealing with Prague and Nuremberg respectively—were published anonymously and as experiments in the romantic style. They have been better thought of by the author and by some competent judges than by the public or the publishers. *The Struggles of Brown, Jones and Robinson* was still more disliked, and is certainly very bad as a whole, but has touches of curious originality in parts. Trollope seldom creates a character of the first merit; at the same time his characters are always alive. Dr Thorne, Mr Harding, who has the courage to resign his sinecure in *The Warden*, Mr Crawley, Archdeacon Grantley, and Mrs Proudie in the same ecclesiastical series, are distinct additions to the *personae* of English fiction. After his first failures he never produced anything that was not a faithful and sometimes a very amusing transcript of the sayings and doings of possible men and women. His characters are never marionettes, much less sticks. He has some irritating mannerisms, notably a trick of repetition of the same form of words. He is sometimes absolutely vulgar—that is to say, he does not deal with low life, but shows, though always robust and pure in morality, a certain coarseness of taste. He is constantly rather trivial, and perhaps nowhere out of the Barset series (which, however, is of itself no inconsiderable work) has he produced books that will live. The very faithfulness of his representation of a certain phase of thought, of cultivation, of society, uninformed as it is by any higher spirit, in the long run damaged, as it had first helped, the popularity of his work. But, allowing for all this it may and must still be said that he held up his mirror steadily to nature, and that the mirror itself was fashioned with no inconsiderable art.

Trollope wrote an *Autobiography*, edited by his son Henry M. Trollope in 1883, explaining his literary methods with amusing frankness. See also Sir L. Stephen's *Studies of a Biographer* (1898), James Bryce's *Studies in Contemporary Biography* (1903), and Henry James's *Partial Portraits* (1888).

TROMBA MARINA, or MARINE TRUMPET (Fr. *trompette marine*; Ger. *Marine Trompete, Trompetengeige, Nonnengeige, Tympanischiza* or *Trummscheit*), a triangular bowed instrument about 6 ft. in length, which owes its characteristic timbre to the peculiar construction of the bridge. The tromba marina consists of a body and neck in the shape of a truncated cone resting on a triangular base. In the days of Michael Praetorius (1618), the length of the Trummscheit was 7 ft. 3 in. and the three sides at the base measured 7 in., tapering to 2 in. at the neck. These measurements varied considerably, as did also the shape of the body and the number of strings. In some cases the base of the body was left open, and in others there were sound-holes. The bridge, from its curiously irregular shape, was known as the "shoe"; it was thick and high at the one side on which rested the string, and low and narrow at the other which was left loose so that it vibrated against the belly with every movement of the bow, producing a trumpet-like timbre. It is to this feature, in conjunction with its general resemblance in contour to the marine speaking-trumpet of the middle ages, that the name of the instrument is doubtless due.

There was at first but one string, generally a D violoncello string, which was not stopped by the fingers in the usual way, but played only in harmonics by lightly touching it with the thumb at the nodal points. The heavy blow, similar to that of the violoncello, is used between the highest positions of the left hand at the nodal points and the nut of the head. In a Trummscheit in the collection of the Kgl. Hochschule, at Charlottenburg (No. 772 in catalogue) the frets are lettered A,D,F,A,D,F,G,A,B,C,D. Sometimes an octave string, half the length of the melody string, and even two more, respectively the twelfth and the double octave, not resting on the bridge but acting as sympathetic strings, were added to improve the timbre by strengthening the pure harmonic tones without increasing the blare due to the action of the bridge. In Germany, at the time when the trumpet was extensively used in the churches, nuns often substituted the tromba marina, whence the name *Nonnengeige*. In France, the Grande Écurie du Roi comprised five trumpets-marine and cromornes among the band in 1662, when the charge was mentioned for the first time in the accounts; and in 1666 the number was increased to six. The instrument fell into disuse during the first half of the 18th century, and was only to be seen in the hands of itinerant and street musicians. (K. S.)

TROMBONE (Fr. *trombone*, Ger. *Posaune*, Ital. *trombono*), an important member of the brass wind family of musical instruments formerly known as *sackbut*. The trombone is characterized by the *slide*, consisting of two parallel cylindrical tubes, over which two other cylindrical tubes, communicating at their lower extremities by means of a short semicircular pipe, slip without loss of air. The outer tube, therefore, slides upon the inner, and as it is drawn downwards by the right hand opens a greater length of tube proportional to the depth of pitch required. When the slide is closed the instrument is at its highest pitch. To the upper end of one of the inner tubes is fastened the cup-shaped mouthpiece and to the end of the other tube is fixed the bell-joint. This joint, on the proper proportions of which depend in a greater measure the acoustic properties of the trombone, consists of a length of tubing with conical bore widening out into a large bell and doubled back once upon itself in a plane at right angles to that of the slide. The bell-joint is strengthened by two or three stays, and the slide also has two, one between the inner immovable tubes and the other on the outer sliding tubes, by means of which the slide is drawn out and pushed in.

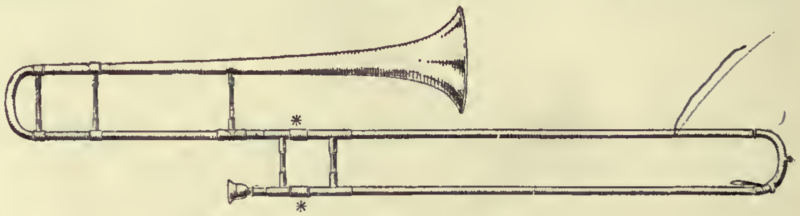

FIG. 1.—Tenor Trombone (Besson & Co.).

Sound is produced on the trombone, as on the horn, by means of the lips stretched like a vibrating reed across the cup mouthpiece from rim to rim; the acoustic principles involved are the same for both instruments. By overblowing, *i.e.* by the varying tension of the lips and pressure of breath, the harmonic series is obtained, which is effective between the second and the tenth harmonics, the fundamental being but rarely of practical use.

There are seven positions of the slide on the trombone, each giving a theoretical fundamental tone and its upper partials a semitone lower than the last, and corresponding to the seven shifts on the violin and to the seven positions on valve instruments. These seven positions are found by drawing out the slide a little more for each one, the first position being that in which the slide remains closed. The performer on the trombone is just as dependent on an accurate ear for finding the correct positions as a violinist.

The table of harmonics for the seven positions of the tenor trombone in B♭ is appended; they furnish a complete chromatic compass of two octaves and a sixth.

Position I. (*with closed slide*). II. III. IV. V. VI. VII.

These notes represent all the notes in practical use, although it is possible to produce certain of the higher harmonics. The instrument being non-transposing, the notation represents the real sounds.

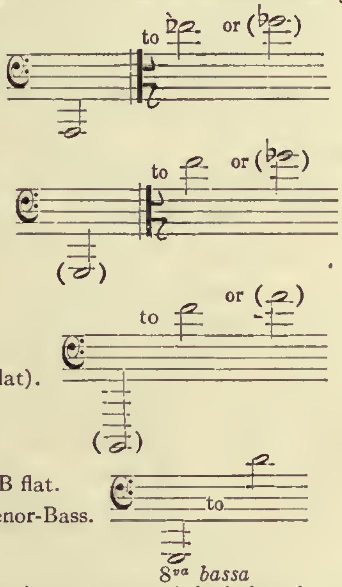
The four chief trombones used in the orchestra are the following:—

The Alto in E flat or F.

The Tenor-Bass in B flat.

The Bass in F or G (with double slide in E flat).

The Contra-Bass in B flat. An octave below the Tenor-Bass.



The compass given above is extreme and includes the notes obtained by means of the slide; the notes in brackets are very difficult; the fundamental notes, even when they can be played, are not of much practical use. The contra-bass trombone, although not much in request in the concert hall, is required for the *Nibelungen Ring*, in which Wagner has scored effectively for it.

The quality of tone varies greatly in the different instruments and registers. The alto trombone has neither power nor richness of tone, but sounds hard and has a timbre between that of a trumpet and a French horn. The tenor and bass have a full rich quality suitable for heroic, majestic music, but the tone depends greatly on the performer's method of playing; the modern tendency to produce a harsh, noisy blare is greatly to be deplored.

Besides the slide trombone, which is most largely used, there are the valve trombones, and the double-slide trombones. The former are made in the same keys as the instruments given above and are constructed in the same manner, except that the slide is replaced by three pistons, which enable the performer to obtain a greater technical execution; as the tone suffers thereby and loses its characteristic timbre, the instruments have never become popular in England.

FIG. 2.

The double-slide trombone (fig. 2)—patented by Messrs Rudall Carte & Co. but said to have been originally invented by Halary in 1830—is made in B♭, G bass and E♭ contrabass. In these instruments each of the branches of the slide is made half the usual length. There are four branches instead of two and the two pairs lie one over the other, each pair being connected at the bottom by a semicircular tube and the second pair similarly at the top as well. The usual bar or stay suffices for drawing out both pairs of slides simultaneously, but as the lengthening of the air column is now doubled in proportion to the shift of the slide, the extension of arm for the lower positions is lessened by half, which increases the facility of execution but calls for greater nicety in the adjustment of the slide, more especially in the higher positions.

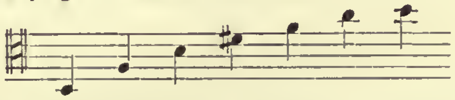
The history of the evolution of the trombone from the buccina is given in the article on the Sackbut (*q.v.*), the name by which the earliest *draw* or *slide* trumpets were known in England. The Germans call the trombone *Posaune*, formerly *buzaun*, *busine*, *pusin* or *pusun* in the poems and romances of the 12th and 13th century, words all clearly derived from the Latin *buccina*. The modern designation "large trumpet" comes from the Italian, in which *tromba* means not only trumpet, but also pump and elephant's trunk. It is difficult to say where or at what epoch the instrument was invented. In a psalter (No. 20) of the 11th century, preserved at Boulogne, there is a drawing of an instrument which bears a great resemblance to a trombone deprived of its bell. Sebastian Virdung, Ottmar Luscinius, and Martin Agricola say little about the trombone, but they give illustrations of it under the name of *busaun* which show that early in the 16th century it was almost the same as that employed in our day. It would not be correct to assume from this that the trombone was not well known at that date in Germany, and for the following reasons. First, the art of trombone playing was in the 15th century in Germany mostly in the hands of the members of the town bands, whose duties included playing on the watch towers, in churches, at pageants, banquets and festivals, and they, being jealous of their privileges, kept the secrets of their art closely, so that writers, such as the above, although acquainted with the appearance, tone and action of the instrument would have but little opportunity of learning much about the method of producing the sound. Secondly, German and Dutch trombone players are known to have been in request during the 15th century at the courts of Italian princes.[1] Thirdly, Hans Neuschel of Nuremberg, the most celebrated performer and maker of his day, had already won a name at the end of the 15th century for the excellence of his "Posaunen," and it is recorded that he made great improvements in the construction of the instrument in 1498,[2] a date which probably marks the transition from sackbut to trombone, by enlarging the bore and turning the bell-joint round at right angles to the slide. Finally in early German translations of Vegetius's *De re militari* (1470) the buccina is described (bk. III., 5) as the trumpet or posaun which is drawn in and out, showing that the instrument was not only well known, but that it had been identified as the descendant of the buccina.

By the 16th century the trombone had come into vogue in England, and from the name it bore at first, not *sackbut*, but *shakbusshe*, it

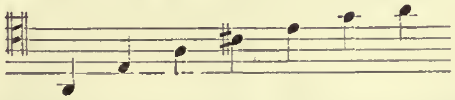
[1] E. Van der Straeten, *Les Musiciens néerlandais* p. 26.

[2] See G. von Retberg "Zur Gesch. d. Musik-instrumente" in *Anzeiger für Kunde der deutschen Vorzeit* p. 241. (Nuremberg, 1860), See also letters from Jorg Neuschell 1540–1545 in *Monatshefte f. Musikwissenschaft*, ix. p. 149 seq.

is evident that the instrument had been introduced from Spain and not from France (where it bore the name of saquebute), as some have assumed from the more frequent use of the word sackbut. The band of musicians in the service of Henry VIII. included ten sackbut players, and under Elizabeth, in 1587, there were six English instrumentalists then enjoyed a certain reputation and were sought for by foreign courts; thus in 1604 Charles III. of Lorraine sought to recruit his sackbut players from English bands.[1] Praetorius[2] classes the trombones in a complete family, the relative tonalities of which were thus composed: 1 *Alt-Posaun*, 4 *Gemeine rechte Posaunen*, 2 *Quart-Posaunen*, 1 *Octav-Posaun*—eight in all. The Alt-posaun was in D. With the slide closed, it gave the first of the accompanying harmonics:—



The gemeine rechte Posaunen, or ordinary trombones, were in A. Without using the slide they gave the subjoined sounds:—



The Quart-Posaun was made either in E, the fourth below the gemeine rechte Posaun, or in D, the lower fifth. In the latter case it was exactly an octave below the Alt-Posaun. The Octav-Posaun was in A. It was constructed in two different fashions: either it had a length double that of the ordinary trombone, or the slide was shortened, the length of the column of air being still maintained by the adaptation of a crook. The first system, which was invented by Hans Schreiber four years before the work of Praetorius appeared, gave the instrumentalist a slide by which he could procure in the lower octave all the sounds of the ordinary trombone. The second system, which Praetorius had known for years, was distinguished from the first, not only by modifications affecting the form, but also by a larger bore. Mersenne[3] calls the trombone *trompette harmonique*, or *tuba tractilis*. He describes carefully the seven positions and gives the diatonic scale for the first octave, but he does not, like Praetorius, mention the pitch of the trombones in use in his day. He established this fact, however, that it was customary in France, as in Germany, to lower the instrument a fourth below the pitch of the ordinary trombone by means of a *tortil*, a kind of crook with a double turn that was fitted between the bell and the slide, "in order," he said, "to make the bass to hautbois concerts." This system, so simple and rational, might have been expected always to serve for the basis of the technique of the instrument; but from the middle of the 18th century the art of playing the trombone became the object of purely empiric teaching. Owing to the decline in the popularity of the trombone during the 18th century in England, France, Germany and Italy, writers of that period are sometimes at a loss to describe the working and effect of the slide, as were the early 16th-century authors. J. J. Eisel, and after him Jacob Lotter, whose work is a *réchauffé* of Eisel's, mention four principal positions, "the others not being of much importance." The lowering of the pitch effected by means of these four positions, however, is almost equal to that of the seven positions of the modern trombone. The tenor or ordinary trombone is given as an example. It stood in the first position in A. The second position, equal to the modern third produced the harmonic series of the fundamental G one tone lower than the first position. The third position gave F again a tone lower and corresponding to our sixth position. The fourth position, which extended so far outward "that the arm could hardly reach it," gave E as fundamental. The intermediate semitones, instead of being considered as positions, are treated as accidentals, lowering or raising any note obtained in one of the positions by drawing out, or pushing in, the slide approximately an extra two-fingers breadth. It would not be correct to state without qualification that four positions only were used on the trombone in the 18th century.

Samuel Wesley, who has left notes on the scales of various instruments, in his own hand (Add MS. 35011 fol. 166 Brit. Mus.), has added under the scales of the trombones—bass, tenor and alto—the remark "sacbut or double trumpet, the scale of which is wanting."

Of all wind instruments the trombone has perhaps been least modified in form; changes have occasionally been attempted, but for the most part with only trifling success. The innovation which has had the most vogue dates from the end of the 18th century; it consisted in bending the tube of the bell in a half circle above the head of the executant, which produced a very bizarre effect. It also gave rise to very serious inconveniences: by destroying the regularity of the proportions of the bell it prejudicially affected the quality of tone and intonation of the instrument. For a long time the curved bell with its serpent's mask known as the Bucin—a term borrowed from the French in this instance—was maintained in military music, and it is not so very long since it was completely given up. By giving a half turn more to the bell tube its opening was directed to the back of the executant; but this

FIG. 3.—Contrabass Trombone (Boosey & Co.).

form, in fashion for a little while about 1830, was not long adhered to, and the trombone reassumed its primitive form, which is still maintained. As appears from a patent deposited by Stölzel and Blümel at Berlin on the 12th of April 1818 the application of ventils or pistons was then made for the first time.[4] The ventils, at first two in number, effected a definite lengthening of the instrument. The first augmented the length of the tube by a tone, lowering by as much the natural harmonics. The second produced a similar effect for a semitone, and the simultaneous employment of the two pistons resulted in the depression of a tone and a half. The principle, therefore, of the employment of ventils or pistons is the same as that which governs the use of slides (see VALVES). Notwithstanding the increased facility obtained by the use of pistons, they are very far from having gained the suffrage of all players: many prefer the slide, believing that it gives a facility of emission that they cannot obtain with a piston trombone. The flat tonalities having been preferred for military music since the beginning of the 19th century the pitch of each variety of trombones has been raised a semitone. At present six trombones are more or less in use, viz. the alto trombone in F, the alto in E♭ (formerly in D), the tenor in B♭ (formerly in A), the bass in G, the bass in F (formerly in E), the bass in E♭ (formerly in D), and the contrabass in B♭. This transposition has no reference to the number of vibrations that may be officially or tacitly adopted as the standard pitch of any country or locality. A trombone an octave lower than the tenor has recently been reintroduced into the orchestra, principally by Wagner. The different varieties just cited are constructed with pistons or slides, as the case may be.

Further information on the trombone will be found in the monographs by the Rev. F. W. Galpin, "The Sackbut: its Evolution and History," *Proc. Mus. Assoc.* (1906–1907); by Victor Mahillon, *Le Trombone, son histoire, sa théorie, sa construction* (Brussels, London, 1907). Before his recent death Professor George Case had in preparation an important work on the trombone. (V. M.; K. S.)

TROMP, the name of two famous Dutch admirals.

1. MARTIN HARPERTZOON TROMP (1597–1653) was born at Brielle, South Holland, in 1597. At the age of eight he made a voyage to the East Indies in a merchantman, but was made prisoner and spent several years on board an English cruiser. On making his escape to Holland he entered the navy in 1624, and in 1637 was made lieutenant-admiral. In February 1639 he surprised, off the Flemish coast near Gravelines, a large Spanish fleet, which he completely destroyed, and in the following September he defeated the combined fleets of Spain and Portugal off the English coast—achievements which placed him in the first rank of Dutch naval commanders. On the outbreak of war with England Tromp appeared in the Downs in command of a large fleet and anchored off Dover. On the approach of Blake he weighed anchor and stood over towards France, but suddenly altered his course and bore down on the English fleet, which was much inferior to his in numbers. In the engagement which followed (May 19, 1652) he had rather the worst of it and drew off with the loss of two ships. In November he again appeared in command of eighty ships of war, and a convoy of 300 merchantmen, which he had undertaken to guard past the English coast. Blake resolved to attack him, and, the two fleets coming to close quarters near Dungeness on the 30th of November, the English, after severe losses, drew off in the darkness and anchored off Dover, retiring next day to the Downs, while Tromp anchored off Boulogne

[4] This was mentioned in the Leipzig *Allg. musik. Ztg.* (1815), the merit of the invention being assigned to Heinrich Stölzel of Pless in Silesia.

till the Dutch merchantmen had all passed beyond danger. The statement that he sailed up the Channel with a broom at his masthead in token of his ability to sweep the seas is probably mythical. In the following February (1653), while in charge of a large convoy of merchantmen, he maintained a running fight with the combined English fleets under Blake, Penn and Monk off Portland to the sands of Calais, and, though baffling to some extent the purposes of the English, had the worst of the encounter, losing nine ships of war and thirty or forty merchantmen. On the 3rd of June he fought an indecisive battle with the English fleet under Richard Dean in the Channel, but the arrival of reinforcements under Blake on the following day enabled the English to turn the scale against him and he retired to the Texel with the loss of seventeen ships. Greatly discouraged by the results of the battle, the Dutch sent commissioners to Cromwell to treat for peace, but the proposal was so coldly received that war was immediately renewed, Tromp again appearing in the Channel towards the end of July 1653. In the hotly contested conflict which followed with the English under Monk on the 29th Tromp was shot by a musket bullet through the heart. He was buried with great pomp at Delft, where there is a monument to his memory in the old church.

2. Cornelius Van Tromp (1629–1691), the second son of the preceding, was born at Rotterdam on the 9th of September 1629. At the age of nineteen he commanded a small squadron charged to pursue the Barbary pirates. In 1652 and 1653 he served in Van Galen's fleet in the Mediterranean, and after the action with the English fleet off Leghorn on the 13th of March 1653, in which Van Galen was killed, Tromp was promoted to be rear-admiral. On the 13th of July 1665 his squadron was, by a hard stroke of ill-fortune, defeated by the English under the duke of York. In the following year Tromp served under De Ruyter, and on account of De Ruyter's complaints of his negligence in the action of the 5th of August he was deprived of his command. He was, however, reinstated in 1673 by the stadtholder William, afterwards king of England, and in the actions of the 7th and of the 14th of June, against the allied fleets of England and France, manifested a skill and bravery which completely justified his reappointment. In 1675 he visited England, where he was received with honour by King Charles II. In the following year he was named lieutenant-admiral of the United Provinces. He died at Amsterdam, on the 29th of May 1691, shortly after he had been appointed to the command of a fleet against France. Like his father he was buried at Delft.

See H. de Jager, *Het Geslacht Tromp* (1883).

TROMSÖ, a seaport of Norway, capital of the *amt* (county) and *stift* (diocese) of the same name on the north-western coast. Pop. (1900), 6955. It stands on the eastern shore of a low fertile islet between Kvalö and the mainland, in 69° 38′ N., 18° 55′ E. (the latitude is that of Disco, Greenland). The vegetation of the island (mountain ash and birch) is remarkably luxuriant. The buildings, mostly of wood, include the town-hall and a museum, which contains a good zoological collection. Sealskins and other furs, and whale and seal oil, are exported, and the herring fishery is very productive. Imports are coal, textiles, salt, grain and flour. Mean temperature of year 36·4° F.; February 25°; July 51·8°. Tromsö was founded in 1794. A number of Lapps usually encamp in the neighbouring Tromsdal during summer. The coast scenery, with its islands and snowy mountains, is wild and beautiful.

TRONCHET, FRANÇOIS DENIS (1726–1806), French jurist, was born in Paris on the 23rd of March 1726. He was an avocat at the parlement of Paris, and gained a great reputation in a consultative capacity. In 1789 he was elected deputy to the states-general. In the Constituent Assembly he made himself especially conspicuous by his efforts to obtain the rejection of the jurisdiction of the jury in civil cases. In the king's trial, he was chosen by Louis as counsel for the defence, and performed this difficult and dangerous task with high ability and courage. During the Directory he was deputy at the Council of the Ancients, where he unsuccessfully opposed the resolution that judges be nominated by the executive directory. Under the Consulate he was president of the tribunal of cassation, and collaborated in preparing the final scheme for the civil code. He had a marked influence on the code, and succeeded in introducing common law principles in spite of the opposition of his colleagues, who were deeply imbued with Roman law. He died on the 10th of March 1806, being the first senator of the empire to be buried in the Panthéon.

See François de Neufchâteau, *Discours sur Tronchet* (Paris, undated); Coqueret, *Essai sur Tronchet* (Caen, 1867).

TRONDHJEM, or Throndhjem (sometimes written in the German form *Drontheim*), a city and seaport of Norway, chief town of the *stift* (diocese) of Trondhjem and the *amt* (county) of South Trondhjem, 384 m. by rail N. of Christiania. Pop. (1900), 38,156. It lies on the south side of the broad Trondhjem Fjord on a low peninsula between the fjord and the River Nid, its situation, though picturesque, lacking the peculiar beauty of that of Christiania or Bergen. The latitude is 63° 26′ N., that of southern Iceland. In front of the town is the islet of Munkholm, formerly a monastery and now a fortress; on the high ground to the east is the small stronghold of Christiansten. The houses are principally of wood, and the streets are wide, as a precaution against the spreading of fire. The principal building is the cathedral, standing finely on a slightly elevated open site, and dating in part from the close of the 11th century, but chiefly belonging to the 12th and 13th centuries (*c.* 1161–1248). Its extreme length is 325 ft. and its extreme breadth 124 ft.; but in the 14th, 15th and 17th centuries it suffered greatly from repeated fires, and after the last of these the nave was completely abandoned and soon became a heap of ruins. The whole building, however, had been extensively and judiciously restored, and is the finest church in Norway and the scene of the coronation of the Norwegian sovereigns. It is cruciform, with a central tower, and has an eastern octagon which may have been copied from the corona of Canterbury Cathedral, as Eystein, archbishop of Trondhjem (1160–1188) and an active builder, was in England during his episcopate. The cathedral contains rich work in Norman style, and also much that is comparable with the best Early English. In the museums at Trondhjem there are interesting zoological and antiquarian collections, also exhibits illustrative of the fisheries and other industries. The port, which has regular communication with all the Norwegian coast towns—Hull, Newcastle, Hamburg, &c.—carries on an extensive trade in timber, oil, fish, copper, &c. The industries include shipbuilding, saw-milling, wood-pulp and fish-curing works and machine shops. Imports (coal, grain, salt, machinery, &c.) come chiefly from Great Britain. A considerable portion of the exports pass into Sweden by the Meraker railway.

Trondhjem, originally Nidaros, was founded by Olaf Tryggvason, who built a royal residence and a church here in 996. It was made an archbishopric in 1152. The city attained its highest development about the latter half of the 13th century, by which time it had become an important pilgrimage centre and had as many as fifteen churches. It sustained frequent sieges, as well as devastating conflagrations. Its importance declined about the time of the Reformation when it ceased to be a resort of pilgrims.

TROON, a police burgh, seaport and watering-place of Ayrshire, Scotland. Pop. (1901), 4764. It is situated 6 m. N. by W. of Ayr, and 35 m. S.W. of Glasgow by the Glasgow & South-Western railway. It has the best natural harbour in the county, with over a mile of quayage, a breakwater 3000 ft. long, and two graving docks. Shipbuilding is the leading industry, and there is a rope and sail factory. The town contains a public hall and library and reading-room. The municipality controls the waterworks and gasworks. Fullarton House, 1 m. south-east, is a seat of the duke of Portland; and at Auchans, about 3 m. west, Susannah, countess of Eglinton, in 1773 entertained Dr Johnson. Adjoining this estate stands the ruined castle of the Dundonalds.

TROOP (an adaptation of Fr. *troupe*, O. Fr. *trope*; cf. Ital. *troppa, truppa*; Med. Lat. *truppus*; the origin is doubtful; suggestions have been made that it represents a German conception of Latin *turba*, crowd, or is an adaptation of Norw. *torp*, flock), a company or assemblage of persons, the term being usually applied in the plural to a body of soldiers of varying strength and of different arms. Specifically, a "troop" is one of the smaller units into which a regiment of horse-soldiers is divided, forming a subdivision of a squadron. Roughly speaking, it consists of sixteen files, and does not exceed from 30 to 40 sabres; in some armies, however, a maximum limit of 60 sabres are found (see CAVALRY). For the military ceremony known as "trooping of the colours," see COLOURS, MILITARY.

TROPHY (Gr. τρόπαιον, from τρέπω, put to flight; Lat. *tropaeum*), in classical antiquities, in the strict sense a memorial of victory set up on the field of battle at the spot where the enemy had been routed. It consisted of captured arms and standards hung upon a tree (preferably an olive or an oak) and booty heaped up at its foot, dedicated to the god to whom the victory was attributed, especially Zeus Tropaeus. If no suitable tree was at hand, a lopped trunk was fixed in the ground on an eminence. The tree or trunk bore an inscription containing the names of the god and the combatants, a list of the booty and of the chief incidents of the battle or the entire war. In the case of a naval victory the trophy, composed of the beaks of ships (sometimes an entire ship), was generally set up on the nearest beach and consecrated to Poseidon. It was regarded as a sacrilege to destroy a trophy, since it was dedicated to a god; but, on the other hand, one that had fallen to pieces through lapse of time was not restored, to prevent feelings of resentment being kept alive. For the same reason trophies of stone or metal were forbidden by law, although this rule was not always observed. To facilitate reconciliation with their conquered foes, neither the Macedonians nor the Romans in early times erected such trophies. The usual custom was to take home the spoils, and to use them for decorating public buildings and private houses. The first example of a trophy set up after the Greek fashion occurs in 121 B.C., when Domitius Ahenobarbus celebrated his victory over the Allobroges in this manner. Although instances are not uncommon in later times, the Romans still showed a preference for setting up the memorials of victory in Rome rather than on the field of battle. These were decorated with the spoils, and were themselves called trophies; such were the trophies of Marius recording his victories over Jugurtha and the Cimbri and Teutones. In later republican and imperial times enormous columns, on which the chief incidents of a battle or war were represented in bas-relief, were frequently erected, the most famous and most perfect example being the column of Trajan (see ROME: *Archaeology*, "The Imperial Forums").

TROPIC-BIRD, so called of sailors from early times,[1] because as W. Dampier (*Voyages*, i. 53) among many others testifies, it is "never seen far without either Tropick"; hence, indulging a pretty fancy, Linnaeus bestowed on it the generic term, continued by modern writers, of *Phaethon*, in allusion to its attempt to follow the path of the sun.[2] There are certainly three well-marked species of this genus, but their respective geographical ranges have not yet been definitely laid down. All of them can be easily known by their totipalmate condition, in which the four toes of each foot are united by a web, and by the great length of the two middle tail-quills, which project beyond the rest, so as to have gained for the birds the name of "Rabijunco," "Paille-en-queue" and "Pijlstaart" among mariners of different nations. These birds fly to a great distance from land and seem to be attracted by ships, frequently hovering round or even settling on the mast-head. Their flight is performed by rapid strokes, unlike the action of other long-winged sea-fowl, and they are rarely seen on the water.

The yellow-billed tropic-bird, *P. flavirostris* or *candidus*, appears to have habitually the most northerly, as well, perhaps, as the widest range, visiting Bermuda yearly to breed there, but also occurring numerously in the southern Atlantic, the Indian, and a great part of the Pacific Ocean. In some islands of all these three it breeds, sometimes on trees, which the other species are not known to do. However, like the rest of its congeners, it lays but a single egg, and this is of a pinkish white, mottled, spotted, and smeared with brownish purple, often so closely as to conceal the ground colour. This is the smallest of the group, and hardly exceeds in size a large pigeon; but the spread of its wings and its long tail make it appear more bulky than it really is. Except some black markings on the face (common to all the species known), a large black patch partly covering the scapulars and wing-coverts, and the black shafts of its elongated rectrices its ground colour is white, glossy as satin, and often tinged with roseate. Its yellow bill readily distinguishes it from its larger congener *P. aethereus*, but that has nearly all the upper surface of the body and wings closely barred with black, while the shafts of its elongated rectrices are white. This species has a range almost equally wide as the last; but it does not seem to occur in the western part of the Indian Ocean. The third and largest species, the red-tailed tropic-bird, *P. rubricauda* or *phoenicurus*, not only has a red bill, but the elongated and very attenuated rectrices are of a bright crimson red, and when adult the whole body shows a deep roseate tinge. The young are beautifully barred above with black arrow-headed markings. This species has not been known to occur in the Atlantic, but is perhaps the most numerous in the Indian and Pacific oceans, in which last great value used to be attached to its tail-feathers to be worked into ornaments.[3]

That the tropic-birds form a distinct family, Phaethontidae, of the Steganopodes (the Dysporomorphae of Huxley), was originally maintained by Brandt, and is now generally admitted, yet it cannot be denied that they differ a good deal from the other members of the group[4]; indeed St G. Mivart in the Zoological *Transactions* (x. 364) hardly allowed *Fregata* and *Phaethon* to be steganopodous at all; and one curious difference is shown by the eggs of the latter, which are in appearance so wholly unlike those of the rest. The osteology of two species has been well described and illustrated by Alph. Milne-Edwards in A. Grandidier's fine *Oiseaux de Madagascar* (pp. 701–704, pls. 279–281*a*). (A. N.)

TROPINE, $C_8H_{15}NO$, a base formed together with tropic acid, $C_9H_{10}O_3$, in the hydrolysis of the alkaloid atropine (K. Kraut, *Ann.*, 1863, 128, p. 280; 1865, 133, p. 87). It crystallizes in plates which melt at 63° C. and boil at 233° C.; it is very hygroscopic and easily soluble in water. It is an optically inactive, strongly alkaline tertiary base. On heating with sodium in amyl alcoholic solution it it sransformed into a stereo-isomer, identical with the ψ-tropine obtained by hydrolysing tropa-cocaine with hydrochloric acid. It possesses alcoholic properties, since it forms esters, the so-called "tropeïnes." On distillation with caustic baryta or soda lime it decomposes into methylamine and tropilidine, C_7H_8 (A. Ladenburg, *Ann.* 1883, 217, p. 74), the same hydrocarbon being also obtained when it is destructively methylated, a certain amount of tropiline, $C_7H_{10}O$, being produced simultaneously When heated with fuming hydrochloric acid to 150–180° C. it yields tropidine, $C_8H_{13}N$, and with hydriodic acid similarly forms an

[1] More recently sailors have taken to call it "Boatswain-bird"—a name probably belonging to a very different kind. (See SKUA.)

[2] Occasionally, perhaps through violent storms, tropic-birds wander very far from their proper haunts. In 1700 Leigh, in his *Nat. Hist. Lancashire* (i. 164, 195, Birds, pl. i., fig. 3), described and figured a "Tropick Bird" found dead in that county. Another is said by Mr Lees (*Zoologist*, 2nd series, p. 2666) to have been found dead at Cradley near Malvern—apparently before 1856 (J. H. Gurney, jun., *op. cit.*, p. 4766)—which, like the last, would seem (W. H. Heaton, *op. cit.*, p. 5086) to have been of the species known as *P. aethereus*. Naumann was told (*Rhea*, i. 25) of its supposed occurrence at Heligoland, and Colonel Legge (*B. Ceylon*, p. 1174) mentions one taken in India 170 m. from the sea. The case cited by Degland and Gerbe (*Ornith. européenne*, ii. 363) seems to be that of an albatross.

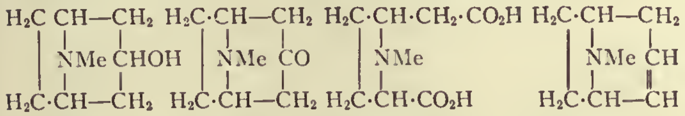
[3] A fourth species, *P. indicus*, has been described from the Gulf of Oman, but doubt has been expressed as to its validity (Legge, pp. 1173, 1174).

[4] Sulidae (Gannet), Pelecanidae (Pelican), Plotidae (Snake-bird). Phalacrocoracidae (Cormorant,) and Fregatidae (Frigate-bird).

iodo-compound, $C_8H_{15}NI_2$, which, on reduction with zinc and hydrochloric acid, is converted into hydrotropidine, $C_8H_{15}N$. It yields various oxidation products. With an alkaline solution of potassium permanganate it yields tropigenine, $C_7H_{13}NO$; with chromic acid in the presence of acetic acid it yields tropinone, $C_8H_{13}NO$; and with chromic acid in the presence of sulphuric acid it yields tropinic acid, $C_6H_{11}N(CO_2H)_2$.

Tropidine, $C_8H_{13}N$, is a liquid having an odour resembling that of conine. It is a strong tertiary base, and is an unsaturated compound, forming addition products with the halogen acids. *Hydrotropidine*, $C_8H_{15}N$, is also a liquid. Its hydrochloride on distillation loses methyl chloride and yields norhydrotropidine, $C_7H_{13}N$, a compound which is a secondary base, and whose hydrochloride when distilled over zinc dust yields α-ethylpyridine. *Tropinic acid*, $C_6H_{11}N(CO_2H)_2$, obtained as above, is inactive; it was resolved by J. Gadamer (*Arch. Pharm.*, 1901, 239, p. 663) by means of its cinchonine salt. It is a dibasic acid, and the methiodide of its dimethyl ester on fusion with caustic alkalis yields *n*-adipic acid. It is apparently a derivative of N—methyl pyrrollidine, since it may be oxidized ultimately to N—methyl succinimide. *Tropigenine*, $C_7H_{13}NO$, is a secondary base.

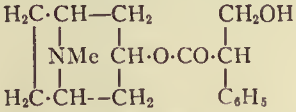
The most important of the oxidation products of tropine is *tropinone*, $C_8H_{13}NO$, which is a ketone containing the grouping $-CH_2\cdot CO\cdot CH_2-$ since it yields a di-isonitroso derivative, a dibenzal derivative, and also forms mono- and di-oxalic esters. It is a strong base and has a powerful reducing action. Its constitution is determined by the above facts and also because tropinic acid on destructive methylation yields a diolefine dicarboxylic acid which on reduction is converted into *n*-pimelic acid. These data point to tropine possessing an unbranched chain of seven carbon atoms and incidentally determine the constitution of the other various oxidation products, &c. (R. Willstätter, *Ber.*, 1895–1901). These compounds may consequently be represented as



Tropine Tropinone Tropinic acid Tropidine.

On the synthesis of tropine, see R. Willstätter, *Ber.*, 1901, 34, pp. 130, 3163.

Tropic acid, $C_9H_{10}O_3$, the other decomposition product of atropine, is a saturated hydroxy-acid which is readily converted into atropic acid, $C_9H_8O_2$, by dehydrating agents. This latter acid is shown by all its reactions to be $C_6H_5C(:CH_2)\cdot CO_2H$, a fact which is confirmed by its synthesis from acetophenone by the action of phosphorus pentachloride, followed by the decomposition of the resulting chloride with an alcoholic solution of potassium cyanide and subsequent hydrolysis of the nitrile so formed. These results show that tropic acid must be either $C_6H_5\cdot CH(CH_2OH)\cdot CO_2H$ or $C_6H_5C\cdot(OH)(CH_3)\cdot CO_2H$, and since the latter compound has been prepared from acetophenone by the addition of the elements of hydrocyanic acid, followed by subsequent hydrolysis and is an isomer of tropic acid, it follows that tropic acid must be represented by the former of the two formulae. Hence the alkaloid atropine, being a tropine-tropate, must have the annexed formula—



Atropine.

TROPPAU (Polish, *Oppava*; Czech, *Opava*), the capital of the Austrian duchy and crown land of Silesia, 180 m. N.E. of Vienna by rail. Pop. (1900), 26,725. It is situated on the Oppa river, close to the Prussian frontier, and is a well-built town with extensive suburbs. The industries comprise the manufacture of cloth, industrial machines, sugar-refining, jute fabrics and brewing. Troppau was founded in the 13th century; but almost its only claim to historical mention is the fact that in 1820 the monarchs of Austria, Russia and Prussia met here to deliberate on the tendencies of the Neapolitan revolution. This congress of Troppau, however, left nearly the whole matter to be considered and decided at Laibach. The former principality of Troppau is now divided between Austria and Prussia, the latter holding the lion's share.

TROPPAU, CONGRESS OF, a conference of the allied sovereigns or their representatives to discuss a concerted policy with regard to the questions raised by the revolution in Naples of July 1820. At this congress, which met on the 20th of October 1820, the emperor Alexander I. of Russia and Francis I. of Austria were present in person; King Frederick William III. of Prussia was represented by the crown prince (afterwards Frederick William IV.). The three eastern powers were further represented by the ministers responsible for their foreign policy: Austria by Prince Metternich, Russia by Count Capo d'Istria, Prussia by Prince Hardenberg. Great Britain, on the other hand, which objected on principle to the suggested concerted action against the Neapolitan Liberals, sent no plenipotentiary, but was represented by Lord Stewart, ambassador in Vienna. France, too, though her policy was less clearly defined, had given no plenary powers to her representatives. Thus from the very first was emphasized that division within the concert of the powers which the outcome of the congress was to make patent.

The characteristic note of this congress was its intimate and informal nature; the determining fact at the outset was Metternich's discovery that he had no longer anything to fear from the "Jacobinism" of the emperor Alexander. In a three hours' conversation over a cup of tea at the little inn he had heard the tsar's confession and promise of amendment: "Aujourd'hui je déplore tout ce que j'ai dit et fait entre les années 1814 et 1818 . . . Dites-moi ce que vous voulez de moi. Je le ferai" (Metternich to Esterhazy, Oct. 24, 1820, *F. O. Austria Dom. Sep.-Dec. 1820*). His failure to convert Castlereagh to his views was now of secondary importance; the "free" powers being in accord, it was safe to ignore the opinions of Great Britain and France, whose governments, whatever their goodwill, were fettered by constitutional forms.

In a series of conferences—to which the representatives of Great Britain and France were not admitted, on the excuse that they were only empowered to "report," not to "decide"—was drawn up the famous preliminary protocol signed by Austria, Russia and Prussia on the 19th of November. The main pronouncement of the "Troppau Protocol" is as follows: "States which have undergone a change of government due to revolution, the result of which threaten other states, *ipso facto* cease to be members of the European Alliance, and remain excluded from it until their situation gives guarantees for legal order and stability. If, owing to such alterations, immediate danger threatens other states the powers bind themselves, by peaceful means, or if need be, by arms, to bring back the guilty state into the bosom of the Great Alliance."

No effort was made by the powers to give immediate effect to the principles enunciated in the protocol; and after its promulgation the conferences were adjourned, it being decided to resume them at Laibach in the following January (see LAIBACH).

For authorities see the bibliography to ch. i. "The Congresses," by W. Alison Phillips, in the *Cambridge Mod. Hist.* x. 787.

TROSSACHS, THE (Gaelic, "the bristled country," a crude allusion to its physical features), a defile in the south-west of Perthshire, Scotland. It is a narrow, beautifully wooded glen, of no great depth, extending from Loch Achray to Loch Katrine, and continued thence by a strip on the north-eastern shore to a point above the now submerged Silver Strand opposite to Ellen's Isle—a total distance of $2\frac{1}{2}$ m. It is situated 8 m. W. of Callander and 5 m. N. of Aberfoyle, with both of which places there is daily communication by coach during the tourist season. It lies between the steep green slopes of Ben Venue (2393 ft.) on the S.W. and the precipitous craigs of Ben A'an (1750 ft.) on the N.E. Characterized by lovely scenery, owing to its harmonious blending of wood, water, rock and hill, the region has been famous ever since the appearance of Sir Walter Scott's *The Lady of the Lake* and *Rob Roy*. Before the construction of the road that now winds through the pass, Sir Walter says that the only access to the lake was by means of a ladder formed out of the branches and roots of trees. A rustic pier has been built at the Trossachs end of Loch Katrine for the convenience of tourists, and a large hotel stands on the northern shore of Loch Achray, near the beginning of the pass.

TROTZENDORFF (or TROCEDORFIUS), **VALENTIN FRIEDLAND** (1490–1556), German educationist, called Trotzendorff from his birthplace, near Görlitz, in Prussian Silesia, was born on the 14th of February 1490, of parents so poor that they could not keep him at school. The boy taught himself to read and write while herding cattle; he made paper from birch bark and ink from soot. When difficulties were overcome and he was sent for education to Görlitz, his mother's last words were "Stick to the school, dear son." The words determined his career: he refused all ecclesiastical promotion, and lived and died a schoolmaster. He became a distinguished student, learned Ciceronian Latin from Peter Mossellanus and Greek from Richard Croke, and after graduation was appointed assistant master in the school at Görlitz. There he also taught the rector and other teachers. When Luther began his attack on indulgences, Trotzendorff resigned his position and went to study under Luther and Melanchthon, supporting himself by private tuition. Thence he was called to be a master in the school at Goldberg in Silesia, and in 1524 became rector. There he remained three years, when he was sent to Liegnitz. He returned to Goldberg in 1531 and began that career which has made him the typical German schoolmaster of the Reformation period. His system of education and discipline speedily attracted attention. He made his best elder scholars the teachers of the younger classes, and insisted that the way to learn was to teach. He organized the school in such a way that the whole ordinary discipline was in the hands of the boys themselves. Every month a "consul," twelve "senators" and two "censors" were chosen from the pupils, and over all Trotzendorff ruled as "dictator perpetuus." One hour a day was spent in going over the lessons of the previous day. The lessons were repeatedly recalled by examinations, which were conducted on the plan of academical disputations. Every week each pupil had to write two "exercitia styli," one in prose and the other in verse, and Trotzendorff took pains to see that the subject of each exercise was something interesting. The fame of the Goldberg School extended over all Protestant Germany, and a large number of the more famous men of the following generation were taught by Trotzendorff. He died on the 20th of April 1556.

See Herrmann, *Merkwürdige Lebensgeschichte eines berühmten Schulmanns, V. F. Trotzendorffs* (1727); Frosch, *V. F. Trotzendorff, Rektor zu Goldberg* (1818); Pinzger, *V. F. Trotzendorff* (with the Goldberg portrait, and a complete list of his writings, 1825); Koehler, *V. F. Trotzendorff, ein biographischer Versuch* (1848). The biographical facts appear to be derived from a funeral or memorial oration delivered by Balthasar Rhau in the university of Wittenberg on the 15th of August 1564, and published in an edition of Trotzendorff's *Rosarium* (1565).

TROUBADOUR, the name given to the poets of southern France and of northern Spain and Italy who wrote in the *langue d'oc* from the 12th to the 14th centuries. In Provençal the word is spelt *trobaire* or *trovador*, and is derived from the verb *trobar*, to find, or to invent (Fr. *trouver*). The troubadour was one who invented, and originally improvised, poetry, who "found out" new and striking stanzaic forms for the elaborate lyrics he composed. In later times, the word has been used for romantic and sentimental persons, who dress in what is supposed to be medieval fashion, and who indite trivial verses to the sound of a lute; but this significance does less than justice to the serious artistic aims of the original and historic troubadours of Provence.

The earliest troubadour of whom anything definite is known is Guilhem IX. (b. 1071), count of Poitiers and duke of Aquitaine, whose career was typical of that of his whole class, for, according to his Provençal biographer, "he knew well how to sing and make verses, and for a long time he roamed all through the land to deceive the ladies." The high rank of this founder of the tradition was typical of its continuation; by far the largest number of the troubadours belonged to the noble class, while no fewer than twenty-three of their number were reigning princes. Among them is a king of England, Richard I., who is believed to have written in *langue d'oil* as well as in *langue d'oc*, and who has left at least one canzo, that written in prison, which is of remarkable beauty. These noble troubadours were distinguished by their wealth and independence from those who made their song their profession, and who wandered from castle to castle and from bower to bower. But whether dependent or independent, the poets exercised a social influence which was extremely remarkable, and had been paralleled by nothing before it in the history of medieval poetry. They had great privileges of speech and censure, they entered into questions of politics, and above all they created around the ladies of the court an atmosphere of cultivation and amenity which nothing had hitherto approached. The troubadour was occasionally accompanied in his travels by an apprentice or servant, called a *joglar*, whose business was to provide a musical setting for the poet's words; sometimes it was not the troubadour himself, but his *joglar*, who sang the songs. It was a matter of jealous attention to the troubadour to keep his name and fame clear of the claims of the *joglar*, who belonged to a lower caste; although it is true that some poets of very high talent rose from being *joglars* and attained the rank of troubadours. The latter were looked upon with deep admiration, and their deeds and sayings, as well as their verses, were preserved and were even embroidered with fiction.

There were recognized about four hundred troubadours, during the whole period in which they flourished, from Guilhem de Poitiers down to Guiraut Riquier (*c.* 1230–1294). Several MS. collections of biographies have been preserved, and from these we gain some idea of the careers of no fewer than 111 of the poets. In this respect, the troubadours possess an immense advantage over the trouvères of northern France, of whose private life very little is any longer known. Early in the living history of the troubadours their personal adventures came to be thought worthy of record. One of themselves, Uc of St Cyr (*c.* 1200–1240), interested himself in "the deeds and words of goodly men and women," and in the collection of lives he seems to claim to be, in several instances, the biographer. At the beginning of the 14th century it became the practice to preface the MS. works of each poet by a life of him, and even where the text seems to be quite independent, it is noticeable that there is little variation in the biography. One late troubadour, Rambaud of Orange, left a commentary on his own poems, and Guiraut Riquier one on those of a fellow troubadour, Guiraut of Calanson (1280). All this proves the poetry of Provence to have passed early into the critical stage, and to have been treated very seriously by those who were proficient in it. This is further shown by the respect with which the Provençal poets are mentioned by Dante, Petrarch and the authors of the *Novelle Critiche*.

The principal source of the lives of the troubadours is a collection, evidently written by various hands, which was made towards the middle of the 13th century. Of these we have said that Uc of Saint Cyr was certainly one of the authors. Another source of information is the *Vies des plus célèbres et anciens poètes provencaux*, published by Jehan de Notredame or Nostradamus, in 1575. This work professed to be founded on the MSS. of a learned monk, who was librarian of the monastery of St Honorat, in the island of Lérins, and died there in 1408. He was known by no other name than that of the Monk of the Golden Isles. This book, unfortunately, lies under more than a suspicion of forgery. Nostradamus no doubt possessed valuable documents, but he did not hesitate to deal with them in a highly fantastic way. His *Vies des poètes* has yet to be examined by careful and searching criticism. Even the genuine biographies, and they are numerous and above suspicion, are often embroidered with fantastic and whimsical statements which make a severe demand upon the credulity of a modern reader.

The verse form most frequently employed by the troubadours was the *sirventés*, a term which is earliest met with in the second half of the 12th century. The early critics believed this word to be derived from *servir*, and to mean that the poem was made by a servant; but Paul Meyer has contested this derivation, and holds that a *sirventés* is a poem composed by a sirvent, that is to say a *soudoyer* or paid man-at-arms. The troubadours also employed the *ballada*, which was a song with a long refrain, not much like the formal ballade of the north of France; the *pastourella*; and the *alba*. This last took its name from the circumstance that the word *alba* (dawn) was repeated in each stanza. This was a morning-song, as the *serena*, a later invention, was an evensong. The *planh* was a funeral elegy, composed by the troubadour for the obsequies of his protector, or for those of the lady of his devotion. Most interesting of all, perhaps, was the *tenson*, which was a lyrical dialogue between two persons, who discussed in it, as a rule, some point of amorous casuistry, but sometimes matters of a religious, metaphysical or satirical nature. The notion that the troubadours cultivated epic or dramatic poetry is now generally discarded; they were in their essence lyrical (see PROVENÇAL LITERATURE).

The biographies of the troubadours, which, in spite of their imperfection and conventionality of form, throw an unparalleled light upon medieval literary life, may perhaps be most conveniently treated in connexion with the courts at which each group of them flourished. It is in Poitou that we trace them first, where Guilhem, count of Poitiers, who reigned from 1087 to 1127, was both the earliest patron and the earliest poet of the school. This prince was the type of medieval gallantry, sudden and violent in arms, brilliant and impudent in wit, with women so seductive as to be esteemed irresistible. He led an army of 300,000 men in the crusade of 1101, being then thirty years of age; he returned in dismal disarray, supported in his defeat by the arts of love and song. His levity was the wonder and delight of his contemporaries; William of Malmesbury, who speaks much of him, tells us of Guilhem's project to found a religious house at Niort for the worship of Venus. Guilhem of Poitiers was handsome, bold and of easy access; Gottfried of Vendôme says that he moved among other men as a god among mortals for the beauty of his body and the magnanimity of his soul. The surviving poems of the great count are simple in form; he does not attempt the technical subtleties of later poets; but he laboured at the art, and he was anxious to be thought a professional, not an amateur writer. His songs are highly personal and betray the author's variety, sensuality, wit and skill as a versifier.

The son of the earliest of the troubadours is known neither as a poet nor as a patron of poets, but the daughter of Guilhem IX. carried on her father's tradition. This was Eleanor of Guienne, at whose court Bernart of Ventadour rose to eminence. This poet was an exception to the rule that the troubadours belonged to the princely class. He seems to have been the son of a kitchen-scullion in the castle of Eble II., viscount of Ventadour. Eble was himself a poet, *valde gratiosus in cantilenis*, but his compositions have wholly disappeared; he was early impressed, we know not how, by the talents of his serving-boy, and he trained him to be a poet. The wife of Eble, the viscountess Agnes of Montluçon, who was extremely beautiful, encouraged the suit of the youthful Bernart; indeed, they had secretly loved one another from their childhood. The poems which this passion inspired are among the most admirable lyrics which have come down to us from the middle ages. The husband at last discovered the intrigue between his wife and the poet, and exiled Bernart from Ventadour, although, as it would seem, without violence. The troubadour took shelter with Eleanor of Guienne, who became in 1152 the queen-consort of Henry II. of England, himself a protector of poets. It has been supposed that Bernart accompanied the royal pair to London. He afterwards proceeded to the court of Raymond V. at Toulouse, where he is said to have remained until the death of that prince in 1194, when he withdrew to a cloister at Dalou in Poitou. He must at that time have been a very old man.

The son of Henry II., Henry Curtmantle, was the patron of another eminent troubadour. Bertran de Born, viscount of Hautefort in Perigord, had become a vassal of England by the marriage of Eleanor. He is the member of his class about whom we possess the most exact historical information. Dante saw Bertran de Born in hell, carrying his severed head before him like a lantern, and compared him with Achitophel, who excited the sons of David against their father. This referred to the subtle intrigues by which the troubadour had worked on the jealousy existing between the three sons of the king of England. The death of Prince Henry (1183) produced from Bertran de Born two *planhs*, which are among the most sincere and beautiful works in Provençal literature. The poet was immediately afterwards besieged in his castle of Hautefort by Richard Cœur de Lion, to whom he became reconciled and whom he accompanied to Palestine. He grew devout in his old age, and died about 1205. As a soldier and a condottiere, as the friend and enemy of kings, and as an active factor in the European politics of his time, Bertran de Born occupies an exceptional position among the troubadours.

There were poetesses in the highly refined society of Provençe, and of these by far the most eminent was Beatrix, countess of Die, whose career was inextricably interwoven with that of another eminent and noble troubadour, Rambaut III., count of Orange, who held his court at Courthézon, a few miles south of Orange. Rambaut said that since Adam ate the apple no poet had been born who could compete in skill with himself, but his existing lyrics have neither the tenderness nor the ingenuity of those of his illustrious lady-love. The poems of Beatrix are remarkable for a simplicity of form rare among the poets of her age. One of the earliest troubadours, Cercamon, was at the court of Guilhem IX. of Poitiers, and was the master of perhaps the most original of all the school, namely the illustrious Marcabrun (*c.* 1120–1195), from whose pen some forty poems survive. He was a foundling, left on the door-step of a rich man in Gascony, and no one knew anything about his descent. Marcabrun was an innovator and a reformer; to him the severity of classical Provençal style is mainly due, and he was one of the first to make use of that complexity and obscurity of form which was known as the *trobar clus*. He was also original in his attitude to love; he posed as a violent misogynist—"I never loved and I was never loved"—and he expressed, in the accents of amorous poetry, an aversion to women. "Famine, pestilence and war do less evil upon earth than the love of woman" is one of his aphorisms. He was in the service of Richard Cœur de Lion, and after 1167 in that of Alfonso II. of Aragon. Marcabrun was the object of much dislike and attack, and it is said that he was murdered by Castellane of Guian, whom he had satirized. This, however, is improbable, and it is rather believed that Marcabrun survived to a great age. For one of his contemporaries he mitigated the severities of his satiric pen; he expresses great affection for "that sweet poet," Jaufre Rudel, prince of Blaye, whose heart turned, like the disk of a sunflower, towards the Lady of Tripoli. Little else than that famous adventure is known about the career of this ultra-romantic troubadour, except that he went as a crusader to the Holy Land, and that his surviving poems, which are few in number, have so mystical a tone that Jaufre Rudel has been suspected of being a religious writer who used the amorous language of his age for sanctified purposes, and whose "Princess Far-away" was really the Church of Christ. If so, the statement that he died in the arms of the Lady of Tripoli would merely mean that he passed away, perhaps at Antioch, in the odour of sanctity. Peire d' Alveona (Peter of Auvergne), like Marcabrun, was of mean birth, son of a tradesman in Clermont-Ferrand, but he was handsome and engaging, and being the first troubadour who had appeared in the mountain district, "he was greatly honoured and fêted by the valiant barons and noble ladies of Auvergne." . . . "He was very proud and despised the other troubadours." It is believed that Peire's poems were produced between 1158 and 1180. He flourished at the court of Sancho III., king of Castile, and afterwards at that of Ermengarde, viscountess of Narbonne.

It is doubtless owing to the vehement and repeated praise which was given by Dante, in the *Inferno* and elsewhere, to Arnaut Daniel that this name remains the most famous among those of the troubadours. Yet not very much is known of the personal history of this poet. He was a knight of Riberac, in Perigord, and he attached himself as a troubadour to the court of Richard Cœur de Lion. Dante had been made acquainted with the highly complicated and obscure verse of Arnaut Daniel by Guido Guinicelli, and thus to the historian of literature a most valuable link is provided between medieval and modern poetry. Dante calls Daniel the "smith," the finished craftsman, of language, and it is evident that it was the brilliant art of the Provençal's elaborated verse which delighted the Italian. In the *De vulgari eloquentia* Dante returned to the praise of Arnaut Daniel, as the greatest of all those who have sung of love, and Petrarch was not less enthusiastic. His invention of forms of verse (see SESTINA), in particular, dazzled the great Italians. But the seventeen *sirventês* which have survived scarcely sustain the traditional idea of the supremacy of Arnaut Daniel as a poet, while their lack of historical and personal allusions deprives them of general interest. Dante was curiously anxious to defend Arnaut Daniel as being a better artist than his immediate rival, Giraut de Bornelh, whose "rectitude" Dante admits, in the sense that Giraut was a singer of gnomic verses of a high morality, but prefers the poetry of Daniel; critical posterity, however, has reversed this verdict. Giraut came from the neighbourhood of Limoges, passed over into Spain about 1180, and became famous in the courts of Pedro II. of Aragon and other Spanish monarchs. He disappears about 1230. There is a curious anecdote of his having incurred the hatred or the cupidity of the viscount of Limoges, who robbed him of his library and then burned his house to the ground. Giraut laments, in his poems, the brutality of the age and the lawlessness of princes. A troubadour of the same district of south-western France was Arnaut de Mareuil, to whom is attributed the introduction into Provençal poetry of the amatory epistle. He settled at the courts of Toulouse and Beziers, where he sang, in mystical terms, his passion for the countess Adalasia, in whose affections he had a dangerous rival in the person of Alfonso II., king of Aragon. Arnaut de Mareuil fled for his life to Montpellier, where he found a protector in Count William VIII., but he continued to address his *sirventês* to Adalasia. As that princess died in 1199, and as no *planh* to her memory is found among the works of Arnaut de Mareuil, it is conjectured that by that time he was already dead.

Peire Vidal of Toulouse was the type of the reckless and scatterbrained troubadour. His biographer says that he was "the maddest man in all the world." His early life was a series of bewildering excursions through France and Spain, but he settled down at last at Marseilles, where he made a mortal enemy of Azalaïs, the wife of Viscount Barral de Baux, from whom he stole a kiss (1180). Vidal fled to Genoa, but he continued to address the viscountess in his songs. At the entreaty of her husband, Azalaïs forgave the poet, and Peire Vidal returned to Marseilles. He committed a thousand follies; among others, being in love with a lady called Louve (she-wolf), the poet dressed himself as a wolf, and was hunted by a pack of hounds in front of the lady's castle. Starting on a crusade, he stopped at Cyprus, where a Greek girl was presented to him as being of the imperial family. He married her, assumed the title of emperor, and carried a throne about with him from camp to camp. According to a late poem, his eccentric adventures closed in Hungary about the year 1215. Folquet of Marseilles was a troubadour of Italian race, the son of a merchant of Genoa; Dante met Folquet in paradise, and gives an interesting notice of him. He was a rival with Peire Vidal for the favours of the beautiful Azalaïs; and he was one of the troubadours who gathered around the unfortunate Eudoxia, empress of Montpellier, until the close of her singular and romantic adventure (1187). He wrote a very touching *planh* on the death of the viscount Barral de Baux in 1192. Soon after this, disgusted with love, Folquet took holy orders, became the abbot of the rich Cistercian house of Torronet in Provençe, and in 1205 became bishop of Toulouse. Here he threw in his lot with Simon de Montfort and disgraced himself by his fanatic rage against the Albigenses, of whom a contemporary says that he slew 500,000 persons, acting "more like Antichrist than like an envoy of Rome." Folquet died in 1231 in the abbey of Grandselve, in his diocese. It is in the *sirventês* of Folquet that critics have seen the earliest signs of that decadence which was so rapidly to destroy Provençal poetry.

Gaucelm Faidit came from Uzerche, in the Limousin. He seems to have been a wandering minstrel of gay and reckless habits, and to have been accompanied by a light-o'-love, Guillelma Monja, who was the object of much satire and ridicule. In Gaucelm we probably see, if we can credit his story, the troubadour at his lowest social level. He made, however, Maria of Ventadour, who was probably a scion of the princely and neighbouring house of that name, the object of his songs, and he addresses her in strains of unusual pathos and delicacy. Gaucelm Faidit ultimately proceeded to Italy, to the court of the marquis Boniface of Montferrat, a prince who greatly encouraged the troubadours and who in 1201 undertook the conduct of a crusade. Gaucelm, who was still celebrating the perfections of Maria of Ventadour, accompanied him to the East. He wrote several canzones in the Holy Land and Syria, returned safely to Uzerche, and disappears about 1240. We possess sixty of his poems. Another troubadour, Raimbaut of Vaquières, passed the greater part of his life at the same court of Montferrat; he devoted himself to the Lady Beatrix, sister of the marquis. It is believed that he died in the Holy Land in 1207. The most celebrated of the Italian troubadours was Sordello, born at Mantua, at the beginning of the 13th century, who owes his fame rather to the benevolence of later poets, from Dante to Robert Browning, than to the originality of his adventures or the excellence of his verse.

We have now mentioned the troubadours who were most famous in their own time, and on the whole modern criticism has been in unison with contemporary opinion. There are, however, still one or two names to be recorded. The English historian of the troubadours, Dr Hueffer, gave great prominence to the writings of a poet who had previously been chiefly heard of in connexion with a romantic adventure, Guillem de Cabestanh (or Capestang). This was a knight of Roussillon, who made love to Seremonda, countess of Castel-Roussillon. The lady's husband, meeting the poet out hunting, slew him in a paroxysm of jealousy and, having cut out his heart, had it delicately cooked and served to his wife's dinner. When Seremonda had eaten her lover's heart, her husband told her what she had done, and she fainted away. Coming to her senses she said: "My Lord, you have served to me so excellent a dish that I will never eat of another," and she threw herself out of window and was killed. The importance of this story lies in the fact that the cruelty of the count of Castel-Roussillon was the cause of universal scandal in all good society. Feeling grew so strong that the surrounding nobles rose against the murderer, with Alfonso, king of Spain, at their head, hunted him down and killed him. The bodies of the lady and the troubadour were buried side by side, with great pomp, in the cathedral of Perpignan, and became the objects of pilgrimage. Doubt has, of course, been thrown on the veracity of this romantic story, but at all events it testifies to the fact that the troubadour enjoyed, or was expected to enjoy, all the privileges of toleration and exemption. A burlesque or satiric troubadour, who disregarded the laws of gallantry and wrote satires of great virulence against the ladies and their lovers, remains anonymous, and is spoken of as the monk or prior of Montaudon.

The classic period of the troubadours lasted until about 1210, and was contemporaneous with the magnificence of the nobles of the south of France. The wealth and cultivated tastes of the seigneurs, and the peace which had long surrounded them, led them into voluptuous extravagances and sometimes into a madness of expenditure. From this the troubadours reaped an immediate advantage, but when the inevitable reaction came they were the first to suffer. The great cause, however, of the decadence and ruin of the troubadours was the struggle between Rome and the heretics. This broke out into actual war in June 1209, when the northern barons, called to a crusade by Pope Innocent III., fell upon the Albigenses and pillaged Beziers and Carcassonne. Most of the protectors of the troubadours were, if not heretics, indulgent to the heretical party, and shared in their downfall. The poets, themselves, were not immediately injured, and no doubt their habits and their art kept them immune from the instant religious catastrophe, but the darkness began to gather round them as the ruin of Languedoc became more and more complete, culminating with the siege of Toulouse in 1218. The greatest name of this period, which was the beginning of the end, is that of Peire Cardenal, of Le Puy. He was protected by Jacme I., king of Aragon, having apparently fled from Narbonne and then from Toulouse in order to escape from the armies of Simon de Montfort. He was the inventor and the principal cultivator of the moral or ethical *sirventés*; and he was the author of singularly outspoken satires against the clergy, continuing the tradition of Marcabrun. The biographer of Cardenal certifies that he lived to be nearly one hundred years of age. Another and a still more violent troubadour of this transitional time was Guillem Figueira, the son of a Toulouse tailor, an open heretic who attacked the papacy with extraordinary vigour, supported and protected by Raimon II. Figueira was answered, strophe by strophe, by a female troubadour, Gormonda of Montpellier. The ruin of the southern courts, most of which belonged to the conquered Albigensi party, continued to depress and to exasperate the troubadours, whose system was further disintegrated by the establishment of the Inquisition and by the creation of the religious orders. The genial and cultured society of Provençe and Languedoc sank rapidly into barbarism again, and there was no welcome anywhere for secular poets.

The last of the French troubadours was Guiraut Riquier (*c.* 1230–1294), who was born at Narbonne, and addressed his earliest poems to Phillippa of Anduza, the viscountess of that city. She does not seem to have encouraged poetry, and Guiraut Riquier left Narbonne, first appealing to St Louis, without success. He then turned to Spain, and found protection at the court of Alfonso X. the Learned. This monarch, himself a great poet, welcomed the crowd of troubadours who were now flying from the troubles of southern France. It was the ambition of Alfonso to be himself a troubadour, but the Provençal pieces which bear his name are now attributed to Riquier and to Nat de Mons; the king's genuine poems are those written in Galician. Riquier remained in the court of Castile until about 1279, when he returned to France and settled in Rodez with the count of that town, Henri II. This prince was almost the last seigneur in the south or centre of France who gathered a school of poets around him, and at Rodez the troubadours enjoyed for a few years their latest gleams of success and recognition. Riquier, in a *sirventés* of about 1285, gives pathetic expression to his sense of the gathering darkness, which makes it useless and almost unbecoming for a troubadour to practise his art, while of himself he mournfully confesses: "Song should express joy, but sorrow oppresses me, and I have come into the world too late." Guiraut Riquier passed away about 1294, and left no successor behind him.

Various editions of the life and works of separate troubadours have been published—Guilhem IX. of Poitiers, by A. Jeanroy (Toulouse, 1905); Bertram de Born, by A. Thomas (Toulouse, 1888); Peire Vidal, by K. Bartsch (Berlin, 1857); Cercamon, by Dejeanne (Toulouse, 1905); Giraut de Bornelh, by A. Kolsen (Halle, 1907–1908); Peire of Auvergne, by Zenker (Erlanger, 1900); Sordello, by Cesare de Lollis (Halle, 1896); Guiraut Riquier by Joseph Anglade (Paris, 1905); Arnaut Daniel, by U. A. Canallo (Halle, 1883). Editions of Bernard de Ventadour, by M. C. Appel, and of Marcabrun, by Dr Dejeanne, had been undertaken in 1908. (E. G.)

TROUBRIDGE, SIR THOMAS, BART. (*c.* 1758–1807), English admiral, was educated at St Paul's School, London, and entered the navy in 1773. Having seen some service in the East Indies, he was taken prisoner by the French in 1794, but his captivity was only a short one and in February 1797 he commanded his ship, the "Culloden," at the battle of Cape St Vincent. In the following July he assisted Nelson in the unsuccessful attack on Santa Cruz, and in August 1798, when getting into position for the attack on the French fleet, the "Culloden" ran aground and was consequently unable to take any part in the battle of the Nile. He then served in the Mediterranean and was created a baronet in 1799; from 1801 to 1804 he was a lord of the admiralty, being made a rear-admiral just before his retirement. In 1805 Troubridge was given a command in the East and he went out in the "Blenheim." In January 1807 in this ship, an old and damaged one, he left Madras for the Cape of Good Hope, but off the coast of Madagascar the "Blenheim" foundered in a cyclone and the admiral perished. His only son, Sir Edward Thomas Troubridge, bart. (d. 1852), entered the navy in 1797 and was present at the battle of Copenhagen. From 1831 to 1847 he was member of parliament for Sandwich and from 1835 to 1841 he was a lord of the admiralty. His son, Sir Thomas St Vincent Hope Cochrane Troubridge, bart. (1815–1867), entered the army in 1834, and was severely wounded at the battle of Inkerman.

TROUGHTON, EDWARD (1753–1835), English instrument maker, was born in the parish of Corney in Cumberland in October 1753. He joined his elder brother John in carrying on the business of making mathematical instruments in Fleet Street, London, and continued it alone after his brother's death, until in 1826 he took W. Simms as a partner. He died in London on the 12th of June 1835.

Troughton was very successful in improving the mechanical part of most nautical, geodetic and astronomical instruments, but complete colour-blindness prevented him from attempting experiments in optics. The first modern transit circle was constructed by him in 1806 for Stephen Groombridge; but Troughton was dissatisfied with this form of instrument, which a few years afterwards was brought to great perfection by G. von Reichenbach and J. G. Repsold, and designed the mural circle in its place. The first instrument of this kind erected at Greenwich in 1812, and ten or twelve others were subsequently constructed for other observatories; but they were ultimately superseded by Troughton's earlier design, the transit circle, by which the two co-ordinates of an object can be determined simultaneously. He also made transit instruments, equatorials, &c.; but his failure to construct an equatorial mounting of large dimensions, and the consequent lawsuit with Sir James South, embittered the last years of his life.

TROUSERS, the name given to the article of dress worn by men, covering each leg separately and reaching from the waist to the foot. The word in its earlier forms is always found without the second *r*, *e.g. trouses*, *trouzes*, *trooze*, cf. the Lowland Scots word "trews," and is an adaptation of the French *trousses*, trunk-hose, breeches, the plural of *trousse*, a bundle, pack, truss, from *trousser*, to pack, bundle up, tuck, tie up, girth, of which the origin is doubtful. In English the word "trousers," when it first appears, was used of the leg-garments of the Irish, who wore their breeches or trunk-hose and stockings in one piece, a custom to which there are many allusions in 17th-century literature. Knee-breeches and top-boots for out-of-door wear or stockings for indoor use lasted till the beginning of the 19th century as the regular costume for men. Pantaloons, loose trousers reaching to above the ankle, were worn in Venice by the poorer classes in the 17th century (for the origin of the name see PANTALOON). The characters of the Italian comedy made the style of garment familiar in France, but it was only seen in the fantastic costumes of the ballet. During the reign of Louis XVI. loose pantaloons became fashionable for the morning deshabille of men. Their adoption by the supporters of the Revolution was the origin of the name of *sans-culottes* applied to the revolutionaries. Beau Brummel, in England, was probably the first to make the "pantaloon" popular. A striking feature of his dress were the tight-fitting black trousers reaching to the ankle, where they were buttoned. From this developed the true trousers, cut over the boot at the instep, at first open at the bottom and fastened by loops, later strapped tight under the boot. It is said that the duke of Wellington introduced this latter form after the Peninsular War. They were not recognized as correct for evening wear, and strong opposition was taken against them by the clergy and at the universities (see COSTUME).

TROUT (*Salmo trutta*), a fish closely related to the salmon. Most modern ichthyologists agree in regarding the various North European forms of trout, whether migratory or not, as varieties or races of a highly variable and plastic species, to be distinguished from the salmon by a few more or less constant characters, the most readily ascertainable of which resides in the smaller scales on the back of the caudal region of the body, these being 14 to 16 (rarely 13) in an oblique series between the posterior border of the adipose fin and the lateral line, and in the greater length of the folded anal fin as compared to the depth of the caudal peduncle. The gill-rakers are also usually fewer, 16 to 18 on the anterior branchial arch. The young may be distinguished from salmon-parr by the greater length of the upper jaw, the maxillary bone extending beyond the vertical of the centre of the eye, and in specimens 6 in. long often to below the posterior of the eye. The young are brown or olive above, silvery or golden below, with more or less numerous black and red spots in addition to the parr marks, and, contrary to what is observed in the salmon, black spots are usually present below the lateral line. Except for the gradual disappearance of the parr marks, this coloration is retained in the form known as the brook trout or brown trout (*S. fario*), which is non-migratory, and varies much in size according to the waters it inhabits, in some brooks not growing to more than 8 in., whilst in larger rivers and lakes it may attain a weight of 20 lb or more. The coloration of the young is more strongly departed from in the races known as sea trout (*S. trutta*) and sewin (*S. eriox* or *cambricus*), anadromous forms resembling the salmon in habits, and assuming in the sea a silvery coat, with, however, as a rule, more black spots on the sides below the lateral line.

The principal British races of trout are the following: the northern sea trout (*S. trutta, sensu stricto*), silvery, losing the teeth on the shaft of the vomer in the adult, and migratory like the salmon; the southern sea trout (*S. eriox* or *cambricus*), similar to the preceding, but with the hind margin of the gill-cover more or less produced, the lower bone (suboperculum) projecting beyond the end of the upper (operculum); the brown trout (*S. fario*), non-migratory, usually retaining the teeth on the shaft of the vomer, brown or olive with black and red spots, rarely more silvery, with numerous black spots; the Lochleven trout (*S. levenensis*), distinguished from the preceding by a more silvery coloration, frequent absence of red spots and a pink or red flesh; the estuary trout (*S. gillivensis* and *S. orcadensis*), large brown trout living in salt water without assuming the silvery coloration; the Gillaroo trout (*S. stomachicus*), in which the membranes of the stomach are conspicuously thicker than in the other trout, more so in adult examples than in young ones. But all these forms are ill-defined and subject to such variations when transported from one locality to another as to render their recognition a matter of insuperable difficulty. The instability of the characters on which *S. levenensis* is based has been conclusively shown by the experiments conducted by Sir James Maitland at Howietoun. Large specimens of migratory trout are often designated as bull-trout, but no definition has ever been given by which this form could be established, even as a race.

Other European varieties are the trout of the Lake of Geneva (*S. lemanus*), of the Lake of Garda (*S. carpio*), of Dalmatia (*S. dentex*), of Hungary (*S. microlepis*), of the Caspian Sea (*S. caspius*), &c. The size of trout varies much according to the waters in which they live, the anadromous forms nearly equalling the salmon in this respect, specimens of over 4 ft. and weighing up to 50 lb being on record.

The habitat of *S. trutta* extends over the whole of Europe, the Atlas of Morocco and Algeria, Transcaucasia, Asia Minor and northern Persia. By the agency of man the species has been thoroughly established in Tasmania and New Zealand, where it thrives in an extraordinary manner, and attains a very large size.

Closely allied species are found in North America, west of the Rocky Mountains, the best known being the rainbow trout (*S. irideus* or *shasta*), which has been introduced into many parts of Europe as well as the eastern states of North America, New Zealand and South Africa. It is more hardy than the English trout, and accommodates itself in almost stagnant waters, and has thus proved a success in many ponds which were regarded as fit for coarse fish only; but in many places it has caused disappointment by going down to the sea, whence it is not known ever to return. It is a handsome trout, bluish or purplish above, silvery or golden below, more or less profusely spotted with black on the body and fins, and with an orange or red lateral band. Its range extends from Alaska to North Mexico. The rainbow trout merges into a larger form, *S. gairdneri*, which resembles the British sea trout.

A remarkable European trout is the short-snouted trout, *S. obtusirostris*, a non-migratory species from Dalmatia, Herzegovina, Bosnia and Montenegro. It has a small mouth with a feeble dentition, resembling that of the grayling. A closely allied form, *S. ohridanus*, has recently been discovered in Macedonia. (G. A. B.)

TROUVÈRE, the name given to the medieval poets of northern and central France, who wrote in the *langue d'oïl* or *langue d'oui*. The word is derived from the French verb *trouver*, to find or invent. The trouvères flourished abundantly in the 12th and 13th centuries. They were court-poets who devoted themselves almost exclusively to the composition and recitation of a particular kind of song, for which the highest society of that day in France had an inordinate fondness. This poetry, the usual subject of which was some refinement of the passion of love, was dialectical rather than emotional. As Jeanroy has said, the best trouvères were those who "into the smallest number of lines could put the largest number of ideas, or at least of those commonplaces which envelop thought in its most impersonal and coldest form." The trouvères were not, as used to be supposed, lovers singing to their sweethearts, but they were the pedants and attorneys of a fantastic tribunal of sentiment. This was more monotonous in the hands of the trouvères than it had been in those of the troubadours, for the latter often employed their art for purposes of satire, religion, humour and politics, which were scarcely known to the poets of the northern language.

The established idea that the poetry of the trouvères was entirely founded upon imitation of that of the troubadours, has been ably combated by Paul Meyer, who comes to the conclusion that the poetry of the north of France was essentially no less original than that of the south. The passage of Raoul Glaber, in which he says that about the year 1000 southern men began to appear in France and in Burgundy, "as odd in their ways as in their dress, and having the appearance of jongleurs," is usually quoted, but although this is valuable contemporary evidence, it proves neither what these "jongleurs" brought from the south nor what the poets of the north could borrow from them. The first appearance of trouvères seems to be much later than this, and to date from 1137, when Eléonore of Aquitaine, who was herself the granddaughter of an illustrious troubadour, arrived in the court of France as the queen of Louis VII. It is recorded that she continued to speak her native language, which would be the Poitiers dialect of the *langue d'oc*. She was queen for fifteen years (1137–1152), and this, no doubt, was the period during which the southern influence was strongest in the literature of northern France. There is not any question that the successive crusades tended to produce relations between the two sections of poetical literature. The great mass of the existing writings of the trouvères deals elaborately and artificially with the passion of love, as it had already been analysed in the *langue d'oc*. But those who are most inclined to favour the northern poets are obliged to confess that the latter rarely approach the grace and delicacy of the troubadours, while their verse shows less ingenuity and less variety. The earliest trouvères, like Cuene de Béthune and Huges de Berzé, in writing their amatory lyrics, were certainly influenced by what troubadours had written, especially when, like Bertrand de Born, these troubadours were men who wandered far and wide, under the glory of a great social prestige. We should know more exactly what the nature of the Provençal influence was if the songs of all the trouvères who flourished before the middle of the 12th century had not practically disappeared. When we become conscious of the existence of the trouvères, we find Cuene de Béthune in possession of the field, a poet of too much originality to be swept away as a mere imitator. At the same time, even Paul Meyer, who has been the great asserter of the independence of the poetry of northern France, is obliged to admit that if, at the end of the 12th century and throughout the 13th, several literary centres were formed where an amatory poetry, full of conventional grace, was held in high honour, it was because several princely courts in the south had set the example. In this sense it cannot be denied that the whole art of the trouvères was secondary and subsidiary to the art of the troubadours.

The poetical forms adopted by the trouvères bore curious and obscure names, the signification of which is still in some cases dubious. As a rule each poem belonged to one of three classes, and was either a *rotruenge*, or a *serventois*, or an *estrabot*. The rotruenge was a song with a refrain; the serventois was, in spite of its name, quite unlike the sirventes of the troubadours and had a more ribald character; the estrabot was allied to the *strambotto* of the Italians, and was a strophaic form "composed of a front part which was symmetrical, and of a tail which could be varied at will" (Gaston Paris). But scholars are still uncertain as to the positive meaning of these expressions, and as to the theory of the verse-forms themselves.

The court poetry of the trouvères particularly flourished under the protection of three royal ladies. Marie, the regent of Champagne, was the practical ruler of that country from 1181 to 1197, and she encouraged the minstrels in the highest degree. She invited Ricaut de Barbezieux to her court, rewarded the earliest songs of Gace Brulé, and discussed the art of verse with Chrétien of Troyes. Her sister, Aélis or Alice, welcomed the trouvères to Blois; she was the protector of Gautier d'Arras and of Le Châtelain de Couci. A sister of the husbands of these ladies, another Aélis, who became the second queen of Louis VII. in 1160, received Cuene de Béthune in Paris, and reproved him for the Picard accent with which he recited his poetry. At the end of the 12th century we see that the refinement and elegance of the court-poets was recognized in the north of France by those who were responsible for the education of princes. A trouvère, Gui de Ponthieu, was appointed tutor to William III. of Macon, and another, Philippe of Flanders, to Philippe Auguste. The vogue of the trouvères began during the third crusade; it rose to its greatest height during the fourth crusade and the attack upon the Albigenses. The first forty years of the 13th century was the period during which the courtly lyrical poetry was cultivated with most assiduity. At first it was a purely aristocratic pastime, and among the principal trouvères were princes such as Thibaut IV. of Navarre, Louis of Blois and John, king of Jerusalem. About 1230 the taste for court poetry spread to the wealthy bourgeoisie, especially in Picardy, Artois and Flanders. Before its final decline, and after the courts of Paris and Blois had ceased to be its patrons, the poetry of the trouvères found its centre and enjoyed its latest successes at Arras. It was here that some of the most original and the most skilful of all the trouvères, such as Jacques Bretel and Adam de la Halle, exercised their art. Another and perhaps still later school flourished at Reims.

About 1280, having existed for a century and a half, the poetical system suddenly decayed and disappeared; the very names of the court-poets were forgotten. During this time the song, *chanson*, had been treated as the most dignified and honourable form of literature, as Dante explains in his *De vulgari eloquentia*. But the song, as the trouvères understood it, was not an unstudied or emotional burst of verbal melody; it was, on the contrary, an effort of the intelligence, a piece of wilful and elaborate casuistry. The poet was invariably a lover, devoted to a married lady who was not his wife, and to whose caprices he was bound to submit blindly and patiently, in an endless and resigned humility. The progress of this conventional courtship was laid down according to certain strict rules of ceremonial; love became a science and a religion, and was practised by the laws of precise etiquette.

The curious interest of the trouvères, for us, lies in the fact that during an age when the northern world was ignorant and brutal, sunken in a rude sensuality, the trouvères advanced a theory of morals which had its absurd and immoral side, but which demanded a devotion to refinement and a close attention to what is reserved, delicate and subtle in personal conduct. They were, moreover, when the worst has been admitted about their frigidity and triviality, refiners of the race, and they did much to lay the foundation of French wit and French intelligence. The trouvères have not enjoyed the advantage of the troubadours, whose feats and adventures attracted the notice of contemporary biographers. Little is known about their lives, and they pass across the field of literary history like a troop of phantoms. Close students of this body of somewhat monotonous poetry have fancied that they detected a personal note in some of the leaders of the movement. It is certainly obvious that Cuene (or Conon) de Béthune had a violence of expression which gives life to his chansons. The delicate grace of Thibaut of Champagne, the apparent sincerity of Le Châtelain de Couci, the descriptive charm of Moniot of Arras, the irony of Richard of Fournival, have been celebrated by critics who have perhaps discovered differences where none exist. It is more certain that Adam de la Halle, the hunchback of Arras, had a superb gift of versification. The *rondel* (published in E. de Coussemaker's edition, 1872) beginning

"A Dieu courant amourctes,
Car je m'en vois
Souspirant en terre estrange!"

marks perhaps the highest point to which the delicate, frosty art of the trouvères attained. Music took a prominent place in all the performances of the trouvères, but in spite of the erudition of de Coussemaker, who devoted himself to the subject, comparatively little is known of the melodies which they used. But enough has been discovered to justify the general statement of Tiersot that "we may conclude that the musical movement of the age of the trouvères was derived directly from the most ancient form of popular French melody." A precious MS. in the Faculty of Medicine of Montpellier contains the music of no fewer than 345 part-songs attributed to trouvères, and an examination of these enables a "pitiless arranger" to divine the air, the primitive, simple and popular melody.

The principal authorities on the poetry and music of the trouvères are: H. Binet, *Le Style de la lyrique courtoise en France aux xii^{me} et xiii^{me} siècles* (Paris, 1891); Gaston Paris, *Les Origines de la poésie lyrique en France au moyen âge* (Paris, 1892); A. Jeanroy, *Les Origines de la poésie lyrique en France au moyen âge* (Paris, 1889); Julian Tiersot, *Histoire de la chanson populaire en France*; E. de Coussemaker, *Art harmonique aux xii^{me} et xiii^{me} siècles* (Paris, 1865). The works of the principal trouvères have been edited: those of Le Châtelain de Coucy by F. Michel (1830); of Adam de la Halle by E. de Coussemaker (1872); of Conon de Béthune by Wallensköld (Helsingfors, 1891); of Thibaut IV., king of Navarre, by P. Tarbé (1851). (E. G.)

TROUVILLE, a seaside town of north-western France, in the department of Calvados, on the English Channel, 34 m. N.E. of Caen by rail. Pop. (1906), 5684. Trouville is situated on the slopes of well-wooded hills at the mouth of the Touques on its right bank opposite Deauville. Its fine stretches of sand and excellent bathing, a spacious casino and beautiful villas, are among the attractions which make it the most frequented French resort on the channel. Deauville is well known for its racecourse and villas, exceeding those of Trouville in luxury, but except during the race fortnight in August (*la grande quinzaine*) it is quiet and comparatively deserted. The port shared with Deauville and formed by the Touques is entered by a channel between jetties with a depth at high tide of 18½ ft. This leads on the one side to a tidal harbour, on the other to an outer and an inner basin. Timber, coals and cement are imported. The

London & South Western Railway Company have a daily steamboat service from Havre to Trouville in connexion with their Southampton and Havre boats. Besides trawling and the provisioning of ships, in which Deauville is also engaged, Trouville carries on boat-building and has rope and briquette works.

TROVER (O. Fr. *trover*, to find, mod. *trouver*), or "trover and conversion," the name of a form of action in English law no longer in use, corresponding to the modern action of conversion. It was brought for damages for the detention of a chattel, and differed from detinue in that the latter was brought for the return of the chattel itself. The name trover is due to the action having been based on the fictitious averment in the plaintiff's declaration that he had lost the goods and that the defendant had found them. The necessity for this fictitious averment was taken away by the Common Law Procedure Act 1852. An action of trover lay (as an action of conversion still lies) in every case where the defendant was in possession of a chattel of the plaintiff and refused to deliver it up on request, such refusal being prima facie evidence of conversion. The damages recoverable are usually the value of the chattel converted. In an action for detention of a chattel (the representative of the old action of detinue), the plaintiff may have judgment and execution by writ of delivery for the chattel itself or for its value at his option. An action for conversion or detention must be brought within six years. The corresponding action in Scots law is the action of spuilzie. It must be brought within three years in order to entitle the pursuer to violent profits, otherwise it prescribes in forty years.

TROWBRIDGE, a market town in the Westbury parliamentary division of Wiltshire, England, 97½ m. W. by S. of London by the Great Western railway. Pop. of urban district (1901), 11,526. It is unevenly built on a slope at the foot of which flows the Biss or Mere, a tributary of the Avon. The parish church of St James is a fine Perpendicular building, with a lofty spire, and a beautiful open-work roof over the nave. It was rebuilt on the original plan in 1848. George Crabbe, the poet, was rector from 1813 to 1831.

Trowbridge (*Trubrig, Trobrigg, Trowbrigge*) was probably mentioned in Domesday under the name of Straburg, a manor held by one Brictric together with Staverton and Trowle, now both included within its limits. The first reference to the "town" of Trowbridge occurs early in the 16th century; previous to that date mention is made of the manor and castle only. The latter, round which the town probably grew up, is said to have been built by the de Bohuns, who obtained possession of the manor by marriage with the daughter of Edward de Sarisbury. Later it passed to William de Longespée, son of Henry II., to the Lancasters, to the protector Somerset (by grant of Henry VIII.) and then to the Rutlands, and Trowbridge is now a non-corporate town. In 1200 John granted a weekly market on Tuesday, Thursday and Saturday; also a yearly fair on the 24th, 25th and 26th of July, on which days it continued to be held until at the end of the 18th century it was changed to the 5th, 6th and 7th of August. The manufacture of woollen cloths has long been the staple trade of Trowbridge. It was introduced before the 16th century, for Leland, writing in the reign of Henry VIII., says: "The town flourisheth by drapery." In 1731 the trade was of some note, and by 1813 had attained such proportions that the whole area of the castle site was sold for the erection of dyeworks, cloth manufactories and other industrial buildings.

TROWEL (Med. Eng. *truel*, O. Fr. *truelle*, Low Lat. *truella*, a variant of *trulla*, diminutive of *trua*, stirring spoon, ladle, Gr. τορύνη, from the root *tar*, to turn round and round; cf. τορεύς, borer), a tool or implement, varying in shape according to the use to which it is put, but consisting of a blade of iron or steel fitted with a handle. The bricklayers' or plasterers' trowel, used for mixing, spreading and smoothing the mortar or plaster, has a flat, triangular, oval or rectangular blade; the gardeners' trowel, for digging plants, laying or mixing mould, &c., has a semi-cylindrical blade. Highly ornamental trowels made of, or decorated with, the precious metals are presented to royal, official or other personages who formally lay the foundation stones of buildings.

TROY, JEAN FRANÇOIS DE (1679–1752), French painter, was born at Paris in 1679. He received his first lessons from his father, himself a skilful portrait painter, who afterwards sent his son to Italy. There his amusements occupied him fully as much as his studies; but his ability was such that on his return he was at once made an official of the Academy, and obtained a large number of orders for the decoration of public and private buildings, executing at the same time a quantity of easel pictures of very unequal merit. Amongst the most considerable of his works are thirty-six compositions painted for the hotel of De Live (1729), and a series of the story of Esther, designed for the Gobelins whilst De Troy was director of the school of France at Rome (1738–1751)—a post which he resigned in a fit of irritation at court neglect. He did not expect to be taken at his word, and was about to return to France when he died on the 24th of January 1752. The life-size painting (Louvre) of the "First Chapter of the Order of the Holy Ghost held by Henry IV.," in the church of the Grands Augustins, is one of his most complete performances, and his dramatic composition, the "Plague at Marseilles," is widely known through the excellent engraving of Thomassin. The Cochins, father and son, Fessard, Galimard, Bauvarlet, Herisset, and the painters Boucher and Parrocel, have engraved and etched the works of De Troy.

TROY and **TROAD.** I. *The Troad.*—The Troad (ἡ Τρῳάς), or the land of Troy, the north-western promontory of Asia Minor. The name "Troad" is never used by Homer—who calls the land, like the city, Τροίη—but is already known to Herodotus. The Troad is bounded on the N. by the Hellespont and the westernmost part of the Propontis, on the W. by the Aegean Sea and on the S. by the Gulf of Adramyttium. The eastern limit was variously defined by ancient writers. In the widest acceptation, the Troad was identified with the whole of western and south-western Mysia, from the Aesepus, which flows into the Propontis, a little west of Cyzicus, to the Caicus, which flows into the Aegean south of Atarneus. But the true eastern boundary is undoubtedly the range of Ida, which, starting from near the south-east angle of the Adramyttian Gulf, sends its north-western spurs nearly to the coast of the Propontis, in the region west of the Aesepus and east of the Granicus. Taking Ida for the eastern limit, we have the definition which, as Strabo says, best corresponds with the actual usage of the name Troad. Ida is the key to the physical geography of the whole region; and it is the peculiar character which this mountain-system imparts to the land west of it that constitutes the real distinctness of the Troad from the rest of Mysia. Nature has here provided Asia Minor with an outwork against invaders from the north-west; and as the Troad was the scene of the struggle between Agamemnon and Priam, so it was in the Troad that Alexander won the battle which opened a path for his further advance.

Natural Divisions.—The length of the Troad from north to south—taking a straight line from the north-west point, Cape Sigeum (Yeni Shehr), to the south-west point, Cape Lectum (Babā Kale)—is roughly 40 m. The breadth, from the middle point of the west coast to the main range of Ida, is not much greater. The whole central portion of this area is drained by the Menderes (anc. *Scamander*), which rises in Ida and is by far the most important river of the Troad. The basin of the Menderes is divided by hills into two distinct parts, a southern and a northern plain. The southern—anciently called the Samonian plain—is the great central plain of the Troad, and takes its modern name from Bairamich, the chief Turkish town, which is situated in the eastern part of it near Ida. From the north end of the plain the Menderes winds in large curves through deep gorges in metamorphic rocks, and issues into the northern plain, stretching to the Hellespont. This is the plain of Troy, which is 7 or 8 m. long, and 2 or 3 m. broad on the average. The hills on the south are quite low, and towards the east the acclivities are in places so gentle as to leave the limits of the plain indefinite. Next to the basin of the Menderes, with its two plains, the best marked feature in the river-system of the Troad is the valley of the Tuzla (anc. *Satniois*). The Tuzla rises in the western part of Mt Ida, south of the plain of Bairamich, from which its valley is divided by hills; and, after flowing for many miles almost parallel with the south coast of the Troad, from which, at

Assus, it is less than a mile distant, it enters the Aegean about 10 m. north of Cape Lectum. Three alluvial plains are comprised in its course. The easternmost of these, into which the river issues from rugged mountains of considerable height, is long and narrow. The next is the broad plain round Assus, which was a fertile source of supply to that city. The third is the plain at the embouchure of the river on the west coast. This was anciently called the Halesian (Ἀλήσιον) plain, partly from the maritime salt-works at Tragasae, near the town of Hamaxitus, partly also from the hot salt-springs which exist at some distance from the sea, on the north side of the river, where large formations of rock-salt are also found. Maritime salt-works are still in operation at the mouth of the river, and its modern name (Tuzla = salt) preserves the ancient association. A striking feature of the southern Troad is the high and narrow plateau which runs parallel with the Adramyttian Gulf from east to west, forming a southern barrier to the valley of the Tuzla. This plateau seems to have been formed by a volcanic upheaval which came late in the Tertiary period, and covered the limestone of the south coast with two successive flows of trachyte. The lofty crag of Assus is like a tower standing detached from this line of mountain-wall. The western coast is of a different character. North of the Tuzla extends an undulating plain, narrow at first, but gradually widening. Much of it is covered with the valonia oak (*Quercus aegilops*), one of the most valuable products of the Troad. Towards the middle of the west coast the adjacent ground becomes higher, with steep acclivities, which sometimes rise into peaks; and north of these, again, the seaboard subsides towards Cape Sigeum into rounded hills, mostly low.

Natural Products.—The timber of the Troad is supplied chiefly by the pine forests on Mt Ida. But nearly all the plains and hills are more or less well wooded. Besides the valonia oak, the elm, willow, cypress and tamarisk shrub abound. Lotus, galingale and reeds are still plentiful, as in Homeric days, about the streams in the Trojan plain. The vine, too, is cultivated, the Turks making from it a kind of syrup and a preserve. In summer and autumn water-melons are among the abundant fruits. Cotton, wheat and Indian corn are also grown. The Troad is, indeed, a country highly favoured by nature—with its fertile plains and valleys, abundantly and continually irrigated from Ida, its numerous streams, its fine west seaboard, and the beauty of its scenery. Under Turkish rule, the natural advantages of the land suffice to mitigate the poverty of the sparse population, but have scarcely any positive result.

Early History.—In the Homeric legend, with which the story of the Troad begins, the people called Troes are ruled by a king Priam, whose realm includes all that is bounded by "Lesbos, Phrygia, and the Hellespont" (*Il.* xxiv. 544), *i.e.* the whole "Troad," with some extension of it, beyond Ida, on the north-west. According to Homer, the Achaeans under Agamemnon utterly and finally destroyed Troy, the capital of Priam, and overthrew his dynasty. But there is an Homeric prophecy that the rule over the Troes shall be continued by Aeneas and his descendants. From the "Homeric" hymn to Aphrodite, as well as from a passage in the 20th book of the *Iliad* (75–353)—a passage probably later than the bulk of the book—it is certain that in the 7th or 6th century B.C. a dynasty claiming descent from Aeneas reigned in the Troad, though the extent of their sway is unknown. The Homeric tale of Troy is a poetic creation, for which the poet is the sole witness. The geographical compactness of the Troad is itself an argument for the truth of the Homeric statement that it was once united under a strong king. How that kingdom was finally broken up is unknown. Thracian hordes, including the Treres, swept into Asia Minor from the north-west about the beginning of the 7th century B.C., and it is probable that, like the Gauls and Goths of later days, these fierce invaders made havoc in the Troad. The Ionian poet Callinus has recorded the terror which they caused farther south.

Greek Settlements.—A new period in the history of the Troad begins with the foundation of the Greek settlements. The earliest and most important of these were Aeolic. Lesbos and Cyme in Aeolis seem to have been the chief points from which the Aeolic colonists worked their way into the Troad. Commanding positions on the coast, such as Assus and Sigeum, would naturally be those first occupied; and some of them have been in the hands of Aeolians as early as the 10th century B.C. It appears from Herodotus (v. 95) that about 620 B.C. Athenians occupied Sigeum, and were resisted by the Aeolic colonists from Mytilene in Lesbos, who had already established themselves in that neighbourhood. Struggles of this kind may help to account for the fact noticed by Strabo, that the earlier colonies had often migrated from one site in the Troad to another. Such changes of seat have been, he observes, frequent causes of confusion in the topography.

The chief Greek towns in the Troad were Ilium in the north, Assus in the south and Alexandria Troas in the west. The site of the Greek Ilium is marked by the low mound of Hissarlik ("place of fortresses") in the Trojan plain, about 3 m. from the Hellespont. Exactly at what date it was founded on the top of earlier remains is uncertain (perhaps the 7th century); but it was not a place of any importance till the Hellenistic age. When Xerxes visited the Trojan plain, he "went up to the Pergamon of Priam," and afterwards sacrificed to the Ilian Athena (Herod. vii. 42). Ilion is mentioned among the towns of the Troad which yielded to Dercyllidas (399 B.C.), and as captured by Charidemus (359 B.C.). It possessed walls, but was a petty place, of little strength. In 334 B.C. Alexander, on landing in the Troad, visited Ilium. In their temple of Athena the Ilians showed him arms which had served in the Trojan War, including the shield of Achilles. Either then, or after the battle of Granicus, Alexander directed that the town should be enlarged, and should have the rank of "city," with political independence, and exemption from tribute. The battle of Ipsus (301 B.C.) added north-western Asia Minor to the dominions of Lysimachus, who executed the intentions of Alexander. He gave Ilium a wall 5 m. in circumference, incorporating with it some decayed towns of the neighbourhood, and built a handsome temple of Athena. In the 3rd century B.C. Ilium was the head of a federal league (κοινόν) of free Greek towns, which probably included the district from Lampsacus on the Hellespont to Gargara on the Adramyttian Gulf. Twice in that century Ilium was visited by Gauls. On the first occasion (278 B.C.) the Gauls, under Lutarius, sought to establish a stronghold at Ilium, but speedily abandoned it as being too weak. Forty years later (218 B.C.) Gauls were brought over by Attalus I. to help him in his war against Achaeus. After deserting his standard they proceeded to pillage the towns on the Hellespont, and finally besieged Ilium, from which, however, they were driven off by the troops of Alexandria Troas. At the beginning of the 2nd century B.C. Ilium was in a state of decay. As Demetrius of Scepsis tells us, the houses "had not even roofs of tiles," but merely of thatch. Such a loss of prosperity is sufficiently explained by the incursions of the Gauls and the insecure state of the Troad during the latter part of the 3rd century. The temple of the Ilian Athena, however, retained its prestige. In 192 B.C. Antiochus the Great visited it before sailing to the aid of the Aetolians. In 190 B.C., shortly before the battle of Magnesia, the Romans came into the Troad. At the moment when a Roman army was entering Asia, it was politic to recall the legend of Roman descent from Aeneas. Lucius Scipio and the Ilians were alike eager to do so. He offered sacrifice to the Ilian Athena; and after the peace with Antiochus (189 B.C.) the Romans annexed Rhoeteum and Gergis to Ilium, "not so much in reward of recent services, as in memory of the source from which their nation sprang." The later history of Ilium is little more than that of Roman benefits. A disaster befell the place in 85 B.C., when Fimbria took it, and left it in ruins; but Sulla presently caused it to be rebuilt. Augustus, while confirming its ancient privileges, gave it new territory. Caracalla (A.D. 211–217) visited Ilium, and, like Alexander, paid honours to the tomb of Achilles. In the 4th century, as some rhetorical "Letters" of that age show, the Ilians did a profitable trade in attracting tourists by their pseudo-Trojan memorials. After the 4th century the place is lost to view. But we find from Constantine Porphyrogenitus (911–959) that in his day it was one of the places in the Troad which gave names to bishoprics.

Other Ancient Sites.—Many classical sites in the Troad have been identified with more or less certainty. (For ALEXANDRIA TROAS and ASSUS, see separate articles. *Neandria* seems to be rightly fixed by F. Calvert at Mount Chigri, a hill not far from Alexandria Troas, remarkable for the fine view of the whole Troad which it commands. *Cebrene* has been conjecturally placed in the eastern part of the plain of Bairamich. *Palaeoscepsis* was farther east on the slopes of Ida, while the new *Scepsis* was near the site of Bairamich itself. At the village of Kulakli, a little south of the mouth of the Tuzla, some Corinthian columns and other fragments mark the temple of Apollo Smintheus (excavated in 1866 by Pullan) and (approximately) the site of the Homeric *Chryse*. *Colonae* was also on the west coast, opposite Tenedos. *Scamandria* occupied the site of Eneh, in the middle of the plain of Bairamich, and *Cenchreae* was probably some distance north of it. The shrine of Palamedes, mentioned by ancient writers as existing at a town called *Polymedium*, has been discovered by J. T. Clarke on a site hitherto unvisited by any modern traveller, between Assus and Cape Lectum. It proves to have been a sacred enclosure (*temenos*) on the acropolis of the town; the statue of Palamedes stood on a rock at the middle of its southern edge. Another interesting discovery has been made by Clarke, viz. the existence of very ancient town walls on Gargarus, the highest peak of Ida.

(R. C. J.; D. G. H.)

II. *The Site of Troy.*—Troy is represented now by the important ruins on and about the mound of Hissarlik which underlie those already referred to as surviving from the Hellenistic Ilion. Hissarlik is situated about 3½ m. both from the Dardanelles and from Yeni Keui, which lies on the Aegean coast north of Besika Bay. The famous academic dispute concerning the precise site, which began about A.D. 160 with Demetrius of Scepsis, may now be regarded as settled. After the full demonstration, made in 1893, that remains of a fortress exist on the mound of Hissarlik, contemporary with the great period of Mycenae, and larger than the earlier acropolis town first identified by Schliemann with Ilion, no reasonable person has continued to doubt that this last site is the local habitation of the Homeric story. The rival ruins on the Bali Dagh have been shown to be those of a small hill fort which, with another on an opposite crag, commanded the upper Menderes gorge. It is inconceivable that this fort should have been chosen by poets, generally familiar with the locality, as the scene of the great siege, while in the plain between it and the sea there had lain from time immemorial, and lay still in the Mycenaean age, a much more important settlement with massive fortified citadel.

No site in the Troad can be brought into complete accordance with all the topographical data to be ingeniously derived from the text of Homer. The hot and cold springs that lay just without the gate of "Troy" (*Il.* xxii. 147) are no more to be identified with Bunarbashi, which wells out more than a mile from the Bali Dagh ruins, than with the choked conduits, opened by Schliemann in 1882, to the south of Hissarlik. But the broader facts of geography are recognizable in the modern plain of the Menderes. The old bed of that river is the Scamander, and its little tributary, the Dumbrek Su, is the Simois. In their fork lies Hissarlik or Troy. In sight of it are, on the one side, the peak of Samothrace (xiii. 11–14); on the other, the mass of the Kaz Dagh *Ida* (viii. 52). Hissarlik lies in the plain (xx. 216) less than 4 m. both from the Hellespontine and the Aegean coasts, easily reached day by day by foes from the shore, and possible to be left and regained in a single night by a Trojan visiting the camp of the Greeks (vii. 381–421).

In summarizing what has been found to exist on the mound of Hissarlik in the excavations undertaken there since 1870, it is not advisable to observe the order of the finding, since Schliemann's want of experience and method caused much confusion and error in the earlier revelations. No certainty as to the distinction of strata or their relative ages was possible till Wilhelm Dörpfeld obtained entire control in 1891, after the original explorer's death. There are in all nine strata of ancient settlement.

1. On the virgin soil of the hillock, forming the core of the mound, scanty remains appear of a small village of the late Aegean neolithic period, at the dawn of the Bronze Age, contemporary with the upper part of the Cnossian neolithic bed. This includes what were originally supposed by Schliemann to be two successive primitive settlements. Thin walls of rough stones, bonded with mud, are preserved mainly in the west centre of the mound. No ground plan of a house is recoverable, and there is no sign of an outer fortress wall. In this stratum were found implements in obsidian and other stones, clay whorls, a little worked ivory, and much dark monochrome pottery, either of a rough grey surface or (in the finer examples) treated with resin, highly hand-polished, and showing simple geometric decoration, which was incised and often filled in with a white substance.

2. Superposed on these remains, where they still exist, but comprehending a much larger area, lies a better constructed and preserved settlement. This has been twice rebuilt. It was enclosed by a massive fortress wall of rudely squared Cyclopean character, showing different restorations, and now destroyed, except on the south side of the mound. Double gates at the south-east and south-west are well-preserved. The most complete and most important structures within the citadel lie towards the north. These are two rectangular blocks lying north-west to south-east, side by side, of which the southern and larger shows a *megaron* and vestibule of the type familiar in "Mycenaean" palaces, while the smaller seems a pendant to the larger, like the "women's quarters" at Tiryns and Phylakopi (see AEGEAN CIVILIZATION). Other blocks, whose plans are difficult to bring into inter-relation in their present state of ruin, are scattered over the area, but mainly in the south-west. This is the fortress proclaimed by Schliemann in 1873 to be the Pergamos of Troy. But we know that, while his identifications of Homeric topographical details in these ruins were fanciful, a much larger fortress succeeded to this long before the period treated of in the *Iliad*. The settlement in the second stratum belongs, in fact, to a primitive stage of that local civilization which preceded the Mycenaean; and it is this latter which is recalled by the Homeric poems. The pottery of the second stratum at Hissarlik shows the first introduction of paint, and of the slip and somewhat fantastic forms parallel to those of the pre-Mycenaean style in the Cyclades. The beaked vases, known as *schnabelkannen*, are characteristic, and rude reproductions of human features are common in this ware, which seems all to be of native fabrication. Bronze had come into use for implements, weapons and utensils; and gold and silver make up a hoarded treasure found in the calcined ruins of the fortification wall near one of the gates. But the forms are primitive and singular, and the workmanship is very rude, the pendants of the great diadems being cut out of very thin plate gold. Disks, bracelets and pendants, showing advanced spiraliform ornament, found mainly in 1878, and then ascribed to this same stratum, belong undoubtedly to a higher one, the sixth or "Mycenaean." Rough fiddle-shaped idols, whorls, a little worked ivory and some lead make up a find, of whose early period comparison of objects found elsewhere leaves no sort of doubt. This treasure is now deposited in Berlin.

3, 4, 5. This primitive "Troy" suffered cataclysmal ruin (traces of conflagration are everywhere present), and Hissarlik ceased for a time to have any considerable population. Three small village settlements, not much more than farms, were successively erected on the site, and have left their traces superposed one on another, but they yielded no finds of importance.

6. The mound, however, stood in too important a relation to the plain and the sea to remain desolate, and in due time it was covered again by a great fortress, while a city spread out below. The latter has not yet been explored. The remains of this period on the acropolis, however, have now been examined. A portion of them was first distinguished clearly by Dörpfeld in 1882, but owing to the confusion caused by Schliemann's drastic methods of trenching, the pottery and metal objects, really belonging to this stratum, had come to be confused with those of lower strata; and some grey monochrome ware, obviously of Anatolian make, was alone referred to the higher stratum. To this ware Schliemann gave the name "Lydian," and the stratum was spoken of in his *Troja* (1884) as the "Lydian city."

In 1893, however, excavations were carried out on the south of the mound in the hitherto undisturbed ground outside the limits of the earlier fortress; and here appeared a second curtain wall of massive ashlar masonry showing architectural features which characterize the "Mycenaean" fortification walls at Mycenae itself, and at Phylakopi in Melos. With this wall was associated not only the grey ware, but a mass of painted potsherds of unmistakably "Mycenaean" character; and further search in the same stratum to west and east showed that such sherds always lay on its floor level. The inevitable inference is that here we have a city, contemporary with the mass of the remains at Mycenae, which imported "Mycenaean" ware to supplement its own ruder products. The area of its citadel is larger than the citadel of the second stratum; its buildings, of which a large *megaron* on the south-west and several houses on the east remain, are of much finer construction than those which lie lower. This was the most important city yet built on the mound of Hissarlik. It belonged to the "Mycenaean" age, which precedes the composition of the Homeric poems, and is reflected by them. Therefore this is Homer's Troy.

Its remains, however, having been obliterated on the crown of Hissarlik, almost escaped recognition. When some centuries later a third important city, the Hellenistic Ilion, was built, all the accumulation on the top of the mound was cut away and a terrace made. In this process the then uppermost strata of ruins wholly vanished, their stones being taken to build the new city. The Mycenaean town, however, which had been piled stage upon stage to the summit, descended on the south side a little down the face of the mound; and the remains of its fortifications and houses at that point, lying below the level cut down to by the Hellenistic terrace-makers, were covered by the depositing of rubbish from the crown and again built over. Thus we find them now on the southern slope of the mound only, but have no difficulty in estimating their original extent. Many tombs and a large lower city of this era will doubtless be explored ere long.

7. To "Mycenaean" Troy succeeded a small unfortified settlement, which maintained itself all through the Hellenic age till the Homeric enthusiasm of Alexander the Great called a city again into being on Hissarlik.

8. The Hellenistic Ilion, however, has left comparatively little trace, having been almost completely destroyed in 85 B.C. by Fimbria. Portions of fortifications erected by Lysimachus are visible both on the acropolis (west face chiefly) and round the lower city in the plain. A small Doric temple belongs to the foundation of this city, and a larger one, probably dedicated to Athena, seems to be of the Pergamene age. Of its metopes, representing Helios and a gigantomachia, important fragments have been recovered. Coins of this city are not rare, showing Athena on both faces, and some inscriptions have been recovered proving that Hellenistic Ilion was an important municipality.

9. Lastly about the Christian era, arose a Graeco-Roman city, to which belong the theatre on the south-east slope of the hill and the ornate gateway in the same quarter, as well as a large building on the south-west and extensive remains to north-east. This seems to have sunk into decay about the 5th century A.D.

III. *The Legend of Troy.*—According to Greek legend, the oldest town in the Troad was that founded by Teucer, who was a son of the river Scamander and the nymph Idaea. Tzetzes says that the Scamander in question was the Scamander in Crete, and that Teucer was told by an oracle to settle wherever the "earth-born ones" attacked him. So when he and his company were attacked in the Troad by mice, which gnawed their bow-strings and the handles of their shields, he settled on the spot, thinking that the oracle was fulfilled. He called the town Sminthium and built a temple to Apollo Smintheus, the Cretan word for a mouse being *sminthius*. In his reign Dardanus, son of Zeus and the nymph Electra, daughter of Atlas, in consequence of a deluge, drifted from the island of Samothrace on a raft or a skin bag to the coast of the Troad, where, having received a portion of land from Teucer and married his daughter Batea, he founded the city of Dardania or Dardanus on high ground at the foot of Mt Ida. On the death of Teucer, Dardanus succeeded to the kingdom and called the whole land Dardania after himself. He begat Erichthonius, who begat a son Tros by Astyoche, daughter of Simois. On succeeding to the throne, Tros called the country Troy and the people Trojans. By Callirrhoe, daughter of Scamander, he had three sons—Ilus, Assaracus and Ganymede. From Ilus and Assaracus sprang two separate lines of the royal house—the one being Ilus, Laomedon, Priam, Hector; the other Assaracus, Capys, Anchises, Aeneas. Ilus went to Phrygia, where, being victorious in wrestling, he received as a prize from the king of Phrygia a spotted cow, with an injunction to follow her and found a city wherever she lay down. The cow lay down on the hill of the Phrygian Atē; and here accordingly Ilus founded the city of Ilion. It is stated that Dardania, Troy and Ilion became one city. Desiring a sign at the foundation of Ilion, Ilus prayed to Zeus and as an answer he found lying before his tent the Palladium, a wooden statue of Pallas, three cubits high, with her feet joined, a spear in her right hand, and a distaff and spindle in her left. Ilus built a temple for the image and worshipped it. By Eurydice, daughter of Adrastus, he had a son Laomedon. Laomedon married Strymo, daughter of Scamander, or Placia, daughter of Atreus or of Leucippus. It was in his reign that Poseidon and Apollo, or Poseidon alone, built the walls of Troy. In his reign also Heracles besieged and took the city, slaying Laomedon and his children, except one daughter Hesione and one son Podarces. The life of Podarces was granted at the request of Hesione; but Heracles stipulated that Podarces must first be a slave and then be redeemed by Hesione; she gave her veil for him; hence his name of Priam (Gr. πρίασθαι, to buy). Priam married first Arisbe and afterwards Hecuba, and had fifty sons and twelve daughters. Among the sons were Hector and Paris, and among the daughters Polyxena and Cassandra. To recover Helen, whom Paris carried off from Sparta, the Greeks under Agamemnon besieged Troy for ten years. At last they contrived a wooden horse, in whose hollow belly many of the Greek heroes hid themselves. Their army and fleet then withdrew to Tenedos, feigning to have raised the siege. The Trojans conveyed the wooden horse into Troy; in the night the Greeks stole out, opened the gates to their friends, and Troy was taken.

See Homer, *Il.* vii. 452 seq., xx. 215 seq., xxi. 446 seq.; Apollodorus ii. 6, 4, iii. 12; Diodorus iv. 75, v. 48; Tzetzes, *Schol. on Lycophron*, 29, 72, 1302; Conon, *Narrat.* 21; Dionysius Halicarn. *Antiq. Rom.* i. 68 seq. The *Iliad* deals with a period of fifty-one days in the tenth year of the war. For the wooden horse, see Homer, *Od.* iv. 271 seq.; Virgil, *Aen.* ii. 13 seq.

The Medieval Legend.—The medieval romance of Troy, the *Roman de Troie*, exercised greater influence in its day and for centuries after its appearance than any other work of the same class. Just as the *chansons de geste* of the 10th century were the direct ancestors of the prose romances which afterwards spread throughout Europe, so, even before Heliodorus and Achilles Tatius, there were quasi-histories, which reproduced in prose, with more or less exactness, the narratives of epic poetry. Long previous to the Ἡρωϊκός of Flavius Philostratus (*fl.* 3rd century A.D.) the Trojan War had been the subject of many a prose fiction, dignified with the title of history; but to remodel the whole story almost in the shape of annals, and to give a minute personal description of the persons and characters of the principal actors, were ideas which belonged to an artificial stage of literature. The work of Philostratus is cast in the form of a dialogue between a Phoenician traveller and a vine-grower at Eleus, and is a discourse on twenty-six heroes of the war. A fictitious journal (*Ephemeris*), professing to give the chief incidents of the siege, and said to have been written by Dictys of Crete, a follower of Idomeneus, is mentioned by Suïdas, and was largely used by John Malalas and other Byzantine chroniclers. This was abridged in Latin prose, probably in the 4th century, under the title of *Dictys Cretensis de bello Trojano libri VI.* It is prefaced by an introductory letter from a certain L. Septimius to Q. Aradius Rufinus, in which it is stated that the diary of Dictys had been found in his tomb at Cnossus in Crete, written in the Greek language, but in Phoenician characters. The narrative begins with the rape of Helen, and includes the adventures of the Greek princes on the return voyage. With Dictys is always associated Dares, a pseudo-historian of more recent date. Old Greek writers mention an account of the destruction of the city earlier than the Homeric poems, and in the time of Aelian (2nd century A.D.) this *Iliad* of Dares, priest of Hephaestus at Troy, was believed to be still in existence. Nothing has since been heard of it; but an unknown Latin writer, living between 400 and 600, took advantage of the tradition to compile *Daretis Phrygii de excidio Trojae historia*, which begins with the voyage of the Argo. It is in prose and professes to be translated from an old Greek manuscript. Of the two works that of Dares is the later, and is inferior to Dictys. The matter-of-fact form of narration recalls the poem of Quintus Smyrnaeus. In both compilations the gods and everything supernatural are suppressed; even the heroes are degraded. The permanent success, however, of the two works distinguishes them among apocryphal writings, and through them the Troy legend was diffused throughout western Europe. The Byzantine writers from the 7th to the 12th century exalted Dictys as a first-class authority, with whom Homer was only to be contrasted as an inventor of fables. Western people preferred Dares, because his history was shorter, and because, favouring the Trojans, he flattered the vanity of those who believed that people to have been their ancestors. Many MSS. of both writers were contained in old libraries; and they were translated into nearly every language and turned into verse. In the case of both works, scholars are undecided whether a Greek original ever existed (but see DICTYS CRETENSIS). The Byzantine grammarian, Joannes Tzetzes (*fl.* 12th century), wrote a Greek hexameter poem on the subject (*Iliaca*). In 1272, a monk of Corbie translated "sans rime *L'Estoire de Troiens et de Troie* (de Dares) du Latin en Roumans mot à mot" because the *Roman de Troie* was too long. Geoffrey of Waterford put Dares into French prose; and the British Museum has three Welsh MS. translations of the same author—works, however, of a much later period.

The name of Homer never ceased to be held in honour; but he is invariably placed in company with the Latin poets. Few of those who praised him had read him, except in the Latin redaction, in 1100 verses, by the so-called Pindarus Thebanus. It supplied the chief incidents of the *Iliad* with tolerable exactness and was a textbook in schools.

For a thousand years the myth of descent from the dispersed heroes of the conquered Trojan race was a sacred literary tradition throughout western Europe. The first Franco-Latin chroniclers traced their history to the same origin as that of Rome, as told by the Latin poets of the Augustan era; and in the middle of the 7th century Fredegarius Scholasticus (*Rer. gall. script.* ii. 461) relates how one party of the Trojans settled between the Rhine, the Danube and the sea. In a charter of Dagobert occurs the statement, "ex nobilissimo et antiquo Trojanorum reliquiarum sanguine nati." This statement is repeated by chroniclers and panegyrical writers, who also considered the *History of Troy* by Dares to be the first of national books. Succeeding kings imitated their predecessors in giving official sanction to their legendary origin: Charles the Bald, in a charter, uses almost the same words as Dagobert, "ex praeclaro et antiquo trojanorum sanguine nati." In England a similar tradition had been early formulated, as appears from Nennius's *Historia britonum* and Geoffrey of Monmouth. The epic founder of Britain was Brutus, son, or in another tradition, great-grandson, of Aeneas, in any case of the royal house of Troy. The tradition, repeated in Wace's version of Geoffrey, by Matthew Paris and others, persisted to the time of Shakespeare. Brutus found Albion uninhabited except by a few giants. He founded his capital on the banks of the Thames, and called it New Troy. Otto Frisingensis (12th century) and other German chroniclers repeat similar myths, and the apocryphal hypothesis is echoed in Scandinavian sagas. About 1050 a monk named Bernard wrote *De excidio Trojae*, and in the middle of the 12th century Simon Chèvre d'Or, canon of the abbey of Saint-Victor, Paris, followed with another poem in leonine elegiacs on the fall of the city and the adventures of Aeneas, in which the Homeric and Virgilian records were blended.

We now come to a work on the same subject, which in its own day and for centuries afterwards exercised an extraordinary influence throughout Europe. About the year 1184 Benoît de Sainte-More (*q.v.*) composed a poem of 30,000 lines entitled *Roman de Troie*. It forms a true Trojan cycle and embraces the entire heroic history of Hellas. The introduction relates the story of the Argonauts, and the last 2680 verses are devoted to the return of the Greek chiefs and the wanderings of Ulysses. With no fear of chronological discrepancy before his eyes, Benoît reproduces the manners of his own times, and builds up a complete museum of the 12th century—its arts, costumes, manufactures, architecture, arms, and even religious terms. Women are repeatedly introduced in unwarranted situations; they are spectators of all combats. The idea of personal beauty is different from that of the old Greeks; by Benoît good humour, as well as health and strength, is held to be one of its chief characteristics. The love-pictures are another addition of the modern writer. The author speaks enthusiastically of Homer, but he derived his information chiefly from the pseudo-annals of Dictys and Dares, more especially the latter, augmented by his own imagination and the spirit of the age. It is to Benoît alone that the honour of poetic invention is due, and in spite of its obligation for a groundwork to Dictys and Dares we may justly consider the *Roman de Troie* as an original work. From this source subsequent writers drew their notions of Troy, mostly without naming their authority and generally without even knowing his name. This is the masterpiece of the pseudo-classical cycle of romances: and in the Latin version of Guido delle Colonne it passed through every country of Europe.

The *De bello trojano* of Joseph of Exeter, in six books, a genuine poem of no little merit, was written soon after Benoît's work or about the years 1187-1188. At first ascribed to Dares Phrygius and Cornelius Nepos, it was not published as Joseph's until 1620 at Frankfort. It was directly drawn from the pseudo-annalists, but the influence of Benoît was considerable. Of the same kind was the *Troilus* of Albert of Stade (1249), a version of Dares, in verse, characterized by the old severity and affected realism. But these Latin works can only be associated indirectly with Benoît, who had closer imitators in Germany at an early period. Herbort of Fritzlar reproduced the French text in his *Lied von Troye* (early 13th century), as did also Konrad von Würzburg (d. 1287) in his *Buch von Troye* of 40,000 verses, which he himself compared to the "boundless ocean." It was completed by an anonymous poet. To the like source may be traced a poem of 30,000 verses on the same subject by Wolfram von Eschenbach; and Jacques van Maerlant reproduced Benoît's narrative in Flemish. The Norse or Icelandic *Trojumanna saga* repeats the tale with some variations.

In Italy Guido delle Colonne, a Sicilian, began in 1270 and finished in 1287 a prose *Historia trojana*, in which he reproduced the *Roman de Troie* of Benoît, and so closely as to copy the errors of the latter and to give the name of Peleus to Pelias, Jason's uncle. As the debt was entirely unacknowledged, Benoît at last came to be considered the imitator of Guido. The original is generally abridged, and the vivacity and poetry of the Anglo-Norman trouvère disappear in a dry version. The immense popularity of Guido's work is shown by the large number of existing MSS. The French Bibliothèque Nationale possesses eighteen codices of Guido to thirteen of Benoît, while at the British Museum the proportion is ten to two. Guido's *History* was translated into German about 1392 by Hans Mair of Nördlingen. Two Italian translations were made: by Filippo Ceffi (1324) and by Matteo Beliebuoni (1333). In the 14th and the commencement of the 15th century four versions appeared in England and Scotland. The best known is the *Troy Book*, written between 1414 and 1420, of John Lydgate, who had both French and Latin texts before him. An earlier and anonymous rendering exists at Oxford (Bodleian MS. Laud Misc. 595). There is the *Gest Hystoriale of the Destruction of Troy* (Early Eng. Text Soc., 1869–1874), written in a northern dialect about 1390; a Scottish version (15th century) by a certain Barbour, not the poet, John Barbour; and *The Seege of Troy*, a version of Dares (Harl. MS. 525 Brit. Mus.). The invention of printing gave fresh impetus to the spread of Guido's work. The first book printed in English was *The Recuyell of the Hystoryes of Troye*, a translation by Caxton from the French of Raoul Lefèvre. The *Recueil des histoires de Troyes* was "composé par vénérable homme Raoul le Feure prestre chappellain de mon tres redoupté seigneur monseigneur le duc Phelippe de Bourgoingne en l'an de grace 1464," but probably printed in 1474 by Caxton or Colard Mansion at Bruges. It is in three books, of which the first deals with the story of Jupiter and Saturn, the origin of the Trojans, the feats of Perseus, and the first achievements of Hercules; the second book is wholly taken up with the "prouesses du fort Herculez"; the third, "traictant de la generalle destruction de Troyes qui vint a l'ocasion du rauissement de dame Helaine," is little else than a translation of that portion of Guido delle Colonne which relates to Priam and his sons. Two MSS. of the *Recueil* in the Bibliothèque Nationale wrongly attribute the work to Guillaume Fillastre, a voluminous author, and predecessor of Lefèvre as secretary to the duke. Another codex in the same library, *Histoire ancienne de Thèbes et de Troyes*, is partly taken from Orosius. The Bibliothèque Nationale possesses an unpublished *Histoire des Troyens et des Thébains jusqu'à la mort de Turnus, d'après Orose, Ovide et Raoul Lefebre* (early 16th century), and the British Museum a Latin history of Troy dated 1403. There were also translations into Italian, Spanish, High German, Low Saxon, Dutch and Danish; Guido even appeared in a Flemish and a Bohemian dress.

Thus far we have only considered works more or less closely imitated from the original. Boccaccio, passing by the earlier tales, took one original incident from Benoît, the love of Troilus and the treachery of Briseida, and composed *Filostrato*, a parable of his own relations with the Neapolitan princess who figures in his works as Fiammetta. This was borrowed by Chaucer for his *Boke of Troilus and Cresside*, and also by Shakespeare for his *Troilus and Cressida* (1609). One reason why the Round Table stories of the 12th and 13th centuries had a never-ceasing charm for readers of the two following centuries was that they were constantly being re-edited to suit the changing taste. The *Roman de Troie* experienced the same fate. By the 13th century it was translated into prose and worked up in those enormous compilations, such as the *Mer des histoires*, &c., in which the middle ages studied antiquity. It reappeared in the religious dramas called Mysteries. Jacques Millet, who produced *La Destruction de Troie la Grande* between 1452 and 1454, merely added vulgar realism to the original. Writers of chap-books borrowed the story, which is again found on the stage in Antoine de Montchrétien's tragedy of *Hector* (1603)—a last echo of the influence of Benoît.

Bibliography.—The Troy legend is dealt with in the elaborate work of A. Joly, *Benoît de Sainte-More et le Roman de Troie* (1870–1871); G. Körting, *Der altfranz. Roman de Troie* (1883); F. Settegast, *Benoît de Ste-More* (Breslau, 1876); G. C. Frommann, *Herbort v. Fritzlar u. Benoît de Ste-More* (Stuttgart, 1837); R. Jäckel, *Dares Phrygius u. Benoît de Ste-More* (Breslau, 1875); E. TROY, a city and the county-seat of Rensselaer county, New York, U.S.A., at the head of tidewater on the eastern bank of the Hudson river, opposite the mouth of the Mohawk, about 6 m. N. of Albany and about 148 m. N. of New York City. Pop. (1880), 56,747; (1890), 60,956; (1900), 60,651, of whom 14,384 were foreign-born (7348 being Irish, 1796 German and 1498 English) and 400 were negroes; (1910, census), 76,813. Troy is served by the Boston & Maine, the New York Central & Hudson River and the Delaware & Hudson railways, and by interurban electric lines connecting with Saratoga and Lake George on the north, Albany on the south and Schenectady and the cities of the populous Mohawk Valley on the west; it is at the head of river steamboat navigation on the Hudson, and has water communication by means of the Erie and Champlain canals with the Great Lakes and Canada. The site is a level oblong tract extending along the Hudson for 7 m. and reaching back a mile or so from the river to highlands which rise to a height of 400 ft., with Mt Ida (240 ft. above tidewater) forming a picturesque background. The older part of the city and the principal business and manufacturing district occupies the low lands; the newer part, chiefly residential, is built upon the heights. The northern part of the city was the village of Lansingburg (pop. 1900, 12,595) until 1901, when with parts of the towns of Brunswick and North Greenbush it was annexed to

Troy. Opposite Troy on the west bank of the Hudson, and connected with it by bridges, are Cohoes, Watervliet and Waterford. Industrially and commercially they virtually form a part of Troy. Troy is the seat of Rensselaer Polytechnic Institute, founded in 1824 by Stephen van Rensselaer as a "school of theoretical and practical science," incorporated in 1826, and reorganized in 1849 as a general polytechnic institute. It is the oldest school of engineering in the country, and has always maintained a high rank of efficiency. The large gifts (about $1,000,000) to the school made by Mrs Russell Sage in 1907 enabled it to add courses in mechanical and electrical engineering to its course in civil engineering. The institute had 55 instructors and 650 students in 1910. The Emma Willard School, founded as the Troy Female Seminary in 1821 by Mrs Emma Willard (1787–1870),[1] is one of the oldest schools for women in the United States. Other educational institutions include Troy Academy (1834), a non-sectarian preparatory school; La Salle Institute (conducted by the Brothers of the Christian Schools); St Joseph's Academy (Roman Catholic) and St Peter's Academy (Roman Catholic). Noteworthy buildings of a public and semi-public character include the post office, the public library, containing in 1910 43,500 volumes, the Troy Savings Bank building, the city hall, the Rensselaer county court house, a Y.M.C.A. building and St Paul's Episcopal, the Second Presbyterian and St Mary's (Roman Catholic) churches. An area of 175 acres is comprised in the city's parks, the largest of which are Prospect Park and Beman Park. In Oakwood cemetery, 400 acres, are the grave of General George H. Thomas, and a monolithic shaft to the memory of General John Ellis Wool (1784–1869), who served with distinction in the War of 1812 and in the Mexican War, and in the Civil War commanded for a time the Department of Virginia. In Washington Square there is a Soldiers' and Sailors' Monument, 93 ft. high. Altro Park, on an island a short distance down the river, is a pleasure resort in summer.

Two rapid streams, Poesten Kill and Wynants Kill, flowing into the Hudson from the east, through deep ravines, furnish good water-power, which, with that furnished by the state dam across the Hudson here, is utilized for manufacturing purposes. In 1905 the value of Troy's factory product was $31,860,829. Of this $11,271,708 was the value of collars and cuffs (89·5% of the value of the total American product), an industry which gave employment to 49·3% of the wage-earners in Troy, and paid 42·1% of the wages. Closely allied with this industry was shirt-making, with an output valued at $4,263,610. Troy is the market for a fertile agricultural region, and the principal jobbing centre for a large district in north-eastern New York and eastern Massachusetts.

The site of Troy was part of the Van Rensselaer manor grant of 1629. In 1659 it was bought from the Indians, with the consent of the patroon, by Jan Barentsen Wemp, and several families settled here. In 1707 it passed into the hands of Derick van der Heyden, who laid out a large farm. During this early period it was known variously as Ferryhook, Ashley's Ferry and Van der Heyden's Ferry. In 1777 General Philip Schuyler established his headquarters on Van Schaick's Island in the Mohawk and Hudson, then the principal rendezvous of the army which later met Burgoyne at Saratoga. After the close of the war there was an influx of settlers from Rhode Island, Connecticut, New Hampshire and Vermont; a town was laid out on the Van der Heyden farm, and in 1789 the name of Troy was selected in town meeting; and in 1791 the town of Troy was formed from part of Rensselaerwyck. The county-seat was established here in 1793, and Troy was incorporated as a village in 1794 and was chartered as a city in 1816. The first newspaper, *The Farmer's Oracle*, began publication in 1797. In 1812 a steamboat line was established between Troy and Albany. Troy benefited financially by the War of 1812, during which contracts for army beef were filled here. The opening of the Erie Canal in 1825 contributed greatly to Troy's commercial importance. During the Civil War army supplies, ammunition and cannon, and the armour-plate and parts of the machinery for the "Monitor" were made here. The first puddling works were opened in 1839, and Troy was long the centre of the New York iron and steel industry; in 1865 the second Bessemer steel works in the United States were opened here. Troy has three times been visited by severe conflagrations, that of June 1820 entailing a loss of about $1,000,000, that of August 1854 about the same, and that of May 1862, known as "the Great Fire," the destruction of over 500 buildings, and a property loss of some $3,000,000.

See Arthur J. Weise, *History of the City of Troy* (Troy, 1876), and *Troy's One Hundred Years* (Troy, 1891).

[1] Emma Hart was born in Berlin, Connecticut, became a teacher in 1803, and in 1809 married Dr John Willard of Middlebury, Vermont, where she opened a boarding school for girls in 1814. In 1819 she wrote *A Plan for Improving Female Education*, submitted to the governor of New York state; and in 1821 she removed to Troy. Her son took charge of the school in 1838. She prepared many textbooks and wrote *Journal and Letters from France and Great Britain* (1833). See the biography (1873) by John Lord.

TROY, a city and the county-seat of Miami county, Ohio, U.S.A., on the west bank of the Great Miami river, about 65 m. W. of Columbus. Pop. (1890), 4494; (1900), 5881 (234 foreign-born); (1910), 6122. Troy is served by the Cleveland, Cincinnati, Chicago & St Louis and the Cincinnati, Hamilton & Dayton railways, and by the Dayton & Troy and the Springfield, Troy & Piqua electric inter-urban lines. The Miami and Erie Canal, formerly important for traffic, is now used only for power. The principal public buildings include the court house and the city hall, and there are a public library (housed in the city hall) and a children's home. Troy is situated in a good general farming region, of which tobacco is an important crop; and there are various manufactures. The municipality owns and operates the waterworks and electric-lighting plant. The first settlement was made in 1807, and Troy was first chartered as a city in 1890.

TROYES, a town of France, capital of the department of Aube, 104 m. E.S.E. of Paris on the Eastern railway to Belfort. Pop. (1906), 51,228. The town is situated in the wide alluvial plain watered by the Seine, the main stream of which skirts it on the east. It is traversed by several small arms of the river, and the Canal de la Haute-Seine divides it into an upper town, on the left bank, and a lower town on the right bank. The streets are, for the most part, narrow and crooked. It is surrounded by a belt of *boulevards*, outside which lie suburbs. The churches of the town are numerous, and especially rich in stained glass of the Renaissance period, from the hands of Jean Soudain, Jean Macadré, Linard Gonthier and other artists.

St Pierre, the cathedral, was begun in 1208, and it was not until 1640 that the north tower of the façade was completed. With a height to the vaulting of only 98 ft. it is less lofty than other important Gothic cathedrals of France. It consists of an apse with seven apse chapels, a choir with double aisles, on the right of which are the treasury and sacristy, a transept without aisles, a nave with double aisles and side chapels and a vestibule. The west façade belongs to the 16th century with the exception of the upper portion of the north tower; the south tower has never been completed. Three portals, that in the centre surmounted by a fine flamboyant rose window, open into the vestibule. The stained glass of the interior dates mainly from the 15th and 16th centuries. The treasury contains some fine enamel work and lace. The church of St Urban, begun in 1262 at the expense of Pope Urban IV., a native of the town, is a charming specimen of Gothic architecture, the lightness and delicacy of its construction rivalling that of churches built a century later. The glass windows, the profusion of which is the most remarkable feature of the church, date, for the most part, from the years 1265 to 1280. The church of La Madeleine, built at the beginning of the 13th century, and enlarged in the 16th, contains a rich rood-screen by Giovanni Gualdo (1508) and fine stained-glass windows of the 16th century. The church of St Jean, though hidden among old houses, is one of the most picturesque in Troyes. The choir is a fine example of Renaissance architecture and the church contains a high altar of the 17th century, stained glass of the 16th century and many other works of art. St Nicholas is a building of the 16th century with a beautiful vaulted gallery in the interior. The church of St Pantaléon of the 16th century and that of St Nizier, mainly of the same period, contain remarkable sculptures and paintings. St Remi (14th, 15th and 16th centuries) and St Martin-ès-Vignes (16th and 17th centuries), the latter notable for its 17th-century windows, are also of interest. The old abbey of St Loup is occupied by a museum containing numerous collections. The Hôtel Dieu of the 18th century is remarkable for the fine gilded iron railing of its courtyard. Most of the old houses of Troyes are of wood, but some of stone of the 16th century are remarkable for their beautiful and original architecture. Amongst the latter the hôtels de Vauluisant, de Mauroy and de Marisy are specially interesting. The prefecture occupies the buildings of the old abbey of Notre-Dame-aux-Nonnains; the Hôtel-de-ville dates from the 17th century; the savings bank, the theatre and the *lycée* are modern buildings. A marble monument to the Sons of Aube commemorates the war of 1870–71.

Troyes is the seat of a bishop and a court of assize. Its public institutions include a tribunal of first instance, a tribunal of commerce, a council of trade arbitrators, a chamber of commerce and a branch of the Bank of France. A *lycée*, an ecclesiastical college, training colleges for male and female teachers, and a school of hosiery are its chief educational institutions. There are also several learned societies and a large library. The dominant industry in Troyes is the manufacture of cotton, woollen and silk hosiery, which is exported to Spain, Italy, the United States and South America; printing and dyeing of fabrics, tanning, distilling, and the manufacture of looms and iron goods are among the other industries. The market gardens and nurseries of the neighbourhood are well known. There is trade in the wines of Burgundy and Champagne, in industrial products, in snails and in the dressed pork prepared in the town.

History.—At the beginning of the Roman period Troyes (*Augustobona*) was the principal settlement of the Tricassi, from whose name its own is derived. It owed its conversion to Christianity to Saints Savinian and Potentian, and in the first half of the 4th century its bishopric was created as a suffragan of Sens. St Loup, the most illustrious bishop of Troyes, occupied the episcopal seat from 426 to 479. He is said to have persuaded Attila, chief of the Huns, to leave the town unpillaged, and is known to have exercised great influence in the Church of Gaul. The importance of the monastery of St Loup, which he founded, was overshadowed by that of the abbey of nuns known as Notre-Dame-aux-Nonnains, which possessed large schools and enjoyed great privileges in the town, in some points exercising authority even over the bishops themselves. In 892 and 898 Troyes suffered from the depredations of the Normans, who on the second occasion reduced the town to ruins. In the early middle ages the bishops were supreme in Troyes, but in the 10th century this supremacy was transferred to the counts of Troyes (see below), who from the 11th century were known as the counts of Champagne. Under their rule the city attained great prosperity. Its fairs, which had already made it a prominent commercial centre, flourished under their patronage, while the canals constructed at their expense aided its industrial development. In the 12th century both the counts and the ecclesiastics joined in the movement for the enfranchisement of their serfs, but it was not till 1230 and 1242 that Thibaut IV. granted charters to the inhabitants. A disastrous fire occurred in 1188; more disastrous still was the union of Champagne with the domains of the king of France in 1304, since one of the first measures of Louis le Hutin was to forbid the Flemish merchants to attend the fairs, which from that time declined in importance. For a short time (1419–1425), during the Hundred Years' War, the town was the seat of the royal government, and in 1420 the signing of the Treaty of Troyes was followed by the marriage of Henry V. of England with Catherine, daughter of Charles VI., in the church of St Jean. In 1429 the town capitulated to Joan of Arc. The next hundred years was a period of prosperity, marred by the destruction of half the town by the fire of 1524. In the 16th century Protestantism made some progress in Troyes but never obtained a decided hold. In 1562, after a short occupation, the Calvinist troops were forced to retire, and on the news of the massacre of St Bartholomew fifty Protestants were put to death. The revocation of the Edict of Nantes in 1685 was a severe blow to the commerce of Troyes, which was not revived by the re-establishment of the former fairs in 1697. The population fell from 40,000 to 24,000 between the beginning of the 16th century and that of the 19th century.

See T. Boutiot, *Histoire de Troyes et de la Champagne méridionale* (4 vols., Troyes, 1870–1880); R. Koechlin and J. J. Marquet de Vasselot, *La Sculpture à Troyes et dans la Champagne méridionale au seizième siècle* (Paris, 1900). (R. Tr.)

Counts of Troyes. The succession of the counts of Troyes from the 9th to the 10th century can be established in the following manner. Aleran, mentioned in 837, died before the 25th of April 854. Odo (or Eudes) I. appears as count on the 25th of April 854, and seems to have been stripped of his dignities in January 859. Raoul, or Rudolph, maternal uncle of King Charles the Bald, was count of Troyes in 863 and 864, and died on the 6th of January 866. Odo I. seems to have entered again into possession of the countship of Troyes after the death of Raoul, and died himself on the 10th of August 871. Boso, afterwards king of Provence, received the countship in ward after the death of Odo I. A royal diploma was granted at his request, on the 29th of March 877, to the abbey of Montier-la-Celle in Troyes. Odo II., son of Odo I., became count of Troyes on the 25th of October 877. Robert I., brother of Odo II., was count from 879. He married Gisla, sister of kings Louis III. and Carloman, and was killed by the Northmen in 886. Aleaume, nephew of Robert I., is mentioned in 893. Richard, son of the viscount of Sens Garnier, is styled count of Troyes in a royal diploma of the 10th of December 926. He was living in 931. Herbert I., already count of Vermandois, succeeded Richard, and died in 943. Robert II., one of the five sons of Herbert of Vermandois, is called count of Troyes in an act of the 6th of August 959, and died in August 968. Herbert II. the Old, younger brother of Robert II., succeeded him and died between 980 and 983. Herbert III. the Young, nephew and successor of Herbert II., died in 995. Stephen I., son and successor of Herbert III., was alive in 1019. His successor was his cousin, Odo II., count of Blois. From the 11th century the counts of Troyes, whose domains increased remarkably, are commonly designated by the name of counts of Champagne.

TROYON, CONSTANT (1810–1865), French painter, was born on the 28th of August 1810 at Sèvres, near Paris, where his father was connected with the famous manufactory of china. Troyon was an animal painter of the first rank, and was closely associated with the artists who painted around Barbizon. The technical qualities of his methods of painting are most masterly; his drawing is excellent, and his composition always interesting. It was only comparatively late in life that Troyon found his *métier*, but when he realized his power of painting animals he produced a fairly large number of good pictures in a few years. Troyon entered the *ateliers* very young as a decorator, and until he was twenty he laboured assiduously at the minute details of porcelain ornamentation; and this kind of work he mastered so thoroughly that it was many years before he overcame its limitations. By the time he reached twenty-one he was travelling the country as an artist, and painting landscapes so long as his finances lasted. Then when pressed for money he made friends with the first china manufacturer he met and worked steadily at his old business of decorator until he had accumulated enough funds to permit him to start again on his wanderings.

Troyon was a favourite with Roqueplan, an artist of distinction eight years his senior, and he became one of his pupils after receiving certain tuition from a painter, now quite unknown, named Riocreux. Roqueplan introduced Troyon to Rousseau, Jules Dupré, and the other Barbizon painters, and in his pictures between 1840 and 1847 he seemed to endeavour to follow in their footsteps. But as a landscapist Troyon would never have been recognized as a thorough master, although his work of the period is marked with much sincerity and met with a certain success. It may be pointed out, however, that in one or two pure landscapes of the end of his life he achieved qualities of the highest artistic kind; but this was after lengthy experience as a cattle painter, by which his talents had become thoroughly developed.

In 1846 Troyon went to the Netherlands, and at the Hague saw Paul Potter's famous "Young Bull." From the studies he made of this picture, of Cuyp's sunny landscapes, and brandt's noble masterpieces he soon evolved a new method of painting, and it is only in works produced after this time that Troyon's true individuality is revealed. When he became conscious of his power as an animal painter he developed with rapidity and success, until his works became recognized as masterpieces in Great Britain and America, as well as in all countries of the Continent. Success, however, came too late, for Troyon never quite believed in it himself, and even when he could command the market of several countries he still grumbled loudly at the way the world treated him. Yet he was decorated with the Legion of Honour, and five times received medals at the Paris Salon, while Napoleon III. was one of his patrons; and it is certain he was at least as financially successful as his Barbizon colleagues.

Troyon died, unmarried, at Paris on the 21st of February 1865, after a term of clouded intellect. All his famous pictures are of date between 1850 and 1864, his earlier work being of comparatively little value. His mother, who survived him, instituted the Troyon prize for animal pictures at the École des Beaux Arts. Troyon's work is fairly well known to the public through a number of large engravings from his pictures. In the Wallace Gallery in London are "Watering Cattle" and "Cattle in Stormy Weather"; in the Glasgow Corporation Gallery is a "Landscape with Cattle"; the Louvre contains his famous "Oxen at Work" and "Returning to the Farm"; while the Metropolitan Museum of Art and other galleries in America contain fine examples of his pictures. His "Vallée de la Toucque, Normandy," is one of his greatest pictures; and at Christie's sale-room in 1902 the single figure of a cow in a landscape of but moderate quality fetched £7350. Émile van Marcke (1827–1891) was his best-known pupil.

TRUCE OF GOD, an attempt of the Church in the middle ages to alleviate the evils of private warfare. Throughout the 9th and 10th centuries, as the life-benefices of the later Carolingian kings were gradually transformed into hereditary fiefs, the insecurity of life and property increased, for there was no central power to curb the warring local magnates. The two measures which were adopted by the Church to remedy these conditions—the *pax ecclesiae* or *Dei* and the *treuga* or *treva Dei*—are usually both referred to as the Truce of God, but they are distinct in character. The latter was a development of the former.

The *pax ecclesiae* is first heard of in the year 990 at three synods held in different parts of southern and central France—at Charroux, Narbonne and Puy. It enlisted the immediate support of the regular clergy, particularly the vigorous congregation of Cluny, and of William V. of Aquitaine, the most powerful lord of southern France, who urged its adoption at the Councils of Limoges (994) and Poitiers (999). The peace decrees of these various synods differed considerably in detail, but in general they were intended fully to protect non-combatants; they forbade, under pain of excommunication, every act of private warfare or violence against ecclesiastical buildings and their environs, and against certain persons, such as clerics, pilgrims, merchants, women and peasants, and against cattle and agricultural implements. With the opening of the 11th century, the *pax ecclesiae* spread over northern France and Burgundy, and diocesan leagues began to be organized for its maintenance. The bishop, or count, on whose lands the peace was violated was vested with judicial power, and was directed, in case he was himself unable to execute sentence, to summon to his assistance the laymen and even the clerics of the diocese, all of whom were required to take a solemn oath to observe and enforce the peace. At the Council of Bourges (1038), the archbishop decreed that every Christian fifteen years and over should take such an oath and enter the diocesan militia. The idea that peace is a divine institution seems to have given rise to a new name for the peace, the *pax Dei*, or peace of God.

The *treuga* or *treva Dei*, the prohibition of every act of private warfare during certain days, goes back at least to the Synod of Elne, held in the Pyrenees in 1027, which suspended all warfare from noon on Saturday till prime on Monday. Like the *pax ecclesiae* it found ardent champions in the regular clergy, especially in Odilo (962–1049), the fifth abbot of Cluny, and soon spread over all France. It penetrated Piedmont and Lombardy in 1041 and Normandy in 1042. By this time the truce extended from the Wednesday evening to the Monday morning in every week and also, in most places, lasted during the seasons of Lent and Advent, the three great vigils and feasts of the Blessed Virgin, and those of the twelve apostles and a few other saints. The *treuga Dei* was decreed for Flanders at the Synod of Thérouanne (1063) and was instituted in southern Italy in 1089, probably through Norman influence. The bishop of Liége introduced it in Germany in 1082, and three years later a synod held at Mainz in the presence of the emperor Henry IV. extended it to the whole empire. It does not appear to have secured a firm footing in England, although its general provisions were incorporated in the laws of the land (1130–1154). The popes took the direction of the matter into their own hands towards the end of the 11th century as they realized the necessity of promoting peace among Christians in order to unite them successfully in the crusades against the Mahommedans; and the first decree of the Council of Clermont (1095), at which Urban II. preached the first crusade, proclaimed a weekly truce for all Christendom, adding a guarantee of safety to all who might take refuge at a wayside cross or at the plough. The Truce of God was reaffirmed by many councils, such as that held at Reims by Calixtus II. in 1119, and the Lateran councils of 1123, 1139 and 1179. When the *treuga Dei* reached its most extended form, scarcely one-fourth of the year remained for fighting, and even then the older canons relating to the *pax ecclesiae* remained in force. The means employed for its enforcement remained practically the same: spiritual penalties, such as excommunication, special ecclesiastical tribunals, sworn leagues of peace, and assistance from the temporal power. The Council of Clermont prescribed that the oath of adherence to the truce be taken every three years by all men above the age of twelve, whether noble, burgess, villein or serf. The results of these peace efforts were perhaps surprisingly mediocre, but it must be borne in mind that not only was the military organization of the dioceses always very imperfect, but feudal society, so long as it retained political power, was inherently hostile to the principle and practice of private peace. The Truce of God was most powerful in the 12th century, but with the 13th its influence waned as the kings gradually gained control over the nobles and substituted the king's peace for that of the Church.

A few bishops, notably Gerard of Cambrai (1013–1051), seem from the first to have opposed the peace laws of the Church as encroaching on royal authority, but the lay rulers usually co-operated with the ecclesiastical authorities in encouraging and maintaining the Truce of God. In fact, the emperor Henry II. and the French king Robert the Pious discussed the subject of universal peace under church auspices at Monzon in 1023. By the 12th century, however, the ecclesiastical measures had proved ineffectual in coping with private warfare, and secular rulers sought independently to diminish the number and atrocity of private wars within their own domains. The provisions of the Truce of God were often incorporated bodily in municipal and district statutes such as the laws of Barcelona (1067). The emperor Henry IV. approved (1085) the extension of the truce to the whole land, and in 1103 royal laws entirely prohibiting private warfare in the empire replaced the Truce of God. In France royalty acquired little by little a preponderant influence over feudalism and used its increased prestige to substitute for the Truce of God the peace of the state. Louis VI., Louis VII. and Philip Augustus gradually obtained recognition not only from the petty lords of their own domain but from most of the magnates of the kingdom. Thanks to the moral support and material resources which it found in the ecclesiastical lords of central and northern France, and to the growing popular desire for the suppression of feuds, royalty was able to support its pretension to the general government of the kingdom. Confirming what was doubtless an older custom, Philip Augustus decreed the *quarantaine-le-roi*, which suspended every act of reprisal for at least forty days; and in 1257 Louis IX. absolutely forbade all private wars in the crown lands. By the beginning of the 14th century the royal authority had sufficient force to ensure the maintenance of the *Landesfriede*. In England, where the Truce of God does not seem to have acquired a firm footing, state law against private warfare obtained practically from the time of the Norman conquest. At least from Henry I. it became an axiom that the law of the king's court stood above all other law and was the same for all.

The principal French documents on the subject are published in Huberti's book, and those of Germany, Italy and Arles are edited by L. Weiland in the *Monumenta Germaniae historica, constitutiones* i. 596 sqq. (C. H. Ha.)

TRUCK. (1) A name for barter, or commodities used in barter or trade. The word came into English from the French *troq*, mod. *troc*; *troquer*, to barter, is borrowed from Spanish *trocar*, for which several origins have been suggested, such as a Low Latin *travicare*, the supposed original of "traffic" (*q.v.*), or some latinized form of Greek τρόπος, turn; it may, on the other hand, be connected with the Greek τροχός, wheel. "Truck," in this sense, is chiefly used now in the sense of the payment of the wages of workmen *in kind*, or in any other way than the unconditional payment of money, a practice known as the "truck system." Colloquially, "truck" is used in the general sense of "dealing," in such expressions as "to have no truck with anyone." The "truck system" has taken various forms. Sometimes the workman has been paid with "portion of that which he has helped to produce," whether he had need of it or not, but the more usual form was to give the workman the whole or part of his wages in the shape of commodities suited to his needs. There was also a practice of paying in money, but with an express or tacit understanding that the workman should resort for such goods as he required to shops or stores kept by his employer. The truck system led in many cases to grave abuses and was made illegal by the Truck Acts, under which wages must be paid in current coin of the realm, without any stipulations as to the manner in which the same shall be expended. (See LABOUR LEGISLATION.) (2) From the Late Latin *trochus*, wheel, Greek τροχός, we get "truck" in the sense of a wheeled vehicle, such as the hand-barrows used for carrying luggage at a railway station; and the word is used generally for all that portion of railway rolling-stock which is intended for the carriage of goods (see RAILWAYS: *Rolling-stock*). The term is also used of a circular disk of wood at the top of a ship's mast, generally provided with sheaves for the signal halyards.

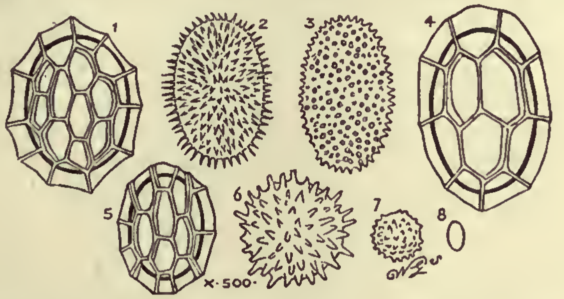
TRUCKLE, a verb meaning to submit servilely or fawningly to another's bidding, to yield in a weak, feeble or contemptible way. The origin is the "truckle bed," a small bed on wheels which could be pushed under a large one. In early times servants or children slept in such beds, placed at the foot of their masters' and parents' bed, but the name first appears as a university word, and was derived direct from Latin *trochlea*, a wheel or pulley-block, Greek τροχός, wheel (τρέχειν, to run).

TRUEBA, ANTONIO DE (1819–1889), Spanish novelist, was born on the 24th of December 1819 at Montellano (Biscay), where he was privately educated. In 1835 he was sent to learn business at Madrid; but commerce was not to his taste, and, after a long apprenticeship, he turned to journalism. In 1851 he hit the popular taste with *El Cid Campeador* and *El Libro de los cantares*; for the next eleven years he was absorbed by journalistic work, the best of his contributions being issued under the titles of *Cuentos populares* (1862), *Cuentos de color de rosa* (1864), and *Cuentos campesinos* (1865). The pleasant simplicity and idyllic sentimentalism of these collections delighted an uncritical public, and Trueba met the demand by supplying a series of stories conceived in the same ingenuous vein. In 1862 he was appointed archivist and chronicler of the Biscay provinces; he was deprived of the former post in 1870, but was reinstated after the restoration. He died at Bilbao on the 10th of March 1889.

TRUFFLE (from Med. Fr. *trufle*, a variant of *truffe*, generally taken to be for *tafie*, from Lat. *tuber*, an esculent root, a tuber, cf. Ital *tartufo*, *truffle*, from Lat. *torae tuber*; another Ital. form *tartufola* gave Ger. *Tartoffel*, dissimilated to *Kartoffel*, potato), the name of several different species of subterranean fungi which are used as food. The species sold in English markets is *Tuber aestivum*; the commonest species of French markets is *T. melanosporum*, and of Italian the garlic-scented *T. magnatum*. Of the three, the English species is the least desirable, and the French is possibly the best. The truffle used for Perigord pie (*pâté de foie gras*) is *T. melanosporum*, regarded by some as a dark variety of our British species, *T. brumale*. When, however the stock of *T. melanosporum* happens to be deficient, some manufacturers use inferior species, such as the worthless or dangerous *Choeromyces meandriformis*. Even the rank and offensive *Scleroderma vulgare* (one of the puff-ball series of fungi) is sometimes used for stuffing turkeys, sausages, &c. Indeed, good truffles, and then only *T. aestivum*, are seldom seen in English markets. The taste of *T. melanosporum* can be detected in Perigord pie of good quality. True and false truffles can easily be distinguished under the microscope.

Tuber aestivum, the English truffle, is roundish in shape, covered with coarse polygonal warts, black in colour outside and brownish and veined with white within; its average size is about that of a small apple. It grows from July till autumn or winter, and prefers beech, oak and birch woods on argillaceous or calcareous soil, and has sometimes been observed in pine woods. It grows gregariously, often in company with *T. brumale* and (in France and Italy) *T. melanosporum*, and sometimes appears in French markets with these two species as well as with *T. mesentericum*. The odour of *T. aestivum* is very strong and penetrating; it is generally esteemed powerfully fragrant, and its taste is considered agreeable. The common French truffle, *T. melanosporum*, is a winter species. It is a valuable article of commerce and is exported from France in great quantities. The tubers are globose, bright brown or black in colour, and rough with polygonal warts; the mature flesh is blackish grey, marbled within with white veins. It is gathered in autumn and winter in beech and oak woods, and is frequently seen in Italian markets. The odour of *T. melanosporum* is very pleasant, especially when the tubers are young, then somewhat resembling that of the strawberry; with age the smell gets very potent, but is never considered really unpleasant. The common Italian truffle, *T. magnatum*, is pallid ochreous or brownish buff in colour, smooth or minutely papillose, irregularly globose, and lobed; the interior is a very pale brownish liver colour veined with white. It grows towards the end of autumn in plantations of willows, poplars and oaks, on clayey soil. Sometimes it occurs in open cultivated fields. The odour of the mature fungus is very potent, and is like strong garlic, onion or decaying cheese. *T. brumale*, referred to above, grows in Britain. It is a winter truffle, and is found chiefly under oaks and abele trees from October to December. It is black in colour, globose, more or less regular in shape, and is covered with sharp polygonal warts; the mature flesh is blackish grey marbled with white veins. The odour is very strong and lasts a long time; the taste is generally esteemed agreeable. *Choeromyces meandriformis*, which occurs in Britain, is sometimes sold for *T. magnatum*, the colour of the flesh of both species being somewhat similar. *Scleroderma vulgare*, the "false truffle," is extremely common on the surface of the ground in woods, and is gathered by Italians and Frenchmen in Epping Forest for the inferior dining-rooms of London where continental dishes are served. It is a worthless, offensive, and possibly dangerous fungus. A true summer truffle, *T. mesentericum*, found in oak and birch woods on calcareous clay soil, is frequently eaten on the Continent. It is esteemed equal to *T. aestivum*, of which it is regarded as a variety and probably grows in Britain. Another edible species, *T. macrosporum*, also grows in Britain, in clayey places under young beeches and oaks, on the borders of streams and roads, and sometimes in fields; more rarely it grows in plantations of willow and poplar. It has a strong scent of onions or garlic somewhat similar to *T. aestivum*, but it is less esteemed on account of its toughness and its small size.

Terfezia leonis, a famous truffle of Italy, Algeria, Sardinia, &c., resembles externally a potato. It grows in March, April and May. Some persons eat it in a raw state, sliced and dipped in oil or egg. It is not scented, and its taste is generally considered insipid or soapy. *Melanogaster variegatus*, an ally of the puff-balls, and therefore (like *Scleroderma*) not a true truffle, is sometimes eaten in England and France. It has been, and possibly still is, occasionally sold in England under the name of "red truffle." It is a small ochreous-brown species with a strong aromatic and pleasant odour of bitter almonds. When the plant is eaten raw the taste is sweet and sugary, but when cooked it is hardly agreeable. The odour belonging to many truffles is so potent that their places of growth can be readily detected by the odour exhaled from the ground. Squirrels, hogs and other animals commonly dig up truffles and devour them, and pigs and dogs have long been trained to point out the places where they grow. Pigs will always eat truffles, and dogs will do so occasionally; it is therefore usual to give the trained pig or dog a small piece of cheese or some little reward each time it is successful. Truffles are reproduced by spores, which serve the same purpose as seeds in flowering plants; in true truffles the spores are borne in transparent sacs (*asci*), from four to eight spores in each ascus. The asci are embedded in vast numbers in the flesh of the truffle.



Spores of the Chief European Truffles. (Enlarged 500 diameters.)

1, *Tuber aestivum.*
2, *T. brumale.*
3, *T. melanosporum.*
4, *T. mesentericum.*
5, *T. magnatum.*
6, *Choeromyces meandriformis.*
7, *Scleroderma vulgare.*
8, *Melanogaster variegatus.*

In false truffles the spores are free and are borne on minute spicules or supports. The spores of the chief European truffles, true and false, enlarged five hundred diameters, are shown in the accompanying illustration. Many references to truffles occur in classical authors. The truffle *Elaphomyces variegatus* was till quite recent times used, under the name of Hart's nut or Lycoperdon nut, on account of its supposed aphrodisiac qualities.

TRUJILLO, or TRUXILLO, a seaport on the Atlantic coast of Honduras, in 15° 54′ N. and 86° 5′ W. Pop. (1905), about 4000. The harbour, an inlet of the Bay of Honduras, is sheltered on the north by the promontory of Cape Honduras; it is deep and spacious, but insecure in westerly winds. Mahogany, dye-woods, sarsaparilla, cattle, hides and fruit are exported; grain, flour, hardware and rum are imported. Trujillo was founded in 1524, and became one of the most prosperous ports of the new world, and the headquarters of a Spanish naval squadron. During the 17th century it was frequently and successfully raided by buccaneers, and thus lost much of its commerce. Still more has in modern times been diverted to Puerto Cortes and the Bay Islands.

TRUJILLO, or TRUXILLO, a city of northern Peru, the see of a bishopric, and capital of the department of Libertad, about 315 m. N.N.W. of Lima and 1½ m. from the Pacific coast, in lat. 8° 7′ S., long. 79° 9′ W. Pop. (1906, estimate), about 6500. The city stands on the arid, sandy plain (Mansiché, or Chimu), which skirts the coast from Paita south to Santa, a few miles north of the Moche or Chimu river, and at the northern entrance to the celebrated Chimu Valley. North and east are the ruins of an old Indian city commonly known as the Grand Chimu, together with extensive aqueducts and reservoirs. The city is partly enclosed by an old adobe wall built in 1686, and its buildings are in great part also constructed of adobe. The public institutions include a university, two national colleges, one of which is for girls, an episcopal seminary, a hospital and a theatre.

Trujillo was once an important commercial centre and the metropolis of northern Peru, but the short railways running inland from various ports have taken away its commercial importance. The port of Salaverry (with which Trujillo is connected by rail) is about 10 m. south-east, where the national government has constructed a long iron pier. Railways also extend northward to Ascope and eastward to Laredo, Galindo and Menocucho, and a short line runs from Roma, on the Ascope extension, to the port of Huanchaco. The only important manufactures of Trujillo are cigars and cigarettes.

Trujillo was founded in 1535, by Francisco Pizarro, who gave it the name of his native city in Spain. Its position on the road from Tumbez to Lima gave it considerable political and commercial importance, and some reflection of that colonial distinction still remains. It suffered little in the War of Independence, but was occupied and plundered by the Chileans in 1882.

Of the ancient aboriginal city, or group of towns, whose ruins and burial-places cover the plain on every side of Trujillo, comparatively little is definitely known. The extent of these ruins, which cover an area 12 to 15 m. long by 5 to 6 m. wide, demonstrate that it was much the largest Indian city on the southern continent. The principal ruins are 4 m. north of Trujillo, but others lie more to the eastward and still others southward of the banks of the Moche. The great aqueduct, which brought water to the several large reservoirs of the city, was 14 m. long and in some places in crossing the Chimu Valley it had an elevation of 60 ft.

The name of Grand Chimu is usually given to the ruined city, this being the title applied to the chief of the people, who were called the Chimu, or Yuncas. They were a race wholly distinct from the Incas, by whom they were finally conquered. They spoke a different language and had developed an altogether different civilization, and it is not unreasonable to presume that they were related to some earlier race of southern Mexico. Specimens of skilfully wrought ornaments of gold and silver, artistically made pottery, and finely woven fabrics of cotton and wool (alpaca), have been found in their *huacas*, or burial-places. Bronze was known to them, and from it tools and weapons were made. Their extensive irrigation works show that they were painstaking agriculturists, and that they were successful ones may be assumed from the size of the population maintained in so arid a region. Since the Spanish conquest their *huacas* have been opened and rifled, and many of the larger masses of ruins have been extensively mined in search of treasure, but enough still remains to impress upon the observer the magnitude of the city and the genius of the people who built it. Nothing is known of their history or of their political institutions, but these remains of their handiwork bear eloquent testimony that they had reached a degree of development in some respects higher even than that of the Incas.

See E. G. Squier, *Peru* (New York, 1877); and Charles Wiener, *Pérou et Bolivie* (Paris, 1882).

TRUJILLO, a town of Spain, in the province of Caceres; on a hill 25 m. east of Caceres, and on the river Tozo, a subtributary of the Tagus. Pop. (1900), 12,512. The surrounding country is rugged, but produces wheat, wine, oils and fruit, besides livestock of all sorts, and much phosphorite. There are valuable forests close to the town. In the oldest part of Trujillo are the remains of a castle said to be of Roman origin, but rebuilt by the Moors and restored in modern times. The Julia tower is also said to be Roman, like much of the fortifications. The Roman name for the town was Turgalium. The principal parish church, Santa Maria, is a fine Gothic structure of the 15th century. Trujillo was a town of importance in the middle ages. Pizarro, the conqueror of Peru, was born here about 1471, and built a palace, which still stands, in the main square of the town.

TRUMBALL, SIR WILLIAM (1639–1716), English politician, was a grandson of William Trumball (d. 1635), who was for sixteen years English resident at Brussels and afterwards a clerk of the privy council. Educated at St John's College, Oxford, young Trumball became a fellow of All Souls and settled down as a practising lawyer in Oxford and in London. He was made chancellor of the diocese of Rochester and was sent to Tangier on public business in 1683, one of his companions on this errand being the diarist Pepys. In 1684 Trumball was knighted by Charles II. and in 1685 he was sent as envoy to France, where he worked hard on behalf of the English Protestants there who were threatened by the Revocation of the Edict of Nantes. In 1685 he became a member of Parliament, in 1687 he went as ambassador to Constantinople, and in 1694 he was made a lord of the treasury. From May 1695 until December 1697 he was a secretary of state under William III. He died on the 14th of December 1716. His son, William Trumball (1708–1760), had an only daughter, who became the wife of the Hon. Martin Sandys. She was thus the ancestress of the later marquesses of Downshire.

Many of Trumball's letters are in the British Museum and in the Record Office, London. Trumball was on friendly terms with Pierre Bayle and with Dryden, whom he advised to translate Virgil. He was also very intimate with Pope, whom he influenced in several ways, especially in urging him to make a translation of Homer.

TRUMBULL, JAMES HAMMOND (1821–1897), American scholar, was born in Stonington, Connecticut, on the 20th of December 1821. He studied at Yale, but ill-health prevented his graduation. He was state librarian in 1854–1855, assistant-secretary of state of Connecticut in 1847–1852 and in 1858–1861, and secretary of state in 1861–1866; and was a prominent member of the Connecticut Historical Society, of which he was president in 1863–1889, the National Academy of Science, to which he was elected in 1872, and of other learned societies. He died in Hartford on the 5th of August 1897. He wrote *Historical Notes on some Provisions of the Connecticut Statutes* (1860–1861) and *The True Blue Laws of Connecticut* (1876), and edited *The Colonial Records of Connecticut* (3 vols., 1850–1859). He is better known, however, as a student of the Indian dialects of New England.

He edited Roger Williams's *Key to the Language of America* (1866), and wrote *The Composition of Indian Geographical Names* (1870), *The Best Methods of Studying the Indian Languages* (1871), *Indian Names of Places in . . . Connecticut with Interpretations* (1881) and other works on similar subjects.

TRUMBULL, JOHN (1750–1831), American poet, was born in what is now Watertown, Connecticut, where his father was a Congregational preacher, on the 24th of April 1750. At the age of seven he passed his entrance examinations at Yale, but did not enter until 1763; he graduated in 1767, studied law there, and in 1771–1773 was a tutor. In 1773 he was admitted to the bar, in 1773–1774 practised law in Boston, working in the law-office of John Adams, and after 1774 practised in New Haven. He was state attorney in 1789, a member of the Connecticut Assembly in 1792 and 1800, and a judge of the Superior Court in 1801–1819. The last six years of his life were spent in Detroit, Michigan, where he died on the 10th of May 1831. While studying at Yale he had contributed in 1769–1770 ten essays, called "The Meddler," imitating *The Spectator*, to the *Boston Chronicle*, and in 1770 similar essays, signed "The Correspondent" to the *Connecticut Journal and New Haven Post Boy*. While a tutor he wrote his first satire in verse, *The Progress of Dulness* (1772–1773), an attack in three poems on educational methods of his time. His great poem, which ranks him with Philip Freneau and Francis Hopkinson as an American political satirist of the period of the War of Independence, was *McFingal*, of which the first canto, "The Town-Meeting," appeared in 1776 (dated 1775). This canto, about 1500 lines, contains some verses from "Gage's Proclamation," published in the *Connecticut Courant* for the 7th and the 14th of August 1775; it portrays a Scotch Loyalist, McFingal, and his Whig opponent, Honorius, evidently a portrait of John Adams. This first canto was divided into two, and with a third and a fourth canto was published in 1782. After the war Trumbull was a rigid Federalist, and with the "Hartford Wits" David Humphreys, Joel Barlow and Lemuel Hopkins, wrote the *Anarchiad*, a poem directed against the enemies of a firm central government.

See the memoir in the Hartford edition of Trumbull's *Poetical Works* (2 vols., 1820); James Hammond Trumbull's *The Origin of "McFingal"* (Morrisania, New York, 1868); and the estimate in M. C. Tyler's *Literary History of the American Revolution* (New York, 1897).

TRUMBULL, JOHN (1756–1843), American artist, was born at Lebanon, Connecticut, on the 6th of June 1756, the son of Jonathan Trumbull (1710–1785), governor of Connecticut. He graduated at Harvard in 1773, served in the War of Independence, rendering a particular service at Boston by sketching plans of the British works, and was appointed second aide-de-camp to General Washington and in June 1776 deputy adjutant-general to General Gates, but resigned from the army in 1777. In 1780 he went to London to study under Benjamin West, but his work had hardly begun when the news of the arrest and execution of Major André, who was deputy adjutant-general in the English army, suggested the arrest of Trumbull as having been an officer of similar rank in the Continental army; he was imprisoned for seven months. In 1784 he was again in London working under West, in whose studio he painted his "Battle of Bunker Hill" and "Death of Montgomery," both of which are now in the Yale School of Fine Arts. In 1785 Trumbull went to Paris, where he made portrait sketches of French officers for "The Surrender of Cornwallis," and began, with the assistance of Jefferson, "The Signing of the Declaration of Independence," well-known from the engraving by Asher B. Durand. These paintings, with "The Surrender of Burgoyne," and "The Resignation of Washington," were bought by the United States government and placed in the Capitol at Washington. Trumbull's "Sortie from Gibraltar" (1787), owned by the Boston Athenaeum, is now in the Boston Museum of Fine Arts, and a series of historical paintings, the "Trumbull Gallery," by far the largest single collection of his works (more than 50 pictures), has been in the possession of Yale College since 1831, when Trumbull received from the college an annuity of $1000. His portraits include full lengths of General Washington (1790) and George Clinton (1791), in the city-hall of New York—where there are also full lengths of Hamilton and of Jay; and portraits of John Adams (1797), Jonathan Trumbull, and Rufus King (1800); of Timothy Dwight and Stephen Van Rensselaer, both at Yale; of Alexander Hamilton (in the Metropolitan Museum of Art, New York City, and in the Boston Museum of Fine Arts, both taken from Ceracchi's bust); a portrait of himself painted in 1833; a full length of Washington, at Charleston, South Carolina; a full length of Washington in military costume (1792), now at Yale; and portraits of President and Mrs Washington (1794), in the National Museum at Washington. Trumbull's own portrait was painted by Stuart and by many others. In 1794 Trumbull acted as secretary to John Jay in London during the negotiation of the treaty with Great Britain, and in 1796 he was appointed by the commissioners sent by the two countries the fifth commissioner to carry out the seventh article of the treaty. He was president of the American Academy of Fine Arts in 1816–1825. He died in New York on the 10th of November 1843.

See his *Autobiography* (New York, 1841); J. F. Weir, *John Trumbull, A brief Sketch of His Life, to which is added a Catalogue of his Works* (New York, 1901); and John Durand, "John Trumbull," *American Art Review*, vol. ii. pt. 2, pp. 181–191 (Boston, 1881).

TRUMBULL, JONATHAN (1710–1785), American political leader, was born at Lebanon, Connecticut, on the 12th of October 1710. He graduated at Harvard in 1727, and began the study of theology, but in 1731 engaged in business with his father. He next studied law, was elected to the Assembly in 1773, and held public office almost continuously afterward. He served for seven years in the Assembly, being Speaker for three years, for seventeen years as county judge of Windham county, for twenty-two years (after 1740) as governor's assistant, for two years as deputy-governor (1767–1769), and for three years (1766–1769) as chief justice of the colony. In 1769 he was elected governor and continued in office until his voluntary retirement in 1784. During the War of Independence he was a valued counsellor of Washington. The story that the term "Brother Jonathan," a sobriquet for the United States, originated in Washington's familiar form of addressing him seems to be without any foundation. After the war Trumbull was a strong Federalist. He died in Lebanon on the 17th of August 1785.

His public papers have been printed in the Massachusetts Historical Society's *Collections*, 5th series, vols. ix.–x. (Boston, 1885–1888), and 7th series, vols. ii.–iii. (1902). See I. W. Stuart, *Life of Jonathan Trumbull, sen.* (Boston, 1859).

His son JONATHAN (1740–1809) graduated at Harvard in 1759, served in the War of Independence as paymaster-general of the northern department in 1775–1778 and as a military secretary of Washington in 1778–1783, and was a member of the national House of Representatives in 1789–1795, serving as Speaker in 1791–1793, and of the United States Senate in 1795–1796; he was lieutenant-governor of Connecticut in 1796–1798, and governor in 1798–1809. Another son, JOSEPH (1737–1778), was a member of the first Continental Congress (1774–1775), became commissary-general of stores of the Continental army in July 1775 and commissary-general of purchases in June 1777, resigned in August 1777, and from November 1777 to April 1778 was commissioner for the board of war. A grandson of the first Jonathan, JOSEPH (1782–1861), was a Whig representative in Congress in 1834–1835 and in 1839–1843, and was governor of Connecticut in 1849–1850.

TRUMBULL, LYMAN (1813–1896), American jurist and political leader, was born at Colchester, Connecticut, on the 12th of October 1813, and was a grandson of Benjamin Trumbull (1735–1820), a Congregational preacher and the author of a useful *Complete History of Connecticut* (2 vols., 1818). He taught in Georgia, studied law, and was admitted to the bar in 1837. Removing to Belleville, Illinois, in the same year, he was elected to the state House of Representatives as a Democrat in 1840, and in 1841–1843 was secretary of state of Illinois. In 1848–1853 he was a justice of the state Supreme Court, and in 1855–1873 was a member of the United States Senate. Elected as an Anti-Nebraska Democrat, he naturally joined the Republicans, and when this party secured control in the Senate he was made chairman of the important judiciary committee, from which he reported the Thirteenth Amendment to the Constitution of the United States abolishing slavery. Throughout the Civil War he was a trusted counsellor of the president. In the impeachment trial of President Andrew Johnson he was one of the seven Republicans who voted to acquit, and he afterwards returned to the Democratic party. After 1873 he practised law in Chicago, was the Democratic candidate for governor of Illinois in 1880, became a Populist in 1894, and defended the railway strikers in Chicago in the same year. He died in Chicago on the 25th of June 1896.

TRUMP (1) (O. Fr. *trompe*), originally the name of a musical instrument, of which "trumpet" is a diminutive; the term is now chiefly used in the sense of the sound of a trumpet, or a sound resembling it, such as is made by an elephant. It has been usually accepted that the Romanic forms (cf. Span. and Port. *trompa*) represent a corruption of Latin *tuba*, tube. On the other hand a distinct imitative or echoic origin is sometimes assigned. (2) In the sense of a playing card belonging to the suit which beats all other cards of other suits for the period during which its rank lasts, "trump" is a corruption of "triumph." The name was first used of a game of cards, also known as "ruff," which was the parent of the modern game of whist. There are traces in English of an early confusion with a term meaning to deceive or trick, cf. "trumpery," properly deceit, imposture, hence idle talk, gossip, now chiefly used as an adjective, worthless, trivial. This is an adaptation of French *tromper*, to deceive, which, according to the generally received explanation, meant "to play on the trumpet," *se tromper de quelqu'un* being equivalent to play with a person, hence to cheat.

TRUMPET (Fr. *trompette, clairon*; Ger. *Trompete, Klarino, Trummet*; Ital. *tromba, trombetta, clarino*), in music, a brass wind instrument with cup-shaped mouthpiece and a very characteristic tone. It consists of a brass or silver tube with a narrow cylindrical bore except for the bell joint, forming from ⅓ to ¼ of the whole length, which is conical and terminates in a bell of moderate diameter. The tube of the trumpet is doubled round upon itself to form a long irregular rectangle with rounded corners. A tuning slide consisting of two U-shaped cylindrical tubes fitting into each other is interpolated between the bell joint and the long cylindrical joint to which the mouthpiece is attached. The mouthpiece consists of a hemispherical cup with a rim across which the lips stretch. The shape of the cup, and more especially of the bottom, in which is pierced a hole communicating with the main bore, is of the greatest importance on account of its influence on the tone quality and on the production of the higher harmonics (see MOUTHPIECE). The shallower and smaller the cup the more easily are the higher harmonics produced; the sharper the angle at the bottom of the cup the more brilliant and incisive is the timbre, given, of course, the correct style of blowing. The diameter of the cup varies according to the pitch and to the lip-power of the player who chooses one to suit him. See HORN for the laws governing the acoustic properties of brass tubes and the production of sound by means of the lips stretched like a vibrating membrane across the mouthpiece.

There are three principal kinds of trumpets: (1) the natural trumpet, mainly used in cavalry regiments, in which the length of the tube and pitch are varied by means of crooks; (2) the slide and double-slide trumpets, in which a chromatic compass is obtained, as in the trombone, by double tubes sliding upon one another without loss of air; (3) the valve trumpet, similar in its working to all other valve instruments. The first and second of these alone give the true trumpet timbre; the tone of the valve trumpet approximates to that of the cornet, nevertheless, it is now almost universally used.

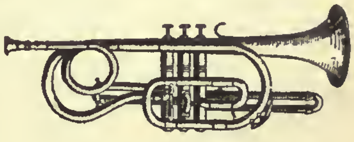


FIG. 1.—Military Trumpet in F (Besson).

In the trumpet the notes of the harmonic series from the 3rd to the 10th or 16th upper partials are produced by the varied tension of the lips and pressure of breath called overblowing. The fundamental and the second harmonic are rarely obtainable, and are therefore left out of consideration; the next octave from the 4th to the 8th harmonics contains only the 3rd, 5th and minor 7th, and is therefore mainly suitable for fanfare figures based on the common chord. The diatonic octave is the highest and its upper notes are only reached by very good players on trumpets of medium pitch. Examination of the scoring for the trumpet before any satisfactory means of bridging over the gaps in the compass had been found, shows how little the composers, and especially Bach, allowed themselves to be daunted by the limited resources at their disposal. A curious phenomenon has been observed [1] in connexion with the harmonic series of the trumpet, when the instrument is played by means of a special clarino mouthpiece (a shallow one enabling the performer to reach the higher harmonics), in which the passage at the bottom of the cup inaugurated by the sharp angle (known as the *grain* in French) is prolonged in *cylindrical* instead of conical bore for a distance of about 10 cm. (4 in.) right into the main tube. This peculiar construction of the mouthpiece, which might be considered insignificant, so upsets the acoustic properties of the tube that extra notes can be interpolated between the legitimate notes of the harmonic series thus:—

The black notes represent the extra notes, which in the next octave transform the diatonic into a chromatic scale.

This phenomenon may perhaps furnish an explanation of some peculiarities in the scoring of Bach and other composers of his day, and also in accounts of certain performances on the trumpet which have read [2] as fairy tales. It is probable that the clarino mouthpiece was one of the secrets of the gilds which has remained undiscovered till now. D. J. Blaikley writes [3]: "I had an opportunity yesterday of trying the trumpet mouthpiece as described by Mahillon with the 'grain' or 'throat,' as we would call it, extended for about 10 cm. and terminating abruptly. With such a mouthpiece, used by itself without any trumpet, I could easily get notes from  to  that is to say, that a continuous glide ranging over that compass can be made, the pitch at any moment being determined by the lip-pressure, rather than by the small air-column. When such a distorted mouthpiece is fitted to a

[1] See V. Mahillon, *La Trompette, son histoire, sa théorie, sa construction* (Brussels and London, 1907, pp. 29–30).

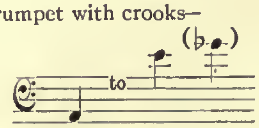
[2] See Fétis, *Biographie universelle des musiciens*, "Fantini."

[3] Letter to the present writer, 6th of February 1909.

trumpet, we have a resonator whose proper tones are disturbed and all the notes sounded are capable of being much modified in pitch by the lips. For instance, we may regard the 'd' as either No. 4 sharpened or No. 5 flattened, merely by lip-action, and other notes in the same way."

The compass of the three kinds of trumpets in real sounds is as follows:—

For the natural trumpet with crooks—



For the slide or double-slide trumpet with all chromatic semitones—

This instrument is a non-transposing one, the music being sounded as written.

For the valve trumpet—

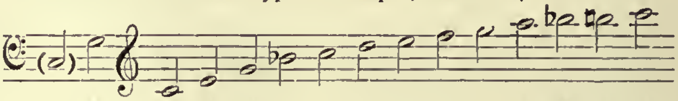
The material of which the tube is made has nothing to do with the production of that brilliant quality of tone by which the trumpet is so easily distinguished from every other mouthpiece instrument; the difference is partly due to the distinct form given to the basin of the mouthpiece, as stated above, but principally to the proportions of the column of air determined by the bore. The difference in timbre between trumpet and trombone is accounted for by the wider bore and differently shaped mouthpiece of the latter instrument.

Tonguing, both double and triple, is used with great effect on the trumpet: this device consists in the articulation with the tongue of the syllables *te-ke* or *ti-ke* repeated in rapid succession for groups of two or four notes and of *te-ke-ti* for triplets.

We have no precise information as to the form which the lituus, one of the ancestors of the modern trumpet, assumed during the middle ages, and it is practically unrepresented in the miniatures and other antiquities, though there is a miniature in the Bible, presented in 850 to Charles the Bald, which places the lituus in the hands of one of the companions of King David. We are not, however, warranted in concluding from this that the Etruscan instrument was in use in the 9th century.[1] The lituus or cavalry trumpet of the Romans seems to have vanished with the fall of the Roman Empire, for although the name occasionally finds a place in Latin vocabularies, the instrument and name are both unrepresented in the development of musical instruments of western Europe: its successor, the cavalry trumpet of the 15th and succeeding centuries, was evolved from the straight *busine*, an instrument traced, by means of its name no less than by the delicate proportions of its tube and the shape of the bell, to the Roman buccina (*q.v.*). The straight busines, if we may judge from the presentments made by various artists, were not all made with bores of the same calibre, some having the wider bore of the trombone, others that of the trumpet. They abound in the illuminated MSS. of the 11th to the 14th centuries. The uses to which they are put, as the instruments of angels, of heralds, of trumpeters on horseback and on foot, at court banquets and functions of state, form additional proof of their identity. Fra Angelico (d. 1455) painted angels with trumpets having either straight or zigzag tubes, the shortest being about 5 ft. long. The perfect representation of the details, the exactness of the proportions, the natural pose of the angel players, suggest that the artist painted the instrument from real models.

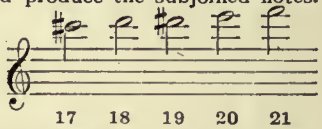
The credit of having bent the tube of the trumpet in three parallel branches, thus creating its modern form, has usually been claimed for a Frenchman named Maurin (1498–1515). But the transformation was really made much earlier, probably in the Low Countries or north Italy; in any case it had already been accomplished in the bas-reliefs of Luca della Robbia intended to ornament the organ chamber of the cathedral of Florence where a trumpet having the tube bent back as just described is very distinctly figured. From the beginning of the 16th century we have numerous sources of information. Virdung[2] cites three kinds of mouthpiece instruments—the *Felttrumet*, the *Clareta*, and the *Thurner Horn*; unfortunately he does not mention their distinctive characters, and it is impossible to make them out by examination of his engravings. Probably the Felttrumet and the Clareta closely resembled each other; but the compass of the former, destined for military signals, hardly went beyond the eighth proper tone, while the latter, reserved for high parts, was like the clarino (see below). The Thurner Horn was probably a kind of clarino or clarion used by watchmen on the towers. The *Trummet* and the *Jäger Trommet* are the only two mouthpiece instruments of the trumpet kind cited by Praetorius.[3] The first was tuned in D at the chamber pitch or "Cammerton," but with the help of a shank it could be put in C, the equivalent of the "chorton" D, the two differing about a tone. Sometimes the Trummet was lowered to B and even B♭. The Jäger Trommet, or "trompette de chasse," was composed of a tube bent several times in circles, like the posthorn, to make use of a comparison employed by Praetorius himself. His drawing does not make it clear whether the column of air was like that of the trumpet; there is therefore some doubt as to the true character of the instrument. The same author further cites a wooden trumpet (*hölzern Trommet*), which is no other than the Swiss Alpenhorn or the Norwegian luur. The shape of the trumpet, as seen in the bas-reliefs of Luca della Robbia, was retained for more than three hundred years: the first alterations destined to revolutionize the whole technique of the instrument were made about the middle of the 18th century. Notwithstanding the imperfections of the trumpet during this long period, the performers upon it acquired an astonishing dexterity.

The usual scale of the typical trumpet, that in D, is



2 3 4 5 6 7 8 9 10 11 12 13 14 15 16

Praetorius exceeds the limits of this compass in the higher range, for he says a good trumpeter could produce the subjoined notes. This opinion is shared by Bach, who, in a trumpet solo which ends the cantata "Der Himmel lacht," wrote up to the twentieth harmonic. So considerable a compass could not be reached by one instrumentalist: the trumpet part had therefore to be divided, and each division was designated by a special name.[4] The part that was called principal went from the fifth to the tenth of these tones. The higher region, which had received the name of "clarino," was again divided into two parts: the first began at the eighth proper tone and mounted up towards the extreme high limit of the compass, according to the skill of the executant; the second, beginning at the sixth proper tone, rarely went beyond the twelfth. Each of these parts was confided to a special trumpeter, who executed it by using a larger or a smaller mouthpiece. Some of the members of the harmonic series also received special names; the fundamental or first proper note was called *Flattergrob*, the second *Grobstimme*, the third *Faulstimme*, the fourth *Mittelstimme*.



17 18 19 20 21

Playing the clarino differed essentially from playing the military trumpet, which corresponded in compass to that called principal. Compelled to employ very small mouthpieces to facilitate the emission of very high sounds, clarino players could not fail to alter the timbre of the instrument, and instead of getting the brilliant and energetic quality of tone of the mean register they were only able to produce more or less sonorous notes without power and splendour. Apart from this inconvenience, the clarino presented numerous deviations from just intonation. Hence the players of that time failed to obviate the bad effects inevitably resulting from the natural imperfection of the harmonic scale of the trumpet in that extreme part of its compass; in the execution, for instance, of the works of Bach, where the trumpet should give sometimes , and sometimes , the instrumentalist could only command the eleventh proper tone, which is neither the one nor the other of these. Further, the thirteenth proper tone, for which  is written, is really too flat, and but little can be done to remedy this defect, since it entirely depends upon the laws of resonance affecting columns of air.

[3] *Organographia* (Wolfenbüttel, 1619).

[4] *Musicus αὐτοδίδακτος oder der sich selbst informirende Musicus* (Eisel, Erfurt, 1738).

Since the abandonment of the clarino (about the middle of the 18th century) our orchestras have been enriched with trumpets that permit the execution of the old clarino parts, not only with perfect justness of intonation, but with a quality of tone that is not deficient in character when compared with the mean register of the old principal instrument. The introduction of the clarinet or the so-called little clarino, although it is a wood wind instrument played with a reed, is one of the causes which led to the abandonment of the older instrument and may explain the preference given by the composers of that epoch to the mean register of the trumpet. The clarino having disappeared before Mozart's day, he had to change the trumpet parts of Handel and Bach to allow of their execution by the performers of his own time. It was now that crooks began to be frequently used. Trumpets were made in F instead of in D, furnished with a series of shanks of increasing length for the tonalities of E, E♭, D, D♭, C, B, B♭, and sometimes even A.

The first attempts to extend the limited resources of the instrument in its new employment arose out of Hampel's *Inventions-Horn*, in which, instead of fixing the shanks between the mouthpiece and the upper extremity, they were adapted to the body of the instrument itself by a double slide, upon the two branches of which tubes were inserted bent in the form of a circle and gradually lengthened as required. This system was applied to the trumpet by Michael Woegel (born at Rastatt in 1748), whose "invention trumpet" had a great success, notwithstanding the unavoidable imperfection of a too great disparity in quality of tone between the open and closed sounds. It is a curious fact that the sackbut or early trombone was merely a trumpet with a slide, or a draw trumpet, and that it was known as such in England, Scotland, Spain, Holland and Italy. Yet as soon as the powerful family of tenor and bass trombones had been created, the slide trumpet seems to have lost its identity and to have become merged in the alto trombone from which it differed mainly in the form of the bent tube. The slide trumpet appears to have been re-invented in the 18th century according to Johann Ernst Altenburg, or as some

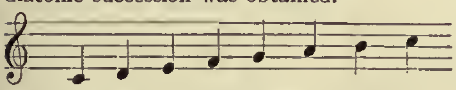
FIG. 2.—Modern Slide Trumpet F to C (Besson).

writers put it, "the slide was adapted to it from the trombone." It was mentioned in 1700 by Kuhnau.[1] Any one wishing to be convinced of this re-incarnation may compare the modern slide-trumpet with the original slide-trumpet or alto sackbut in the *Grimiani Breviary*,[2] a MS. of the 15th century, and with E. van der Straeten's reproduction[3] of an old engraving by Galle and Stradan from the *Encomium Musices* in which the forms are identical except that in the modern slide-trumpet the bell reaches the level of the U-shaped bottom of the slide.

(From the *Encomium Musices.*)

FIG. 3.—Slide Trumpet 16th century.

The slide trumpet is still used in England in a somewhat modified form. The slide is a short one allowing of four positions. In 1889 a trumpet was constructed by Mr W. Wyatt with a double slide which gave the trumpet a complete chromatic compass. This instrument, which has the true brilliant trumpet tone, requires delicate manipulation, for the shifts are necessarily very short. About 1760 Kölbel, a Bohemian musician,[4] applied a key to the bugle, and soon afterwards the trumpet received a similar addition. By opening this key, which is placed near the bell, the instrument was raised a diatonic semitone, and by correcting errors of intonation by the tension of the lips in the mouthpiece the following diatonic succession was obtained.



This invention was improved in 1801 by Weidinger,[5] trumpeter to the imperial court at Vienna, who increased the number of keys and thus made the trumpet chromatic throughout its scale.[6] The instrument shown in fig. 4 is in G; the keys are five in number, and as they open one after another or in combination it is possible to connect the second proper tone with the third by chromatic steps, and thus produce the following succession:—

The number of keys was applied to fill up the gaps between the extreme sounds of the interval of a fifth; and a like result was arrived at more easily for the intervals of the fourth, the major third, &c., furnished by the proper tones of 3, 4, 5, &c. But, though the keyed trumpet was a notable improvement on the invention trumpet, the sounds obtained by means of the lateral openings of the tube did not possess the qualities which distinguish sounds caused by the resonance of the air-column vibrating in its entirety. But in 1815 Stölzel made a genuine chromatic trumpet by the invention of the Ventile or piston.[7] The natural-trumpet is now no longer employed except in cavalry regiments.[8] It is usually in E♭. The bass trumpet in E♭, which is an octave lower, is sometimes, but rarely, used. Trumpets with pistons are generally constructed in F, with crooks in E and E♭. In Germany trumpets in the high B♭ with a crook in A are very often used in the orchestra. They are easier for cornet à piston players than the trumpet in F. A quick change trumpet in B♭ with combined tuning and transposing slides, for changing into the key of A, known as the "Proteano" trumpet,

FIG. 4.—Keyed Trumpet.

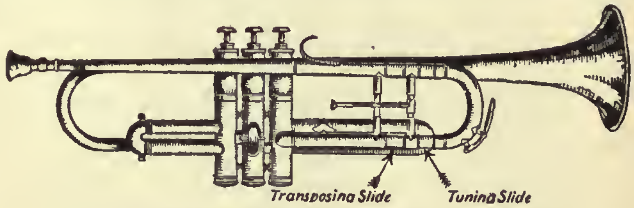


FIG. 5.—Proteano Trumpet in B♭ and A (Besson).

has been patented by Messrs Besson & Co. The transposing slide always remains at the correct length, and change of the tuning slide does not necessitate readjustment of the former. This combination slide is fitted to the ordinary valve trumpet as well as to the trumpet with "enharmonic" valves. Mahillon constructed for the concerts of the Conservatoire at Brussels trumpets in the high D, an octave above the old trumpet in the same key. They permit the execution of the high trumpet parts of Handel and J. S. Bach. The bass trumpet with pistons used for Wagner's tetralogy is in E♭, in unison with the ordinary trumpet with crooks of D and C; but, when constructed so as to allow of the production of the second proper tone as written by this master, this instrument belongs rather to the trombones than to the trumpets.

(V. M.; K. S.)

TRUMPET, SPEAKING AND HEARING. The speaking trumpet, though some instrument of the kind appears to have been in earlier use, is connected in its modern form with the name of Athanasius Kircher and that of Sir Samuel Morland, who in 1670 proposed to the Royal Society of London the question of

[6] Robert Eitner made a curious confusion between the keyed and valve trumpets (*Klappen-und Ventil-Trompete*). In an article entitled *Wer hat die Ventil-Trompete erfunden?* (*Monatshefte für Musikwissenschaft*, p. 41, Berlin, 1881) he deprives Stölzel of the credit of the invention of the valve in favour of Weidinger, ridiculing the notion that the keyed and the valve trumpets were not *one and the same thing*. Following up the idea in his *Tonkünstler Lexikon*, he leaves out Stölzel's name and ascribes to Weidinger the invention of the valve, with a reference to his article.

[7] For this ingenious mechanism, see VALVE; also Gottfried Weber, *Über Ventilhorn und Trompete mit 3 Ventilen*, *Caecilia* xvii. 73–104 (Mainz, 1835); and *Allg. musikal. Ztg.* xxiii. 411 (Leipzig, 1821); also A. Ung, "Verbesserung der Trompete und ähnlicher Instrumente," ibid. (1815), xviii. 633.

[8] For accounts of the early use of the trumpet as a signalling and cavalry instrument in the British army, see Sir Roger Williams, *A Brief Discourse of War*, p. 9, &c. (London, 1590); Grose, *Military Antiquities*, ii. 41; Sir S. D. Scott, *The British Army*, ii. 389–400 (London, 1868); and H. G. Farmer, *Memoirs of the Royal Artillery Band* (London, 1904).

the best form for a speaking trumpet. Lambert, in the *Berlin Memoirs* for 1763, seems to have been the first to give a theory of the action of this instrument, based on an altogether imaginary analogy with the behaviour of light. In this theory, which is still commonly put forward, it is assumed that sound, like light, can be propagated in rays. This, however, is possible only when the aperture through which the wave-disturbance passes into free air is large compared with the wave-length. If the fusiform mouth of the speaking trumpet were half a mile or so in radius, Lambert's theory might give an approximation to the truth. But with trumpets whose aperture is only a foot in diameter at the most the problem is one of diffraction.

In the hearing trumpet, the disturbance is propagated along the converging tube much in the same way as the tide-wave is propagated up the estuary of a tidal river. In speaking and hearing trumpets alike all reverberation of the instrument should be avoided by making it thick and of the least elastic materials, and by covering it externally with cloth. (See SOUND.)

TRUMPETER, or TRUMPET-BIRD, the literal rendering in 1747, by the anonymous English translator of De la Condamine's travels in South America (p. 87), of that writer's "Oiseau trompette" (*Mém. de l'Acad. des Sciences*, 1745, p. 473), a bird, which he says was called "Trompetero" by the Spaniards of Maynas on the upper Amazons, from the peculiar sound it utters. He added that it was the "Agami" of the inhabitants of Para and Cayenne,[1] wherein he was not wholly accurate, since those

(After Mitchell.)
White-winged Trumpeter (*Psophia leucoptera*).

birds are specifically distinct, though, as they are generically united, the statement may pass. But he was also wrong, as had been P. Barrère (*France equinoxiale*, p. 132) in 1741, in identifying the "Agami" with the "Macucagua" of Marcgrav, for that is a Tinamou (*q.v.*); and both still more wrongly accounted for the origin of the peculiar sound just mentioned, whereby Barrère was soon after led (*Ornith. Spec. Novum*, pp. 62, 63) to apply to the bird the generic and vulgar names of *Psophia* and "Petteuse," the former of which, being unfortunately adopted by Linnaeus, has ever since been used, though in 1766 and 1767 Pallas (*Miscellanea*, p. 67, and *Spicilegia*, iv. 6), and in 1768 Vosmaer (*Descr. du Trompette Américain*, p. 5), showed that the notion it conveys is erroneous. Among English writers the name "Trumpeter" was carried on by Latham and others so as to be generally accepted, though an author may occasionally be found willing to resort to the native "Agami," which is that almost always used by the French.

P. L. Sclater and O. Salvin in their *Nomenclator* (p. 141) admit 6 species of Trumpet-Birds: (1) the original *Psophia crepitans* of Guiana; (2) *P. napensis* of eastern Ecuador (which is very likely the original "Oiseau trompette" of De la Condamine); (3) *P. ochroptera* from the right bank of the Rio Negro; (4) *P. leucoptera* from the right bank of the upper Amazons; (5) *P. viridis* from the right bank of the Madeira; and (6) *P. obscura* from the right bank of the lower Amazons near Para. And they have remarked in the Zoological *Proceedings* (1867, p. 592) on the curious fact that the range of the several species appears to be separated by rivers, a statement confirmed by A. R. Wallace (*Geogr. Distr. Animals*, ii. 358); and in connexion therewith it may be observed that these birds have short wings and seldom fly, but run, though with a peculiar gait, very quickly. A seventh species *P. cantatrix*, from Bolivia, has since been indicated by W. Blasius (*Journ. f. Ornith.*, 1884, pp. 203–210), who has given a monographic summary of the whole group very worthy of attention. The chief distinctions between the species lie in colour and size, and it will be here enough to describe briefly the best known of them, *P. crepitans*. This is about the size of a large barndoor fowl; but its neck and legs are longer, so that it is a taller bird. The head and neck are clothed with short velvety feathers; the whole plumage is black, except that on the lower front of the neck the feathers are tipped with golden green, changing according to the light into violet, and that a patch of dull rusty brown extends across the middle of the back and wing-coverts, passing into ash-colour lower down, where they hang over and conceal the tail. The legs are bright pea-green. The habits of this bird are very wonderful, and it is much to be wished that fuller accounts of them had appeared. The curious sound it utters, noticed by the earliest observers, has been already mentioned, and by them also was its singularly social disposition towards man described; but the information supplied to Buffon (*Oiseaux*, iv. 496–501) by Manoncour and De la Borde, which has been repeated in many works, is still the best we have of the curious way in which it becomes semi-domesticated by the Indians and colonists and shows strong affection for its owners as well as for their living property—poultry or sheep—though in this reclaimed condition it seems never to breed.[2] Indeed nothing can be positively asserted as to its mode of nidification; but its eggs, according to C. E. Bartlett, are of a creamy white, rather round, and about the size of bantams'. C. Waterton in his *Wanderings* (Second Journey, chap. iii.) speaks of falling in with flocks of 200 or 300 "Waracabas," as he called them, in Demerara, but added nothing to our knowledge of the species; while the contributions of Trail (*Mem. Wern. Society*, v. 523–532) and as Dr Hancock (*Mag. Nat. History*, 2nd series, vol. ii. pp. 490–492) as regards its habits only touch upon them in captivity.

To the trumpeters must undoubtedly be accorded the rank of a distinct family, *Psophiidae*; but like so many other South-American birds they seem to be the less specialized descendants of an ancient generalized group—perhaps the common ancestors of the *Rallidae* and *Gruidae*. The structure of the trachea, though different from that described in any Crane (*q.v.*), suggests an early form of the structure which in some of the *Gruidae* is so marvellously developed, for in *Psophia* the windpipe runs down the breast and belly immediately under the skin to within about an inch of the anus, whence it returns in a similar way to the front of the sternum, and then enters the thorax. Analogous instances of this formation occur in several other groups of birds not at all allied to the *Psophiidae*. (A. N.)

TRUNK (Fr. *tronc*, Lat. *truncus*, cut off, maimed), properly the main stem of a tree from which the branches spring, especially the stem when stripped of the branches; hence, in a transferred sense, the main part of a human or animal body without the head, arms or legs. It is from this last sense that the term "trunk-hose" is derived. These were part of the typical male costume of the 16th century, consisting of a pair of large puffed and slashed over-hose, reaching from the waist to the middle of the thigh, the legs clad in the long hose being thrust through them; the upper part of the body was covered by the jerkin or jacket reaching to the thigh (see COSTUME). The word "trunk" as applied to the elongated proboscis of the elephant is due to a mistaken confusion of French *trompe*, trump, with "trunk" meaning the hollow stem of a tree. A somewhat obscure meaning of French *tronc*, *i.e.* an alms-box, has given rise to the general use of "trunk" for a form of travellers' luggage.

TRURO, THOMAS WILDE, 1ST BARON (1782–1855), lord chancellor of England, was born in London on the 7th of July

[1] Not to be confounded with the "Heron Agami" of Buffon (*Oiseaux*, ii. 382), which is the *Ardea agami* of other writers.

[2] In connexion herewith may be mentioned the singular story told by Montagu (*Orn. Dict.*, Suppl. Art. "Grosbeak, White-winged"), on the authority of the then Lord Stanley, afterwards president of the Zoological Society, of one of these birds, which, having apparently escaped from confinement, formed the habit of attending a poultry-yard. On the occasion of a pack of hounds running through the yard, the trumpeter joined and kept up with them for nearly three miles!

1782, being the second son of Thomas Wilde, an attorney. He was educated at St Paul's School and was admitted an attorney in 1805. He subsequently entered the Inner Temple and was called to the bar in 1817, having practised for two years before as a special pleader. Retained for the defence of Queen Caroline in 1820 he distinguished himself by his cross-examination and laid the foundation of an extensive common law practice. He first entered parliament in the Whig interest as member for Newark (1831–1832 and 1835–1841), afterwards representing Worcester (1841–1846). He was appointed solicitor-general in 1839, and became attorney-general in succession to Sir John (afterwards Baron) Campbell in 1841. In 1846 he was appointed chief justice of the common pleas, an office he held until 1850, when he became lord chancellor, and was created Baron Truro of Bowes, Middlesex. He held this latter office until the fall of the ministry in 1852. He died in London on the 11th of November 1855. His son Charles (1816–1891) succeeded as 2nd baron, but on the death of his nephew the 3rd baron in 1899 the title became extinct.

Lord Truro was the uncle of James Plaisted Wilde, Baron Penzance (1816–1899), who was appointed a baron of the court of exchequer in 1860, and was judge of the court of probate and divorce from 1863 to 1872. In 1875 he was appointed dean of the court of arches, retiring in 1899. He was created a peer in 1869, but died without issue, and the title became extinct.

TRURO, the chief town of Colchester county, Nova Scotia, on the Salmon river, near the head of Cobequid Bay, 61 m. from Halifax by rail. Pop. (1901), 5993. It is an important junction on the Intercolonial and Midland railways, and the thriving centre of a lumbering and agricultural district. There are numerous local industries, such as engine and boiler works, carriage factory and milk-condensing factory. It also contains the county buildings and the provincial normal school. The Victoria (or Joseph Howe) Park in the vicinity is of great natural beauty.

TRURO, an episcopal city and municipal borough in the Truro parliamentary division of Cornwall, England, 11 m. N. of Falmouth, on the Great Western railway. Pop. (1901), 11,562. It lies in a shallow valley at the junction of the small rivers Kenwyn and Allen in Truro river, a branch creek of the great estuary of the Fal. It is built chiefly of granite, with broad streets, through the chief of which there flows a stream of water. The episcopal see was founded in 1876, covering the former archdeaconry of Cornwall in the diocese of Exeter; the area including the whole of the county of Cornwall, with a small portion of Devonshire. The cathedral church of St Mary was begun in 1880 from the designs of John Loughborough Pearson, and is among the most important modern ecclesiastical buildings in England. The architect adopted the Early English style, making great use of the dog-tooth ornament. The form of the church is cruciform, but it is made irregular by the incorporation, on the south side of the choir, of the south aisle of the parish church, this portion retaining, by Act of Parliament of 1887, all its legal parochial rights. The design of the cathedral includes a lofty central and two western towers with spires, and a rich west front and south porch; with a cloister court and octagonal chapter-house on the north. Among other noteworthy modern institutions may be mentioned the theological library presented by Bishop Phillpotts in 1856, housed in a Gothic building (1871). The grammar school possesses exhibitions to Exeter College, Oxford. Truro has considerable trade in connexion with the tin mines of the neighbourhood. There are tin-smelting works, potteries, and manufactures of boots, biscuits, jam and clothing. Small vessels can lie at the quays, though the harbour is dry at low water; but large vessels can approach within three miles of the city. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 1127 acres.

At the time of the Domesday Survey Truro (Trueret, Treurok, Treueru) was a comparatively small manor held by Jovin of Count Robert of Mortain. Its municipal charter dates from Richard Lucy the chief justiciar who held the demesne lands and under whom the free burgesses had apparently a grant of sake and soke, toll and team and infangenethef. Reginald earl of Cornwall, by an undated charter, added to these privileges exemption from the jurisdiction of the hundred and county courts and from toll throughout the county. Henry II. confirmed the grant of his uncle the said Reginald. In 1304 Truro was constituted a coinage town for tin. In 1378 the sheriff reported that the town was so impoverished by pestilence, hostile invasions and intolerable payments made to the king's progenitors that it was almost uninhabited and wholly wasted. A similar complaint was preferred in 1401 in consequence of which the fifteenth and tenth amounting to £12 was for the three years ensuing reduced to 50s. The charter of incorporation granted in 1589 provided for a mayor, recorder and steward and a council of twenty capital burgesses and four aldermen. Under it the mayor and burgesses were to enjoy the liberties of infangenethef, utfangenethef, sake, soke, toll, team, thefbote, backberindthef and ordelf; also freedom from toll passage, pontage, murage, fletage, picage, anchorage, stallage, lastage and tollage of Horngeld throughout England except in London; they were, moreover, to be entitled in respect of their markets to pontage, keyage, &c. The assize of bread and ale and wine and view of frankpledge were also granted and a court of piepowder was to regulate certain specified fairs. In 1835 the number of aldermen was increased to six. From 1295 to 1885 Truro enjoyed separate parliamentary representation, returning two members. The charter of 1589 provided that the burgesses should have power by means of the common council to elect them. Such was the procedure from 1589 to 1832 when the burgesses recovered the privilege. Under the Redistribution of Seats Act of 1885 the representation of Truro was merged in the county. No fairs or markets are mentioned prior to 1589 when two markets, on Saturdays and Wednesdays, were provided, also three fairs. Both markets and two of the three fairs are held.

See *Victoria County History: Cornwall*; Canon Donaldson, *Bishopric of Truro* (1902).

TRUSS (from O. Fr. *trusser*, *trosser*, *torser*, *trousser*, to pack, bind, gird up, Low Lat. *tortiare*, formed from *tortus*, twisted, *torquere*, to twist; cf. "torch" and "trousers," also *trousseau*, a bride's outfit, literally a small pack or bundle), a pack or bundle, applied specifically to a quantity of hay or straw tied together in a bundle. A truss of straw contains 36 lb, of old hay 56 lb, of new hay 60 lb. A load contains 36 trusses. The term is also used generally of a supporting frame or structure, especially in the construction of a roof or a bridge. It is thus used as the name of a surgical appliance, a belt with an elastic spring keeping in place a pad used as a support in cases of hernia (*q.v.*).

TRUST COMPANY, the name given to a form of fiduciary corporation, originally adopted in the United States under state laws to accomplish financial objects not specially provided for under the national banking system. The function which gives a trust company its name is to execute trusts for individuals, estates and corporations. In the United States, however, these functions have been extended to include many of those of commercial banks receiving deposits payable on demand and subject to check. The relations between trust companies and their depositors are based, however, upon different principles from those between the bank and its client (see Banks and Banking). The larger trust companies prefer deposit accounts which, even when subject to check, are not actively drawn upon. The fact that they pay interest on such deposits absolves them from the obligation to extend accommodation by way of loans, except upon collateral security. Hence out of the difference in their relations with depositors grows a difference in the character of their investments, which are usually in loans on stock exchange securities and not on commercial paper discounted. In New York they are prohibited from directly discounting commercial paper, but not from buying it. The rate of interest paid on demand deposits is usually

2% for small accounts, and 3% for large accounts; for time deposits it is sometimes more.

In the administration of estates for private individuals, the trust company has taken the place to a large extent of individual attorneys. The trust company has the advantage of corporate responsibility, which involves continuous life, and of proper offices, fire-proof safes, and special employees in each department devoting their time and attention exclusively to their special functions. Investments for estates are limited by law, like savings bank investments, to certain classes of securities, and a trust company has little temptation to violate such laws. It is customary, moreover, for investments of trust funds to be made by authority of the board of directors, thus protecting the estate against the uncertainties of individual judgment.

The trust company has found a special field in America as agent of railway and industrial corporations in the issue, transfer and exchange of securities. For these purposes it has an organized system, tested by experience, more perfect in its operation and less expensive than each corporation could organize for itself separately. As trustee for the bondholders under a railway mortgage, for instance, it becomes the duty of the trust company, in case of default in payment of interest on the bonds, to take steps to foreclose the mortgage and protect the bondholders. Trust companies have sometimes been named as receivers of failed banks.

The big industrial combinations in America have contributed to the business of the trust companies as registrars or transfer agents for capital stock, agents for the issue of bonds and payment of interest thereon, agents for underwriting and distributing new securities, and depositories of securities and cash under plans of reorganization or while held in escrow. In the case of the reorganization of the tobacco companies, in the autumn of 1904, securities aggregating about $600,000,000 passed through the hands of the trust company charged with the work; and while this was the largest single operation of its kind, it is typical of many similar operations resulting from the activity in the creation of new companies in America which bring business to trust companies.

The attractions offered by the trust company to the non-commercial depositor by the payment of interest on his deposit built up the deposit balances of trust companies rapidly after 1896. Their competition in this respect with national banks soon led to an effort to compel trust companies to keep cash reserves against their deposits. This demand was resisted for a while, but in 1903 a rule was made by the New York Clearing House requiring trust companies to keep certain reserves. The alternative was to withdraw from the Clearing House, and this all but a few did. The New York legislature, however, at the session of 1906, passed an act requiring trust companies in New York city to establish within fixed dates reserves of 15% of their deposits, of which only 5% was required to be currency, 5% might be on deposit in another banking institution, and 5% might be kept in certain classes of bonds.

The experience of the panic of 1907 developed several weaknesses in the position of the trust companies, and in New York led a special commission appointed by Governor Hughes to recommend much stronger reserves. The fact that the trust companies relied upon the national banks to meet the heavy demands upon them for currency doubled the strain imposed on the national banks of New York city, and the isolation of the trust companies through their withdrawal from the Clearing House in 1903 made it difficult to bring about co-operation in support of those which were subjected to severe runs. Between the 22nd of August and the 19th of December 1907 the deposits of the trust companies of New York declined by the sum of more than $275,000,000 while deposits in national banks increased about $50,000,000.

The number, resources and activities of trust companies have shown a rapid development. In New York the general law under which companies can be formed without a special act dates only from 1887, but several companies ante-date this law. The following figures[1] from reports made to the comptroller of the currency speak for themselves:—

Trust Companies of the United States.

30th June.	Number.	Capital.	Individual Deposits.
		$	$
1891	171	79,292,889	355,330,080
1897	251	106,968,253	566,922,205
1900	290	126,930,845	1,028,232,407
1901	334	137,361,704	1,271,081,174
1902	417	179,732,581	1,525,887,493
1903	531	232,807,735	1,589,398,796
1904	585	237,745,488	1,600,322,325
1905	683	243,133,622	1,980,856,737
1906	742	268,384,337	2,008,937,790
1907	794	276,146,081	2,061,623,035

Approximately half of the deposits in United States trust companies are in the state of New York, the number of such companies in New York about the 30th of June 1907, being 88, with a capital of $67,850,000, and deposits of $1,020,678,220. The next highest states in amount of deposits were Pennsylvania, with 328 companies, with capital of $103,953,067 and deposits of $381,397,305; and Massachusetts, with 46 companies, with capital of $16,677,000 and deposits of $179,278,436.

See Kirkbride and Sterrett, *The Modern Trust Company* (New York, 1905). (C. A. C.)

[1] The table, it may be observed, represents only the number of companies *reporting* and not the number actually in existence. Kirkbride and Sterrett, for example, give the number of trust companies in the United States on the 1st of January 1905 as 1427, or more than twice the number given here for 1905. On this point the comptroller of the Treasury in 1905 said: "In order to obtain this information [from institutions other than national banks] the comptroller is necessarily dependent upon the courtesy of officers of different states, and upon individual banks in states the laws of which states do not provide for compilation of data of this character . . . Each year one or more states formerly without adequate provision for obtaining and compiling reports of banks incorporated under their laws, have through legislative enactment, placed such banks under the supervision of an official whose duty it is to receive and tabulate the reports so required, which information is placed at the disposal of the comptroller. Every year this office is thereby enabled to publish official, and hence more reliable statistics. . . ."

TRUST and **TRUSTEES,** in the law of equity. In Roman and English law alike that legal relation between two or more persons implied in the word *trust* was of comparatively late growth. The trust of English law is probably based upon a combination of the Roman conceptions of *usus* and *fideicommissum.* To *usus* is perhaps due the name as well as the idea of that right over property, co-ordinate with the right of the nominal owner, possessed by the person having the use. To *fideicommissum* appears to be due the name as well as the idea of that confidence reposed in another which is the essence of the modern trust. *Usus* was in Roman law a personal servitude, or right of one person over the land of another, confined to his personal wants and without the right to the produce and profits which *ususfructus* carried. It has little in common with the use of English law but the name and the conception of a dual ownership. The *fideicommissum* is more important (see ROMAN LAW). By the legislation of Justinian the law of *legata* was practically assimilated to that of *fideicommissa.* The only thing that distinguished the one from the other was the mode in which the gift was made: if by words of direct bequest it was a *legatum,* if by precatory words, a *fideicommissum.* It may be noticed, as an illustration of the course afterwards taken by the law in England, that *fideicommissa* in favour of the Church were so far favoured over others that if paid over by mistake they could not be recovered. In addition to *usus* and *fideicommissum,* the Roman division of ownership into quiritary and bonitary (to use words invented at a later time) may perhaps to some extent have suggested the English division into legal and equitable estate. The two kinds of ownership were amalgamated by Justinian. The gradual manner in which the beneficiary became subject to the burdens attaching to the property of which he enjoyed the benefit was a feature common to both the Roman and the English system.

Use in Early English Law.—The use or trust[2] is said to have been the invention of ecclesiastics well acquainted with Roman law, the object being to escape the provisions of the laws against Mortmain by obtaining the conveyance of an estate to a friend on the understanding that they should retain the use, *i.e.* the actual profit and enjoyment of the estate. Uses were soon extended to other purposes. They were found valuable for the defeat of creditors, the avoiding of attainder and the charging of portions. A use had also the advantage of being free from the incidents of feudal tenure: it could be alienated *inter vivos* by secret conveyance, and could be devised by will. In many cases the feoffee[3] to uses, as he was called, or the person seised to the use of another, seems to have been specially

[2] Use seems to be an older word than trust. Its first occurrence in statute law is in 7 Ric. II. c. 12, in the form *oeps.* In Littleton "confidence" is the word employed. The Statute of Uses seems to regard use, trust and confidence as synonymous. According to Bacon, it was its permanency that distinguished the use from the trust.

[3] Feoffment, though the usual, was not the only mode of conveyance to uses. The preamble of the Statute of Uses mentions fines and recoveries, and other assurances.

chosen on account of his rank and station, which would enable him to defy the common law and protect the estate of his *cestui que use*, or the person entitled to the beneficial enjoyment. The act of 1 Ric. II. c. 9 was directed against the choice of such persons. This alienation of land in use was looked upon with great disfavour by the common law courts, in whose eyes the cestui que use was only a tenant at will. Possibly the ground of their refusal to recognize uses was that the assizes of the king's court could only be granted to persons who stood in a feudal relation to the king. The denial of the right followed the denial of the remedy. The use was on the other hand supported by the court of chancery, and execution of the confidence reposed in the feoffee to uses was enforced by the court in virtue of the general jurisdiction which as a court of conscience it claimed to exercise over breach of faith. Jurisdiction was no doubt the more readily assumed by ecclesiastical judges in favour of a system by which the Church was generally the gainer. A double ownership of land thus gradually arose, the nominal and ostensible ownership—the only one acknowledged in the courts of common law— and the beneficial ownership protected by the court of chancery. The reign of Henry V. to a great extent corresponds with that of Augustus at Rome, as the point of time at which legal recognition was given to what had previously been binding only in honour. The means of bringing the feoffee to uses before the court was the writ of *subpoena*, said to have been invented by John de Waltham, bishop of Salisbury and master of the rolls in the reign of Richard II. By means of this writ the feoffee to uses could be compelled to answer on oath the claim on his cestui que use. The doctrine of the court of chancery as to the execution of a use varied according as there was transmutation of possession or not. In the former case it was unnecessary to prove consideration; in the latter, generally a case of bargain and sale, the court would not enforce the use unless it was executed in law—that is, unless there was a valuable consideration, even of the smallest amount. Where no consideration could be proved or implied, the use resulted to the feoffor. This theory led to the insertion in deeds (especially in the lease of the lease and release period of conveyancing) of a nominal consideration, generally five shillings. Lands either in possession, reversion or remainder could be granted in use. Most persons could be feoffees to uses. The king and corporations aggregate were, however, exceptions, and were entitled to hold the lands discharged of the use. On the accession of Richard III., who from his position of authority had been a favourite feoffee, it was necessary to pass a special act (1 Ric. III. c. 5), vesting the lands of which he had been feoffee either in his co-feoffees or, in the absence of co-feoffees, in the cestui que use. The practical convenience of uses was so obvious that it is said that by the reign of Henry VII. most of the land in the kingdom was held in use. The freedom of uses from liability to forfeiture for treason must have led to their general adoption during the Wars of the Roses.[1] The secrecy with which a use could be transferred, contrary as it was to the publicity required for livery of Seisin (*q.v.*) at common law, led to the interference of the legislature on several occasions between the reign of Richard II. and Henry VIII., the general tendency of the legislation being to make the cestui que use more and more subject to the burdens incident to the ownership of land. One of the most important statutes was the Statute of Mortmain (15 Ric. II. c. 5), forbidding evasion of the Statute *De Religiosis* of Edward I. by means of feoffments to uses. Other acts enabled the cestui que use to transfer the use without the concurrence of the feoffee to uses (1 Ric. III. c. 1), made a writ of *formedon* maintainable against him (1 Hen. VII. c. 1), rendered his heir liable to wardship and relief (4 Hen. VII. c. 17), and his lands liable to execution (19 Hen. VII. c. 15). At length in 1535 the famous Statute of Uses (27 Hen. VIII. c. 10) was passed.[2] The preamble of the statute enumerates the mischiefs which it was considered that the universal prevalence of uses had occasioned, among others that by fraudulent feoffments, fines, recoveries and other like assurances to uses, confidences and trusts lords lost their feudal aids, men their tenancies by the curtesy, women their dower, manifest perjuries in trials were committed, the king lost the profits of the lands of persons attainted or enfeoffed to the use of aliens, and the king and lords their rights of year, day and waste, and of escheats of felons' lands. To remedy this state of things it was enacted, *inter alia*, that, where any person was seised of any hereditaments to the use, confidence or trust of any other person by any means, the person having such use, confidence or trust should be seised, deemed and adjudged in lawful seisin, estate and possession of such hereditaments. Full legal remedies were given to the cestui que use by the statute. He was enabled to distrain for a rent-charge, to have action, entry, condition, &c. The effect of this enactment was to make the cestui que use the owner at law as well as in equity (as had been done once before under the exceptional circumstances which led to 1 Ric. III. c. 5), provided that the use was one which before the statute would have been enforced by the court of chancery. For some time after the passing of the statute an equitable as distinct from a legal estate did not exist. But the somewhat narrow construction of the statute by the common law courts in Tyrrel's case[3] (1557) enabled estates cognisable only in equity to be again created. In that case it was held that a use upon a use could not be executed; therefore in a feoffment to A and his heirs to the use of B and his heirs to the use of C and his heirs only the first use was executed by the statute. The use of B being executed in him, that of C was not acknowledged by the common law judges; but equity regarded C as beneficially entitled, and his interest as an equitable estate held for him in trust, corresponding to that which B would have had before the statute. The position taken by the Court of Chancery in trusts may be compared with that taken in Mortgage (*q.v.*). The Judicature Act 1873, while not going as far as the Statute of Uses and combining the legal and equitable estates, makes equitable rights cognisable in all courts. From the decision in Tyrrel's case dates the whole modern law of uses and trusts. In modern legal language use is restricted to the creation of legal estate under the Statute of Uses, trust is confined to the equitable estate of the cestui que trust or beneficiary.

Uses since 1535.—The Statute of Uses is still the basis of conveyancing. A grant in a deed is still, after the alterations in the law made by the Conveyancing Act 1881, made "to and to the use of A." The statute does not, however, apply indiscriminately to all cases, as only certain uses are executed by it. It does not apply to leaseholds or copyholds, or to cases where the grantee to uses is anything more than a mere passive instrument, *e.g.* where there is any direction to him to sell the property. The seisin, too, to be executed by the statute, must be in another than him who has the use, for where A is seised to the use of A it is a common law grant. The difference is important as far as regards the doctrine of Possession (*q.v.*). Constructive possession is given by a deed operating under the statute even before entry, but not by a common law grant, until actual receipt of rent by the grantee. The operation of the Statute of Uses was supplemented by the Statute of Inrolments and that of Wills (see WILL). The Statute of Inrolments (27 Hen. VIII. c. 16) enacted that no bargain and sale should pass a freehold unless by deed indented and enrolled within six months after its date in one of the courts at Westminster or with the *custos rotulorum* of the county. As the statute referred only to freeholds, a bargain and sale of a leasehold interest passed without enrolment. Conveyancers took advantage of this omission (whether intentional or not) in the act, and the practical effect of it was to introduce a mode of secret alienation of real property, the lease and release, which was the general form of conveyance up to 1845. (See CONVEYANCING.) Thus the publicity of transfer, which it was the special object of the Statute of Uses to effect, was almost at once defeated. In addition to the grant to uses there were other modes of conveyance under the statute which are now obsolete in practice, viz., the covenant to stand seised and the bargain and sale. Under the statute, as before it, the use has been found a valuable means of limiting a remainder to the person creating the use and of making an estate take effect in derogation of a former estate by means of a shifting or springing use. At common law a freehold could not be made to commence *in futuro*; but this end might be attained by a shifting use, such as a grant (common in marriage settlements) to A to the use of B in fee simple until a marriage, and after the celebration of the marriage to other uses. An example of a springing use would be a grant to A to such uses as B should appoint and in default of and until appointment to C in fee simple. The difficulty of deciding where the seisin was during the suspension of the use led to the invention of the old theory of *scintilla juris*, or continued possibility of seisin in the grantee to uses. This theory was abolished by 23 & 24 Vict. c. 38, which enacted that all uses should take effect by force of the estate and seisin originally vested in the person seised to the uses. The most frequent instances of a springing use are powers of appointment, usual in wills and settlements. There has been much legislation on the subject of powers, the main effect of which has been to give greater facilities for their execution, release or abandonment, to aid their defective execution, and to abolish the old doctrine of illusory appointments.

Trusts.—A trust in English law is defined in Lewin's *Law of Trusts*, adopting Coke's definition of a use, as "a confidence reposed in some other, not issuing out of the land, but as a thing collateral, annexed in privity to the estate of the land, and to the person touching the land, for which *cestui que trust* has no remedy but by *subpoena* in Chancery." The term *trust* or *trust estate* is also used to denote the beneficial interest of the cestui que trust. The term *truster* is not used, as it is in Scotland, to denote the creator of the trust. A trust has some features in common with contract (*q.v.*); but the great difference between them is that a contract can only be enforced by a party or one in the position of a party to it, while a trust can be, and generally

[1] The use, as in later times the trust, was, however, forfeited to the Crown on attainder of the feoffee or trustee for treason.

[2] It was adopted in Ireland exactly a century later by 10 Car. I. c. 1 (Ir.). The law of uses and trusts in Ireland is practically the same as that in England, the main differences being in procedure rather than in substantive law.

[3] Dyer's *Reports*, 155a.

is, enforced by one not a party to its creation. It has more resemblance to *fideicommissum.* But the latter could only be created by a testamentary instrument, whilst a trust can be created either by will or *inter vivos*; nor was there any trace in Roman law of that permanent legal relation which is suggested by the position of trustee and cestui que trust. The heir, too, in Roman law was entitled, from A.D. 70 to the reign of Justinian, to one-fourth of a *hereditas fideicommissaria* as against the beneficiary, while the very essence of the trust is its gratuitous character. Trusts may be divided in more than one way, according to the ground taken as the basis of division. One division, and perhaps the oldest, as it rests on the authority of Bacon, is into *simple* and *special*, the first being where the trust is simply vested in a trustee and the nature of the trust left to construction of law, the second where there is an act to be performed by the trustee. Another division is into *lawful* and *unlawful*, and corresponds to Bacon's division into intents or confidences and frauds, covins, or collusions. A third division is into *public* and *private*. A division often adopted in modern textbooks and recognized by parliament in the Trustee Act 1850, is into *express, implied* and *constructive*. An express trust is determined by the person creating it. It may be either *executed* or *executory*, the former where the limitations of the equitable interest are complete and final, the latter where such limitations are intended to serve merely as minutes for perfecting the settlement at some future period, as in the case of marriage articles drawn up as a basis of a marriage settlement to be in conformity with them. An implied trust is founded upon the intention of the person creating it; examples of it are a resulting trust, a precatory trust, and the trust held by the vendor on behalf of the purchaser of an estate after contract and before conveyance. In this case the vendor is sometimes called a trustee *sub modo* and the purchaser a cestui que trust *sub modo*. A constructive trust is judicially created from a consideration of a person's conduct in order to satisfy the demands of justice, without reference to intention. The distinction between an implied and a constructive trust is not always very consistently maintained. Thus the position of a vendor towards a purchaser after contract is sometimes called a constructive trust. The present law governing trusts rests upon the doctrines of equity as altered by legislation. The law was consolidated by the *Trustee Act* 1893 and some subsequent amending statutes. Its great importance has led to its becoming one of the most highly developed departments of equity.

Who may be a Trustee or Cestui que Trust.—The modern trust is considerably more extensive in its operation than the ancient use. Thus the Crown and corporations aggregate can be trustees, and personalty can be held in trust. Provision is made by the Municipal Corporations Act 1882, for the administration of charitable and special trusts by municipal corporations. There are certain persons who for obvious reasons, even if not legally disqualified, ought not to be appointed trustees. Such are infants, lunatics, persons domiciled abroad, felons, bankrupts and *cestuis que trustent*. The appointment of any such person, or the falling of any existing trustee into such a position, is generally ground for application to the court for appointment of a new trustee in his place. Any one may be a cestui que trust except a corporation aggregate, which cannot be a cestui que trust of real estate without a licence from the Crown. For the Public Trustee, see below.

Creation and Extinction of the Trust.—A trust may be created either by act of a party or by operation of law. Where a trust is created by act of a party, the creation at common law need not be in writing. The Statute of Frauds altered the common law by enacting that all declarations or creations of trusts or confidences of any lands, tenements or hereditaments shall be manifested and proved by some writing, signed by the party who is by law enabled to declare such trust, or by his last will in writing, or else they shall be utterly void and of none effect. Trusts arising or resulting by implication or construction of law are excepted, and it has been held that the statute applies only to real estate and chattels real, so that a trust of personal chattels may still be declared by parol. The declaration of a trust by the Crown must be by letters patent. Trusts created by will must conform to the requirements of the Will Act (see WILL). Except in the case of charitable trusts, the cestui que trust must be a definite person. A trust, for instance, merely for keeping up family tombs is void. Alteration of the trust estate by appointment of a new trustee could up to 1860 only be made where the instrument creating the trust gave a power to so appoint, or by order of the court of chancery. But now by s. 10 of the Trustee Act 1893 (superseding Lord St Leonards's Act of 1860 and the Conveyancing Act 1881), the surviving or continuing trustee or trustees, or the personal representative of the last surviving or continuing trustee, may nominate in writing a new trustee or new trustees. On such appointment the number of trustees may be increased. Existing trustees may by deed consent to the discharge of a trustee wishing to retire. Trust property may be vested in new or continuing trustees by a simple declaration to that effect. Also a separate set of trustees may be appointed for any part of the property held on distinct trusts. Trusts created by operation of law are those which are the effect of the application of rules of equity. They include resulting and constructive trusts. A resulting trust is a species of implied trust, and consists of so much of the equitable interest as is undisposed of by the instrument creating the trust, which is said to result to the creator and his representatives. An example is the purchase of an estate in the name of the purchaser and others, or of others only. Here the beneficial interest is the purchaser's. An example of a constructive trust is a renewal of a lease by a trustee in his own name, where the trustee is held to be constructively a trustee for those interested in the beneficial term. Besides being duly created, it is necessary for the validity of the trust that it should be a lawful one. An unlawful trust is one which contravenes the policy of the law in any respect. Examples of such trusts are trusts for a corporation without licence, for a perpetuity, and for purposes subversive of morality, such as trusts for illegitimate children to be hereafter born. Superstitious uses also fall under this head. There are also certain trusts which are avoided by statute under particular circumstances, such as settlements in fraud of creditors (see BANKRUPTCY). The law cannot be evaded by attempting to constitute a secret trust for an unlawful purpose. If an estate be devised by words prima facie carrying the beneficial interest, with an understanding that the devisee will hold the estate in trust for such a purpose, he may be compelled to answer as to the secret trust, and on acknowledgment or proof of it there will be a resulting trust to the heir-at-law. In the case of an advowson suspected to be held for the benefit of a Roman Catholic patron, there is a special enactment to the same effect (see QUARE IMPEDIT). The rules of equity in charitable trusts are less strict than those adopted in private trusts. Charitable trusts must be lawful, *e.g.* they must not contravene the Statutes of Mortmain; but a wider latitude of construction is allowed in order to carry out the intentions of the founder, and they will not be allowed to fail for want or uncertainty of objects to be benefited. The court, applying the doctrine of *cy près* (*q.v.*), will, on failure of the original ground of the charity, apply the funds as nearly as possible in the same manner. On this principle gifts originally made for purely charitable purposes have been extended to educational purposes. Further, trustees of a charity may act by a majority, but ordinary trustees cannot by the act of a majority (unless specially empowered so to do) bind a dissenting minority or the trust property. A trust estate is subject as far as possible to the rules of law applicable to a legal estate of a corresponding nature, in pursuance of the maxim, "Equity follows the law." Thus trust property is assets for payment of debts, may be taken in execution, passes to creditors in bankruptcy, and is subject to dower and curtesy, to the rules against perpetuities, and to the Statutes of Limitation. This assimilation of the legal and equitable estates has been produced partly by judicial decisions, partly by legislation. A trust is extinguished, as it is created, either by act of a party or by operation of law. An example of the former mode of extinction is a release by deed, the general means of discharge of a trustee when the purposes of the trust have been accomplished. Extinction by operation of law takes place when there is a failure of the objects of the trust: *e.g.* if the cestui que trust die intestate without heirs or next of kin, the property, by the Intestates Estates Act 1884, escheats in the same manner as if it were a legal estate in corporeal hereditaments. Equitable interests in real estate abroad are as a rule subject to the *lex loci rei sitae*, and an English court has no jurisdiction to enforce a trust or settle a scheme for the administration of a charity in a foreign country. An English court has, however, jurisdiction to administer the trusts of a will as to the whole real and personal estate of a testator, even though only a very small part of the estate, and that wholly personal, is in England. This was decided by the House of Lords in a well-known case in 1883 (*Ewing* v. *Orr-Ewing*, L.R. 9, A.C. 34).

Rights and Duties of the Trustee.—The principal general properties of the office of trustee are these: (1) A trustee having once accepted the trust cannot afterwards renounce. (2) He cannot delegate it, but an inconvenience which formerly attached to dealings with trustees and trust property, in consequence partly of this rule, and partly of the liability of persons dealing with trustees to see that money paid to them was properly applied, was largely obviated by s. 17 of the Trustee Act 1893 (replacing s. 2 of the Trustee Act 1888), which in effect provides that a trustee may appoint a solicitor to be his agent to receive and give a discharge for any money or valuable consideration or property receivable by the trustee under the trust, by permitting the solicitor to have the custody of and to produce a deed having in the body thereof or endorsed thereon a receipt for the consideration money or other consideration, the deed being executed or the endorsed receipt being signed by the trustee; and a trustee is not chargeable with breach of trust by reason only of his having made or concurred in making any such appointment; and the producing of any such deed by the solicitor is a sufficient authority to the person liable to pay for his paying to the solicitor without the solicitor producing any separate or other direction or authority in that behalf from the trustee. (3) In the case of co-trustees the office must be exercised by all the trustees jointly. (4) On the death of one trustee there is survivorship: that is, the trust will pass to the survivors or survivor. (5) One trustee shall not be liable for the acts of his co-trustee. (6) A trustee shall derive no personal benefit from the trusteeship. The office cannot be renounced or delegated, because it is one of personal confidence. It can, however, be resigned, and legislation has given a retiring trustee large powers of appointing a successor. The liability of one trustee for the acts or defaults of another often raises very difficult questions. A difference is made between trustees and executors. An executor is liable for joining in a receipt *pro forma*, as it is not necessary for him to do so, one executor having authority to act without his co-executor; a trustee can show that he only joined for conformity, and that another received the money. The rule of equity by which a beneficiary who consented to a breach of trust was liable to indemnify the trustees to the extent of his interest has taken definite statutory shape in s. 45 of the Trustee Act 1893 (replacing s. 6 of the Trustee Act 1888), which enacts that when a trustee commits a breach of trust at the instigation or request, or with the consent in writing of a beneficiary, the High Court may, if it thinks fit, and notwithstanding that the beneficiary is a married woman entitled for her separate use and restrained from anticipation, make such order as to the court seems just for impounding all or any part of the interest of the beneficiary in the trust estate by way of indemnity to the trustee. The rule that a trustee is not to benefit by his office is subject to some exceptions. He may do so if the instrument creating him trustee specially allows him remuneration, as is usually the case where a solicitor is appointed. The main duties of trustees are to place the trust property in a proper state of security, to keep it (if personalty) in safe custody, and to properly invest and distribute it. A trustee must be careful not to place himself in a position where his interest might clash with his duty. As a rule he cannot safely purchase from his cestui que trust while the fiduciary relation exists between them. Investments by trustees demand special notice. The Trustee Act 1893 has consolidated the law on this point, and provides, as it were, a code or charter of investment authorizing trustees, unless expressly forbidden by the instrument (if any) creating the trust, to invest trust funds in various modes, of which the more important are as follows: In any of the parliamentary stocks or public funds or government securities of the United Kingdom; on real or heritable securities in Great Britain or Ireland; in stock of the Bank of England or the Bank of Ireland; in India $3\frac{1}{2}$% stock and India 3% stock; in any securities, the interest of which is for the time being guaranteed by parliament; in consolidated stock created by the London County Council; in the debenture or rent-charge or guaranteed or preference stock of any railway company in Great Britain or Ireland incorporated by special act of parliament, and having during each of the ten years last past before the date of investment paid a dividend at the rate of not less than 3% on its ordinary stock; in the debenture stock of any railway company in India, the interest on which is paid or guaranteed by the secretary of state in council of India; in the "B" annuities of the Eastern Bengal, the East Indian and the Sind, Punjab and Delhi railways; and also in deferred annuities—comprised in the register of holders of annuity Class D, and annuities comprised in the register of annuitants Class C of the East Indian Railway Company; in the stock of any railway company in India upon which a fixed or minimum dividend in sterling is paid or guaranteed by the secretary of state in council of India, or upon the capital of which the interest is so guaranteed; in the debenture or guaranteed or preference stock of any company in Great Britain or Ireland established for the supply of water for profit, and incorporated by special act of parliament or by royal charter, and having during each of the ten years last past before the date of investment paid a dividend of not less than 5% per annum on its ordinary stock; in nominal or inscribed stock issued, or to be issued, by the corporation of any municipal borough having, according to the returns of the last census prior to the date of investment, a population exceeding 50,000; or by any county council under the authority of any act of parliament or provisional order; in any of the stocks, funds or securities for the time being authorized for the investment of cash under the control or subject to the order of the High Court. Trustees may from time to time vary any such investments for others of an authorized nature. The statutory power to invest on real securities does not, of course, authorize the purchase of realty; but by s. 5 of the Trustee Act 1893 a power to invest in real securities (in the absence of express provision to the contrary) authorizes investment on mortgage of leasehold property held for an unexpired term of not less than 200 years and not subject to a greater rent than one shilling a year, or to any right of redemption or condition of re-entry except for non-payment of rent.

The position of trustees in respect of what was frequently an undue personal responsibility for the administration of their trust has been much improved by s. 8 of the Trustee Act 1888 (not repealed by the Trustee Act 1893) and s. 3 of the Judicial Trustees Act 1896. Sub-section (1) of the former enactment (with some omissions) runs as follows: "In any action or other proceeding against a trustee or any person claiming through him, except where the claim is founded upon any fraud or fraudulent breach of trust to which the trustee was party or privy, or is to recover trust property, or the proceeds thereof still retained by the trustee, or previously received by the trustee and converted to his use, the following provisions shall apply: (*a*) All rights and privileges conferred by any statute of limitations shall be enjoyed in the like manner and to the like extent as if the trustee or person claiming through him had not been a trustee or person claiming through him. (*b*) If the action or other proceeding is brought to recover money or other property, and is one to which no existing statute of limitations applies, the trustee or person claiming through him shall be entitled to the benefit of, and be at liberty to plead the lapse of time as a bar to such action or other proceeding in the like manner and to the like extent as if the claim had been against him in an action of debt for money had and received." The statutory period of limitation which trustees are thus permitted to plead is the six years fixed as the period of limitation for actions of debt by the Limitation Act 1623. It has been decided on the above section that in the case of a breach of trust consisting of an improper investment of the trust funds, time begins to run in favour of the trustee from the date of the investment. Sub-section (3) of the Judicial Trustees Act 1896 provides that "if it appears to the court that a trustee, whether appointed under that act or not, is or may be personally liable for any breach of trust, whether the transaction alleged to be a breach of trust occurred before or after the passing of that act, but has acted honestly and reasonably, and ought fairly to be excused for the breach of trust and for omitting to obtain the directions of the court in the matter in which he committed such breach, then the court may relieve the trustee either wholly or partly from personal liability for the same." Owing to the generally reduced rate of interest obtainable for money invested on trust securities, the court has in several instances, and even as against defaulting trustees, charged them with interest at 3% per annum (instead of 4%, which was formerly the recognized rate) upon sums found due from them to the trust estate.

Under the old law trustees could not safely advance on mortgage more than two-thirds of the actual value of agricultural land or one-half of the value of houses. This "two-thirds rule" is now made statutory by s. 8 of the Trustee Act 1893, which enacts that "A trustee lending money on the security of any property on which he can lawfully lend shall not be chargeable with breach of trust by reason only of the proportion borne by the amount of the loan to the value of the property at the time when the loan was made, provided that it appears to the court that in making the loan the trustee was acting upon a report as to the value of the property made by a person whom he reasonably believed to be an able practical surveyor or valuer instructed and employed independently of any owner of the property, whether such surveyor or valuer carried on business in the locality where the property is situate or elsewhere, and that the amount of the loan does not exceed two equal third parts of the value of the property as stated in the report, and that the loan was made under the advice of the surveyor or valuer expressed in the report." The same section protects trustees for not investigating the lessor's title when lending on the leasehold security, and for taking a shorter title than they might be otherwise entitled to on the purchase or mortgage of any property, if they act with prudence and caution. By s. 9 (replacing s. 5 of the Trustee Act 1888) trustees who commit a breach of trust by lending more than the proper amount on any property are excused from making good any more than the excess of the actual loan over the sum which they might have properly lent in the first instance.

Rights and Duties of the Cestui que Trust.—These may be to a great extent deduced from what has been already said as to the correlative duties and rights of the trustee. The cestui que trust has a general right to the due management of the trust property, to proper accounts and to enjoyment of the profits. He can as a rule only act with the concurrence of the trustee, unless he seeks a remedy against the trustee himself.

Judicial Trustees.—The Judicial Trustees Act 1896, inaugurated a semi-official system of trusteeship which was new in England, but had been known in Scotland for upwards of 150 years. The general scope of the act is indicated by s. 1 (1), which runs as follows: "Where application is made to the court by or on behalf of the person creating or intending to create a trust, or by or on behalf of a trustee or beneficiary, the court may, in its discretion, appoint a person (in this act called a judicial trustee) to be a trustee of that trust, either jointly with any other person or as sole trustee, and if sufficient cause is shown, in place of all or any existing trustees." The act and the rules made under it (the Judicial Trustees Rules 1897) provide that judicial trustees shall be under the control and supervision of the court as officers thereof, and may be paid for their services out of the trust property. The trust accounts are to be audited annually, and a report thereon made to the court, which has power to order inquiries into transactions connected with the administration of the trust. A judicial trustee may be required to give security, and in any case has to keep the trust account with a bank approved by the court, and deposit title-deeds and other documents of title in such custody as the court directs. Communications between judicial trustees and the court with reference to their duties are permitted to be made with little or no formality, and strict proof of facts may be waived in proper cases. The act may, in short, be described as an attempt to provide for an official check upon the administration of trusts, while avoiding the formality and expense incident to the procedure in an administration action.

Public Trustee.—A step further was taken by the Public Trustee Act 1906, which established the office of public trustee. By the act he is a corporation sole, with perpetual succession and an official seal and may sue and be sued under his official title. He may, if he thinks fit, act in the administration of estates of small value; as custodian trustee, or as an ordinary trustee; he may be appointed a judicial trustee, or administrator of a convict's property. The law of trusts generally is applicable to him and he can act either alone or jointly with other persons. He has an absolute discretion as to whether he will accept or not any trust, but cannot decline acceptance on the ground only of the small value of the trust property. He cannot accept any trust which involves the management or carrying on of a business, except in certain cases authorized under rules appended to the act. He cannot accept a trust under a deed of arrangement for the benefit of creditors, nor of an insolvent estate, nor one exclusively for religious or charitable purposes. His powers and duties are dealt with by the act under three headings: (1) *In the administration of small estates.*—On the application of any person entitled to apply to the court (*i.e.* the High Court, and as respects trusts within its jurisdiction, the county court) for an order for administration of any estate, the gross value of which is proved to the satisfaction of the public trustee to be less than £1000, he may administer the estate, and must do so if the persons beneficially entitled are persons of small means, unless he sees good reason for refusing. By declaration in writing signed and sealed by him the trust property other than stock vests in him, and the right to transfer or call for the transfer of any stock forming part of the estate, provided that he does not exercise the right of himself transferring stock without the leave of the court; this general provision also does not apply to copyhold, in respect of which he has the same powers to convey them as if he had been appointed under s. 33 of the Trustee Act 1893. Power is given to the court to order, for reasons of economy, that an estate being administered by the court be administered by the public trustee. (2) *As custodian trustee.*—The public trustee, if he consents to act, may be appointed custodian trustee on an application to the court, or by the testator, settlor or other creator of any trust or by a person having power to appoint new trustees. When he is so appointed the trust property is transferred to him as if he were the sole trustee, but the management of the trust property and any discretionary power remain vested in the other trustees. His relations with the managing trustees are further defined by the act. (3) *As an ordinary trustee.*—The public trustee may be appointed trustee, executor, &c., of any will or settlement or instrument of any date either under his official title or other sufficient designation. In a will a sentence to the following effect would be sufficient. "I appoint the Public Trustee executor and trustee of this my will." Where the public trustee has been appointed a trustee of any trust, a co-trustee may retire from the trust under s. 11 of the Public Trustee Act 1893 notwithstanding that there are not more than two trustees, and without such consents as are required by that section. The consolidated fund of the United Kingdom is liable to make good all sums required to discharge any liability which the public trustee, if he were a private trustee, would be personally liable to discharge, except where neither the public trustee nor his officers has contributed to it, and which neither he nor any of his officers could by reasonable diligence have averted. A person aggrieved by any act or omission or decision of the public trustee in relation to any trust may apply to the court, and the court may make such order in the matter as it sees fit. The act contains provisions for the investigation and audit of trust accounts, which may take place on the application of any trustee or beneficiary; if the parties do not agree upon a solicitor and public accountant for the purpose, they are appointed by the public trustee, who has entire discretion over the source from which the expenses are to be defrayed. The fees payable under the act are fixed by the Public Trustee (Fees) Order; they are of two kinds: fees on capital and fees on income. The object of the department is not to make a profit, but merely to pay expenses. Full information as to the machinery and procedure of the office and the requirements necessary to obtain the services of the public trustee are obtainable on application to the Public Trustee Office, Clement's Inn, London.

Scotland.—The history of the law differs considerably from that of England, though perhaps the position of the Scottish trustee is now not very different from that of the trustee in England. The Statute of Uses did not apply to Scotland, since neither that nor any similar legislation was necessary in a system in which law and equity were administered by the same tribunals. Trusts seem to have existed from time immemorial, and have been frequently regulated by statute. The policy of the English Statute of Frauds was no doubt intentionally imitated in the Act 1696, c. 25, enacting that no action of declarator of trust should be sustained as to any deed of trust made for thereafter, except upon a declaration or back-bond of trust lawfully subscribed by the person alleged to be trustee and against whom or his heirs or assignees the declarator should be intended, or unless the same were referred to the oath of the party *simpliciter*. The act does not apply to all cases, but only to those in which by the act of parties documents of title are in the name of a trustee, but the beneficial interest in another. The person creating the trust is called the *truster*, a term unknown in England. On the other hand the term *cestui que trust* is unknown in Scotland. The office of trustee is prima facie gratuitous, as in England, it being considered to fall under the contract of mandate. Some of the main differences between English and Scottish law are these. There is no presumption in Scotland of a resulting trust in favour of a purchaser. A trust which lapses by the failure of a beneficiary goes to the Crown as *ultimus heres*. The office of trustee is not a joint office, therefore there is no right of survivorship, and on the death of a trustee the survivors are incompetent to act, unless a certain number be declared or presumed to be a *quorum*, or the office be conferred on trustees and the accedors and survivors of them. Sometimes the concurrence of one trustee is rendered absolutely necessary by his being named *sine qua non*. The Court of Session may appoint new trustees, but generally appoints a judicial factor. There has been a considerable amount of legislation, chiefly in the direction of extending the powers of trustees and of the court in trust matters. The powers of investment given to trustees are much the same as those allowed in England.

United States.—In New York and many other States uses and trusts have been abolished (with certain exceptions), and every estate, subject to those exceptions, is deemed a legal right cognisable in courts of law. Some of these exceptions are implied trusts and express trusts to sell land for the benefit of creditors, to sell, mortgage or lease lands for the benefit of legatees, or for the purpose of satisfying any charge thereon, to receive the rents and profits of lands and apply them to the use of any person during the life of such person or any shorter term, or to receive such rents and profits, and accumulate the same within the limits allowed by the law. Some states allow the creation of trusts (other than those arising by implication or operation of law) only by means of will or deed. Where the trust is of real estate, the deed must generally be registered. Forms of deeds of trust are given in the Statutes of Virginia and other states. The English doctrine of *cy près* is being adopted in many states. A public trustee as a corporation sole exists in some states. A trustee under American law is generally entitled to compensation for his services. Spendthrift trusts, *i.e.* those under which the enjoyment of income bequeathed by will in such a way as to prevent creditors of the beneficiary from reaching it before it gets into his hands, are generally supported (*Nichols* v. *Eaton*, 91 United States Reports, 713). A "voting trust" is a concerted transfer of their shares in a corporation by a majority of the shareholders to trustees to hold and vote on them for a specified period for the purpose of securing the adoption or continuance of a certain line of corporate action. Any shareholder may recede from such an arrangement and reclaim his stock.

AUTHORITIES.—The principal authority is Lewin's *Law of Trusts*; other treatises are those of Godefroi and Underhill. For American Law see Perry *On Trusts*. The principal authority on charitable trusts is Tudor. For the history may be consulted Bacon, *Law Tracts*; Reading, *On the Statute of Uses*; Gilbert, *On Uses*; Sanders, *On Uses and Trusts*; Spence, *Equitable Jurisdiction*, i. 435; Digby, *Hist. of the Law of Real Property*, chs. vi., vii.

TRUSTS, in Economics. The word "trusts," as used here, includes all those aggregations of capital engaged in productive industry that, by virtue of their industrial strength, have or are supposed to have some monopolistic power. Legal monopolies, as such, and natural monopolies are excluded, although it is frequently true that the trusts are aided by and sometimes control natural monopolies. Trusts are here considered to be identical with the so-called "capitalistic monopolies." As "trusts" started in America, the subject will be considered here first from the point of view of American experience.

While it is probably true that trusts are a product of evolution, it is desirable to analyse and explain that conception in some detail if we are to understand their industrial significance. Competition, especially among industries managed on a great scale, often makes modern business unprofitable. Commercial men have been thus compelled in some way to modify former methods of doing business. So long as most industries were run on a small scale, the differences in the ability and the facilities of the various competitors were so great that only those at the lower end of the scale of excellence were forced out of the business—this to the general advantage of industrial society. The great mass of producers remained vigorously competing with one another, some making larger, others smaller profits, but all except a few at the lower margin making at least a living. Under modern business conditions competitors are often, relatively speaking, few in number, of substantially equal ability, and controlling substantially equal facilities for managing the business economically. Consequently, in such circumstances, modern competition differs greatly from that form which was familiar to the earlier economists. Among competitors of such great resources, the struggle may last long after the business has become unprofitable to all before any will fail. Among competitors so nearly equal in strength, the entire industry may be very seriously injured by competition before enough are forced out to affect materially the severity of the competition.

The dictum of Stephenson, that "where combination is possible, competition is impossible," has a much wider application now than in the early days of railways. The modern facilities for the transportation of goods, for the rapid transmission of intelligence by fast mail, and especially for the instantaneous exchange of information by the telegraph and telephone, have made it possible to manage easily a large business, however widely separated its different plants or establishments may be. In the middle of the 19th century or thereabouts, on account of the lack of these facilities, management of such institutions would often have been impossible. Many of the advantages of combinations are entirely dependent upon these modern facilities, and on that account these facilities may be said to be an occasion, if not a cause, of the trusts.

Two Kinds of Trust Industries.

If the product of an industry is of such a nature that its quality is substantially uniform and can be readily tested by purchasers, especially if the goods are such that they are ordinarily sold in large quantities, the competition between rival establishments must almost of necessity be a competition in price. Sugar refining, oil refining, the distilling of spirits, the manufacture of salt, are such industries. The standard quality is readily tested, and the manufacturer who can offer the standard product at the lowest price effects a sale. Industries manufacturing comparatively inexpensive articles for the retail trade, put them up in packages which become well known to customers; and those industries whose goods are sold under brands or trade-marks, or in some other form so that they are familiar to buyers, afford an example of competition of an entirely different kind. When the reputation of a certain brand of goods of this nature becomes established, consumers make no further efforts to test its quality, and the retail price often becomes a customary price. If a manufacturer of such goods finds his trade injured by a rival, his most effective means of competition will often be, not a lowering of the price, but an increase of the outlay on advertising. Soap, baking-powder, photographic cameras for general use, and of late years certain brands of coffee, patent medicine, and other drugs of similar nature, are examples of this class. Those industries in which the competition becomes a matter of cutting of prices can by combination remove rivals from the field, and then put prices up to a remunerative rate. Competitors in industries of the second class by combination can save many of the costs of selling, and thus without any increase in the price of the product may save enough of the cost to make the business profitable.

Some of the advantages of combination over competition which have led to the organization of trusts may be enumerated:—

Savings from Combination.

1. The cost of selling may be greatly lessened. As has been intimated, competition in the case of industries of the second class named above leads to very expensive advertising in order to effect sales. An examination of the pages of any of the American magazines, with a thought as to the amount charged for the use of these advertising pages (from one hundred to as high as even four hundred dollars, or from £20 to £80, per page for a single insertion in some of the magazines with the largest circulation) will convince one of the cost of such competitive advertising. The expense involved in making attractive show-windows in stores or shops, and in calling the attention of the public to popular wares by posters scattered about the country and by legends painted on rocks, on buildings along the lines of railways, &c., are other common examples.

2. The salaries of commercial travellers, together with their hotel and travelling expenses, are of a similar nature. This competitive advertising in many cases does not increase to any noteworthy extent the consumption of the products in question, but merely attracts customers from one manufacturer to another. Combination among establishments that do this costly advertising saves a large part of the expense without lessening materially the quantity of goods sold.

3. If different manufacturing establishments, scattered throughout the country, are brought under one management, it will be possible for orders for goods to be received at one central office, and then to be distributed to the federated establishments, so that goods can be despatched to customers in each case from the nearest establishment. In this way freight expenses may be very greatly lessened, cross freights over the same territory being substantially eliminated. A single establishment supplying all of its customers would often be compelled to deliver much longer distances at greatly increased expense.

4. The entire profit of an establishment frequently depends upon the skill of the manager. When many different establishments are organized into one, it is possible to select the most skilful manager of all and to put him in charge of the combination, thus securing in many cases, if the trust includes practically all of the establishments in the entire industry, the ablest manager in the country for them all. It is of course true that as an establishment increases in size, or as a combination increases the number of its branches, especially if they are widely scattered, it becomes impossible for the manager to give his personal supervision to the details of management of each institution. An executive officer of the highest skill, however, will so select his subordinates, so direct their work, and so infuse into them his own spirit, that, under careful inspection, comparatively little will be lost from his inability to be present personally in each separate establishment. In the larger combinations frequent reports, often daily, are made from each concern, giving in detail the quantity of the output, the quality of the goods, the exact cost of the different processes of manufacture; so that it is possible to compare continually each of them with all of the others; to detect the special weakness of each, and in this way to remedy any slight defects in any one establishment, and to bring all nearly up to the highest level of productive capacity.

5. Each business manager is likely to have some special excellence in his methods of management. One will be particularly skilful in the technique of manufacturing; another in the organization of the business; a third in selling goods, and so on. By combining many establishments into one, it is possible so to distribute this managerial skill that each superintendent will be given the department for which he is peculiarly fitted, and the whole establishment will thus get the benefit, not merely of the best executive ability at the head, but also of the best managing skill at the head of each separate department. In many cases it is probable that as much is saved in this way as in any other.

6. Besides this distribution of skill of the managers, it is sometimes equally beneficial to distribute the various products of the combination among the different plants. For example, in the manufacture of hoop and bar iron the products are turned out in great varieties of size, probably from seventy-five to a hundred. Wholesale dealers in sending their orders to the mills are likely to call for from ten to fifty different kinds. If these orders go to an establishment which has but one large mill, it may be necessary, in order to execute the order, to change the rolls in the mill several times, causing thus a waste of power, of time and of energy. If several establishments are combined, each can be equipped for certain sizes. When, in these circumstances, a large order is received, to each establishment will be sent that part of the order which it is especially equipped to fulfil, and thus, without any changes of rolls or stoppage of machinery, the separate sizes can be made. The same principle holds of course in nearly all lines of work, in some to a greater degree than in others; but in the manufacture of hoop and bar iron a saving from this source amounting to from a dollar to a dollar and a half, or from 4s. to 6s., per ton is sometimes made.

7. The advantage of unifying in one establishment the manufacture of products somewhat allied in nature appears also in selling goods. If customers can buy all of the various kinds of related goods in one establishment, much of their time and energy will be saved. Some of the larger combinations, therefore, in order to make this saving for their customers and thus to be sure of retaining their orders, add to their plant facilities for making products which a smaller establishment could hardly manufacture. For example, the Distilling Company of America, which controls probably 90% of the entire product of corn spirits, found it to its advantage to add to its plant several rye distilleries, and to purchase a number of the leading brands of whiskies for consumption as beverages, in order that they might supply the needs along different lines of practically all dealers in spirits and whiskies, in this way saving for themselves many customers who otherwise might have been lost.

8. The mere size of an establishment and its ability to supply at any time on short notice any order, however large, gives it also an advantage in retaining custom. A concern that controls only

from 5 to 10% of the entire output of a country in any special line of goods might at times find it impossible to supply goods promptly. Large customers who might thus be embarrassed are more ready to deal regularly with an establishment controlling 75 to 90% of the output, if they can in this way be sure of having their orders attended to promptly. It is stated that the American Sugar Refining Company on this account has been able to secure, with considerable regularity, one-sixteenth of a cent a pound more on its refined sugars than the independent refiners, the latter being frequently compelled to cut their prices to that extent in order to make sales.

9. Owing to the fact that the introduction of goods into new markets, especially into foreign markets, is a matter of time, expenditure of energy, and of money, the large establishment with great capital has in this particular also a decided advantage. The Standard Oil Company, and American Tobacco Company, and other similar establishments, have thus been able to open up new markets in Europe, in Japan, China and other portions of the Far East more readily by far than individual producers along those lines could have done. This stimulus to the foreign trade acts also beneficially to the domestic trade, inasmuch as the exportation of part of the product tends to keep prices somewhat higher at home, and as the added demand for the raw material influences its price, thus creates a demand for labour along many lines.

10. The combination also frequently saves for its stockholders considerable sums from its wiser dealing with credits, and this in a way also that is beneficial to the entire business community. When competition is very severe among different establishments, the managers, in order to increase their sales, will not infrequently grant credit somewhat unwisely. The combination controlling a large part of the market is not so tempted, and moreover has the power to bring needed pressure to bear upon delinquent debtors more readily, so that losses from bad debts are much less frequent.

Besides the special savings that serve as reasons for the formation of combinations, certain special favours at times lead to their formation.

Special Favours to Combinations.

1. The protective tariff is most frequently cited as such a favour. By the protection which a protective duty gives against foreign competition, it doubtless often furnishes the occasion for the formation of trusts. If a large amount of capital is tempted into the industry through the profits promised by the tariff, and therefore competition among the various establishments becomes fierce, it is much easier for them to form a combination with the certainty of good profits, provided the domestic competition can be overcome, if they are certain that foreign competition also is to be excluded. On the other hand, it would hardly be right to speak of the tariff as in this case the direct cause. In other industries not protected by the tariff the same fierce competition leads to the formation of combinations. The tariff is simply an encouraging condition. The removal of the tariff would not destroy the combination unless it destroyed the industry at the same time; but, on the other hand, the removal of a protective tariff might very easily prevent the abuses of exorbitant prices which might be exacted by a combination protected by the tariff.

2. It is doubtless true that combinations have a good many times been encouraged by special discriminating rates of freight granted by the railways or other transportation agencies. There is, of course, a certain economic advantage to the railways in having goods despatched in large quantities by consigners who are able to supply their own cars, loading and unloading facilities, &c. Railways on that account often prefer to deal with large firms, and, other things being equal, are willing to give them some special rates. These concerns also are likely to have rather better credit than the smaller ones, so that dealing with them ensures prompt pay and cheaper collection of accounts. The competition among the different railways also for the freights which an important customer can furnish leads to cutting of the rates in their favour. These special rates, however, whether justified from the business point of view or not, are beyond any question from the social point of view, often a very grave injury. A manufacturer who receives these special favours can build up a business substantially monopolistic in its extent, whereas his rival of equal or even of greater ability, and equally skilful as a manufacturer, would be ruined if he did not receive like rates. The injustice of such discriminations and their evil effects on the community have been recognized by legislatures and courts in America, and they are practically universally forbidden. It remains beyond question true that they are, notwithstanding, very frequently granted.

Promotion.

In recent years in the United States there can be little question that the formation of the great combinations has been much encouraged by the opportunities, which promoters were able to seize, of making for themselves large profits. The movement towards combination was so fully recognized and the advantages in many cases so palpable, that a well-informed and skilful promoter was often able to persuade a large proportion of the manufacturers in some special industry to combine. In preparing the plan for such combination, the promoter has in many cases seen to it that he himself first bought the properties which he could very shortly turn over to the combination at high rates of profit; or else he has been able to persuade the new corporation to issue large amounts of stock, of which considerable proportions were given to him in return for his services. It has been true in many cases that these securities have been speculative in nature, but nevertheless the promoter has often reaped in this way large rewards. The possibility of this profit has doubtless stimulated his activity in urging the combinations.

The Underwriter.

Associated with the promoter in the organization of these combinations have usually been bankers or other financiers who stood ready, for an amount of stock or other promised profit sufficiently large to compensate them for their risk, to furnish to the combinations cash sufficient to start the business and to provide other needed capital. Usually the form of underwriting employed has been this: A promoter engaged in the formation of a combination and needing a certain fixed sum in cash, would make an arrangement with a bank to sell to it at a price agreed upon such portions of a named amount of stock as were not disposed of to other customers before a certain fixed date. For example, the bank might agree to furnish one million dollars in cash (£200,000) in return for say four millions of stock (£800,000), or to purchase itself at a fixed price all the remainder of the $4,000,000 stock unsold at the date agreed upon, the bank itself to become the sales agent. In those circumstances the bank would naturally use its best endeavours to sell the four millions of stock to other customers at the price agreed upon, say twenty-five dollars, or £5, per share. So far as it failed of disposing of the entire amount, it would take the remainder itself. For taking these risks, naturally the bank has almost invariably asked a very high commission, and not infrequently it has been asserted that the managers of the banks have been given a special bonus for themselves privately, in addition to the rates of profits granted the bank.

The Basis of Capitalization.

These large amounts of stock that are paid to the promoter and the financier for the purpose of bringing about the organization of a large trust, lead, of course, to what is called over-capitalization. What the proper basis of capitalization for a manufacturing industry should be, is a matter that cannot perhaps easily be determined by a definite principle which shall be applicable in every case. The laws that have been most strict on the subject attempt to limit the capitalization to the "actual cash value" of the business, by that being understood at times simply the cost of the plant itself with the running cash capital needed. On the other hand, most business men think that it is a wiser plan, and on the whole equally just, to capitalize a business on the basis of its earning capacity, regardless of what the plant may have cost. When, as has been frequently the case of late years, in addition to this cash value of the plant and the cash itself which may have been paid in, large sums of stock are issued also for properties which may be in themselves highly over-valued, and for the services of the promoter, the financier and others, we can see that the capitalization must be far above what may ordinarily be considered a paying basis. On the other hand, if the element of monopoly enters into the business to any noteworthy extent, the prices of the product may be kept so high that fair dividends may be paid even on this high capitalization. That the tendency towards increasing the capital has been very strong there can be no question, and a penalty is apt to be paid for this somewhat reckless financiering. As soon as a slight depression in business comes, so that it is perfectly evident not merely that dividends cannot be paid on the common stock, but that in all probability both the deferred stock and the bonds, if any have been issued, will also have to go without interest, it may be necessary to reorganize many of these combinations and to start them anew on a much lower capitalization.

The Industrial Manager.

When the person organizing the combination is himself an active business man, and has the intention of himself directing the affairs of the combination, another element besides that of personal profit very frequently enters into the problem. Most strong men like to take responsibility and to be dominant in affairs. When, owing to the advantages of combination that have been enumerated above, the prospect of a virtual monopoly seems certain, provided due skill in management is exercised, it is natural that the manager should wish to bring about the combination in order that he may himself have the satisfaction of being in substantially absolute control of the entire industry in a country, or possibly even in the world. The ambition thus to dominate in a great industry is akin to that of a statesman, and there can be little question that this pride of power and the desire to control the destinies of others has been a more or less conscious element in the formation of many of the most successful and most skilfully managed combinations.

The Forms of Combination.

1. The form of combination which has ordinarily been first adopted has been some kind of agreement with reference to maintaining prices, or to paying wages, or to dividing the territory for the distribution of the product, or similar questions. Experience has shown that, generally speaking, such agreements are not likely to be kept in good faith for a long period.

2. In order to make the combination more permanent in its nature, the form of the trust, technically so called, was adopted. Under this form of combination, the stockholders of the various constituent companies of the trust place their stock in the hands of a small board of trustees, giving to these trustees an irrevocable power of attorney to vote the stock as they see fit, or in accordance with specific instructions given at the beginning. The title to the stock itself remains in the original holder, with the right to sell or pledge or dispose of it as he sees fit, but without the power of recalling his right to vote. In return for this stock thus deposited with the trustees, the trustees have ordinarily issued trust certificates, which are in themselves negotiable and take the place of the stock. Inasmuch as the holding of the voting power of the majority of the stock of each of the different constituent companies gave to the trustees absolute power of election of directors, and consequently the power of guiding harmoniously the affairs of all of the plant entering into the combination regardless of the will of the stockholders, the United States courts held that the corporations entering into such an agreement had gone beyond their powers, and that such a trust was illegal. Owing chiefly to these hostile decisions of the courts, this form of trust was abandoned, and new forms, which still, however, leave the power of unified direction in the hands of a few men, were adopted.

3. After the trusts were declared illegal, it was usual, when a combination was formed, to organize a new corporation which bought all of the properties of the constituent members of the trust. These constituent companies then dissolved, and the one great corporation owning all of the properties remained.

4. The form that now seems to be much in favour approaches in its general nature more closely to that of the original trust. Under this form a corporation is organized for the special purpose of buying and owning all, or a controlling share, of the stocks of each one of the constituent companies. The separate companies are then managed technically independently, the dividends of the separate corporations are all paid to the parent corporation as the stockholder owning all of the stocks, and these dividends are the source of profits of the new corporation. The officers in this parent corporation, of course, vote the stocks of the separate companies, and thus absolutely control.

The Trust and Wages.

From the savings which it is possible for the combinations to make, it would seem possible for them to pay higher rates of wages to those remaining in their employment than it was possible for the constituent companies to do. In certain instances, especially when the combination has first been made, wages have been increased. On the whole, however, it is probable that as yet the wage-earners have succeeded in getting an increase of wages in circumstances substantially similar to those under which their wages would be increased by single corporations. An increase of wages comes only through pressure on their part. Under a prosperous condition of industry it is possible, without materially lowering profits, to increase the wages.

Certain classes of employés, especially superintendents and commercial travellers, are less needed by the combinations, and consequently the total sum of wages paid to these classes by the combination is less than that formerly paid by the constituent companies. On the other hand, the number of employés of these classes being less than before, the average wage has, in certain cases at least, been increased. Owing to the fact that competitive selling is in certain cases largely done away with, it has in some, perhaps in many, cases been possible for fewer travelling salesmen, of less skill and with lower wages, to do the work than before the combination, so that not merely has the total expense been lessened, but also the average salary paid to those retained in the business.

In case of disputes arising between the combination and the operatives, the position of the combination is stronger than that of an individual corporation. It is possible to close one or two works where troubles have arisen, and to transfer orders to the other works without any material injury to the business, provided the closing of the one or two establishments is not for too long a period. Such instances have occurred. On the other hand, labour organizations are also rapidly increasing in strength, and their leaders are of the opinion that within a comparatively short time they will be so thoroughly organized in all of the chief industries that a strike can be instituted and supported not merely in one or two establishments, but throughout the entire industry. Whenever this condition of affairs shall have been reached, the employés will be substantially on an equality with their employers in such cases of conflict, so that the advantage now resting with the combination will be largely removed. In certain industries this condition seems already to have been reached.

Prices.

From the sources of savings that were enumerated before, it is evident that it would be possible for a combination either to increase the prices paid for raw materials, or to lower the prices of its finished products. Experience, however, seems to show beyond question that whenever the combinations are powerful enough to secure a monopolistic control it has usually been the policy to increase the prices above those which obtained during the period of competition preceding the formation of the combination. Inasmuch, however, as an attempt to increase prices to any great extent, so as to secure very high profits, would certainly result in tempting new capital into the field, it has been the general experience that prices have either been increased only comparatively little after the combination was formed, or else that competition entering the field has comparatively soon forced a lowering of prices to substantially the former competitive rates. It should be noted, however, that inasmuch as combinations have very frequently been formed only after a period of competition so fierce that practically all the competitors were running at a loss, it is hardly just to speak of a combination placing its prices above "competitive rates" unless one defines what is meant exactly by that expression. Whenever they have put their prices above the competitive rates existing just before the combination, it may mean that they have put their prices back to rates that will allow medium profits instead of losses, and not above rates that would be normal in the case of small competitors.

Legislative Remedies.

It will have been noted from what has been said that the excellences of the combination consist largely in the savings that have already been enumerated. The evils are: (1) The losses to investors through the acts of the promoters and financiers at the time of the organization of the combinations, and through the speculation in the stocks which is at times carried on by the directors of the combinations themselves. (2) The losses to the wage-earners from the power that sometimes exists of forcing wages rather lower than it would be possible for a single corporation or manufacturer to do, and also from the discharge of certain classes of employés whose services are no longer needed, such as commercial travellers. It should be remarked of the latter case, however, that the injury is a personal one to those men that are discharged, but that it results in a saving to the community, and, therefore, presumably to the wage-earning class as a whole in the long run. (3) A further injury at times to the consumer arises, as has been suggested, from the increase in price. Other evils come through the power that is sometimes exercised by combinations in the corruption of legislatures; in the control over industries of such a nature that it tends to destroy the spirit of individual activity and independence on the part of many persons who would otherwise enter business independently; and evils also come through the increased force of any improper or dishonourable business practices, since this added force for evil is given to any combination by virtue of its greater influence in the community. It is not intended to convey the impression that managers of combinations are less moral than other business men, but merely that whenever they are dishonourable in their practices the influence reaches more widely.

The chief remedies for these evils enumerated would seem to be more rigid laws with reference to the methods of incorporation and to the responsibility of directors to stockholders and to the public. This can perhaps best be brought about through greater publicity in both of these directions, probably under the inspection of government officials. The other line of remedies would seem to be the removal of special favours granted to these combinations either by the government or by railways or other bodies so situated that they can distribute favours to the larger combinations.

The Movement Towards Consolidation.

The movement towards consolidation of industries in the United States began to be noticeable soon after the Civil War (1861–65), but it had not reached noteworthy proportions, excepting in connection with the railways, until within the last twenty years of the 19th century. During the later years many consolidations were made, the largest number during the years 1898–1900. From what has been said earlier, it is evident that certain classes of industries, especially those that require the investment of fixed capital to large amounts, are especially adapted for combination. Very little tendency towards consolidation is found in the farming industry, and, relatively speaking, little in industries that require the investment of but small capital. It is perhaps, however, not too much to say that in nearly all lines of industry which from their nature are adapted for consolidation combinations more or less firm have been made during the last few years. It is probable that as time passes we shall have many of these combinations reorganized, and that in many lines of industry there will be further consolidation of present combinations.

Experience has shown that when combinations are made in industries that from their nature do not seem well suited for consolidation, failure follows. In many individual instances corporation lawyers, who have had much practice in forming combinations, advise their clients in lines of business especially fitted for competition not to enter a combination, but to remain independent, assuring them that an individual is able to compete in such lines of industry with any combination, however large. Such advice, of course, would not be given were the industry one which was well adapted for consolidation.

European Experience.

Great Britain.—The tendency towards consolidation has been for several years very noticeable in Great Britain, although the form has been rather that of a *pool* or *ring* than that of a trust or of a single large corporation. In the coal and milling industries there have been agreements; and, particularly in London and other distributing centres, these selling combinations have been able at times to control the market. This has also been true with reference to certain kinds of provisions, such as the bacon imported from Denmark.

Of late years there has been a marked tendency towards the formation of large corporations that buy up a very large proportion of competing manufacturing plant, and in this way secure at least a temporary monopoly of the market. The Salt Union was formed along these lines, but this has not proved successful, owing probably to the fact that new sources of supply were discovered. The dyeing industries in Bradford and in Yorkshire have been consolidated, so that in certain respects they have an absolute monopoly of the business, and in most directions of over 90% of it. The calico printers, the fine cotton spinners, the thread manufacturers, the bleachers, and others connected with the cotton manufacturing industries in Great Britain, have nearly all been brought together into large corporations which control from 90% upwards of the entire business. Similar combinations in cement, wall-paper, soap, tobacco and other trades have been formed. Most of these large corporations have been in existence for such a short time that one cannot yet judge accurately regarding their permanent success. Many of them seem to have been over-capitalized and their dividends have not always met shareholders' anticipations. There has been no active popular movement against consolidation in England, and the government has passed no laws opposed to it. Parliament, however, has passed stringent amendments to the Companies Acts, changes enforcing publicity regarding the organization of all limited liability companies and their methods of management. The amended law is expected to prevent most of the abuses of the combinations.

Germany.—Germany seems to be peculiarly the home of combinations so far as Europe is concerned. In 1897 Liefmann, writing regarding combinations in Germany, was able to mention combinations which were international in their scope in forty-one different branches of industry. Of combinations that were confined to Germany alone he mentioned 345, although many of them were in the same line of industry; for example, he found 80 combinations in different branches of the iron industry, 82 in the chemical industries, 38 in the textiles, and so on. Of that number he thought that definite information could be secured, but he was of the opinion that very many more of less importance existed, and had excluded from his reckoning all of those that were purely local, as for example those among the breweries in the different cities, as well as those among firms engaged merely in trade. The form of combination in Germany is ordinarily that merely of contracts among independent establishments (*Cartels, Kartells*) regulating the amount of output for each, and in certain cases also the prices. As in Austria and in France, a central selling bureau for all the members of the combination is frequently found. The most successful combinations have been those among the coal-miners in western Germany and the four or five in the leading branches of iron manufacture, also in western Germany. Others of somewhat similar rank have been organized, one, for example, in the sugar industry, which includes both refiners and producers, and another among the manufacturers of spirits. The former, following that among the Austrian sugar manufacturers, is somewhat peculiar in that the refiners guarantee to the producers of raw sugar a fixed price for their output so far as the sugar is intended for the home market, the refiners expecting to recoup themselves from the consumers through the monopolistic power which they possess. The law does not seem to be hostile to these combinations. Contracts that are immoral in their nature are, of course, non-enforceable. But the courts have, on the whole, not taken an attitude inimical to the larger combinations, and the government seems at times to have been inclined to favour them. In one or two cases where the government is itself a producer, as of soda, it is a member of a combination. Indeed, a Prussian minister in a speech in the Landtag has expressed himself favourably regarding the coal and iron combinations. The facts seem to show that the coal combination, at any rate, has used its power of fixing prices in a conservative way, and it has at times held prices somewhat lower than they probably would have been had free competition existed in that industry. So long as the combinations are managed conservatively, and so long as the government is able to secure a careful supervision over them, it is not to be expected that there will be much hostility in Germany on the part of the government.

France.—The number of combinations in France is probably much less than in Great Britain or Germany. In the penal code there has been a provision for many years against monopoly brought about by unfair means, and in one or two rather prominent instances there seem to have been convictions under this article. Consequently, the agreements that have been made, so far as they are intended to control prices, are usually kept secret. There have been, however, notably in the case of the iron industries, agreements made among the leading manufacturers, under which the proportion of output assigned to each was fixed. A single selling bureau has also in such cases been established, which receives all orders and fixes the prices for all of the different establishments concerned. So far this form of organization, although in certain localities it seems to have secured monopolistic power has not been successfully attacked in the courts. For several years it has been supposed that a similar agreement existed among the sugar refiners. They themselves, however, acknowledge only an agreement regarding the amount of the output which shall be assigned to each, and deny any agreement as to prices. Of course an agreement regarding output would be likely to have a material effect upon prices. Somewhat similar combinations exist among the petroleum refiners, the porcelain makers, and some few others. The government has taken no active steps in the matter, but popular opinion seems to be awakening somewhat.

Austria.—In Austria the development of combinations has been very marked. The most successful combination, on the whole, as well as one of the earliest, has been that of the iron industry. The sugar industry, however, including both refiners and producers of the raw sugar, and the petroleum industry, are also combinations of great power. The form of these combinations is ordinarily that of an agreement regarding both output and prices. In some instances a central selling bureau fixes the prices, in others the market is divided, while in others still other forms of agreements of many kinds which serve to secure a monopoly are found. The movement has spread very rapidly indeed, until, in the opinion of many writers in Austria, practically all branches of industry, in which agreements for the lessening of competition will prove advantageous, are now largely controlled by combinations. The courts of Austria have, on the whole, shown themselves hostile to the movement. Contracts for the division of the market, for the assignment of fixed proportions of the entire output to different establishments, the fixing of prices, &c., are declared void and will not be enforced by the courts. This adverse action, however, does not seem to have affected very materially the tendency towards combination, although it has perhaps tended somewhat to encourage the formation of large corporations which should purchase all of the separate plant in any one industry. This tendency, again, is checked by the fact that the corporation law requires publicity in business, and that the taxes are heavier on corporations than on private firms, both as regards the legal rate and the certainty of collection. A government commission has recommended recognition of the combinations by law and their careful supervision and regulation by government authority. (J. W. J.)

TRUXTUN, THOMAS (1755–1822), American naval officer, was born at Jamaica, Long Island, on the 17th of February 1755. He went young to sea, and during the War of Independence was first persuaded to serve in a royal ship. But having been wounded in an action with a privateer manned by his countrymen, it is said that he declared he would never fight them again. Henceforth he commanded a succession of privateers sent out to cruise against British trade and transports—the "St. James," the "Mars," the "Independence." He had the reputation of being uniformly successful in all engagements with British vessels. When the independence of the United States was recognized he returned to trade with a high reputation as a seaman. He was the author of a treatise on longitude and latitude, of a "System of masting a 44-gun frigate," and was an advocate for the foundation of a national navy. When the United States navy was reconstituted in 1798 he was one of the original corps of six captains. During the last years of the 18th and first of the 19th century American commerce was subject to much intolerable interference on the part of the French as well as of the British naval officers. It was against the first that Truxtun rendered the services which have made him a prominent personage in the history of the United States navy. In February 1799 he was captain of the United States "Constellation" (36) and on the 19th of that month he captured the French "L'Insurgente" (36). In the following year, and while still in command of the "Constellation," he fought the French "Vengeance" (40), and drove her into Curaçao. The crippled state of his own ship, which had lost her mainmast, prevented him from taking possession of the enemy. In 1802 he was to have sailed in command of the squadron sent against the Barbary pirates, but a difference having occurred between him and the navy department in regard to the appointment of a captain to his flagship, his remonstrance against the official decision of the authorities was treated as a resignation, which it was apparently not meant to be, and he was not employed any further. He died at Philadelphia on the 5th of May 1822.

TRYON, DWIGHT WILLIAM (1849–), American artist, was born at Hartford, Connecticut, on the 13th of August 1849. At the age of twenty-five he left his position as a clerk in a Hartford publishing house to devote himself entirely to art, and two years afterwards went to Paris, where he became a pupil of the École des Beaux Arts, under J. de la Chevreuse, Charles Daubigny and A. Guillemet. A skilful landscape painter, New England provided his best subjects. He first exhibited at the Salon in 1881, and in the same year returned to the United States, settling first in New York City; in 1882–1886 he was director of the Hartford School of Art, and in 1886 became professor of art at Smith College. He became a member of the Society of American Artists (1882), a National Academician (1891), and a member of the American Water Color Society. He won numerous medals and prizes at important exhibitions, among his pictures being "Daybreak," "Moonlight" and "Early Spring, New England."

TRYON, SIR GEORGE (1832–1893), British admiral, a younger son of Thomas Tryon, of Bulwick Park, Northamptonshire, was born on the 4th of January 1832. He entered the navy in 1848, on board Lord Dundonald's flagship on the North American station; was subsequently in the "Vengeance" with Lord Edward Russell in the Black Sea; was landed for service with the naval brigade; and was made a lieutenant in November, but dated back to the 21st of October 1854. From 1855 to 1858 he was in the "Royal Albert" flagship of Sir Edmund Lyons; and from 1858 to 1860 in the royal yacht, which gave him his promotion to commander on the 25th of October 1860. From 1861 to 1864 he was commander of the "Warrior," the first British sea-going ironclad; from 1864 to 1866 he commanded the "Surprise" gun-vessel in the Mediterranean; and was promoted to be captain on the 11th of April 1866. In 1867 he was sent out as director of transports and store ships for the Abyssinian expedition, a post which involved a great deal of hard work in a sweltering and unhealthy climate. He discharged his duties exceedingly well, but his health broke down, and he returned to England a helpless invalid. From 1871 to 1873 he was private secretary to Mr Goschen, then first lord of the admiralty; and from 1874 to 1877 commanded the "Raleigh" in India with the Prince of Wales, and later in the Mediterranean. In the years 1878–1881 he had command of the "Monarch," one of the Mediterranean fleet under Sir Geoffrey Hornby and Sir Beauchamp Seymour, afterwards Lord Alcester. He was subsequently for two years secretary of the admiralty; and for three years more, on his promotion in April 1884 to the rank of rear-admiral, commander-in-chief on the Australian station. On his return in June 1887 he was made K.C.B.; afterwards he was for three years superintendent of reserves, in which capacity it fell to him to command one of the opposing fleets during the summer manœuvres, when he showed marked ability and originality of ideas. In 1889 he was promoted to be vice-admiral; and in August 1891 was appointed to command the Mediterranean fleet, which under him—following the example of his old chief, Sir Geoffrey Hornby—became very distinctly an evolutionary and, in that sense, experimental squadron. Some of his methods were afterwards said to be dangerous; but those which were most severely criticized do not appear to have had anything to do with the lamentable accident which ended Tryon's career. On the 22nd of June 1893, the fleet being then off Tripoli on the coast of Syria, in two columns, Tryon made the signal to invert the course, the ships turning inwards in succession. By a fatal error, the psychological cause of which has never been explained, he ignored the patent fact that the two columns were so near each other that the manœuvre, as ordered, must entail the most serious risk, if not certainty, of collision. And, in fact, the two leading ships did come into collision, with the result that the "Victoria," Tryon's flagship, was cut open and sank in a few minutes. Tryon and 358 officers and men were drowned.

See the *Life*, by Rear-Admiral C. C. Penrose-FitzGerald.

TRYON, THOMAS (1634–1703), English humanitarian, was born at Bilbury near Cirencester on the 6th of September 1634. He had but little schooling, spending his youth first in spinning and carding and then as a shepherd. In 1652 he went to London, apprenticed himself to a hatter, and accepted his master's Anabaptist principles until he read the works of Jacob Behmen. He now lived a very ascetic life, though he married and became a prosperous merchant. In 1682 he began to publish his views in support of vegetarianism and abstinence from alcohol and tobacco. He detested war, and in this and his mysticism resembled the early Quakers. He died on the 21st of August 1703.

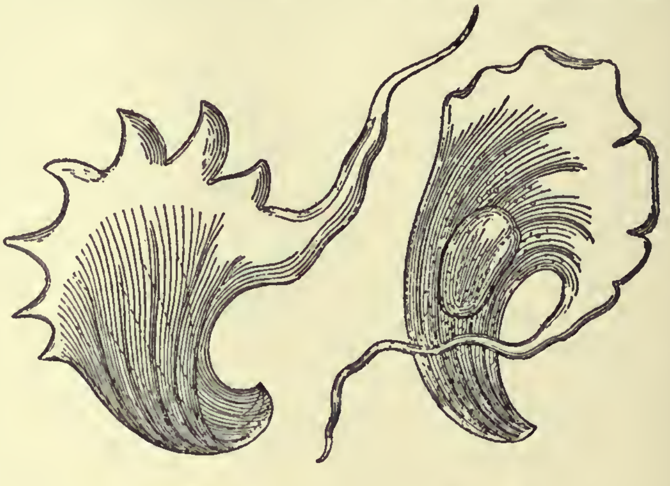
His best known book, *The Way to Health* (1691), which much impressed Benjamin Franklin, was a second edition of *Health's Grand Preservative; or, The Women's Best Doctor* (London, 1682). He wrote on many other subjects, *e.g.* the education of children, the treatment of negro slaves, the way to save wealth, and dreams and visions. Some scanty autobiographical memoirs were published in 1705.

TRYON, WILLIAM (1729–1788), American colonial governor, was born at Norbury Park, Surrey, England, in 1729. In 1757, when he was a captain of the First Foot Guards, he married a London heiress with a dower of £30,000. In 1764 he was appointed lieutenant-governor of North Carolina, upon Arthur Dobbs's death in 1765 became governor *pro tem.*, and in December of the same year received his commission as governor. Like many other pre-Revolutionary officials in America, he has generally been pictured by American writers as a tyrant. In reality, however, he seems to have been tactful and considerate, an efficient administrator, who in particular greatly improved the colonial postal service, and to have become unpopular chiefly because, through his rigid adherence to duty, he obeyed the instructions of his superiors and rigorously enforced the measures of the British government. By refusing to allow meetings of the Assembly from the 18th of May 1765 to the 3rd of November 1766, he prevented North Carolina from sending representatives to the Stamp Act Congress in 1765. To lighten the stamp tax he offered to pay the duty on all stamped paper on which he was entitled to fees. With the support of the law-abiding element he suppressed the Regulator uprising in 1768–71, caused partly by the taxation imposed to defray the cost of the governor's fine mansion at New Bern (which Tryon had made the provincial capital), and executed seven or eight of the ringleaders, pardoning six others. From 1771 nominally until the 22nd of March 1780 he was governor of New York. While he was on a visit to England the War of Independence broke out, and on the 19th of October 1775, several months after his return, he was compelled to seek refuge on the sloop of war "Halifax" in New York Harbour, but was restored to power when the British took possession of New York City in September 1776, though his actual authority did not extend beyond the British lines. In 1777, with the rank of major-general, he became commander of a corps of Loyalists, and in 1779 invaded Connecticut and burned Danbury, Fairfield and Norwalk. In 1780 he returned to England, and in 1782 was promoted to be lieutenant-general. He died in London on the 27th of January 1788.

See Marshal D. Haywood, *Governor William Tryon and his Administration in the Province of North Carolina* (Raleigh, North Carolina, 1903).

TRYPANOSOMES, or HAEMOFLAGELLATES, minute Protozoan parasites, characterized by the possession of one or two flagella and an undulating membrane, and specially adapted for life in the blood of a vertebrate.[1] Of late years considerable progress has taken place in our knowledge of these organisms, research upon them having been stimulated by the realization of their extreme importance in medical parasitology. Not only has the number of known forms been greatly multiplied, but the study of the biology and life-history of the parasites has been attended in some cases with remarkable and unexpected results.

Historical.—The first observation of a trypanosome is usually ascribed to Valentin (55), who in 1841 announced his discovery of certain amoeboid parasites in the blood of a trout. In the two or three years following several other observers recorded the occurrence of similar haematozoa in various fishes. The generic name of *Trypanosoma* was conferred by Gruby in 1843 upon the well-known parasite of frogs. E. Ray Lankester (18) subsequently described this same form (under the name of *Undulina ranarum*)



(From Lankester.)

FIG. 1.[2]—*Undulina ranarum*, Lankester, 1871. In B the nucleus is shown.

and was the first to indicate the presence of a nucleus in the cell-body. To Mitrophanow (1883–1884) and Danilewsky (1885–1889) we owe the first serious attempts to study the comparative anatomy of these haematozoa. Trypanosomes were first met with in cases of disease by Griffith Evans, who in 1880 found them in the blood of horses suffering from surra in India. In 1894 (Sir) David Bruce discovered the celebrated South African parasite (*T. brucei*) in cattle and horses laid low with nagana or the tsetse-fly disease; and this worker subsequently demonstrated, in a brilliant manner, the essential part played by the tsetse-fly in transmitting the parasites. The credit for first recognizing a trypanosome in human blood, and describing it as such, must undoubtedly be assigned to G. Nepveu (1898). Trypanosomes were next seen in human blood

[1] *Trypanophis*, although lacking (so far as is known) a haemal habitat, is included here, since it is undoubtedly closely related to *Trypanoplasma*.

[2] The illustrations in this article are from H. M. Woodcock's "Trypanosomes," in the *Quarterly Journal of Microscopical Science*.

in Senegambia in 1901, in a European suffering from intermittent fever. Forde discovered the parasites, but was uncertain of their nature; he shewed them to E. Dutton, who (11) gave this form the name of *Trypanosoma gambiense.* A year later A. Castellani (6) found the organisms (most probably the same species) in the cerebro-spinal fluid of patients suffering from sleeping-sickness in Uganda; and it has since been conclusively proved by Sir David Bruce and D. Nabarro (4) that they are the true cause of that dreadful malady.

More important, from the standpoint of protozoology, than these interesting medical discoveries have been the investigations by A. Laveran and F. Mesnil (20–24), L. Léger (30–35), S. Prowazek (47), F. Schaudinn (50) and others, upon numerous tolerated (*i.e.* non-pathogenic) forms; these researches supply, indeed, practically all the material facts on which to base an account of the Haemoflagellates at the present day.

Trypanosomes are harboured by members of all the chief classes of vertebrates with the exception of cyclostomes. By far the greater number of hosts are furnished by fishes, birds and mammals. Among batrachians the parasites have been found, up till now, only in frogs; and among reptiles their occurrence has only been observed in one or two solitary instances (*T. damoniae*, fig. 3 J). Data with regard to the frequency with which individual species occur, in any kind of host, are as yet somewhat scanty; in one or two cases the parasites are fairly common, *T. lewisi*, for example, being met with in a considerable percentage of sewer-rats throughout the world.

Occurrence.

In considering the occurrence of Trypanosomes in mammals, careful distinction must be drawn between natural or true hosts, which are tolerant of the parasites, and casual ones, which are unaccustomed and unadapted to them. A Trypanosome usually produces markedly harmful effects upon gaining an entry into animals which have never been, by their distribution, liable to its invasion previously. Such a state of affairs is produced by the march of civilization into the "hinterlands" of the various colonies, when man, together with the numerous domesticated animals which accompany him, is brought into proximity to big game, &c., and, what is equally important, into the zone of the particular blood-sucking insects which prey upon the same.

Very many of the common domestic mammals can be successfully infected (either thus accidentally or else on purpose) with different "pathogenic" Trypanosomes, to which they succumb more or less readily, but they cannot be regarded as the natural hosts of those Trypanosomes. In dealing with disease-causing forms, the more narrowly the original source of the parasite concerned is defined, the closer do we get to the true vertebrate host or hosts. In the case of the nagana-parasite, various Antilopidae (*e.g.* the gnu, bushbuck and koodoo) can certainly lay a strong claim to the honour. The capybara, again, is most probably the native host of *T. equinum* of mal de caderas of horses in South America. Similarly with regard to the many other pathogenic Trypanosomes now known, there is undoubtedly, in each case, some indigenous wild animal tolerant of that particular form, which serves as a "latent source of supply" to strange mammals.

Transmission; Alternation of Hosts.

The transmission of the parasites from one vertebrate individual to another is effected, in the great majority of cases,[1] by a blood-sucking invertebrate, and by this means alone. The "carrier" of a Trypanosome of warm-blooded vertebrates is, in all instances so far described, an insect, generally a member of the Diptera; in the case of parasites of cold-blooded vertebrates the same rôle is usually played by an ichthyobdellid leech (piscine forms), but possibly, now and again, by an *Ixodes* (amphibian or reptilian forms).

Until lately it remained quite uncertain, however, whether the invertebrate merely conveys the Trypanosomes or whether it is a true alternate host, one *i.e.* in which definite stages of the parasite's life-cycle are undergone. Schaudinn (50), who investigated certain avian Trypanosomes, considered the latter view to be correct, and believed that the carrier—in this instance a gnat—is indeed the definitive host, *i.e.* the one in which sexual conjugation occurs. Many other workers have since studied the subject and, so far as the parasites of fishes are concerned, there can be little doubt, thanks to the researches of E. Brumpt (5*a*), L. Léger (32, 33) and others, that leeches are true alternate hosts for these forms, in which certain phases of the life-cycle are normally undergone.

We cannot write quite so confidently with regard to the relation of the various pathogenic Trypanosomes to Tsetse-flies (*Glossinae*). In the first place experiment has shown that biting-flies, other in all probability than the true, natural hosts, may at times transmit the parasites—as it were—accidentally, if, after feeding on an infected animal, they are allowed to bite a fresh one within a limited time. One very helpful factor in determining which is the principal carrier of any form is the coincidence of the zone of a particular insect with that of any disease. By this means it has been ascertained with practical certainty that, among the family of Tsetse-flies (*Glossinae*) for instance, at least four species are the natural carriers of different Trypanosomes. Of these perhaps the best-known is *G. palpalis*, of Equatorial Africa, whose bite transmits the human parasite (*T. gambiense*). Nevertheless, the fact, commented upon by several observers, that even here an infected fly is only infectious for a comparatively short period suggests that this species of fly, at any rate, is not the true alternate host in which the life-cycle of that particular Trypanosome is completed. However, indications furnished by Koch (16*a*) point in this connexion to *G. fusca.* Lastly, before leaving this interesting and important subject, F. Stuhlmann's work (54*a*) on developmental phases of *T. brucii*, the nagana parasite in *G. fusca* and *G. tachinoides*, does render it probable that the pathogenic forms also have true invertebrate hosts.

Habitat: Effects on Host.

Schaudinn had fully described the relations of certain avian Trypanosomes to their invertebrate host, *Culex pipiens* (females). The distribution of the parasites in the gnat is closely connected with the process of digestion. The Trypanosomes ultimately overrun practically all parts of the body, sometimes not even the ova escaping. Thus true hereditary infection of a succeeding generation of gnats may be brought about. The life of the parasites while in the insect is characterized by an alternation of active periods, during which multiplication goes on, with resting-periods, when the Trypanosomes become attached to the epithelial cells of the host. According to S. Prowazek (47), the behaviour of *T. lewisi* in a louse (*Haematopinus*) is, in its main features, similar.

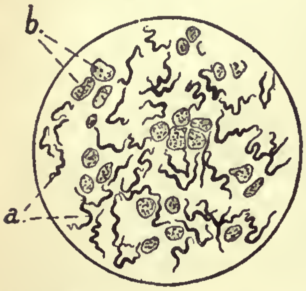
On gaining an entry into the blood of a vertebrate the organisms pass rapidly into the general circulation, and are thus carried all over. Considering them first in a tolerant host, the trend of observation is to show that they are never abundant, but on the contrary usually somewhat scarce. One reason for this scarcity is to be sought in connexion with the fact that multiplicative stages are very rarely met with, at any rate in the general circulation. The parasites are frequently more numerous in the spleen, bone-marrow, kidneys, &c., than elsewhere, and it has been found that multiplication goes on rather more actively in the capillaries of these organs.

The Trypanosomes, in the active phase, are of course always free in the blood plasma (interglobular). In the majority of cases it is very uncertain whether they actually come into relation with the blood corpuscles or not. Schaudinn has stated, however, that *Trypanomorpha* becomes, in certain phases, attached to a red blood-corpuscle (ectoglobular), and, in others, penetrates inside one and eventually destroys it (endoglobular); while his other avian parasite, *Trypanosoma ziemanni*, apparently draws up into itself the white corpuscle (leucocyte) to which it becomes attached. In addition, there are two or three

[1] *Trypanosoma equiperdum*, the cause of dourine in horses and asses, is apparently only conveyed by the act of coitus. This direct mode of transmission is most likely a secondary acquirement.

obervations to hand which shew that piscine, amphibian and mammalian Trypanosomes may also become attached. Probably most forms possess a resting, attached phase at some period or other, in the invertebrate, if not in the vertebrate host.

Considering now the Trypanosomes in an unaccustomed, mammalian host, they may either remain infrequent or rare (sometimes, indeed, being unnoticed until shortly before death), or, on the other hand, they may soon become numerous and go on increasing (fig. 2). In the latter case the disease is acute and rapidly fatal; in the former it is more chronic and lasts much longer, often several months. The main features of *trypanosomosis*, or illness caused by a Trypanosome, show a general agreement, whichever variety is considered; one symptom may be, of course, more marked than another in any particular case. Death is due either to weakness and emaciation (in chronic cases), or to blocking of the cerebral capillaries by the parasites (where these are abundant), or to disorganization of the nervous system (paraplegic and sleeping-sickness cases).



(After Doflein.)

FIG. 2.—*Trypanosoma equiperdum* (of dourine), in the blood of a rat eight days after inoculation.
a, Parasites.
b, Blood-corpuscles.

In post-mortem examination, the most obvious pathological lesion is hypertrophy of the spleen, which may be very pronounced; the lymphatic glands in the neck, inguinal region, &c., are also often greatly swollen. These are undoubtedly the organs which react most strongly to the parasites, and their enlarged condition is to a great extent due to their enhanced activity in elaborating blood-corpuscles and leucocytes to cope with the enemy. Ingestion and dissolution of the Trypanosomes by phagocytes has frequently been observed; and it is probable also that the haematopoietic organs secrete some substance which exerts a harmful action on the parasites, and causes them to undergo involution and assume weird-looking "amoeboid" and "plasmodial" forms.

Agglomeration.

A peculiar feature in the behaviour of the parasites, which is most probably caused by unfavourable biological conditions in the host, is that known as agglomeration. The process is readily brought about artificially by the addition of sera or chemical solutions to blood containing the parasites. Agglomeration consists in the grouping or union together of several Trypanosomes around a common centre; this leads to the formation of rosette-like clusters, or even of large masses composed of several rosettes. The end by which the parasites join is typically, in the case of *Trypanosoma*, the non-flagellate (anterior) end. If a favourable change in the surrounding medium sets in, the Trypanosomes are able to undergo the reverse process, namely disagglomeration; the parasites liberate themselves and the rosette is dissolved.

Morphology.

Trypanosomes vary greatly with regard to size; even in one and the same species this variation is often noticeable, especially under different conditions of life. The common *Trypanosoma rotatorium* of frogs (fig. 4, A and B) is, taking it all in all, one of the largest forms so far described. Its length (inclusive of the flagellum) varies from 40–60 μ, while its greatest width (including the undulating-membrane) is from 8–30 μ; in the very wide individuals breadth is gained more or less at the expense of length. Conversely, *T. gambiense*, the human parasite (fig. 3 C), is one of the smallest forms known, its average size being about 21–23 μ by $1\frac{1}{2}$–2 μ.

There is equally great diversity in respect of form. Typically, the body is elongated and spindle-shaped; it is usually more or less curved or falciform (fig. 3, A–D), and tends to be slightly compressed laterally. It may be, however, anything from extremely slender or vermiform (fig. 3, H) to squat and stumpy (fig. 3, G, 4, A). Moreover, apart from the fact that a full-grown adult, ready to divide, is in many cases much plumper than a young adult (cf. *T. lewisi*, fig. 6, A and B), there can be no doubt that considerable polymorphism also sometimes occurs (*e.g. T. rotatorium*). In many cases, at any rate, this indicates a difference in sexuality; and it is particularly necessary to bear this factor in mind when considering the avian Trypanosomes, where, perhaps, the extremes of form are to be met with. That one and the same species may appear entirely different in different phases of the life-history is manifest on comparing, for instance, the chief "forms" of *Trypanosoma* ziemanni described by Schaudinn. The asexual or indifferent type (fig. 3, H) is extremely thread-like, greatly resembling, in fact, a *Spirochaete*; on the other hand, both male and female individuals have the form of a very wide spindle.

c.g, Chromatoid grains; *v*, vacuole; *l.s*, fold or striation.

In *Trypanoplasma* and *Trypanophis* there are two flagella, inserted into the body very close to the anterior end (fig. 4, F and G). One flagellum is entirely free and directed forwards; the other at once turns backwards and is attached to the convex or dorsal side of the body for the greater part of its length. In all other Trypanosomes there is only one flagellum, which is invariably attached to the body in the same manner as the posterior one of biflagellate forms. This flagellum, however, is most probably not to be considered homologous in all cases. (See Woodcock, *loc. cit.*)

In *Trypanomorpha* (fig. 3, E), which is to be derived from a Herpetomonadine type, the single, anterior flagellum of the ancestral parasite has been drawn backwards along one side of the body and now originates in the posterior half. Hence in this genus the end bearing the free part of the flagellum is the anterior one. The genus *Trypanosoma*, in which are included at present the great majority of Trypanosomes, is rather to be regarded as derived from a Heteromastigine ancestor, such as *Trypanoplasma*, by the loss of the anterior flagellum. Hence in this type the single flagellum represents the posteriorly-directed one of *Trypanoplasma*, and the end at which it becomes free is the hinder end. The point of origin of the flagellum in *Trypanosoma* is usually near the anterior end, but may vary considerably (cf. figs.); and its free portion may be very short or lacking.

Along the dorsal side runs the characteristic fin-like expansion of the body, the undulating-membrane, which is the organella principally concerned in locomotion. This always begins at the place where the attached flagellum emerges from the body; and its free edge is really constituted by the latter, which forms a flagellar border. The membrane is usually more or less sinuous in outline, and is sometimes thrown into broad folds (fig. 3, F and J). Distally it thins away concurrently with the body.

The body appears to be in all cases naked. A differentiation of the peripheral cytoplasm in the form of an ectoplasmic layer has been described in one or two instances, and it seems probable that in most Trypanosomes there is such a layer, although only poorly developed, as a rule, around the body generally. On the other hand, the undulating-membrane is largely if not entirely an ectoplasmic development. This is usually much clearer and more hyaline than the general cytoplasm. In many forms deep-staining grains or granules, of a chromatoid nature and of varying size, are to be seen in the cytoplasm. In most cases these granules are, if not confined to, chiefly distributed in the posterior (flagellate) half of the body (figs. 3, B, D and E, 4, E and G). In certain Trypanosomes a well-defined, usually oval vacuole is often, though not constantly, to be observed, situated at a varying distance from the anterior end (figs. 3 and C, G, 4, F). There is no reason to doubt that this vacuole is a normal cell-constituent, for it has been described in parasites in quite normal surroundings and conditions.

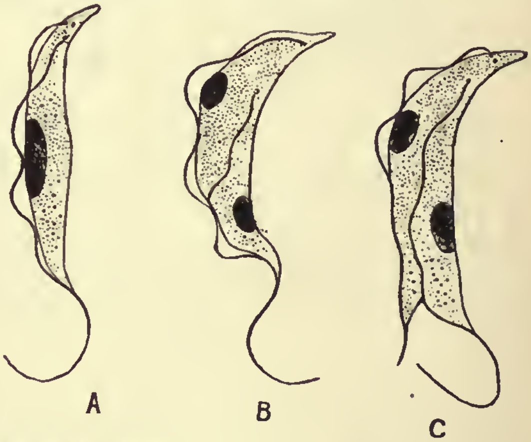
a.fl, Anterior flagellum;
p.fl, Posterior flagellum;
l.s, Longitudinal striations (myonemes);
v, Cytoplasmic vacuole.

A Trypanosome always possesses two distinct nuclear bodies, one the *trophonucleus*, regulating the trophic life of the cell, the other, the *kinetonucleus*, directing its locomotor activities. The recent investigations of Schaudinn and Prowazek (11. c) have shown that, in some forms at any rate, the finer structure and detailed development of the nuclear apparatus is extremely complex. Not only is there an intimate correspondence in this respect between the two principal organellae, but the flagellar apparatus itself is really of nuclear origin and remains closely connected with the kinetonucleus (cf. fig. 7). In most cases, however, little beyond the position and general appearance of the nuclei has been so far made known. The trophonucleus is usually situated somewhere about the middle of the body. The kinetonucleus is typically near the anterior end; but in a few instances it lies more centrally (*e.g. T. inopinatum, T. rotatorium*, fig. 4, A–C); in *Trypanomorpha* it is in the posterior half of the body (fig. 3, E).

In certain forms the occurrence of prominent myonemes or muscle-fibrillae has been described, and, moreover, a nuclear origin assigned to them also. In *Trypanomorpha* they are confined to the undulating-membrane (fig. 3, E), but in other cases—*Trypanosoma ziemanni, T. lewisi, T. brucei*, and *T. soleae*—they are arranged laterally, half running down each side of the body (fig. 4, J). In *Trypanoplasma borreli* there is only a single myoneme on either side.

Multiplication.

All Trypanosomes are capable of binary longitudinal fission, and this appears to be the chief method of multiplication. The division of the nuclear apparatus is the first to take place (fig. 5, A). The kinetonucleus more often leads the way, but sometimes either kinetonucleus or trophonucleus may do so indifferently. The duplication of the flagellum begins at its proximal end, that which is in relation with the kinetonucleus. Until recently the process has been considered as an actual longitudinal splitting of the flagellum, following upon the separation of the two daughter-kinetonuclei. Both Schaudinn (in the case of *Trypanomorpha*) and Prowazek (in the case of *Trypanosoma lewisi* and *T. brucei*), have found, however, that the new flagellum is developed quite independently and laid down alongside the old one. It is at present somewhat uncertain, therefore, in what cases actual splitting occurs. The same applies equally to the formation of the undulating-membrane. If the flagellar border splits, the membrane doubtless divides also; but where the flagellum is a new formation the membrane will be too. The division of the cytoplasm in most forms is equal or sub-equal, and two approximately equal daughter-Trypanosomes result (fig. 5, C). In some instances (*e.g. T. equinum, T. equiperdum*) the longitudinal fission is apparently multiple, three or even four descendants being produced simultaneously.



(After Lav. and Mesnil.)

FIG. 5.—Stages in Binary Longitudinal Fission of *Trypanosoma brucei*.

T. lewisi differs from most Trypanosomes in that the cytoplasm divides in a very unequal manner (fig. 6). The process is more comparable to budding, since the larger or parent-individual may produce, successively, more than one "daughter"; moreover, the daughter-individuals may subdivide before separating, the whole family remaining attached by the non-flagellate (anterior) end (fig. 6, F). In this type of division it may be noted that the kinetonucleus comes to lie alongside the trophonucleus, or even passes to the other side of it (*i.e.* nearer the flagellar end). Easily derivable from this method is the other one characteristic of *T. lewisi*, viz. segmentation. The chief difference is that in the latter no parent-individual is distinguishable, a rosette of many equal daughter-parasites being formed.

The small Trypanosomes resulting from either of these modes of division differ from typical adults by their stumpy, pyriform shape, the position of the kinetonucleus near the flagellar end of the body, and the absence, during the first part of their youth, of an undulating-membrane. At this period they have, in fact, what may be termed a "pseudo-Herpetomonadine" aspect. These young individuals can themselves multiply by equal binary fission, giving rise to little fusiform parasites; with growth, these gradually assume the adult appearance.

Development and Life-cycle.

Comprehensive researches (1905, seq.) have made it evident that Trypanosomes have a much more varied and complex development and life-history than was previously supposed. This has now been found to be the case in widely-differing parasites, occurring in widely-different hosts. The following examples have been investigated: *Trypanosoma lewisi* (also, but much less completely, *T. brucei*),[1] among mammalian forms, described by Prowazek (47); *T. ziemanni* and *Trypanomorpha noctuae*, among avian parasites, described by Schaudinn (50); *Trypanosoma inopinatum*, among batrachian forms, described by A. Billet (1*a* and 2), *T. barbatulae* and *Trypanoplasma varium*, described by Léger (32 and 33), and *T. borreli*, by

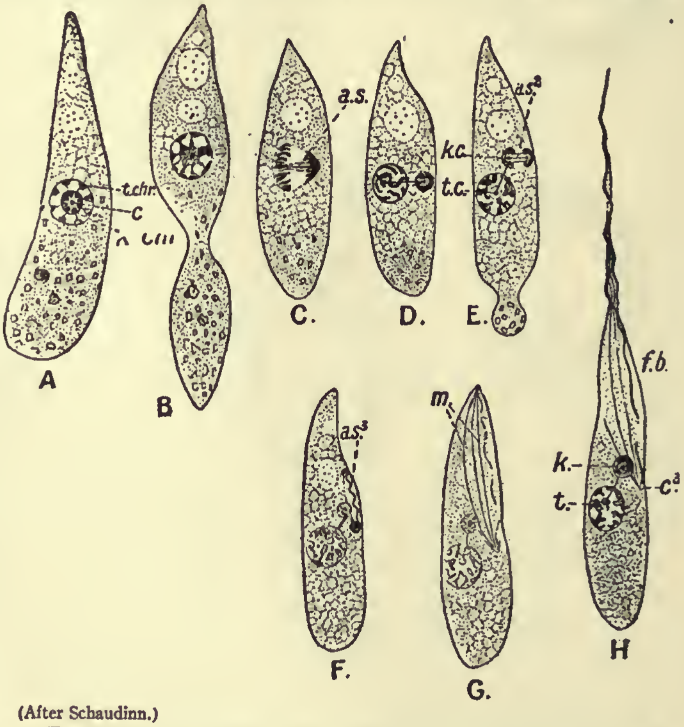
G. Keysselitz (16), from fishes; also several other piscine Trypanosomes have their development phases in leeches worked on by Brumpt (5*a*). In addition, a Trypanosome whose vertebrate host is yet unknown (*T. grayi*) has been studied in detail by Minchin (41*a*).

It is impracticable here to consider fully all the various developmental phases and modifications of the life-cycle described as occurring in the above parasites. In view, however, of the great interest excited by Schaudinn's work on avian parasites, as well as on account of the far-reaching importance of his conclusions to the study of the Haematozoa, a brief summary of his celebrated research is necessary.

According to Schaudinn's account, he was dealing with two separate Trypanosome parasites of the Little Owl (*Athene noctua*), viz. *Trypanomorpha* (*Trypanosoma*) *noctuae* and *Trypanosoma* (*Spirochaete*) *ziemanni*. The latter organism, in certain phases, very closely resembles a *Spirochaete*. In the blood of the owl resting, intracellular phases of both parasites alternate with active trypaniform ones; and, when in the former condition, Schaudinn considers that the parasites are identical with what have been formerly regarded as distinct Haemosporidia, *Halteridium* and a *Leucocytozoon* respectively. In other words, he considers that these two Haemosporidian forms are really only phases in the life-history of particular Trypanosomes. To this life-cycle belongs the formation of sexual individuals and their conjugation on arrival in the gnat (*Culex*); the process is described as agreeing in the main, in both cases, with what has already been made known by MacCallum for another species of *Halteridium*. The male gametes, it may be noted, are said to possess the essential characters of a Trypanosome. The motile copula or ookinete formed in the gnat gives rise to one of three types of Trypanosome individual: indifferent, male or female. The development of an indifferent ookinete into an indifferent Trypanosome is shown in fig. 7, from which it will be seen that the cytological details are very complex. The indifferent parasites exhibit an alternation of resting, attached phases with active periods, during which they multiply actively and become very abundant in the insect. The male forms, which are very small and the homologues of the microgametes developed in the blood, appear to die off soon. The female Trypanosomes, on the other hand, grow to a large size, laying up a store of reserve nutriment. They are very sluggish and do not divide. They are the most resistant to unfavourable conditions of environment, and are able, by a process of parthenogenesis, to give rise to ordinary, indifferent forms again, which can repopulate the gnat.

So far as regards the remarkable connexion between Trypanosomes and Haemosporidia indicated by Schaudinn, this has met with a great deal of criticism on the part of Novy and McNeal among others, and it must be admitted that up to 1909 no definite corroboration can be said to have been brought forward. Again, the spirochaetiform *Trypanosoma* (*T. ziemanni*) described may have been really a true *Spirochaete*, *i.e.* a Bacterium. In short, it is quite possible Schaudinn did not sufficiently distinguish between the life-cycles of four distinct parasites of the Little Owl: a Trypanosome, a *Spirochaete*, a *Halteridium* and a *Leucocytozoon*; though, on the other hand, this is by no means proved. However this may be, the research of subsequent workers—*e.g.* Brumpt (5a), Léger (32, 33), Keysselitz (16), Prowazek (47), Minchin (41b) and others—has undoubtedly shown that much of Schaudinn's scheme of the life-history of a Trypanosome is well-founded. It is certain, for instance, that the three types of form which he discovered, viz. indifferent, male or female, can be recognized in many cases, often in the vertebrate, but always more sharply differentiated in the invertebrate. Moreover, it is very probable that conjugation occurs soon after the arrival of the parasites in their specific invertebrate host; and this act may perhaps give rise to an aflagellar copula, which is gregariniform and comparable to an ookinete. Different investigators, it may be noted, have described various



(After Schaudinn.)

FIG. 7.—Development of an Ookinete (of *Halteridium*) into an indifferent Trypanosome (*Trypanomorpha*).

A–D shows the formation of the two nuclear elements (trophonucleus and kinetonucleus) from the definitive nucleus (synkaryon) of the ookinete.

E–H shows the formation of the myonemes and the flagellar border (flagellum) of the undulating membrane, by means of a greatly elongated nuclear-spindle.

complicated nuclear changes and divisions undergone by Trypanosomes; these are considered, in many cases, to represent some kind of parthenogenesis.

A very interesting modification of the life-cycle of a Trypanosome which must be mentioned has been made known by Minchin, in his account of *T. grayi*, in a tsetse-fly (*G. palpalis*). Unfortunately the vertebrate host of this form is not yet known. Certain individuals of a particular character form definite rounded cysts in the rectum of the fly; in this condition, the only sign of Trypanosome structure is afforded by the two nuclei, which remain separate. These cysts are doubtless for dispersal by way of the anus, and the vertebrate host is in all likelihood infected by the mouth and alimentary canal. This reveals a quite novel mode by which infection with a Trypanosome may be brought about; so far, however, *T. grayi* remains the only known example.

Classification. As remarked in the section on morphology, the Trypanosomes as a whole are preferably regarded as including two entirely distinct groups, Monadina and Heteromastigia.

Sub-order Monadina

Family: Trypanomorphidae, Woodcock.—Haemoflagellates derived from a uniflagellate, Herpetomonadine form, in which the point of insertion of the single (anterior) flagellum into the body has travelled backwards from the anterior end for a greater or less distance, the flagellum itself having become, concurrently, attached to the body for a portion of its length by means of an undulating membrane.

Genus *Trypanomorpha*, Woodcock, 1906.—With the characters of the family. The only species yet known is the type species, *T. noctuae* (Celli and San Felice). [Syn. *Trypanosoma n.* (C. & S.F.), Schaud. = *Halteridium n.* (C. & S.F.)]. See figs. 3, E, 7. Vertebrate host, *Athene noctua*, Little Owl; invertebrate host, *Culex pipiens*.

There are, in addition, other forms, which are probably to be placed in this family, but which are not yet sufficiently well known for their systematic position to be settled. It is, for instance, quite likely that certain Herpetomonadine parasites described by Léger (29, 34) from various blood-sucking insects are really only stages in the life of a Haemoflagellate. Some of these are placed by Léger in a newly discovered genus, *Crithidia*.

Sub-order Heteromastigina

Family: Trypanosomatidae, Doflein.—Flagellates, in the great majority of instances haemal parasites, derived from a biflagellate, *Bodo*-like type, in which the posteriorly-directed (trailing) flagellum is always present and attached to the body by an undulating membrane, of which it constitutes the thickened edge. The other, the anterior flagellum, may or may not persist.

Genus *Trypanoplasma*, Lav. and Mesnil, 1902.—The anterior flagellum is present. Both flagella are inserted close together, near the anterior end of the body. Two sub-groups may be distinguished. In one, exemplified by *T. borreli* (fig. 4, F and G) from the rudd and minnow, the anterior flagellum is well-developed, and the free parts of both are of about equal length. In the other, exemplified by *T. cyprini* (fig. 4, H) from carp, the anterior flagellum is much shorter than the free part of the posterior one, and evidently tending to disappear. Known invertebrate hosts for different species are *Hemiclepsis* and *Piscicola*, leeches.

Genus *Trypanophis*, Keysselitz, 1904.—The body resembles that of *Trypanoplasma* in general appearance, but the locomotor apparatus does not appear to be so well-developed, especially in *T. grobbeni*. The anterior flagellum is longer than the free part of the posterior one. The species included are not, so far as is known, haemal parasites. *T. grobbeni* occurs in the coelenteric cavity of various Siphonophora.

An interesting form, "*Trypanoplasma*" *intestinalis*, which resembles both the above genera, occurs in the alimentary canal of *Box boops*. Probably this is not a haemal parasite, and lacks an alternate host.

Genus *Trypanosoma*, Gruby, 1843.—(Principal synonyms: *Undulina*, Lank., 1871; *Herpetomonas*, Kent, 1880, only in part; *Paramoecioides*, Grassi, 1881; *Haematomonas*, Mitrophan, 1883.) There is no anterior flagellum. The point of insertion of the attached (posterior) flagellum into the body, and, consequently, the commencement of the undulating membrane may be almost anywhere in the anterior half of the body, but is usually near the extremity.

Among the more important and better-known forms are the following:—

Parasitic in mammals: *T. lewisi* (Kent), the well-known natural Trypanosome of rats (figs. 3, A, 6, A); *T. brucii*, Plim. and Bradf., the cause of nagana among cattle, horses, &c., in South Africa (fig. 3, B); *T. evansi*, Steel, the cause of surra to horses in Indo-Burmah; *T. equiperdum*, Dofl., the cause of dourine in horses in Algeria and other regions of the Mediterranean littoral; *T. equinum*, Voges, causing mal de caderas or "hip-paraplegia" in South America (fig. 3, D); *T. theileri*, Lav., a very large form, the cause of galziekté or bile-sickness to cattle in the Transvaal; and *T. gambiense*, Dutton (syn. *T. ugandense*, Castellani, *T. castellanii*, Kruse), the cause of human trypanosomosis in central Africa, which becomes sleeping-sickness when the organisms penetrate into the cerebro-spinal fluid (fig. 3, C).

Parasitic in birds: *T. avium* (Danil., Lav. emend.), probably the form to which Danilewsky's original investigations related, parasitic in owls and (according to Novy and McNeal) also in other birds (fig. 3, F); *T. johnstoni*, Dutt. and Todd, a very spirochaetiform type, from little birds (*Estrelda*) in Senegambia; and Hanna's peculiar wide species from Indian birds, with a remarkably tapering anterior end (fig. 3, G). Lastly, there is *T. ziemanni*, Lav., [syn. *Spirochaete z.* (Lav.), Schaud, "*Haemamoeba*" *z.*, Lav., the "Leucocytozoon" of Danil.], from various owls, and *Culex pipiens*, whose life-history has been described by Schaudinn (fig. 3, H). (As above mentioned, this form may not be a true Trypanosome.)

Only one reptilian form is well known, *T. damoniae*, Lav. and Mesn., from a tortoise, *Damonia reevesii* (fig. 3, J). Parasitic in batrachia: *T. rotatorium*, Mayer (syn. *Amoeba r.*, Mayer, July 1843, *T. sanguinis*, Gruby, November 1843, *Undulina ranarum*, Lank., 1871), the best-known parasite of frogs, which exhibits remarkable polymorphism (fig. 4, A and B); *T. mega* and *T. karyozeukton*, Dutt. and Todd, even larger than *T. r.* (fig. 4, D), with peculiar cytological differentiation, may be only sub-species; *T. inopinatum*, Sergent, and *T. nelspruitense*, Lav., also from frogs (fig. 4, C). Parasitic in fishes: *T. remaki*, Lav. and Mesnil, from pike, a relatively small form (fig. 4, L); *T. barbatulae*, Léger, from loach; *T. granulosum*, Lav. and Mesnil, a very long vermiform parasite, from eels (fig. 4, K); *T. soleae*, Lav. and Mesnil, from soles, with a relatively small flagellum (fig. 4, J); and *T. scyllii* and *T. rajae*, from those Elasmobranchs, both very large forms, described by Lav. and Mesnil.

The Leishman-Donovan-Wright Bodies. Undoubtedly closely allied to the Haemoflagellates, although no actual trypaniform phase has yet been observed, are the important parasites usually known as the "Leishman-Donovan" bodies, without some consideration of which an account of the Haemoflagellates would hardly be complete. These bodies are constantly found in certain tropical fevers (*e.g.* dum-dum fever, kala-azar) particularly prevalent throughout Indo-Burma, of which they are generally held to be the cause. They were discovered by W. Leishman in 1900, but before his first account of them (36) was published they were also seen quite independently by C. Donovan. Moreover, organisms very similar to these (morphologically, indeed, the two sorts appear scarcely distinguishable) are found in various sores or ulcers (*e.g.* Delhi boil, Oriental sore, "bouton d'Alep") to which people in different parts of the East are liable. These were first described by J. H. Wright (58).

The chief distinction between the parasites in the two cases is in their habitat. In the one case they are entirely restricted to the neighbourhood of the boil or ulcer, whereas in the other there is a general infection of the body, the organisms spreading to all parts and being met with in the spleen, liver, bone-marrow, &c., and (rarely) in the peripheral circulation. The parasites are either free or intracellular. In the latter case they invade cells of a leucocytic or phagocytic character as a rule; Leishman's form is particularly abundant in large macrophageal cells originating from the vascular endothelium of the spleen (fig. 8, I. *M*).

The parasites themselves are very minute and usually ovoid or pyriform in shape (fig. 8, I. *a*), the latter being, perhaps, the most typical. The splenic type is somewhat smaller than Wright's parasite; the former, when pear-shaped, is from $3\frac{1}{2}$ to $4\ \mu$ in length by $1\frac{1}{2}$ to $2\ \mu$ in width, the latter being about $4\ \mu$ by $3\ \mu$ (fig. 8, III.). The body is probably not limited by any distinct membrane. The cytoplasm is finely granular and fairly uniform in character. The most interesting point about the morphology is the fact that two chromatic bodies, of very unequal size, are almost invariably to be recognized. The larger nuclear body, which corresponds to the trophonucleus of a Trypanosome, is usually round or oval; the smaller one, representing a kinetonucleus, has the form either of a little rod or of a round grain, and is generally separate from the larger nucleus.

The parasites multiply in two ways—(*a*) by binary fission, and (*b*) by multiple division or segmentation. The principal stages in the first method are well known (fig. 8, I. *b*); they offer strong resemblance to the process in *Piroplasma*. Multiple division has not yet been so satisfactorily made out. It appears to conform more or less to the radial or rosette type of multiplication, enlarged rounded parasites, with a varying number of nuclei (up to about eight) uniformly arranged near the periphery, having been often noticed (fig. 8, I. *c* and IV. *b*). The details of the process are somewhat differently described, however, by different observers.

Laveran and Mesnil (27) gave the name *Piroplasma donovani* to

Leishman's form,[1] and there is no doubt that the parasites are closely allied to that type of organism. This does not, however, preclude in any way the supposition that they—equally with certain other Haemosporidia—represent, nevertheless, only a phase of a complete life-cycle; and this supposition has in fact been definitely proved to be true by the work of Rogers (48). Rogers cultivated the parasites obtained from cases of kala-azar in artificial media, and found that what were unmistakably flagellate

stages developed in the cultures at different intervals (fig. 8, IV. *e*, *f*, *g*). These forms were elongated and spindle-like; and to one end of the body, near which the smaller nuclear element was situated, a well-developed flagellum was attached. Since then many other workers have obtained similar stages [see Leishman and Statham (38), Christophers (7)]; but however slender and Trypanosome-like the flagelliform parasites may appear, up till now no indications of an undulating membrane have been seen, and the kinetonuclear element is never far from the insertion of the flagellum. Nevertheless, the general appearance and structure of these motile forms so greatly resemble that of a Herpetomonad, or of the "pseudo-Herpetomonadine" forms of a Trypanosome which are obtained in cultures, that it cannot be doubted that the "Leishman-Donovan-Wright" bodies are closely connected with the Haemoflagellates. That being so, it is quite possible that, in normal conditions and circumstances, these parasites also possess, at some period of the life-cycle, a trypaniform phase. Nothing definite is yet known with regard to the transmission of the parasites by an alternate invertebrate host, although there is presumptive evidence in favour of this supposition.[2]

Supposed Connexion of the Spirochaetae with Trypanosomes.

A word or two must be said in conclusion with reference to the supposed connexion of the *Spirochaetae* with the Trypanosomes. In Schaudinn's great memoir he regarded *Trypanosoma ziemanni* as possessing, in certain phases, the actual characteristics of a *Spirochaete* as then known; and, further, he was inclined to think that other *Spirochaetae* (*e.g. S. obermeieri* of relapsing fever) were also only phases in the life-cycle of a particular Haemoflagellate. As a result of his more recent investigations on *S. plicatilis* (the type-species of Ehrenberg) and other forms (51), he finds, however, that this is not the case, but that the organisms exemplified by *S. plicatilis* are to be widely separated from the Trypanosomes, and placed rather with the Bacteria. In addition, it is most probable that, at any rate, certain other spirilliform parasites, *e.g. S. balbianii*, *S. refringens*, agree fundamentally in structure with the type-species.

On the other hand, evidence has lately been brought forward to show that certain parasites which greatly resemble a *Spirochaete* are really related to the Trypanosomes. This is the case with the celebrated organism first described by Schaudinn and E. Hoffmann (52) from essential syphilitic lesions, and now known as *Treponema* (*Spirochaete*) *pallida*, Schaud. F. Krzysztalowicz and M. Siedlecki have published an important account (17) of this parasite, which they consider possesses a true trypaniform phase, and for which they have proposed the name *Trypanosoma luis*. This view requires, however, corroboration. Nevertheless the resemblance between the biology of this organism in relation to syphilis (as regards mode of infection, habitat, &c.) and that of *Trypanosoma equiperdum*, the cause of dourine or "horse-syphilis," may not be without significance.

[1] R. Ross (49), regarding the parasites as a quite different kind of Sporozoan, termed them *Leishmania*; and Wright named his variety from tropical ulcers *Helcosoma tropicum*.

[2] Patton (*Sci. Mem. India*, No. 27, 1907) has brought forward evidence to show that the bed-bug (*Cimex macrocephalus*) is the invertebrate host.

BIBLIOGRAPHY.—A comprehensive review of the Haemoflagellates and allied parasites, considered up to the end of 1905, has been published by (1) H. M. Woodcock, *Quart. Journ. Mic. Sci.* (1906), 50, p. 150. The principal original papers referred to are: (1*a*) A. Billet, "Culture d'un trypanosome de la grenouille chez une hirudinée," &c., *C. r. ac. sci.* (1904), 139, p. 574; (2) "Sur le *Trypanosoma inopinatum* de la grenouille verte d'Algérie et sa relation possible avec les Drepanidium," *C. r. soc. biol.* (1904), 57, p. 161, figs; (3) J. TSAIDAM, or more correctly TSÄDUM, a depression, or self-contained shallow basin in the N.E. of Tibet, crossed by 37° N. and stretching from 92° to 97°. It is separated from the high plateau of Tibet by the Burkhan-Buddha range, and on the N.E. it is bounded by the eastward continuation of the Astin-tagh ranges, which there consist of four, namely, the lower and upper ranges, and a subsidiary chain flanking the lower range on the north and another subsidiary chain flanking the upper range on the south (see KUEN-LUN).

The valleys which divide the east ranges of the Kuen-Lun system terminate, or rather merge in, the sandy desert basin of Tsaidam; amongst them the Kakir valley between the upper Astin-tagh and the Akato-tagh and the Kum-kol valley between the Kalta-alagan and the range I. of the Arka-tagh (see KUEN-LUN). Tsaidam lies at an altitude of 11,400 ft. or about 3000 ft. lower than the Kum-kol lakes, and receives from the valley in which they lie the river Chulak-akkan or Tsagan tokhoy, which rises probably on the north slope of the Shapka-monomakha Mountain, one of the culminating summits in the region north of the Arka-tagh range. "It is very possible that the north-west of Tsaidam, which is perfectly unknown, is broken up into several separate basins. The south-east part of the same great expanse also appears to consist of several smaller basins rather than of one single great basin, each possessing its own salt lake; but then these smaller basins are undoubtedly separated from one another by remarkably low and insignificant thresholds or swellings."[1] The north-east part of the basin consists of a network of basins, which admit of being grouped in four divisions—Särtäng or Serteng, Makhai, Tsädam or Tsaidam, and Kurlyk or Tosun. The characteristic feature of each of these is that which is found in so many of the valleys of the Tibetan borderland, namely, a pair of linked lakes, one containing salt water and the other fresh water. The only inhabitants of Tsaidam are Mongols—Särtäng Mongols in the north and Tajinur Mongols in the south. The south-east part of the region is drained by the Holuzun-nor or Baïn-gol, an affluent of the upper Hwang-ho or Yellow River of China. The Särtäng basin is drained by the Khalting-gol and its tributary the Holuin-gol, which rise in the Humboldt and Ritter Mountains and empty into the lake of Sukhain-nor.

TSANA, a lake of North-East Africa, chief reservoir of the Abai or Blue Nile. Tsana lies between 11° 36′ and 12° 16′ N. and 37° 2′ and 37° 40′ E., filling a central depression in the Abyssinian highlands. It is about 5690 ft. above the sea, but from 2500 to 3000 ft. below the mountain plateau which encircles it. Its greatest length is 47 m., its greatest breadth 44 m., and it covers, approximately 1100 sq. m., having a drainage area, including the lake surface, of some 5400 sq. m. In shape it may be compared to a pear, the stem being represented by the escaping waters of the Abai. The shores of the lake are well defined, generally flat, and bordered by reeds, but at places the mountains descend somewhat abruptly into the water. Elsewhere the land rises in gentle undulations, except at the mouths of the larger tributary streams, where are alluvial plains of considerable size. At the south-east end the lake forms a bay about eleven miles long, and from three to eight miles across, and from this bay the Abai issues. The whole of the coast-line is considerably indented and many narrow promontories jut into the lake. The island of Dek (8 m. long by 4 broad) is in the south-western part of the lake. Near it is the smaller island of Dega, whilst numerous islets fringe the shores.

Lake Tsana is fed by three large rivers and by many petty streams. The chief tributary is the Abai, which enters the lake at its south-west corner through a large papyrus swamp. This river, and the Abai or Blue Nile which issues from the lake, are regarded as one and the same stream and a current is observable from the inlet to the outlet. Next in importance of the affluents are the Reb and Gumara, which run in parallel courses and enter the lake on its eastern side. The outlet of the lake is marked by openings in a rocky ledge, through which the water pours into a lagoon-like expanse. Thence it issues by two or three channels, with a fall of about 5 ft. in a succession of rapids. These channels unite within a couple of miles into one river—the Abai with a width of 650 ft. After passing a large number of rapids in the first sixteen miles of its course the Abai enters a deep gorge by a magnificent fall—the Fall of Tis Esat—the water being confined in a channel not more than 20 ft. across and falling 150 ft. in a single leap. The gorge is spanned by a stone bridge built in the 17th century. From this point the Abai makes its way through the mountains to the plains of Sennar, as described in the article NILE.

The average annual rainfall in the Tsana catchment area is estimated at $3\frac{1}{4}$ ft., and the volume of water received by the lake yearly at 6,572,000,000 of cubic metres. More than half of this amount is lost by evaporation, the amount discharged into the river being placed at 2,924,000,000 cubic metres. The seasonal alteration of the lake level is not more than 5 ft. The rainy season lasts from the beginning of June to the end of September. During this period the discharge from the lake is, it appears, little greater than in the dry season, the additional water received going to raise the lake level. Thus the rise in the Blue Nile, in its lower course, would seem to be independent of the supply it derives from its source.

Tsana has been identified with the *Coloe Palus* of the ancients, which although placed 12° too far south by Ptolemy was described by him as a chief reservoir of the Egyptian Nile and the source of the *Astapos*, which was certainly the Blue Nile. In 1625 it was visited by the Portuguese priest Jeronimo Lobo, and in 1771 by James Bruce. Dr. Anton Stecker, in 1881, made a detailed examination of the lake, enabling the cartographers to delineate it with substantial accuracy. By the Portuguese of the 17th century the lake was styled Dambia,

[1] Sven Hedin, *Scientific Results of a Journey in Central Asia, 1899–1902*, iii. 344 (Stockholm, 1905–1907).

and this name in the slightly altered form of Dembea was in use until towards the close of the 19th century. By many Abyssinians the lake is called Tana, but the correct Amharic form is Tsana.

See NILE and ABYSSINIA, and the authorities there cited. The British Blue Book, *Egypt*, No. 2, 1904, contains a special report (with maps) upon Lake Tsana by Mr C. Dupuis, of the Egyptian Irrigation Service. In the *Boll. soc. geog. italiana* for December 1908 Captain A. M. Tancredi gives the results (also with maps) of an Italian expedition to the lake. (W. E. G.; F. R. C.)

TSAR, or CZAR, the title commonly given both abroad and in Russia itself to the sovereign of Russia, whose official style is, however, "Emperor and Autocrat" (*Imperator i Samovlastityel*). In its origin the word *tsar* seems to have connoted the same as *imperator*, being identical with the German *Kaiser* in its derivation from the Latin Caesar. In the old Slavonic Scriptures the Greek *βασιλεύς* is always translated *tsar*, and this title was also given to the Roman Emperor. The old Russian title for a sovereign was *knyaz*, prince, or *veliky knyaz*, grand prince. The title *tsar* was first adopted by the Slavonic peoples settled in the Balkan peninsula, who were in close touch with the Eastern emperor; thus it was used by the medieval Bulgarian kings. It penetrated into Russia as a result of the growing intercourse between old Muscovy and Constantinople, notably of the marriage alliances contracted by Russian princes with the dynasty of Basil the Macedonian; and it was assumed by the Muscovite princes who revolted from the yoke of the Mongols. The other *tsars* were gradually ousted by those of Moscow, and the modern Russian emperors inherit their title of *tsar* from Ivan III. (1462–1505), or perhaps rather from his grandson Ivan IV. (1533–1584) who was solemnly crowned *tsar* in 1547.

Throughout, however, the title *tsar* was used, as it still is in popular parlance, indifferently of both emperors and kings, being regarded as the equivalent of the Slavonic *krol* or *kral* (Russ. *korol*, Magyar, *király*), a king, which had been adopted from the name of Charlemagne (Germ. *Karl*, Lat. *Carolus Magnus*). This use being equivocal, Peter the Great, at the peace of Nystad (November 2, 1721), assumed the style of *imperator*, an exotic word intended to symbolize his imperial dignity as the equal of the western emperor. This new style was not, however, recognized by the powers until the time of Catherine II., and then only on the express understanding that this recognition did not imply any precedency or superiority of the Russian emperor over other sovereigns. Henceforth, whatever popular usage might be, the title *tsar* was treated officially as the equivalent of that of king. Thus the Russian emperor is tsar (king) of Poland and of several other parts of his dominions. Thus, too, the prince of Bulgaria, on assuming the royal style, took the title of tsar of Bulgaria.

The title "White Tsar," applied to the Russian emperor and commonly quoted as though it had a poetic or mystic meaning, is a translation of a Mongol word meaning "independent" (cf. the feudal "blanch tenure," *i.e.* a tenure free from all obligation of personal service).

The wife of the tsar is *tsaritsa*. In former times the title *tsarevich* (king's son) was borne by every son of a tsar; but the word has now fallen out of use. The heir to the throne is known as the *tsesarevich* or *cesarevich* (*q.v.*), *i.e.* son of Caesar, the other Imperial princes bearing the old Russian title of *veliky knyaz* (grand duke; *q.v.*).

TSARITSYN, a town of Russia, in the government of Saratov, situated on the right bank of the Volga, where it suddenly turns towards the south-east, 40 m. distant from the Don. Pop. (1900), 67,650. Tsaritsyn is the terminus of a railway which begins at Riga and, running south-eastwards, intersects all the main lines which radiate from Moscow to the south. It is also connected by rail with Kalach on the Don, where merchandise from the Sea of Azov is disembarked. Corn from middle Russia for Astrakhan is transferred from the railway to boats at Tsaritsyn; timber and wooden wares from the upper Volga are unloaded here and sent by rail to Kalach; and fish, salt and fruits sent from Astrakhan by boat up the Volga are here unloaded and despatched by rail to the interior of Russia. The town has grown rapidly since the completion of the railway system, and has a large trade in petroleum from Baku. Tsaritsyn is also the centre of the trade in the mustard of Sarepta, Dubovka and the neighbourhood. The fisheries are important. The buildings of the town include a public library, and the church of St John (end of 16th century), a fine specimen of the architecture of its period. Here are iron, machinery and brick works, tanneries, distilleries, and factories for jam, mustard and mead. Market gardening is an important industry.

A fort was erected here in the 16th century to prevent the incursions of the free Cossacks and runaway serfs who gathered on the lower Volga, as also the raids of the Kalmucks and Circassians. In 1606 Tsaritsyn took part in the rising in favour of the false Demetrius, and Stenka Razin took the town in 1670. The Kalmucks and Circassians of the Kubañ attacked it repeatedly in the 17th century, so that it had to be fortified by a strong earthen and palisaded wall, traces of which are still visible.

TSARSKOYE SELO, a town of north Russia, in the government of St Petersburg, and an imperial residence, 15 m. by rail south of the capital. Pop. (1885), 15,000; (1897), 22,353. The town stands on the Duderhof Hills and consists (1) of the town proper, surrounded by villages and a German colony, which are summer resorts for the inhabitants of St Petersburg; and (2) of the imperial parks and palaces. The former is built on a regular plan, and its houses nearly all stand in gardens. The cathedral of St Catherine is a miniature copy of that at Constantinople. The imperial parks and gardens cover 1680 acres; the chief of them is the "old" garden, containing the "old palace," built (1724) by Rastrelli and gorgeously decorated with mother-of-pearl, marbles, amber, lapis lazuli, silver and gold; the gallery of Cameron adorned with fine statues and entrance gates; numerous pavilions and kiosks; and a bronze statue (1900) of the poet Pushkin. A second palace, the Alexander, was built by Catherine II. in 1792, and has in its park an historical museum and an arsenal.

When Peter the Great took possession of the mouth of the Neva, a Finnish village, Saari-mois, stood on the site now occupied by the town, and its Russified name Sarskaya was changed into Tsarskoye when Peter presented it to his wife Catherine. It was especially embellished by the tsaritsa Elizabeth. Under Catherine II., a town, Sophia, was built close by, but its inhabitants were transferred to Tsarskoye Selo under Alexander I. The railway connecting the town with St Petersburg was the first (1838) to be constructed in Russia.

TSCHAÏKOVSKY, PETER ILICH (1840–1893), Russian composer, born at Votkinsk, in the province of Vyatka, on the 7th of May 1840, was the son of a mining engineer, who shortly after the boy's birth removed to St Petersburg to assume the duties of director of the Technological Institue there. While studying in the school of jurisprudence, and later, while holding office in the ministry of justice, Tschaïkovsky picked up a smattering of musical knowledge sufficient to qualify him as an adept amateur performer. But the seriousness of his musical aspiration led him to enter the newly founded Conservatorium of St Petersburg under Zaremba, and he was induced by Anton Rubinstein, its principal, to take up music as a profession. He therefore resigned his post in the ministry of justice. On quitting the Conservatorium he was awarded a silver medal for his thesis, a cantata on Schiller's "Ode to Joy." In 1866 Tschaïkovsky became practically the first chief of the recently founded Moscow Conservatorium, since Serov, whom he succeeded, never took up his appointment. In Moscow Tschaïkovsky met Ostrovskiy, who wrote for him his first operatic libretto, *The Vojevoda*. After the Russian Musical Society had rejected a concert overture written at Rubinstein's suggestion, Tschaïkovsky in 1866 was much occupied on his *Winter Day Dreams*, a symphonic poem, which proved a failure in St Petersburg but a success at Moscow. In 1867 he made an unsuccessful début as conductor. Failure still dogged his steps, for in January 1869 his *Vojevoda* disappeared off the boards after ten performances, and subsequently Tschaïkovsky destroyed the score. The *Romeo and Juliet* overture has been much altered since its production by the Russian Musical Society in 1870, in which year the composer once more attempted unsuccessfully an operatic production, St Petersburg rejecting his *Undine.* In 1871 Tschaïkovsky was busy on his cantata for the opening of the exhibition in celebration of the bicentenary of Peter the Great, his opera *The Oprischnik,* and a textbook of harmony, which latter was adopted by the Moscow Conservatorium authorities. At Moscow in 1873 his incidental music to the *Snow Queen* failed, but some success came next year with the beautiful quartet in F. During these years Tschaïkovsky was musical critic for two journals, the *Sovremennaya Lietopis* and the *Russky Vestnik.* On the death of Serov he competed for the best setting of Polovsky's *Wakula the Smith,* and won the first two prizes. Yet on its production at St Petersburg in November 1876 this work gained only a *succès d'estime.* Since then it has been much revised, and is now known as *The Little Shoes.* Meanwhile the Second Symphony and the *Tempest* fantasia had been heard, and the pianoforte concerto in B flat minor completed. This was first played by von Bülow in Boston, Massachusetts, some time later, and was entirely revised and republished in 1889. At last something like success came to Tschaïkovsky with the production of *The Oprischnik,* in which he had incorporated much of the best of *The Vojevoda.* The Third—or Polish—Symphony, four sets of songs, the E-flat quartet (dedicated to the memory of Lamb), the ballet "The Swan Lake," and the "Francesca da Rimini" fantasia, all belong to the period of the late 'seventies—the last being made up of operatic fragments. Tschaïkovsky in 1877 first began to work on the opera of *Eugen Onegin.* With the production of this work at the Moscow Conservatorium in March 1879 real success first came to him. The story, by Pushkin, was a familiar one, and the music of Tschaïkovsky was not so extravagant in its demands as had been the music of his earlier operas.

Meanwhile the more personal side of the composer's career had been given a romantic touch by his acquaintance with his lifelong benefactress, Mme von Meck, and his deplorable fiasco of a marriage. In 1876 he had aroused the interest of Nadezhda Filaretovna von Meck (1831–1894), the wife (left a widow in 1876) of a wealthy railway engineer and contractor. She had a large fortune and she began by helping the composer financially in the shape of commissions for work, but in 1877 this took the more substantial shape of an annual allowance of £600. The romance of their association consisted in the fact that they never met, though they corresponded with one another continually. In 1890 Mme von Meck (who died two months after the composer, of progressive nervous decline), imagining herself—apparently a pure delusion—to be ruined, discontinued the allowance; and though Tschaïkovsky was then no longer really in need of it, he failed to appreciate the pathological reason underlying Mme von Meck's condition of mind, and was deeply hurt. The wound remained unhealed, and the correspondence broken, though on his death-bed her name was on his lips. Her connexion with his life was one of its dominating features. His marriage was only a brief and misguided incident. Tschaïkovsky married Antonina Ivanovna Milyukova on the 6th of July 1877, but the marriage rapidly developed into a catastrophe, through no fault of hers but simply through his own abnormality of temperament; and it resulted in separation in October. He had become taciturn to moroseness, and finally quitted Moscow and his friends for St Petersburg. There he fell ill, and an attempt to commit suicide by standing chin-high in the river in a frost (whereby he hoped to catch his death from exposure) was only frustrated by his brother's tender care.

With his brother, Tschaïkovsky went to Clarens to recuperate. He remained abroad for many months, moving restlessly from one place to another. In 1878 he accepted (but later resigned) the post of director of the Russian musical department at the Paris Exhibition, completed his Fourth Symphony and the Italian *Capriccio,* and worked hard at his "1812" overture, more songs, the second pianoforte concerto, and his "Liturgy of St Chrysostom," an interesting contribution to the music of the Eastern Church. The work was confiscated for some time by the intendant of the imperial chapel, on the ground that it had not received the imprimatur of his predecessor Bortniansky in due accordance with a ukaz of Alexander I. Bortniansky was dead, but his successor was obstinate. Finally the work was saved from destruction by an official order. Tschaïkovsky returned only for a short time to Moscow. Thence he went to Paris. In 1879 he wrote his *Maid of Orleans* (produced in 1880) and his first suite for orchestra. In 1881 died Nicholas Rubinstein—to whose memory Tschaïkovsky dedicated the trio in A minor. During the next five years Tschaïkovsky travelled, and worked at *Manfred* and *Hamlet,* the operas *Mazeppa* and *Charodaïka,* the Mozartian suite and the fine Fifth Symphony. During a great part of the time he lived in retirement at Klin, where his generosity to the poor made him beloved. His operas *The Queen of Spades* and the one-act *Iolanthe* were feeble by comparison with his earlier works; more effective, however, were the ballets *Sleeping Beauty* and *Casse-noisette.* In 1893 Tschaïkovsky sketched his Sixth Symphony, now known as the *Pathetic,* a work that has done more for his fame in foreign lands than all the rest of his works. This was the year in which the composer conducted a work of his own at Cambridge on the occasion of his receiving the honorary degree of Doctor of Music. In the same year, on the 6th of November, he died from an attack of cholera at St Petersburg.

Tschaïkovsky's work is unequal. In dramatic compositions he lacked point precisely as Anton Rubinstein lacked point. But in the invention of broad, sweeping melody Tschaïkovsky was far ahead of his compatriot. Among his songs and smaller pianoforte works, as in his symphonies and quartets, are passages of exquisite beauty. The best of Tschaïkovsky's work is more distinctly Russian than that of most of his compatriots; it is not German music in disguise, as is so much of the music by Rubinstein and Glazounow, and it is not incoherently ferocious, like so much of the music by Balakirev.

See Mrs Rosa Newmarch's *Tchaikovsky* (1900) supplemented in 1906 by her condensed English edition of the *Life and Letters,* which appeared in Russian in 1901 in three volumes, edited by Modeste Tschaïkovsky, the composer's brother.

TSCHUDI, or SCHUDY, the name of one of the most distinguished families of the land of Glarus, Switzerland. It can be traced back as a peasant, not a noble, race to 1289, while after Glarus joined the Swiss Confederation in 1352 various members of the family held high political offices at home, and were distinguished abroad as soldiers and in other ways.

In literature, its most eminent member was GILES or AEGIDIUS TSCHUDI (1505–1572), who, after having served his native land in various offices, in 1558 became the chief magistrate or *landammann,* and in 1559 was ennobled by the emperor Ferdinand, to whom he had been sent as ambassador. Originally inclined to moderation, he became later in life more and more devoted to the cause of the counter-Reformation. It is, however, as the historian of the Swiss Confederation that he is best known; by incessant wanderings and unwearied researches amongst original documents he collected material for three great works, which therefore can never wholly lose their value, though his researches have been largely corrected by those of more recent students. In 1538 his book on Rhaetia, written in 1528, was published in Latin and in German—*De prisca ac vera Alpina Rhaetia,* or *Die uralt wahrhafftig Alpisch Rhätia.* The historical reputation of Giles Tschudi has suffered very much owing to recent researches. His inventions as to the early history of the Swiss Confederation are described under TELL. His statements and documents relating to Roman times and the early history of Glarus and his own family had long roused suspicion. Detailed examination of late years has proved beyond the shadow of a doubt that he not merely claimed to have copied Roman inscriptions that never existed, and amended others in a most arbitrary fashion, but that he deliberately forged a number of documents with a view to pushing back the origin of his family to the 10th century, thus also entirely misrepresenting the early history of Glarus, which is that of a democratic community, and not (as he pretended) that of a preserve of several aristocratic families. Tschudi's historical credit is thus hopelessly ruined, and no document printed or historical statement made by him can henceforward be accepted without careful verification and examination. These discoveries have a painful interest and importance, since down to the latter part of the 19th century Swiss historical writers had largely based their works on his investigations and manuscripts.

For a summary of these discoveries see G. v. Wyss in the *Jahrbuch* of the Historical Society of Glarus (1895), vol. xxx., in No. 1 (1894), of the *Anzeiger f. schweizerische Geschichte*, and in his *Geschichte d. Historiographie in d. Schweiz* (1895), pp. 196, 201, 202. The original articles by Vögelin (Roman inscriptions) appeared in vols. xi., xiv. and xv. (1886–1890) of the *Jahrbuch f. schweizer Geschichte*, and that by Schulte (Glarus) in vol. xviii. (1893) of the same periodical. For the defence, see a weak pamphlet, *Schulte u. Tschudi* (Coire, 1898), by P. C. v. Planta.

Tschudi's chief works were not published until long after his death. The *Beschreibung Galliae Comatae* appeared under Gallati's editorship in 1758, and is mainly devoted to a topographical, historical and antiquarian description of ancient Helvetia and Rhaetia, the latter part being his early work on Rhaetia revised and greatly enlarged. This book was designed practically as an introduction to his magnum opus, the *Chronicon helveticum*, part of which (from 1001 to 1470) was published by J. R. Iselin in two stately folios (1734–1736); the rest consists only of rough materials. There exist two rather antiquated biographies of Tschudi by I. Fuchs (2 vols., St Gall, 1805) and C. Vogel (Zürich, 1856), but his extensive complete correspondence has not yet been printed.

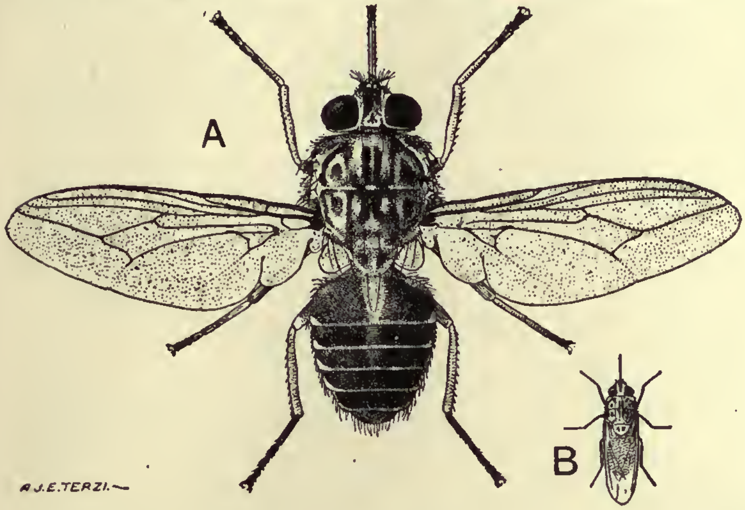
Subjoined is a list of other prominent members of the family. DOMINIC (1596–1654) was abbot of Muri and wrote a painstaking work, *Origo et genealogia gloriosissimorum comitum de Habsburg* (1651). JOSEPH, a Benedictine monk at Einsiedeln, wrote a useful history of his abbey (1823). The family, which became divided in religious matters at the Reformation, also includes several Protestant ministers: JOHN HENRY (1670–1729), who wrote *Beschreibung des Lands Glarus* (1714); JOHN THOMAS (1714–1788), who left behind him several elaborate MSS. on the local history of Glarus; and JOHN JAMES (1722–1784), who compiled an elaborate family history from 900 to 1500, and an account of other Glarus families. JOHN LOUIS BAPTIST (d. 1784), who settled in Metz and contributed to the *Encyclopédie*, and FREDERICK (1820–1886), the author of *Das Thierleben der Alpenwelt* (1853), were distinguished naturalists. Among the soldiers may be mentioned CHRISTOPHER (1571–1629), a knight of Malta and an excellent linguist, who served in the French and Spanish armies; while the brothers LOUIS LEONARD (1700–1779) and JOSEPH ANTHONY (1703–1770) were in the Neapolitan service. VALENTINE (1499–1555), the cousin of Giles, was, like the latter, a pupil of Zwingli, whom he afterwards succeeded as pastor of Glarus, and by his moderation gained so much influence that during the thirty years of his ministry his services were attended alike by Romanists and Protestants. The best-known member of the family in the 19th century was IWAN (1816–1887), author of an excellent guide-book to Switzerland, which appeared first (1855) under the name of *Schweizerführer*, but is best known under the title (given in 1872 to an entirely recast edition) of *Der Tourist in der Schweiz*. (W. A. B. C.)

TSĒNG KUO-FAN (1811–1872), Chinese statesman and general, was born in 1811 in the province of Hunan, where he took in succession the three degrees of Chinese scholarship. In 1843 he was appointed chief literary examiner in the province of Szechuen, and six years later was made junior vice-president of the board of rites. When holding the office of military examiner (1851) he was compelled by the death of his mother to retire to his native district for the regulation mourning. At this time the Taiping rebels were overrunning Hunan in their conquering career, and had possessed themselves of the cities and strongholds on both shores of the Yangtse-kiang. By a special decree Tsēng was ordered to assist the governor of the province in raising a volunteer force, and on his own initiative he built a fleet of war junks, with which he attacked the rebels. In his first engagement he was defeated, but, happily for him, his lieutenants were more successful. They recovered the capital, Chang-sha, and destroyed the rebel fleet. Following up these victories of his subordinates, Tsēng recaptured Wuchang and Hanyang, near Hankow, and was rewarded for his success by being appointed vice-president of the board of war. In 1853 other triumphs led to his being made a baturu (a Manchu order for rewarding military prowess), and to his being decorated with a yellow riding-jacket. Meanwhile, in his absence, the rebels retook Wuchang and burnt the protecting fleet. The tide quickly turned, however, and Tsēng succeeded in clearing the country round the Poyang lake, and subsequently in ridding the province of Kiangsu of the enemy. His father died in 1857, and after a brief mourning he was ordered to take supreme command in Cheh-kiang, and to co-operate with the governor of Fukien in the defence of that province. Subsequently the rebels were driven westwards, and Tsēng would have started in pursuit had he not been called on to clear the province of Ngan-hui of rebel bands. In 1860 he was appointed viceroy of the two Kiang provinces and Imperial war commissioner. At this time, and for some time previously, he had been fortunate in having the active support of Tso Tsung-t'ang, who at a later period recovered Kashgar for the emperor, and of Li Hung-Chang. Like all true leaders of men, he knew how to reward good service, and when occasion offered he appointed the former to the governorship of Cheh-kiang and the latter to that of Kiangsu. In 1862 he was appointed assistant grand secretary of state. At this time the Imperial forces, assisted by the "Ever-victorious Army," had checked the progress of the rebellion, and Tsēng was able to carry out a scheme which he had long formulated of besieging Nanking, the rebel headquarters. While Gordon, with the help of Li Hung-Chang, was clearing the cities on the lower waters of the Yangtse-kiang, Tsēng drew closer his besieging lines around the doomed city. In July 1864 the city fell into his hands, and he was rewarded with the rank and title of marquis and the right to wear the double-eyed peacock's feather. After the suppression of the Taipings the Nienfei rebellion, closely related to the former movement, broke out in Shantung, and Tsēng was sent to quell it. Success did not, however, always attend him on this campaign, and by Imperial order he was relieved of his command by Li Hung-Chang, who in the same way succeeded him in the viceroyalty of Chihli, where, after the massacre of Tientsin (1870), Tsēng failed to carry out the wishes of his Imperial master. After this rebuff he retired to his viceroyalty at Nanking, where he died in 1872.

Tsēng was a voluminous writer. His papers addressed to the throne and his literary disquisitions are held in high esteem by the scholars of China, who treasure as a memorial of a great and uncorrupt statesman the edition of his collected works in 156 books, which was edited by Li Hung-Chang in 1876. (R. K. D.)

TSETSE-FLY (*Tsetse*, an English rendering of the Bantu *nsi-nsi*, a fly), a name applied indiscriminately to any one of the eight species of *Glossina*, a genus of African blood-sucking Diptera (two-winged flies, see DIPTERA), of the family Muscidae. Tsetse-flies are of great economic and pathological importance as the disseminators of tsetse-fly disease (nagana) and sleeping sickness. These maladies are caused by minute unicellula animal parasites (*haematozoa*) of the genus *Trypanosoma* (see TRYPANOSOMES); and recent investigations have shown that, under normal conditions, the particular species of *Trypanosoma* concerned (*T. brucei*, in the case of nagana, and *T. gambiense* in that of sleeping sickness) are introduced into the blood of susceptible animals or man only by the bite of one or other of the species of tsetse. (See PARASITIC DISEASES). The names of the recognized species of tsetse-flies are as follows: *Glossina palpalis* (see fig.); *G. pallicera*; *G. morsitans*; *G. tachinoides*; *G. pallidipes*; *G. longipalpis*; *G. fusca*; and *G. longipennis*. A ninth so-called species, described in 1905 from specimens from Angola, is not really distinct from *G. palpalis* but appears to be identical with the sub-species *G. palpalis wellmani*.

In appearance tsetse are somewhat narrow-bodied flies, with a prominent proboscis, which projects horizontally in front of the head, and with the wings in the resting position closed flat one over the other like the blades of a pair of scissors (see fig., B). The latter characteristic affords an infallible means for the recognition of these insects, since it at once serves to distinguish them from any blood-sucking flies with which they might otherwise be confused. The coloration of tsetse-flies is sombre and inconspicuous; the brownish or greyish-brown thorax usually exhibits darker longitudinal markings, and when the insect is at rest the abdomen or hinder half of the body is entirely concealed by the brownish wings. In some species the abdomen is of a paler colour and marked with sharply defined, dark brown bands, which are interrupted on the middle line. The length of the body, exclusive of the proboscis, which measures about a line to a line and a half, varies according to the species from 6 or 8 millimetres in the case of *G. tachinoides*, to about 11½ millimetres in that of *G. fusca* or *longipennis*; the closed



wings, however, project beyond the body and thus increase its apparent length. *G. palpalis*, the disseminator of sleeping sickness (see fig.), is about 9½ millimetres in length and is the darkest of all the tsetse-flies, though the dark brown abdomen has pale lateral triangular markings and usually at least an indication of a pale longitudinal median stripe. In all tsetse-flies the proboscis in the living insect is entirely concealed by the palpi, which are grooved in their inner sides and form a closely fitting sheath for the piercing organ; the base of the proboscis is expanded beneath into a large onion-shaped bulb, which is filled with muscles. The head of the insect contains a muscular pharynx by means of which the blood from the wound inflicted by the proboscis (labium) is pumped into the alimentary canal and the so-called sucking-stomach. The tip of the proboscis is armed with a complicated series of chitinous teeth and rasps, by means of which the fly is enabled to pierce the skin of its victim; as usual in Diptera the organ is closed on the upper side by the labrum, or upper lip, and contains the hypopharynx or common outlet of the paired salivary glands, which are situated in the abdomen. The proboscis of tsetse-flies is without the paired piercing stilets (mandibles and maxillae) possessed by other blood-sucking Diptera, such as the female horse-flies and mosquitoes.

For the anatomy of the tsetse see E. A. Minchin, *Proc. Roy. Soc.* lxxvi. 531–547.

Tsetse-flies are restricted to Africa, where they occur in suitable localities throughout the greater portion of the tropical region, although not found either in the Sahara or in the veld country of the extreme south. For practical purposes the northern limit of *Glossina*, as at present known, may be shown on the map by drawing a line from Cape Verde to the Nile a little to the south-east of El Obeid, and thence to the coast of Somaliland at 4° N.; while the southern boundary of the genus may similarly be represented by the Cunene river, in the south of Angola, and a line thence to the north-eastern end of St Lucia lake, in Zululand. Within the area thus defined tsetse-flies are not found continuously, however, but occur only in small tracts called "belts" or "patches," which, since cover and shade are necessities of life to these insects, are always situated in forest, bush or banana plantations, or among other shady vegetation. In South and Central Africa, at any rate, "fly-belts" are usually met with in damp, hot, low-lying spots on the margins of water-courses, rivers and lakes, and seldom far from water of some kind. It appears, however, that in this respect the habits of the different species show a certain amount of variation; thus, while *G. palpalis* exhibits an especial fondness for water and haunts more or less dense cover at the water's edge, recent observations in German East Africa show that *G. fusca* is in no way connected with water, but is much more frequently encountered at a distance from it. Similarly, the oft-repeated assertion that there is a definite connexion between tsetse-flies and big game, especially the buffalo (*Bubalus caffer*), in that the former are dependent upon the latter for their continued existence, is certainly not true as regards *G. palpalis*, although in South Africa there can be no question that the extermination of big game has been followed or accompanied by the disappearance of tsetse from many localities in which they formerly abounded.

As a rule tsetse-flies are most active during the warmer hours of the day, but they frequently bite at night, especially by moonlight. The blood-sucking habit is common to both sexes, and the abdomen, being capable of great expansion, is adapted for the periodical ingestion of an abundant food-supply. The act of feeding, in which the proboscis is buried in the skin of the victim nearly up to the bulb, is remarkably quick, and in thirty seconds or less the abdomen of the fly, previously flat, becomes swollen out with blood like a berry. Stuhlmann's experiments with *G. fusca* show that the insect is able to ingest considerably more than (sometimes more than twice) its own weight of blood, which would appear to be the only food, and must be drawn from the tissues of a victim. Specimens of *G. fusca*, even though fasting and kept for days in absolutely dry air, could never be induced to imbibe water, sugar-cane juice or extravasated blood. The reproduction of tsetse-flies is highly remarkable; instead of laying eggs or being ovoviviparous the females deposit at intervals of about a fortnight or three weeks a single full-grown larva, which forthwith buries itself in the ground to a depth of several centimetres, and assumes the pupal state. The practical importance of this peculiar life-history is very great, since larvae thus protected cannot easily be destroyed. It is important to note that although sleeping sickness (of which the chief foci are at present the Congo Free State and Uganda) has hitherto been associated with one particular species of *Glossina*, it has been shown experimentally both that other tsetse-flies are able to transmit the parasite of the disease, and that *G. palpalis* can convey kindred parasites which are fatal to domestic animals. Since, moreover, it is believed that at least five species of *Glossina* are carriers of nagana, it may well be that *all* tsetse-flies can disseminate both nagana and sleeping sickness. (E. E. A.)

TSHI, Tchwi, Chi, or Oji, a group of Negro peoples of the Gold Coast (*q.v.*). The chief of these are the Ashanti, Fanti, Akim and Aquapem. Their common language is the Tshi, from which they gain their family name.

TSU-SHIMA ("the island of the port"), an island belonging to Japan, situated about midway between Korea and the island of Iki, so that the two islands were used as places of call in former times by vessels plying between Japan and Korea. Tsu-shima lies about 34° 20′ N., 129° 20′ E. The nearest point of the Korean coast is 48 m. distant. It has an area of 262 sq. m. and a population of 39,000. It is divided at the waist by a deep sound (Asaji-ura), and the southern section has two hills, Yatachi-yama and Shira-dake, 2130 ft. and 1680 ft. high respectively, while the northern section has Ibeshi-yama and Mi-take, whose heights are 1128 ft. and 1598 ft. The chief town is Izu-hara. The Mongol armada visited the island in the 13th century and committed great depredations. In 1861 an attempt was made by Russia to obtain a footing on the island. The name of the battle of Tsu-shima is given to the great naval engagement of the 27th and 28th of May 1905, in which the Russian fleet under Admiral Rozhdestvensky was defeated by the Japanese under Admiral Togo.

TUAM, a market town and episcopal city of Co. Galway, Ireland, 20 m. directly N.N.E. of Galway on the Limerick & Sligo branch of the Great Southern & Western railway. Pop. (1901), 3012. An abbey was founded here towards the end of the 5th century, and in the beginning of the 6th an episcopal see by St Jarlath. The Protestant archbishopric of Tuam was lowered to a bishopric on the death of Archbishop Power Le Poer Trench in 1839, and united with that of Killala and Achonry. It is, however, a Roman Catholic archbishopric. The Protestant cathedral is also the parish church, and was to a great extent rebuilt *c.* 1861 from plans by Sir Thomas Deane. Only the chancel of the old church remains, but its red sandstone arch is a remarkably fine example of Norman work; it dates from the middle of the 12th century. The modern Roman Catholic cathedral is Perpendicular in style and cruciform in plan. The interior is elaborately decorated. The cross of Tuam, re-erected in modern times, bears inscriptions in memory of Turlogh O'Conor, king of Ireland, and O'Hoisin, successively (1128) abbot of St Jarlath's Abbey and archbishop (1152) of Tuam, when the see was raised. St Jarlath's Roman Catholic college, usually called the New College, is a seminary founded in 1814 for the education of priests. To the west are the archbishop's palace and a convent of

Presentation nuns. The town has a considerable retail trade, and is a centre for the disposal of agricultural produce. Tuam received its first charter from James I. Before the union in 1800 it returned two members to the Irish Parliament.

TUAREG, or TAWAREK (more properly Tawarik, the collective form of *tarki*, from Arabic *terek*, to give up), the name given to the western and central Saharan Berber peoples, in reference possibly to their abandonment of Christianity or their early home in Mauretania. They call themselves *Imoshagh* ("the noble people"), another form of Amazigh. They inhabit the desert from Tuat to Timbuktu and from Fezzan to Zinder. The Tuareg country covers about 1,500,000 sq. m., less than 3000 acres of which are cultivated. There are only some half-dozen commercial places in the whole Sahara to which the Tuareg resort. These are the centres from which the trade routes radiate, Wargla, Timbuktu, Ghat, Ghadames, Murzuk and Insalah.

The Tuareg, at any rate the noble class, are regarded as among the purest of the Berber stocks, but with the adoption of Islam they have become largely Arabized in manners and customs, though the nomad Tuareg preserve in singular purity the Tamashek dialect of the Berber language. Their general colour is the reddish yellow of southern Europeans, the uncovered parts of the body being, however, darker through exposure. Their hair is long, black, and silky, beards black and thin; eyes black, sometimes blue; noses small; hands delicate, but bodies muscular. They are a tall people, the chiefs being especially noted for their powerful build. They dress generally in a black tunic (some tribes wear white), trousers girt with a woollen belt, and wear as turban a cloth called *litham*, the end of which is drawn over the face, allowing nothing to be seen but the eyes and the tip of the nose. The purpose of this is to protect the throat and lungs from the sand. These cloths are dark blue or white: the former being worn most by the nobles, the latter by the common people. To this difference of colour is due the terms "black" and "white" Tuareg. The Tuareg seldom remove their masks or face-cloths. Even abroad they wear them, and have been seen so dressed in the streets of Paris. The Arabs call them "People of the Veil."

The Tuareg are divided into five main tribes or confederations of tribes: the Azgar (Asjer) about Ghat and Ghadames; the Kelui around Air; the Hoggar (Ahaggar) in the mountains of that name and in the centre of the Sahara; the Awellimiden in the desert north and east of Timbuktu; and the Arrerf Ahnet, a recent offshoot of the Hoggars living in the Adrar'n Ahnet region north-west of the Hoggar massif. Owing to their nomadic life their political organization is not so democratic as that of other Berber peoples; chiefs and the members of the popular assembly are nominally elective; practically, however, the office of chief is hereditary in a ruling family. On a chief's death the office goes, with the approval of the tribesmen, to the eldest son of his eldest sister, in no case to any of his sons. The Tuareg are nominally Mahommedans, and belong to the Malikite section of the Sunnites. The Senussite sect, however, has many adherents, but more because of the Tuareg hatred of foreigners than from devoutness. A very few perform, by way of Tripoli, the pilgrimage to Mecca. They have not many mosques, and these are merely small stone enclosures a few feet high, with a niche at one end towards Mecca. There are a number of desert monasteries, huge camps pitched in a circle. Here the marabout lives surrounded by his followers, shifting the "monastery" as the requirements of his flocks compel. In these monasteries many Tuareg children receive their education.

Socially the Tuareg are divided into five classes, viz.: *Thaggaren* or nobles; Marabouts or priests; *Imghad* or serfs; *Ireghenaten* or cross-breeds; and the slaves. The nobles are all pure-blooded, and provide the tribal chiefs. They do no manual work, but almost live in the saddle, either convoying those caravans which have paid blackmail for safe passage, or making raids on trade-routes or even outlying Arab settlements. Before the French occupation they sometimes penetrated into the very heart of Algeria and Tunisia. Among the Imghad serfdom is hereditary, and whole tribes are vassals to the nobles. They cannot be sold or freed like slaves, though they may be inherited. Most of them have practical independence and act as "squires" to the nobles on their pillaging expeditions. The cross-breeds are the descendants of mixed marriages between the nobles and serfs. These follow their mother's status. The slaves are chiefly Sudanese negroes. They are well treated and are practically members of the Tuareg family, but the Tuareg never intermarry with them. The Tuareg weapons are a straight two-edged sword about 4 ft. long, a dagger bound to the left forearm by a leather ring, and a slender iron lance some 9 ft. long barbed for about a foot. On his right arm the Tuareg warrior wears a heavy stone to give increased weight to his lance and sword-play or to parry blows. Muskets are common, no noble or freedman being without one. Besides this the Tuareg carry leathern shields. In hunting, wooden missiles like boomerangs are used. Among the low-caste hill tribes of Hoggar bows and arrows are the only weapons.

Little is known of the history of the Tuareg. The name is that given them by the Arabs. They are the descendants of those Berbers who were driven into the desert by the great Arab invasion of North Africa in the 11th century. Ibn Khaldūn in the 14th century locates them to the south and west of Tunisia. They were constantly at war with the Arabs on the north, and the Negro peoples of the Sudan on the south. For their relations with the French, with whom they came into contact after the conquest of Algeria, see SAHARA.

Harding King, *A Search for the Masked Tuaregs* (London, 1903); M. Benhazera, *Six Mois chez les Touareg du Ahaggar* (Algiers, 1908); Lieut. C. Jean, *Les Touareg du sud-est: l'Aïr, leur rôle dans la politique saharienne* (Paris, 1909); E. Doutté, *Magie et religion dans l'Afrique du nord* (Algiers, 1909); "Essai de transcription méthodique des noms de lieux touareg" in *Bull. soc. géog. d'Alger* (1908).

TUAT, a Berber word [1] sometimes applied generally to all the oases in the western part of the Algerian Sahara, *i.e.* between 2° W. and 2½° E. 26° and 30° N., sometimes restricted to a particular group which borders the east side of Wad Mzaud between 26⅛° and 27½° N. According to the first usage Tuat includes the oases of Gurara in the north and Tidikelt in the south with the important centre of Insalah. The three groups are spoken of collectively by the French as the Tuat archipelago. The district is comparatively fertile, being formed of recent alluvium extending along the base of the Tademait plateau (Cretaceous), and produces dates and some cereals and vegetables. The wadi Saura (known in its lower course as the Messaud), formed by the junction of the wadis Zusfana and Ghir, marks the north-western boundary of the oases. After the winter rains in the Atlas it carries a considerable body of water in its upper course, but lower down its channel is choked by sand. Works were undertaken (1909) by the French to keep open the channel as it passes Tuat proper. At Gurara water is obtained from springs brought to the surface by the outcrop of impervious Devonian rocks. There is an extensive *sebkha* or salt lake at Gurara. The oases support a comparatively large population. The separate *ksurs* or hamlets, of which the district is said to contain over 300, are in Tuat proper placed close together. The political centre of Tuat is the oasis of Timmi, which has some forty ksurs. All the ksurs are strongly fortified, the walls of the citadels being of immense thickness. The whole region has been formed into an administrative unit known as *territoire des oasis sahariennes*, and comprising a native commune subdivided into the annexes of Tuat, Gurara and Tidikelt. In 1906 the commune had a population of 134 Europeans and 49,873[2] natives, of whom 112 enjoyed municipal rights. There were four places with over 2000 inhabitants: Adrar (Timmi), 2686, and Zaniet-Kunta, 3090, in Tuat; Insalah, 2837, in Tidikelt; and Timimun, 2330, in Gurara. Nine other places had between 1000 and 2000 inhabitants. By race (excluding the troops) there were 19,654 Arabs, 5470 Berbers, 4374 negroes, 191 Jews (professing Islam) and 19,412 persons of mixed blood. The district is of importance as commanding the routes southwards to Timbuktu from both Morocco and Algeria, and it is thus a great centre of trade. The oases appear to have been inhabited from a very early period. According to tradition numbers of Jews migrated thither in the 2nd century A.D. They were the predominant element in the oases when the conquests of Sidi Okba drove the Zenata south (7th century). These Berbers occupied Tuat and, to a large extent, absorbed the Jewish population. The Arabs took possession of the oases in the 10th century and imposed Islam upon the people. Thereafter the region was governed by Zenata Berbers or by Arab chieftains. In the 14th

[1] The etymology of the word is doubtful; it is used in the sense of an inhabited district—hence an oasis.

[2] By a clerical error the native population in the census returns is given as 60,497.

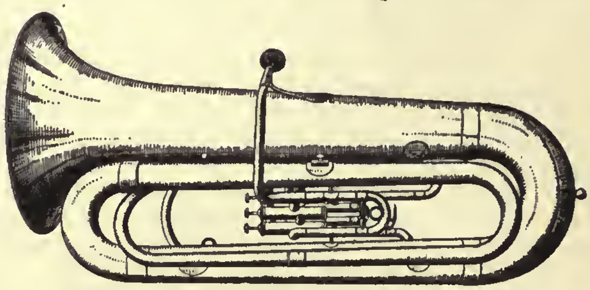
century the sultan of Morocco occupied the oases, which remained in political dependence upon Morocco. In the 17th century, however, the sovereignty of the sultan had become almost nominal and this state of quasi-independence continued. The treaty of 1845 between Morocco and France left the question of the possession of Tuat, Gurara and Tidikelt unsettled. After the murder in 1881 of the members of the Flatters mission—a French expedition sent into the Sahara—a measure concerted at Insalah, several of the Tuat headmen sought Moroccan protection, fearing the vengeance of France. A chief calling himself the Moroccan pasha established himself at Timmi, but Morocco took no active step to assert her sovereignty. In 1899 a French scientific mission, under Colonel Flamand, was despatched to the oasis of Tidikelt. The French were attacked by the natives (Dec. 28, 1899), whom they defeated, and the next day Insalah was occupied. This was the beginning of a serious campaign in which the French suffered severe losses, but by March 1901 the whole of the fortified places in the three oases had been captured. To cut off the oases from Morocco the town of Igli, 140 m. north-west of Gurara, was also annexed by the French (April 5, 1900). Igli (pop. 1057 in 1906) occupies an important position, being placed at the junction of the wadi Zusfana and the wadi Ghir. The French were not, however, left in peaceable possession of their newly acquired territory. Attacks by the nomad tribes, Moroccan and others, were made on the line of communications, and during 1903 the French troops suffered serious losses. To punish the tribes the town of Figig was bombarded by the French (June 8, 1903). On the 2nd of September following a band of nomads attacked, at a place called El Mungar, the escort of a convoy going to Taghit. After maintaining the fight 7½ hours the French were reinforced and their enemies drew off. Out of 115 combatants the French lost 38 killed and 47 wounded.

To consolidate their position the French authorities determined to connect the oases with the Algerian Sahara proper by carriage roads and railways. One road goes north-east to El Golea, 150 m. distant from Insalah; another north from Igli to a post called Beni Ounif, 2½ m. south of Figig, to which point the railway from Ain Sefra, in the Oranese Sahara, was carried in 1903. The continuation of this railway to Igli was begun in the following year.

Major A. G. Laing visited the Tuat territory in 1825 on his way to Timbuktu, but his papers were lost. The next European to visit Tuat was Gerhard Rohlfs, who described his explorations and investigations in *Tagebuch seiner Reise durch Marokko nach Tuat, 1864* (Gotha, 1865) and *Reise durch Marokko . . . Exploration der Oasen von Tafilet, Tuat und Tidikelt . . .* (Bremen, 1868). A. G. P. Martin's *Les Oasis sahariennes* (Algiers, 1908) gives an account of the history and economic condition of the oases. Consult also Commandant E. Laquière, *Les Reconnaissances du Général Servière dans les oasis sahariennes* (Paris, 1902), a valuable monograph by an officer who took part in the operations in 1900–1901; E. F. Gautier, *Sahara algérien* (Paris, 1908), and various contributions by G. B. M. Flamand in *La Géographie* and *Annales géographiques* for 1900, *Comptes rendus* (1902), *Bull. géog. hist. et descriptive* (1903), &c. (F. R. C.)

TUBA, in music. The tubas—bombardon, helicon, euphonium (Fr. *tuba, sax-tuba, bombardon*; Ger. *Tuben, Tenor-bass, Bombardon, Kontrabasstuba, Helikon*; Ital. *basstuba, bombardone*)—are a family of valved instruments of powerful tone forming the tenor and bass of the brass wind. In the orchestra these instruments are called tubas; in military bands euphonium (tenor), bombardon and helicon (bass).

The modern tubas owe their existence to the invention of valves or pistons (Ger. *Ventile*) by two Prussians, Stölzel and Blümel, in 1815. The tubas are often confounded with the baritone and bass of the saxhorns, being like them the outcome of the application of valves to the bugle family. There is, however, a radical difference in construction between the two types: given the same length of tubing, the fundamental octave of the tubas is an octave lower than that of the saxhorns, the quality of tone being besides immeasurably superior. This difference is entirely due to the proportions of the truncated cone of the bore and consequently of the column of air within. By increasing the calibre of the bore in proportion to the length of the tube it was found that the fundamental note or first sound of the harmonic series was easily obtained in a full rich quality, and by means of the valves, with this one note as a basis, a valuable pedal octave is obtained, absent in the saxhorns. Prussia has not adopted these modifications; the bass tubas with large calibre, which have long been introduced into the military bands of other countries and retained in that country, are founded on the original model invented in



BB♭ Bombardon or Contrabass Tuba (Besson).

1835 by Wieprecht and Moritz, a specimen of which is preserved in the museum of the Brussels Conservatoire. The name "bass tuba" was bestowed by Wieprecht upon his newly invented bass with valves, which had the narrow bore afterwards adopted by Sax for the saxhorns. The evolution of the modern tubas took place between 1835 and 1854 (see VALVES).

The instruments termed Wagner tubas are not included among the foregoing. The Wagner tubas are really horns designed for Wagner in order to provide for the *Nibelungen Ring* a complete quartet having the horn timbre. The tenor tuba corresponds to the tenor horn, which it outwardly resembles, having its tube bent in rectangular outline and being played by means of a funnel-shaped mouthpiece. The bore of the Wagner tenor and tenor-bass tubas, in B♭ and F, is slightly larger than in the horn, but much smaller than in the real tubas. The bell, funnel-shaped as in the German tubas, is held to the right of the performer, the valves being fingered by the left hand. There are four valves, lowering the pitch respectively 1 tone, ½ tone, 1½ tone, 2 tones (or 2½ tones). The harmonic series is the same for both instruments, the notation being as for the horn in C.

N.B.—The black notes are difficult to obtain strictly in tune as open notes.

By means of the valves the compass is extended downwards an octave for each instrument. The timbre of the tenor tuba is only slightly more metallic and less noble than that of the French horn with valves. Many motives in the *Ring* are given out by the quartet of horns and Wagner tubas.

The modern tuba finds its prototype as well as the origin of the name in the Roman tuba (the Greek *salpinx*), definite information concerning which is given by Vegetius.[1] Compared with the other military service instruments of the Romans, the *buccina* and *cornu*, the tuba was straight and was used to sound the charge and retreat, and to encourage and lead the soldiers during action; it was sounded at the changing of the guard, as the signal to begin and leave off work, &c. The tuba is represented, together with the buccina and cornu, on Trajan's column in the scenes described by Vegetius.

During the middle ages the tuba was as great a favourite as the busine (see BUCCINA and TRUMPET), from which it may readily be distinguished by its marked conical bore and absence of bell. It is recorded that King Frederick Barbarossa gave an order on the 14th of January 1240 in Arezzo for four tubas of silver and for slaves to be taught to play upon them.[2] During the middle ages the Latin word *tuba* is variously translated, and seems to have puzzled the compilers of vocabularies, who often render it by *trumba* (Fr. *trompe*). (K. S.)

TUBE (Lat. *tuba*), a pipe or hollow cylinder. Tubes play an important part in engineering and other works for the conveyance of liquids or gases, and are made of diverse materials and dimensions according to the purpose for which they are intended, metal pipes being of the greatest consequence. According to the process of manufacture metal tubes may be divided into seamed and seamless. One of the earliest uses of seamed wrought-iron tubes was for gun-barrels, and formerly these were made by taking a strip of wrought iron, bending it so that the edges overlapped and then welding by hammering, with or without the aid of grooved swages. The development of gas lighting increased the demand for tubes, and in 1824 James Russell introduced the butt-welded tube, in which the edges of the skelp are not made to overlap, but are brought into closest possible contact and the welding is effected in a double swage, having corresponding grooves of the diameter of the tube required; this method required no mandrel as did those previously in use. The following year saw another improvement in making these pipes, when Cornelius Whitehouse effected a butt weld by drawing the bent skelp through a die. Stronger tubes are obtained by using grooved rollers instead of a die, the skelp being mounted on a mandrel. This is the method commonly adopted at the present day for making this class of tube. Seamed tubes, especially of copper and brass, are made by brazing or soldering the edges of the skelp. Another method is to bend the edges so that they interlock, the contact being perfected by rolling. Seamless tubes, which are stronger than those just described, are made by drawing a bloom of the metal perforated by an axial hole or provided with a core of some refractory material, or, in certain cases, by forcing the plastic metal by hydraulic pressure through an appropriate die. The seamless steel tube industry is now of great dimensions owing to the development of steam engineering. Another type of seamless tube is the cast-iron tube, usually of large diameter and employed for gas and water mains; these pipes are made by casting.

TUBERCULOSIS. The word "tuberculosis," as now used, signifies invasion of the body by the tubercle bacillus, and is applied generally to all morbid conditions set up by the presence of the active parasite. The name is derived from the "tubercles" or "little lumps" which are formed in tissues invaded by the bacillus; these were observed and described long before their real nature or causation was known. (For an account of the organism, which was discovered by Koch in 1882, see PARASITIC DISEASES.) The bacillus attacks every organ and tissue of the body, but some much more frequently than others. The commonest seats of tuberculous disease are the lungs, lymphatic glands, bones, serous membranes, mucous membranes, intestines and liver. Before the discovery of the bacillus its effects in different parts of the body received separate names and were classified as distinct diseases. For instance, tuberculosis of the lung was called "consumption" or "phthisis," of the bones and lymphatic glands "struma" or "scrofula," of the skin "lupus," or the intestinal glands "tabes mesenterica." Some of these names are still retained for convenience, but the diseases indicated by them are known to be really forms of tuberculosis. On the other hand, there are "tubercles" which are not caused by the tubercle bacillus, but by some other source of irritation, including various parasitic organisms, some of which closely resemble the tubercle bacillus. To these forms of disease, which are not as yet well understood, the term pseudo-tuberculosis has been given. Lastly, the word "tubercular" is still sometimes applied to mere lumpy eruptions of the skin, which have no connexion with tuberculosis or pseudo-tuberculosis.

Pathology.—The effects of tuberculosis on the structures attacked vary greatly, but the characteristic feature of the disease is a breaking-down and destruction of tissue. Hence the word "phthisis," which means "wasting away" or "decay," and was used by Hippocrates, accurately describes the morbid process in tuberculosis generally, as well as the constitutional effect on the patient in consumption. According to the most recent views, the presence and multiplication of the bacilli excite by irritation the growth of epithelioid cells from the normal fixed cells of the tissue affected, and so form the tubercle, which at first consists of a collection of these morbidly grown cells. In a typical tubercle there is usually a very large or "giant" cell in the centre, surrounded by smaller epithelioid cells, and outside these again a zone of leucocytes. The bacilli are scattered among the cells. In the earliest stages the tubercle is microscopic, but as several of them are formed close together they become visible to the naked eye and constitute the condition known as miliary tubercle, from their supposed resemblance to millet seeds. In the next stage the cells forming the tubercle undergo the degenerative change known as "caseation," which merely means that they assume in the mass an appearance something like cheese. In point of fact, they die. This degeneration is believed to be directly caused by a toxin produced by the bacilli. The further progress of the disease varies greatly, probably in accordance with the resisting power of the individual. In proportion as resistance is small and progress rapid the cheesy tubercles tend to soften and break down, forming abscesses that burst when superficial and leave ulcers, which in turn coalesce, causing extensive destruction of tissue. In proportion as progress is slow the breaking-down and destructive process is replaced by one in which the formation of fibrous tissue is the chief feature. It may be regarded as Nature's method of defence and repair. In tuberculosis of the lungs, for instance, we have at one end of the scale acute phthisis or "galloping consumption," in which a large part or even the whole of a lung is a mass of caseous tubercle, or is honeycombed with large ragged cavities formed by the rapid destruction of lung tissue. At the other end we have patches or knots of fibrous tissue wholly replacing the original tubercles or enclosing what remains of them. Such old encapsuled tubercles may undergo calcareous degeneration. Between these extremes come conditions which partake of the nature of both in all degrees, and exhibit a mixture of the destructive and the healing processes in the shape of cavities surrounded by fibrous tissue. Such intermediate conditions are far more common than either extreme; they occur in ordinary chronic phthisis. The term "fibroid phthisis" is applied to cases in which the process is very chronic but extensive, so that considerable cavities are formed with much fibrous tissue, the contraction of which draws in and flattens the chest-wall. Tuberculosis commonly attacks one organ or part more than another, but it may take the form of an acute general fever, resembling typhoid in its clinical features. "Acute miliary tuberculosis" is a term generally used to indicate disseminated infection of some particular organ —usually the lungs or one of the serous membranes—in which the disease is so severe and rapid that the tubercles have not time to get beyond the miliary state before death occurs. Tuberculosis is exceedingly apt to spread from its original seat and to invade other organs. The confusing multiplicity of terms used in connexion with this disease is due to its innumerable variations, and to attempts to classify diseases according to their symptoms or anatomical appearances. Now that the cause is known, and it has become clear that different forms of disease are caused by variations in extent, acuteness and seat of attack, the whole subject has become greatly simplified, and many old terms might be dropped with advantage.

Tuberculosis in the Lower Animals.—Most creatures, including worms and fishes, are experimentally susceptible to tuberculosis, and some contract it spontaneously. It may be called a disease of civilization. Domesticated animals are more susceptible than wild ones, and the latter are more liable in captivity than in the natural state. Captive monkeys, for instance, commonly die of it, and of birds the most susceptible are farmyard fowls, but it is practically unknown in animals in the wild state. In cattle coming chiefly from the plains (*United States Bureau of Animal Industry Reports*, 1900–1905) the number found diseased was only 0·134% in 28,000,000. Of the domesticated animals, horses and sheep are least, and cattle most, affected; pigs, dogs and cats occupy an intermediate position.

The percentage of tuberculous animals recorded at the slaughter-houses of Berlin in 1892–1893 was as follows: Cows and oxen, 15·1; swine, 1·55; calves, 0·11; sheep, 0·004. Similar records at Copenhagen in 1890–1893 give the following result: Cows and oxen, 17·7; swine, 15·3; calves, 0·2; sheep, 0·0003. The order of the animals is the same, and it is confirmed by other slaughter-house statistics; but the discrepancies between the figures indicate considerable variation in frequency, and only allow general conclusions to be drawn. A striking fact is the comparatively small amount of tubercle in calves. It shows, as Nocard has pointed out, that heredity cannot play an important part in the transmission of bovine tuberculosis. The infrequency of the disease in sheep is attributed to the open-air life they lead, and no doubt that is an important factor. The more animals and persons are herded together and breathe the same air in a confined and covered space, the more prevalent is tuberculosis among them. Stefansky found the disease in 5% of the rats caught in Odessa, and Lydia Rabinowitch obtained similar results in rats caught in Berlin. But there are evidently degrees of natural resistance also. Horses are more confined than cattle in the United Kingdom, yet they are far less affected; and on the other hand, cattle running free in the purest air may take the infection from others. Professor McEacharn of Montreal states that he has seen tuberculosis prevalent in ranch cattle, few of which were ever under a roof, ranging on the foothills of the Rocky Mountains in Montana. In cows and monkeys the lungs are chiefly affected; in horses and pigs the intestine and abdominal organs.

The relation between human and animal tuberculosis has been much debated. The bacillus in man very closely resembles that found in other mammalia, and they were considered identical until Koch threw doubt on this view at the British Congress on Tuberculosis in 1901. The British government thereupon appointed a royal commission to inquire into the relations of human and animal tuberculosis. The second interim report of the commission was issued in 1907, and the conclusions arrived at in it are: "That there seems to be no valid reason for doubting the opinion, never seriously doubted before 1901, that human and bovine bacilli belong to the same family. On this view the answer to the question, Can the bovine bacillus affect man? is obviously in the affirmative. The same answer must also be given to those who hold the theory that human and bovine tubercle bacilli are different in kind, since the 'bovine kind' are readily to be found as the causal agents of many fatal cases of human tuberculosis." The commission also found that there is an essential unity not only in the nature of the morbid processes induced by human and bovine tubercle bacilli, but also in the morphological characteristics exhibited by the tubercle bacilli which cause these processes. The conclusions of the members of the Paris Congress on Tuberculosis, held in 1905, are: "That human tuberculosis can be transferred to the bovine animal, and that what is termed the bacillus of bovine origin can be discovered in the human subject, and that there is a possibility that they may be varieties of one species."

Distribution and Mortality.

The distribution of tuberculosis is universal, and it is coincident with the existence of the human race in the habitable regions of the globe. Its comparative absence in the Arctic regions seems more due to the sparsity of population than to climatic effect. Indeed, it has been shown that climate has much less effect in its prevalence than has been formerly thought to be the case, the conclusion of Hirsch being that "the mean level of the temperature has no significance for the frequency or rarity of phthisis in any locality." The nature of the occupations and the density of population in any given area tend to its increase or otherwise, and the comparative immunity enjoyed by uncivilized races is due to their open-air life and to the sanitary advantages derived from the comparatively frequent changes of the sites of their camps and villages. Segregation of these races in fixed areas has shown an increased incidence of tuberculosis, and when living under civilized conditions they fail to exhibit any natural immunity. Altitude has an apparent influence on the frequency of phthisis, the rarity of the disease at high altitudes in Switzerland having been demonstrated, and a like protective influence is enjoyed by certain elevated districts in Mexico, notwithstanding the insanitary conditions of the towns thereon. The protection afforded by the altitude is alleged to be due to the dryness of the atmosphere, its freedom from impurities and the increased solar radiation. While no race is exempt from tuberculosis, certain races afford a greater case incidence. E. Baldwin states that the mortality from consumption in recently immigrated races in the United States is much greater than in those of longer residence. It was found that among those whose mothers were of foreign birth the rate was—in Russians 71·8, Germans 167, Scottish 172·5, French 187·7 and Irish 339·6, while in native-born Americans it was 112·8. The well-known susceptibility of the Irish has been attributed to the moisture of the climate, under-feeding, and the residual inferiority of a population drained by the emigration of a large number of able-bodied adults. That there is some added factor is shown by the fact that the above mortality of 339 in those having Irish mothers, in 1901, was greater by 31% than that of the Irish in Ireland at the same period. The Jews are said to show a relative immunity, but the matter requires further investigation. The factor which seemingly has the most constant influence on the mortality from tuberculosis is density of population. A high rate of mortality occurs in connexion with overcrowding and bad ventilation in cities, and it is proved that the death-rate from this disease is considerably lower in the country than in the towns. In addition, when we consider that it does not occur in epidemics or at certain seasons, but is constantly active, it will easily be seen that no other disease is so destructive to the human race. At the Tuberculosis Congress, held in Paris in 1905, it was stated by Kayserling that one-third of all deaths and one-half the sickness amongst adults in Germany was due to tuberculosis.

In 1908 the mortality from all forms of tuberculosis in England and Wales was, according to the registrar-general's returns, 56,080, less by 3455 than the average of the previous five years, being equal to 10·8% of the mortality from all causes, while in Ireland in 1909 14% of the total mortality was assigned to it.

The following table gives the comparative mortality from pulmonary tuberculosis for certain fixed years together with the estimated population of certain selected countries:—

	Estimated Population in Years.			Mortality from Pulmonary Tuberculosis.		
	1892.	1900.	1907.	1892.	1900.	1907.
England and Wales	29,760,842	32,249,187	34,945,600	43,323	42,987	39,839
Ireland	4,633,808	4,468,501	4,377,064	10,048	10,076	8,828
German Empire . .	47,125,446	52,624,706	61,994,743	113,720	108,827	97,555
France	38,360,000	38,900,000	39,222,000	31,080	34,357	40,304
Norway	2,010,000	2,211,300	2,305,700	3,358	4,249	4,656
Italy	30,665,662	32,346,366	33,776,087	39,715*	41,733*	41,968*
Holland	4,645,660	5,159,347	5,709,755	8,906	8,451	7,403
Belgium	6,195,355	6,693,548	7,317,561	10,491	9,117	7,377
Switzerland . . .	3,002,263	3,299,939	3,525,290	5,785	6,692	6,063

* In Italy the mortality given is for all forms of tuberculosis.

We thus see there is a general tendency to decrease in the death-rate, with the possible exception of France and Norway. In England the decrease has been most marked, having fallen from 3457 per million living in 1851–1860, or 15·6% of all deaths, to 1583 per million living, or a mortality of 10·8% of the death-rate from all causes for all ages and sexes.

Death-rate of Tuberculosis per million living in England and Wales.

	1860.	1870.	1880.	1890.	1900.	1908.
Males	3300	3300	2900	2700	2200	1800
Females	3300	3000	2500	2100	1600	1350
Both Sexes . . .	3300	3150	2700	2400	1900	1583

In English counties containing populations of 100,000 or over the highest rates were—in 1908—London, 1806; Lancashire, 1848; Northumberland, 1947; Carnarvonshire, 2025; and Carmarthenshire, 2328 per million living. Of the fifteen counties in England and Wales with the highest tuberculosis mortalities, no fewer than seven are Welsh. Cardiganshire, with 2270 for both sexes, has a rate nearly double that of England.

According to the United States census of 1900, the death-rate from tuberculosis in the area chosen for registration which embraced ten registration states, namely, Connecticut, Maine, District of Columbia, Massachusetts, Michigan, New Hampshire, New Jersey, New York, Rhode Island and Vermont, and 153 registration cities outside these states, was:—

	Number of Deaths from Tuberculosis.	Death-rate per 100,000.
1890	48,236	245·4
1900	54,898	190·5

The returns of the mortality statistics of the United States for the year 1908 cover an area of 17 states, the district of Columbia and 74 registration cities, representing an aggregate population of 45,028,767, or 51·8 % of the total estimated population of the United States.

Mortality from Tuberculosis in the United States in given areas.

Annual Average, 1901–1905.	Tuberculosis (all forms), 62,835.	Pulmonary Phthisis, 55,251.	Number Tuberculosis (all forms) per 100,000 of the population, 193·2.
1904	66,797	58,763	201·6
1905	65,352	56,770	193·6
1906	75,512	65,341	184·2
1907	176,650	66,374	183·6
1908	78,289	67,376	173·9

In the United States tuberculosis of the lungs forms from 86 to 87 % of all cases. The death-rate, as we see, is steadily decreasing. It is, however, difficult to estimate the ravages of the disease in that country owing to the fact that rather less than half the United States is still unprovided with an adequate system of registration.

The following was the death-rate from tuberculosis (all forms) per 100,000 of the population of the chief cities of the United States during 1908:—

New Orleans	298·3
Sacramento, California	294·3
Washington	264·0
Baltimore	249·9

The returns in the United States show a high rate of mortality from tuberculosis amongst the coloured population, the negro being particularly susceptible to pulmonary phthisis; the death-rate from this cause is nearly double that amongst whites.

Age and Sex.—The most complete information under this heading is derived from the English records. "In both sexes," says Dr Tatham, "the real liability to phthisis begins somewhere between the fifteenth and the twentieth year. Among males it attains its maximum at age 45–55, when it reaches 3173 per million living. Among females it attains its maximum (2096) at age 35-45. In both sexes the rate rapidly declines after the attainment of its maximum. Practically the incidence of pulmonary phthisis is upon the ages from 15 to 75 years, very old people and young children being comparatively exempt. According to recent experience, females seem to be rather *less liable* than males to death by phthisis at ages under 5 years, *more liable* at the age of 5–20, and again *less liable* at subsequent ages." These observations, it must be noted, refer only to consumption. The comparative immunity of the very young does not extend to all forms of tuberculous disease. On the contrary, tuberculosis of the bowels and mesenteric glands (tabes mesenterica), tuberculous peritonitis and tuberculous meningitis are pre-eminently diseases of childhood. The tables at foot of page show in detail the relative incidence of pulmonary phthisis at different ages, and the steady diminution of the disease in England and Wales since 1850.

Occupation has a marked influence on the prevalence of pulmonary tuberculosis. The comparative mortality figures for various occupations are taken from the supplement to the registrar-general's 65th annual Report, and show the incidence of pulmonary phthisis, agriculturists being taken at 100 for purposes of comparison.

Occupied Males: England and Wales.

Highest.		*Lowest.*	
Tin miner	816	Coal miner	89
Copper miner	574	Chemical manufacturer	98
Scissors maker	533	Carpenter, joiner	150
File maker	387	Artist	156
General shopkeeper	387	Blacksmith	158
Brush maker	325	Worsted manufacturer	159
Furrier	316	Baker	165
Printer	300	Bricklayer	194
Chimney sweep	284	Cotton manufacturer	197
Hatter	280	Tailor	248

The high incidence in the first group will be seen chiefly to affect those occupations where there is dust (scissors and file makers and furriers). The high mortality amongst general shopkeepers can only be ascribed to continuous indoor occupation. Coal miners enjoy an unexplained immunity.

Dr Von Körösy has tabulated the result of seventeen years' observation in Budapest, which is an excessively tuberculous town. His figures include both males and females above fifteen years of age, and extend to 106,944 deaths. The field of observation is evidently very different from those which furnished the statistics already given. His results are: (1) *Males*—printers 606, butlers 520, shoemakers 494, dyers 493, millers 492, joiners 485, tinkers and locksmiths 484, masons 467, labourers 433, tailors 418, bakers 398, drivers 370, servants 360, carpenters 339, officials 336, butchers 333, innkeepers 272, merchants 253, lawyers 205, physicians 118, capitalists 106; (2) *Females*—servants 353, day labourers (? char-women) 333, washerwomen 314, gardeners 269, capitalists 42. The inmates of lunatic asylums, who are classed among the

"unoccupied," suffer excessively from tubercle. According to Dr Mott, pathologist to the London County Council, tuberculous lesions are found in more than one-third of the bodies of inmates examined post mortem. The majority contract the disease in the asylums.

Medical opinion has undergone a great change with regard to the influence of heredity. The frequent occurrence of consumption among members of the same family used to be explained by assuming the existence of a tuberculous "diathesis" or inherent liability to consumption which "ran in families" and was handed down from one generation to another. As the real nature of the disease was not understood, the inherited diathesis was regarded as a sort of latent or potential consumption which might develop at any time and could hardly be avoided. The children of consumptive parents had the "seeds" of the disease in them, and were thought to be doomed with more or less certainty. Great importance was therefore attached to heredity as a factor in the incidence of tuberculosis. The discovery that it is caused by a specific parasitic infection placed the question in a different light, and led to a more careful examination of the facts, which has resulted in a general and increasing tendency to minimize or deny the influence of heredity. At the Berlin Congress on Tuberculosis in 1899 Virchow pronounced his disbelief in the theory on pathological grounds. "I dispute this heredity absolutely," he said. "For a course of years I have been pointing out that if we examine the bodies of infants newly born, who have had no life apart from the mother, we find no tuberculosis in them. I am convinced that what looked like tuberculosis in the newly born was none of it tuberculosis. In my opinion there is no authenticated case of tubercle having been found in a dissected newly-born infant." Observations on animals similarly tend to disprove the existence of congenital tuberculosis (Nocard). The theory that the germs may remain latent in the offspring of tuberculous parents (Baumgarten) is unsupported by evidence. The occurrence of disease in such offspring is ascribed to infection by the parents, and this view is confirmed by the fact that the incidence in consumptive families is greater on female children, who are more constantly exposed to home infection, than on the male (Squire). The statistical evidence, so far as it goes, points in the same direction. It is even denied that the children of consumptives are specially predisposed.

Heredity.

Recognition of the communicability of tuberculosis has directed attention to the influence of conditions in which people live massed together in close proximity. The prevalence of the disease in large centres of population has already been noted, and the influence of aggregation is no doubt considerable; but it does not always hold good. The distribution in England and Wales does not correspond with density of population, and some purely rural districts have a very high mortality. Broadly, however, the rural counties have a low mortality, and those containing large urban populations a high one. In France in the department of the Oise, in purely industrial villages, the mortality from pulmonary phthisis is from 56 to 61 per 10,000; in a village in which part of the population worked in the fields and part in factories the mortality was 46 per 10,000; and in purely agricultural villages it ranged from 0 to 10 per 10,000.

Density of Population and Overcrowding.

The following table is taken from the Supplement to the Registrar-General's 65th Report for England and Wales:—

	All occupied Males.		Occupied Males (London).		Occupied Males (industrial districts).		Occupied Males (agricultural districts).	
	1900–1902.	1890–1892.	1900–1902.	1890–1892.	1900–1902.	1890–1892.	1900–1902.	1890–1892.
All Causes	100	119	119	143	121	156	72	86
Tuberculous Phthisis.	100	122	156	183	115	147	71	90

It will be noted that the rate in the agricultural districts is low compared to the industrial districts or purely urban district chosen. There is obviously a close relation between density of population and the prevalence of phthisis. Comparing phthisis with other diseases in relation to overcrowding, the same authority found that "while associated with overcrowding is a tendency of the population to die from disease generally, this tendency is especially manifested in the case of phthisis, and is not manifested in the case of every disease."

Other Conditions.—Poverty, insufficient food and insanitary dwellings are always more or less associated with overcrowding, and it is difficult to distinguish the relative influence of these factors. An analysis of 553 deaths in Edinburgh according to rentals in 1899 gave these results: under £10, 230; from £10 to £20, 190; above £20, 106 (Littlejohn); but the corresponding population is not stated. An investigation of selected houses in Manchester gave some interesting results (Coates). The houses were divided into three classes: (1) infected and dirty; (2) infected but clean; (3) dirty but not infected; infected meaning occupied by a tuberculous person. Dust was taken from all parts of the rooms and submitted to bacteriological tests. The conclusions may be summarized thus: The effects of overcrowding were not apparent; a large cubic space was found to be of little avail if the ventilation was bad; the beneficial effects of light and fresh air were markedly shown even in the dirtiest houses; ordinary cleanliness was found not sufficient to prevent accumulation of infectious material in rooms occupied by a consumptive; no tuberculous dust was found in dirty houses in which there was no consumption. The upshot is to emphasize the importance of light and air, and to minimize that of mere dirt. This is quite in keeping with earlier investigations, and particularly those of Dr Tatham on back-to-back houses. Darkness and stuffiness are the friends of the tubercle bacillus.

So much has the question of cleanliness, and of housing in a sanitary district, to do with the prevalence of the disease, that the following table taken from the Report of the Registrar-General for Ireland for the year 1909 shows the marked class incidence in all forms of tuberculosis.

Distribution of Tuberculosis Mortality by Classes in Ireland, 1909.

	All forms of Tuberculosis.	Pulmonary Phthisis.	Other forms of Tuberculosis.
Professional and independent class	1·41	0·64	0·77
Middle class, civil service and smaller officials	1·82	1·30	0·52
Large traders, business managers	1·59	1·04	0·55
Clerks	2·92	2·33	0·59
Householders in 2nd-class localities	2·52	1·85	0·67
Artisans	2·94	2·23	0·71
Petty shopkeepers and other traders	3·85	3·00	0·85
Domestic servants	1·31	1·04	0·27
Coach and car drivers, and vanmen	4·24	3·06	1·18
Hawkers, porters and labourers	4·83	2·88	1·95

In relation to the last two classes the effect of exposure and also of alcoholic excess must be added to overcrowding and privation. The low rate noticeable for domestic servants must be ascribed to the better food and housing they enjoy while in situations. In Hamburg the mortality was 10·7 per 10,000 in those whose income rose above 3500 marks, 39·3 where the income was 900 to 1200 marks, and 60 per 10,000 where the income fell below that figure.

It is now generally accepted that tubercle bacilli may enter the body by various paths. At the International Congress on Tuberculosis held in Vienna in 1907 Weichselbaum summarized the channels of infection in pulmonary tuberculosis as follows: (1) By inhalation directly into the bronchioles and pulmonary alveoli, or by way of the bronchial glands through the blood and lymph channels into the lung. (2) Through the mucous membrane of the nose, mouth or tonsils into the neighbouring lymphatic glands, and thence through the blood or lymph into the lungs. (3) By ingestion of tubercle bacilli into the lower part of the gastro-intestinal tract in the food; thence the bacilli may pass through the lining membrane, infect the neighbouring glands and pass by the blood or lymph stream to the lungs. (4) By penetration of other mucous membranes (such as the conjunctival or urogenital) or through the skin. (5) Possible, though very rare, placental infection.

Path of Infection.

Tubercle bacilli may not produce any anatomical lesion at the point of entrance, or they may remain latent for a very long time; and it has been experimentally proved that they may pass through mucous membranes and leave no trace of their progress. As reported to the Royal Commission, the introduction of bacilli into the alimentary canal is not necessarily followed by the development of tuberculosis. The writings of Von Behring have led to renewed attention being paid to intestinal infection, particularly through the milk supply. Von Behring suggests that the bacillus itself may become modified in the human body.

Prevention.

Measures for the prevention of tuberculosis may be divided into two classes: (1) general; (2) special. Great attention has been paid to the latter since the infectious nature of the disease was established. The former include all means by which the conditions of life are improved among the mass of the people. The most important of these are probably housing and food supply. The reduction of the disease recorded in England is attributed to the great changes which have gradually taken place in such conditions since, say, 1850. Wages have been raised, food cheapened, housing improved, protection afforded in dangerous trades, air spaces provided, locomotion increased, the ground and the atmosphere have been cleaned and dried by sanitary means. In addition to these general measures is the provision of consumption hospitals, which act by segregating a certain amount of disease. Yet all these things, beneficial as they may be, do not wholly account for the reduction, for, if the records can be trusted, it was in progress before they had made any way or had even been begun. This observation, coupled with the apparently general tendency to diminution among civilized races, suggests the operation of some larger agency. The theory of acquired resistance, which has been already mentioned, would explain the diminution; and it is also in keeping with other facts, such as the great susceptibility of savage races, which have not been long exposed to tuberculosis, and the results of laboratory experiments in artificial immunity. The point is of great importance, and deserves careful attention; for if the theory be correct, the special measures for preventing tuberculosis, which are occupying so much attention, may eventually have unexpected results. Their general aim is the avoidance of infection, and they include (1) the provision of special institutions—hospitals, sanatoria and dispensaries; (2) the prevention of spitting; (3) the notification of consumption; (4) the administrative control of tuberculosis in animals; (5) the dissemination of popular knowledge concerning the nature of the disease.

The greatest stress is laid upon the prevention of spitting, because the germs are contained in the sputum of consumptive persons, and are scattered broadcast by expectoration. The sputum quickly dries, and the bacilli are blown about with the dust. There is no question that infection is so conveyed. The Manchester scientific experiments, mentioned above, are only one series out of many which prove the infectivity of dust in the proximity of consumptive persons, and they are confirmed by actual experience. Several cases are recorded of healthy persons having contracted the disease after occupying rooms in which consumptive persons had previously lived. It is a legitimate inference that spitting in public is an important means of disseminating tuberculosis, though it may be noticed that international prevalence by no means corresponds with this disgusting practice, which is a perfect curse in Great Britain, and far more common both there and in the United States than on the continent of Europe. Prohibition of spitting under a statutory penalty is attended with certain difficulties, as it is obviously impossible to make any distinction between tuberculous and other persons; but it has been applied in New York and elsewhere in America, and some local authorities in Great Britain have adopted by-laws to check the practice. Another means of controlling dangerous sputa is more practicable, and probably more effective, namely, the use of pocket spittoons by consumptive persons. Convenient patterns are available, and their use should always be insisted on, both in public and in private. The most effective way of destroying the sputa is by burning. For this purpose spittoons of papier mâché and of turf have been successfully used in the Vienna hospitals (Schrötter). When glass spittoons are used the contents can be sterilized by disinfectants and passed down the drain.

Notification is of great service as an aid to practical measures of prevention. It has been applied to that purpose with good results in several cities and states in America, and in some towns in Great Britain. New York has made the most systematic use of it. Voluntary notification was adopted there in 1894, and in 1897 it was made compulsory. The measures linked with it are the sanitary supervision of infected houses, the education of the people and the provision of hospitals. In England, Manchester has led the way. Voluntary notification was adopted there in 1899: it was at first limited to public institutions, but in 1900 private practitioners were invited to notify their cases, and they heartily responded. In Sheffield notification was made compulsory by a local act in 1904 for a limited period, and was found so valuable that the period was extended in 1910. The objects aimed at are to visit homes and instruct the household, to arrange and provide disinfection, to obtain information bearing on the modes of infection, to secure bacteriological examination of sputum, and to collect information to serve as a basis of hospital provision. Disinfection is carried out by stripping off paper, previously soaked with a solution of chlorinated lime ($1\frac{1}{2}$ oz. to the gallon), and washing the bare walls, ceiling, floor and everything washable with the same solution. This is found effective even in very dirty houses. In clean ones, where the patients have not been in the habit of spitting about the rooms, it is sufficient to rub the walls with bread-crumb and wash the rest with soap and water. Clothing, bedding, &c., are disinfected by steam. The advantages of these sanitary measures are obvious. Notification is no less important as a step towards the most advantageous use of hospitals and sanatoria by enabling a proper selection of patients to be made. It is compulsory throughout Norway, and is being adopted elsewhere, chiefly in the voluntary form. In 1908 the Prevention of Tuberculosis (Ireland) Act was passed, which conferred on local authorities the right to make notification compulsory in their districts, and provided that certain sections of the Public Health (Ireland) Act 1878 and the Infectious Diseases Prevention Act 1890 should apply to tuberculosis. By this act also the county councils were enabled to establish hospitals and dispensaries for the treatment of tuberculosis and were empowered to borrow money or levy a poor rate for the erection of sanatoria for the treatment of persons from their respective counties suffering from the disease.

The prevalence of tuberculosis in cattle is of importance from the point of view of prevention of the probability that abdominal tuberculosis, which is a very fatal form of the disease in young children, and has not diminished in prevalence like other forms, is caused by the ingestion of tuberculous milk. Whether it be so or not, it is obviously desirable that both meat and milk should not be tuberculous, if it can be prevented without undue interference with commercial interests. Preventive measures may be divided into two classes. They may deal merely with the sale of meat and milk, or they may aim at the suppression of bovine tuberculosis altogether. The former is a comparatively easy matter, and may be summed up in the words "efficient inspection." The latter is probably impracticable. If practicable, it would be excessively costly, for in many herds one half the animals or even more are believed to be tuberculous, though not necessarily the sources of tuberculous food. Unless the danger is proved to be very much greater than there is any reason to suppose, "stamping out" may be put aside. Efficient inspection involves the administrative control of slaughter-houses, cowsheds and dairies. The powers and regulations under this head vary much in different countries; but it would be useless to discuss them at length until the scientific question is settled, for if the reality of the danger remains doubtful, oppressive restrictions, such as the compulsory slaughter of tuberculous cows, will not have the support of public opinion. Whatever measures may be taken for the public protection, individuals can readily protect themselves from the most serious danger by boiling milk; and unless the source is beyond suspicion, parents are recommended, in the present state of knowledge, so to treat the milk given to young children.

A great deal has been done in most countries for the dissemination of popular knowledge by forming societies, holding conferences and meetings, issuing cheap literature, and so forth. It is an important item in the general campaign against tuberculosis, because popular intelligence and support are the most powerful levers for setting all other forces in motion. In Ireland, where an attempt had been made to deal with the question by arousing the interest of all classes, tuberculosis exhibitions have been held in nearly every county, together with lectures and demonstrations organized by the Women's National Health Association; and an organized attempt was made in the autumn of 1910 in England, by a great educational campaign, to compel the public to realize the nature of the disease and the proper precautions against it.

Diagnosis and Treatment. The improved outlook in regard to the arrest or so-called "cure" of tuberculosis is mainly derived from the improved methods of diagnosis, thus enabling treatment to be undertaken at an earlier and therefore more favourable stage of the disease. The physical signs in early stages of the lung affection are often vague and inconclusive. A means of diagnosis has therefore been sought in the use of tuberculin. The methods are three: (1) The subcutaneous injection method of Koch; (2) the cutaneous method of Von Pirquet; (3) the conjunctival method of Wolff-Eisner and Calmette. The first method depended on the reaction occurring after an injection of "old tuberculin." It is unsuitable in febrile conditions, and has now been relegated to the treatment of cattle, where it has proved invaluable. In Von Pirquet's method a drop of old tuberculin diluted with sodium chloride is placed on a spot which has been locally scarified. The presence of tuberculosis is demonstrated by a local reaction in which a hyperaemic papule forms, surrounded by a bright red zone. Reaction occurs in tuberculosis of the bones of joints and skin. Von Pirquet in 1000 cases obtained a reaction in 88% of the tuberculous, and 10% of those clinically non-tuberculous. In the latter there may have been latent cases of tuberculosis. In the conjunctival or opthalmo-reaction of Calmette and Wolff-Eisner the instillation of a drop of a dilute solution of tuberculin into the conjunctiva is followed in the tuberculous subject by conjunctivitis. The reaction generally appears in from 3 to 12 hours, but may be delayed to 48. In a series of cases observed by Audeoud a positive reaction was obtained in 95% of 261 obviously tuberculous cases and in 8·3 % of 303 cases which presented no clinical symptoms. Very advanced cases fail to react to any of these tests, as do general miliary tuberculosis and tuberculous meningitis. As well as the three methods mentioned above the occurrence of a "negative phase" in the phagocytic power of the leucocytes following an injection of Koch's tuberculin T.R. may be said to be diagnostic of tuberculosis. Another valuable aid in diagnosis is that of the X-rays. By their help a pulmonary lesion may be demonstrated long before the physical signs can be obtained by ordinary examination.

To discuss at all fully the treatment of the various forms of tuberculosis or even of consumption alone would be quite beyond the scope of this article. It must suffice to mention the more recent points. The open-air treatment of consumption has naturally attracted much attention. Neither the curability of this disease nor the advantages of fresh air are new things. Nature's method of spontaneous healing, explained above, has long been recognized and understood. There are, indeed, few diseases involving definite lesions which exhibit a more marked tendency to spontaneous arrest. Every case, except the most acute, bears signs of Nature's effort in this direction; and complete success is not at all uncommon, even under the ordinary conditions of life. Perhaps it was not always so: the ominous character popularly attributed to consumption may once have been justified, and the power of resistance, as we see it now, may be the result of acquired immunity or of the gradual elimination of the susceptible. However this may be, the natural tendency to cure is undoubtedly much assisted by the modern system of treatment, which makes pure air its first consideration. The principle was known to Sydenham, who observed the benefit derived by consumptives from horse exercise in the open air; and about 1830 George Boddington proposed the regular treatment of patients on the lines now generally recognized. The method has been most systematically developed in Germany by the provision of special sanatoria, where patients can virtually live in the open air. The example has been followed in other countries to a certain extent, and a good many of these establishments have been provided in Great Britain and elsewhere; but they are, for the most part, of a private character for the reception of paying patients. Germany has extended these advantages to the working classes on a large scale. This has been accomplished by the united efforts of friendly and philanthropic societies, local authorities, and the state; but the most striking feature is the part played by the state insurance institutes, which are the outcome of the acts of 1889 and 1899, providing for the compulsory insurance of workpeople against sickness and old age. The sanatoria have been erected as a matter of business, in order to keep insured members off the pension list, and they are supported by the sick clubs affiliated to the institutes. They number forty-five, and can give three months' treatment to 20,000 patients in the year. The clinical and economic results are said to be very encouraging. In about 70% of the cases the disease has been so far arrested as to enable the patients to return to work.

In England, where more than 14 millions of the population belong to friendly societies, it is estimated that the sick pay of consumptive members costs three times as much as the average sick pay to members dying of other causes. An effort has been made by the National Association for the Establishment and Maintenance of Sanatoria for Workers Suffering from Tuberculosis to establish such sanatoria, together with training for suitable work during convalescence, the gradual resumption of wage-earning being resumed while in touch with the medical authorities.

The important features of the sanatorium treatment are life in the open air, independently of weather, in a healthy situation, rest and abundance of food. The last has been carried to rather extravagant lengths in some institutions, where the patients are stuffed with food whether they want it or not. The sanatorium movement on the German model is rapidly extending in all countries. For those who are able to do so advantage may be taken of the combined sanatorium and sun treatment. In certain high altitudes in Switzerland, which are favoured by a large amount of sunshine and a small percentage of moisture, much benefit has been derived from the exposure of the unclothed body to the sun's rays. The power of the sun in high altitudes is so great that the treatment can be continued even when the snow is on the ground. Not only is the sun-treatment applicable to pulmonary tuberculosis, but also to the tuberculosis of joints, even in advanced cases. The treatment has to a great extent replaced surgical procedure in tuberculosis of joints, but it requires to be persevered in over a considerable period of time. It should be remembered that the benefits of fresh air are not confined to sanatoria. If the superstitious dread of the outer air, particularly at night, could be abolished in ordinary life, more would be done for public health than by the most costly devices for eluding microbes. Not only consumption, but the other respiratory diseases, which are equally destructive, are chiefly fomented by the universal practice of breathing vitiated air in stuffy and overheated rooms. The cases most suitable for the treatment are those in an early stage. Other special institutions for dealing with consumption are hospitals, in which England is far in advance of other countries, and dispensaries; the latter find much favour in France and Belgium.

In Great Britain the pioneer work as regards the establishment of tuberculosis dispensaries was the establishment of the Victoria Dispensary for Consumption in Edinburgh in 1887, where the procedure is similar to that in Dr Calmette's dispensaries in France. In connexion with the dispensary home visits are made, patients suitable to sanatoria selected, advanced cases drafted to hospitals, bacteriological examinations made, cases notified under the voluntary system, and the families of patients instructed. There is an urgent need for the multiplication of such dispensaries throughout the United Kingdom. The recent act providing for the medical inspection of schools has done much to sort out cases of tuberculosis occurring in children, and to provide them with suitable treatment and prevent them from becoming foci for the dissemination of the disease. In Germany special open-air schools, termed forest-schools, are provided for children suffering from the disease, and an effort is being made in England to provide similar schools.

Of specific remedies it must suffice to say that a great many substances have been tried, chiefly by injection and inhalation, and good results have been claimed for some of them. The most noteworthy is the treatment by tuberculin, first introduced by Koch in 1890, which, having sunk into use as a diagnostic reagent for cattle, received a new lease of life owing to the valuable work done by Sir Almroth Wright on opsonins. The tuberculins most in use are Koch's "old" tuberculin T.O., consisting of a glycerin broth culture of the tubercle bacilli, and Koch's T.R. tuberculin, consisting of a saline solution of the triturated dead tubercle bacilli which has been centrifuged. This latter is much in use, the dosage being carefully checked by the estimation of the tuberculo-opsonic index. The injections are usually unsuitable to very advanced cases. Marmorek's serum, the serum of horses into which the filtered young cultures of tubercle bacilli have been injected, and in which a tuberculo-toxin has been set free, has proved very successful. Behring's Tulase is a tuberculin preparation formed by a process of treating tubercle bacilli with chloral, and Béreneck's tuberculin consists of a filtered bouillon culture treated with orthophosphoric acid. The variety of cases to which these treatments are suitable can only be estimated from a careful consideration of each on its own merits.

In the treatment of tuberculous lesions, the surgeon also plays his part. Tuberculosis is specially prone to attack the spongy bone-tissue, joints, skin (*lupus*) and lymphatic glands—especially those of the neck. Recognizing the infective nature of the disease, and knowing that from one focus the germs may be taken by the blood-stream to other parts of the body, and so cause a general tuberculosis, the surgeon is anxious, by removing the primary lesion, to cut short the disease and promote immediate and permanent convalescence. Thus, in the early stage of tuberculous disease of the glands of the neck, for instance, these measures may render excellent service, but when the disease has got a firm hold, nothing short of removal of the glands by surgical operation is likely to be of any avail. The results of this modern treatment of tuberculous disease of the skin and of the lymphatic glands has been highly gratifying, for not only has the infected tissue been completely removed, but the resulting scars have been far less noticeable than they would have been had less radical measures been employed. One rarely sees now a network of scars down the neck of a child, showing how a chain of tuberculous glands had been allowed to work out their own cure. A few years ago, however, such conditions were by no means unusual.

TUBEROSE. The cultivated tuberose (*Polianthes tuberosa*) is a plant allied to the Mexican agaves, and is a native of the same country. The tuberous root-stock sends up a stem 3 ft. in height, with numerous lanceolate leaves and terminal racemes of waxy white funnel-shaped very fragrant flowers. Each flower is about 1½ in. long, with a long tube and a six-parted limb. The stamens are six in number, emerging from the upper part of the tube, and bear linear anthers. The ovary is three-celled, and the ovoid fruit is crowned by the persistent flower. The plant is largely grown in the United States and at the Cape of Good Hope for export to England, as it is found that imported bulbs succeed better than those grown in the United Kingdom. The double-flowered form is that principally grown. Cultivated plants require a rich soil, considerable heat, and, at first, abundance of water.

TÜBINGEN, a town of Germany, in the kingdom of Württemberg, picturesquely situated on the hilly and well-wooded banks of the Neckar, at its junction with the Ammer and Steinlach, 22 m. south of Stuttgart by road and 43 m. by rail. Pop. (1905), 16,809. The older town is irregularly built and unattractive, but the newer suburbs are handsome. The most conspicuous building is the old ducal castle of Hohentübingen, built in 1507–1535 on a hill overlooking the town, and now containing the university library of 460,000 volumes, the observatory, the chemical laboratory, &c. Among the other chief buildings are the quaint old *Stiftskirche* (1469–1483), a Gothic building containing the tombs of the rulers of Württemberg, the new *aula* and numerous institutes of the university, all of which are modern, and the town-hall dating from 1435 and restored in 1872. The university possesses a very important library. A monument was erected in 1873 to the poet Johann Ludwig Uhland (1787–1862), who was born and is buried here, and another, in 1881, to the poet Johann Christian Friedrich Hölderlin (1770–1843). Tübingen's chief claim to attention lies in its famous university, founded in 1477 by Duke Eberhard of Württemberg. Melanchthon was a lecturer here (1512–1518). The university adopted the reformed faith in 1534, and in 1537 a Protestant theological seminary, a residential college—the so-called Stift—was incorporated with it. In 1817 a Roman Catholic theological faculty was added, with a seminary called the *Konvikt*, and there are now also faculties of law, medicine, philosophy, political economy and natural science. The leading faculty has long been that of theology, and an advanced school of theological criticism, the founder and chief light of which was F. C. Baur, is known as the Tübingen school. The university was attended in 1908 by 1891 students and had a teaching staff of over 100. The commercial and manufacturing industries of the town are slight. Printing, book-selling, the manufacture of surgical and scientific instruments, chemicals, gloves and vinegar, and the cultivation of hops, fruit and vines are among the leading occupations of the inhabitants. The country in the neighbourhood of Tübingen is very attractive; one of the most interesting points is the former Cistercian monastery of Bebenhausen, founded in 1185, and now a royal hunting-château.

Tübingen is mentioned as a strong fortress in 1078, and was ruled from 1148 by counts palatine. In 1342 it was purchased by the count of Württemberg, whose descendants afterwards acquired the title of duke. The treaty of Tübingen is the name given in German history to an arrangement made in 1514 between Duke Ulrich and his subjects, by which the latter acquired various rights and privileges on condition of relieving the former of his debts. The town was captured by the Swabian League in 1519, by Turenne in 1647, and again in 1688 by the French, who destroyed the walls.

See Eifert, *Geschichte und Beschreibung der Stadt und Universität Tübingen* (Tübingen, 1849); Maier, *Die Musenstadt Tübingen* (Tübingen, 1904); *Tübingen und seine Umgebung* (Tübingen, 1887–1889).

TUBUAI, or Austral Islands, an archipelago in the south Pacific Ocean, between 21° 49′ and 27° 41′ S., 144° 22′ and 154° 51′ W., to the south of the Society Islands, with a total land area of 110 sq. m., belonging to France. They form a curved broken chain from north-west to south-east which includes four principal islands: Tubuai (area 40 sq. m.), Vavitao or Ravaivai, Rurutu or Oheteroa, Rapa or Oparo, and Rimitara, with Maretiri or the Bass Islands, and other islets. Tubuai, Vavitao and Rapa are volcanic and reach considerable elevations (2100 ft. in Rapa). The islands are well watered and fertile, producing coco-nut palms, arrowroot and bananas; but they lie too far south for the bread fruit to flourish. The natives belong to the Polynesian race; they were once much more numerous than now, the present population not exceeding 2000. A Tahitian dialect is spoken in the western islands; in Rapa, however, which with the Bass Islands lies detached from the rest, to the south, the language is akin to that of the Rarotongans in the Cook Islands. There are remarkable ancient stone platforms and walls, massively built, on the summits of some of the peaks in Rapa; they resemble the terraces in Easter Island (Rapanui), which is believed to have been peopled from Rapa. The scattered islands of the Tubuai archipelago were discovered at different times. Captain Cook visited Rurutu in 1769 and Tubuai in 1777; Rapa was discovered by George Vancouver in 1791, Vavitao perhaps in 1772 by the Spaniards who attempted to colonize Tahiti, and certainly by Captain Broughton in 1791. The islands never attracted much attention from Europeans, and the French protection and subsequent annexation were carried out spasmodically between the middle of the 19th century and 1889.

TUCKER, ABRAHAM (1705–1774), English moralist, was born in London, of a Somerset family, on the 2nd of September 1705, son of a wealthy city merchant. His parents dying during his infancy, he was brought up by his uncle, Sir Isaac Tillard. In 1721 he entered Merton College, Oxford, as a gentleman commoner, and studied philosophy, mathematics, French, Italian and music. He afterwards studied law at the Inner Temple, but was never called to the bar. In 1727 he bought Betchworth Castle, near Dorking, where he passed the remainder of his life. He took no part in politics, and wrote a pamphlet, "The Country Gentleman's Advice to his Son on the Subject of Party Clubs" (1755), cautioning young men against its snares. In 1736 Tucker married Dorothy, the daughter of Edward Barker of East Betchworth, cursitor baron of the exchequer. On her death in 1754, he occupied himself in collecting together all the letters that had passed between them, which, we are told, he transcribed twice over under the title of "The Picture of Artless Love." From this time onward he occupied himself with the composition of his chief work, *The Light of Nature Pursued*, of which in 1763 he published a specimen under the title of "Free Will." The strictures of a critic in the *Monthly Review* of July 1763 drew from him a pamphlet called *Man in Quest of Himself, by Cuthbert Comment* (reprinted in Parr's *Metaphysical Tracts*, 1837), "a defence of the individuality of the human mind or self." In 1765 the first four volumes of his work were published under the pseudonym "Edward Search." The remaining three volumes appeared posthumously. His eyesight failed him completely in 1771, but he contrived an ingenious apparatus which enabled him to write so legibly that the result could easily be transcribed by his daughter. In this way he completed the later volumes, which were ready for publication when he died on the 20th of November 1774.

His work embraces in its scope many psychological and more strictly metaphysical discussions, but it is chiefly in connexion with ethics that Tucker's speculations are remembered. In some important points he anticipates the utilitarianism afterwards systematized by Paley, who expresses in the amplest terms his obligations to his predecessor. "Every man's own satisfaction" Tucker holds to be the ultimate end of action; and satisfaction or pleasure is one and the same in kind, however much it may vary in degree. This universal motive is further connected, as by Paley, through the will of God, with the "general good, the root where out all our rules of conduct and sentiments of honour are to branch."

The *Light of Nature* was republished with a biographical sketch by Tucker's grandson, Sir H. P. St John Mildmay (1905), 7 vols. (other editions 1834, 1836, &c.), and an abridged edition by W. Hazlitt appeared in 1807. See James Mackintosh, *Dissertation on the Progress of Ethical Philosophy* (Edinburgh, 1832); and specially Sir Leslie Stephen, *English Thought in the 18th Century*, iii. 119–130.

TUCKER, CHARLOTTE MARIA (1821–1893), English author, who wrote under the pseudonym "A.L.O.E." (a Lady of England), was born near Barnet, Middlesex, on the 8th of May 1821, the daughter of Henry St George Tucker (1771–1851), a distinguished official of the East India Company. From 1852 till her death she wrote many stories for children, most of them allegories with an obvious moral, and devoted the proceeds to charity. In 1875 she left England for India to engage in missionary work, and died at Amritsar on the 2nd of December 1893.

TUCKER, JOSIAH (1712–1799), English economist and divine, the son of a small Welsh farmer, was born at Laugharne, Carmarthenshire, in 1712. He was educated at St John's College, Oxford, and became successively a curate and rector in Bristol. This led him to take considerable interest in politics and trade, and during the greater portion of a long life he poured out a succession of pamphlets on these matters. He was appointed dean of Gloucester in 1758. He died on the 4th of November 1799, and was buried in Gloucester Cathedral. His *Important Questions on Commerce* (1755) was translated into French by Turgot.

TUCSON (possibly from Piman *styuk-son*, "dark or brown spring," pronounced *Tooson*), a city and the county-seat of Pima county, Arizona, U.S.A., on the Santa Cruz river, in the S.E. part of the state, about 130 m. S.E. of Phoenix. Pop. (1880), 7007; (1890), 5150; (1900), 7531 (2352 foreign-born, chiefly from Mexico); (1910), 13,193. It is served by the Southern Pacific and the Twin Buttes railways, the latter connecting with the mines of the Twin Buttes district, about 27 m. south by east, and with the Randolph lines in Mexico. The city lies about 2360 ft. above the sea in a broad valley sheltered by mountains 5000–9000 ft. high. Its climate, characteristic of southern Arizona, attracts many invalids and winter visitors. Tucson is the seat of the university of Arizona (1891; non-sectarian, coeducational), which is organized under the Morrill Acts; in 1909 it had 40 instructors and 201 students. At Tucson also are a desert botanical laboratory (owning a tract of some 1000 acres about 1 m. west of the city) established by the Carnegie Institution of Washington, St Joseph's Academy (Roman Catholic); a Roman Catholic cathedral; the Tucson Mission (Presbyterian), a boarding school for Indians, the San Xavier Mission for Indians (Roman Catholic) and a Carnegie library. In 1900 Tucson became the see of a Roman Catholic bishop. The surrounding country is arid and unproductive except where irrigated; but the soil is very rich, and Tucson is the centre of one of the oldest farming and ranching districts of the state. The Southern Pacific railway has division headquarters and repair shops here.

Tucson is first heard of in history in 1699, conjecturally, as an Indian rancheria or settlement; and in 1763 certainly as a *visita*, in that year temporarily abandoned, of the Jesuit mission of San Xavier del Bac, founded between 1720 and 1732, 9 m. south of what is now Tucson; in 1776 it was made a presidio (San Augustin del Tugison), or military outpost, and although a few Spaniards may possibly have lived there before, the foundation of Tucson as a Spanish town dates from this time. It was never after abandoned during the Indian wars. In 1848 it had 760 inhabitants. The abandonment by the Mexicans in 1848 of the mission towns of Tamacacori (a *visita* of Guevavi, a mission founded in the first third of the 18th century) and the presidio at Tubac (established before 1752) increased its importance. Tucson lay within the territory acquired by the United States by the Gadsden Purchase in 1853; it was occupied by the United States in 1856. Fort Lowell, 7 m. north-east of the city, was built as a protection against the Apache Indians in 1873; it was abandoned in 1891. In the earlier days of Territorial history Tucson was the political centre of Arizona. Here were held in August 1856 a convention that demanded a Territorial government from Congress, another in April 1860 that organized a provisional government independently of Congressional permission, and others in 1861 that attempted to cast in the lot of Arizona with the Confederate states. Tucson was occupied by the Confederates in February 1862 and by the Union forces in May. It was the Territorial capital from 1867 to 1877. Its prosperity fluctuated with the fortunes of the surrounding mining country. Tucson was incorporated as a town in 1877, and chartered as a city in 1883.

TUCUMAN, a northern province of Argentina, bounded N. by Salta, E. by Santiago del Estero, S. and W. by Catamarca. Area, 8926 sq. m. Pop. (1895), 215,742; (1904, estimated) 263,079. The Sierra de Aconquija is on the western frontier of the province and there is also broken country in the north, but in the east the country is flat, alluvial and very fertile. The only large river is the Salí, or Dulce, which receives a large number of small streams from the Sierra de Aconquija and flows through Santiago del Estero to the Porongos lagoons on the frontier of Cordoba. The exports are sugar, rum (*aguardiente*), timber, hides, leather, fruit and Tafi cheese made in an upland valley of the Aconquija.

TUCUMAN, or San Miguel de Tucuman, a city of Argentina, capital of the province of Tucuman, on the right bank of the Salí, or Dulce river, 780 m. by rail N.W. of Buenos Aires, in lat. 26° 50′ S., long. 64° 35′ W. Pop. (1895), 34,305; (1904, estimated) 55,000. The climate is warm and enervating, with no great seasonal variation during the year except in the rainfall, which falls almost wholly between September and April. The temperature averages about 67°, with a maximum of 104°. Malarial diseases, especially "chucho" (fever and ague), are common. Tucuman is laid out in regular squares, and still retains many of its old characteristics, low buildings enclosing large courts (*patios*), with large rooms, thick walls, and tile roofs. The more noteworthy edifices and institutions of Tucuman are the "matriz" church, Merced church, cabildo, national college, normal school, the Belgrano theatre, hospital, public library, courts of justice, post office, and sundry charitable institutions.

Tucuman was founded in 1565 by Diego Villaruel at the confluence of the Salí and Monteros rivers, but frequent inundations led to a removal to its present site in 1585. In 1680 it succeeded Santiago del Estero as the capital of the province of Tucuman, then under the government of the Spanish viceroy at Lima. The province of Tucuman then extended from Jujuy south to Cordoba. In 1776 the viceroyalty of La Plata was created and Tucuman was transferred to its jurisdiction. In 1816 a convention of delegates from the La Plata provinces met in Tucuman and signed (July 9th) an act of independence, which formally dissolved all ties with the mother country.

TUDELA, a town of northern Spain, in the province of Navarre, on the Saragossa-Logroño and Tudela-Tarazona railways, and on the right bank of the river Ebro, which is here joined by its tributary the Queiles. Pop. (1900), 9499. The Ebro is here crossed by a massive and ancient bridge of 19 arches. Most of the public buildings, such as the town-hall, bull-ring, hospitals and schools, are modern; but there is a Romanesque collegiate church, Santa Maria, which was founded in 1135 and consecrated in 1188. This church is one of the most perfect in northern Spain, the sculptured doorways and cloisters being especially fine. There are many sawmills in the town, and an active timber trade; the manufactures of cloth, linen, spirits, preserved fruit, pottery, &c., and the trade in grain, wine and oil are of less importance. Tudela, the Roman *Tutela*, was occupied by the Moors in the 8th century, and taken from them by Alphonso I. of Aragon in 1114. The town was an episcopal see from 1783 to 1851. In 1808 the Spanish forces under Generals Castaños and Palafox were twice defeated here by the French under Marshal Lannes.

TUDOR (Family). The house of Tudor, which gave five sovereigns to England, is derived by all the Welsh genealogists from Ednyfed Vychan of Tregarnedd in Anglesey, who is named in 1232 as steward of Llywelyn, prince of North Wales, and seven years later, as an arbitrator in a convention to which Davydd, the son of Llywelyn, was a party. His pedigree has been traced from Marchudd ap Cynan and beyond him, according to the veracious Lewys Dwnn, from Brutus, the great-grandson of Aeneas. Gronw, or Gronwy, one of his younger sons, had Trecastell for his portion. Tudor, son of Gronw, who lived to be called Tudor Hen or the old Tudor, founded the Carmelite friary in Bangor and was grandfather of Tudor Vychan ap Gronw of Trecastell, who is said to have assumed the style of a knight, and to have had that rank confirmed to him by Edward III.

This Tudor Vychan was the father of four sons, of whom the eldest, Gronw Vychan, was in favour with the Black Prince and with Richard II. He was forester of Snowdon and steward of the bishop of Bangor's lordship in Anglesey. He died in 1382, an infant son being heir to his lands in Penmynydd, whose sister carried them to her husband Gwylym ap Gmffydd of Penrhyn. Gronw Vychan, whom a bard calls "a pillar of the court: the ardent pursuer of France," was probably the warrior whose effigy remains in the church at Penmynydd.

Gronw's brothers Gwylym and Rhys served Richard II. as captains of archers. Their youngest brother, Meredydd ap Tudor, escheator of Anglesey in 1392 and, like Gronw, an officer of the household of the bishop of Bangor, is said to have slain a man and fled to the wild country about Snowdon. He was the father of Owen ap Meredydd, commonly called Owen Tudor, a squire who appears at the court of the infant king Henry VI. By all accounts he was a goodly young man: the chroniclers dwell upon the beauty which attracted the queen mother. She gave the handsome squire a post in her household. About 1428 or 1429, it must have been common knowledge that the presumptuous Welshman and the daughter of Charles VI. of France were living as man and wife. There is no direct evidence for their marriage. An act had but lately been passed for making it a grave offence to marry with the queen dowager without the royal consent: this act is said to have been afterwards cut out from the statute book. Richard III. denounced his rival Richmond as the son of a bastard, but it must be remembered that Richard was ready to foul the memory of his own mother in order to say the same of the young Edward V. But no one yet has found time or place of Owen Tudor's marriage with Catherine of France.

Five children were born to them, the sons being Edmund and Jasper and another son who became a monk. In 1436, a date which suggests that Bedford had been Owen's protector, the influence of Gloucester was uppermost. In that year the queen dowager was received within Bermondsey Abbey, where she died in the following January. Her children were taken from her, and Owen Tudor "the which dwelled with the said queen" was ordered to come into the king's presence. He had already seen the inside of Newgate gaol, and he would not obey without a safe conduct. When he had the safe conduct sent him he came up from Daventry and went at once to sanctuary at Westminster, whence even the temptations of the tavern would not draw him. Allowed to go back to Wales, he was retaken and lodged again in Newgate. He broke prison again, with his chaplain and his man, the sheriffs of London having a pardon in 1438 for the escape from gaol of "Owen ap Tuder, esquire," and he returned to his native Wales. When Henry VI. came of full age he made some provision for his step-father, who took the red rose and fought manfully for it. But Mortimer's Cross was his last battle (Feb. 4, 1460/1). He fell into the hands of the Yorkists, who beheaded him in Hereford market place and set up his head on the market cross. Thither, they say, came a mad woman who combed the hair and washed the face of this lover of a queen, setting lighted wax torches round about it.

His eldest son Edmund of Hadham, born about 1430 at Hadham in Herts, one of his mother's manors, was brought up with his brothers by the abbess of Barking until he was about ten years old. The king then took them into his charge. Edmund was a knight in 1449 and in 1453 he was summoned as earl of Richmond, his patent, dated the 6th of March 1452/3, giving him precedence next to the dukes. He was declared of legitimate birth, and in 1455 the royal favour found him a wife in the Lady Margaret, daughter of John Beaufort, duke of Somerset. But he died the next year, and his only child, afterwards Henry VII., was born on the 28th of January 1456/7, three months after his death.

Edmund's younger brother, Jasper Tudor, survived him many years. Jasper was knighted in 1449 and, about the date of Edmund's patent, was created earl of Pembroke. He bore the royal arms of France and England, differenced with a blue border charged with the royal martlets of the Confessor's fabulous shield, and the same was formerly to be seen upon his Garter stall-plate of 1459. He fought at St Albans in 1455 for the king who had advanced him, and two years later we find him strengthening the defences of Tenby. In 1460 he seized and took Denbigh, where the queen joined him after Northampton. He shared the defeat in 1461 at Mortimer's Cross, where his father the Welsh squire was taken and beheaded, and left the country in 1462. In 1465 he made a last descent upon Wales, to be driven off by William Herbert, who was rewarded with his earldom of Pembroke, already forfeited by attainder. But he was an obstinate and loyal partisan. He came back again with Warwick in 1470 and was hurrying to join the queen when Tewkesbury was fought and lost. After many adventures he carried off his young nephew Richmond to Brittany. The two came back together in 1485. After Bosworth, Jasper was created duke of Bedford and restored to his earldom, the earl-marshalship being given him in 1492. He lived to fight at Stoke in 1487 against Lincoln and Simnel his puppet and to be one of the leaders of the host that landed in France in 1492. He died in 1495 leaving no issue by his wife Catherine, the widow of the second duke of Buckingham and a daughter of Richard Widvile, Earl Rivers. But his bastard daughter Ellen is said to have been mother of Stephen Gardiner, bishop of Winchester. (O.Ba.)

TUDOR FLOWER, or Cresting, an architectural ornament much used in the Tudor period on the tops of the cornices of screen work, &c., instead of battlements. It consists generally of a flat, upright leaf standing on stems.

TUDOR PERIOD, in architecture, the later development of medieval architecture which followed the Perpendicular and, although superseded by the Elizabethan and the Renaissance styles, still retained its hold on English taste, portions of the additions to the various colleges of Oxford and Cambridge being still carried out in the Tudor style down to the middle of the 18th century. In church architecture the principal examples are Henry VII.'s Chapel at Westminster (1503), King's College Chapel, Cambridge, and St George's Chapel, Windsor; and the old schools at Oxford; and in domestic work, Eltham Palace, Kent; Oxburgh Hall, Norfolk; King's College, Aberdeen; Layer Marney Hall, Essex; the manor house at East Barsham, Norfolk; and Ford's Hospital, Coventry. It was a further debasement of the Perpendicular style, and the four-centred arch was its principal feature; some of the most remarkable examples of the bow-window belong to this period; the mouldings are more spread out and the foliage becomes more natural.

TUFF (Ital. *tufo*), a rock consisting of volcanic ashes, the ejectamenta of craters in a state of eruption. The products of a volcanic eruption may be classified into three groups: (*a*) steam and other gases, (*b*) lavas, (*c*) ashes. The ashes have not been burnt in any way though they resemble cinders in appearance: they are merely porous, slaggy pieces of lava which have been tossed into the air by outbursts of steam and have become vesicular by the expansion of the gases within them while they were still plastic.

Among the loose beds of ash which cover the slopes of many volcanoes, three classes of materials are represented. In addition to true ashes (*a*) of the kind above described, there are lumps of the old lavas and tuffs (*b*) forming the walls of the crater, &c., and which have been torn away by the violent outbursts of steam, pieces of sedimentary rocks (*c*) from the deeper parts of the volcano, which were dislodged by the rising lava, and are often intensely baked and recrystallized by the heat to which they have been subjected. In some great volcanic explosions nothing but materials of the second kind were emitted, as at Bandaisan in Japan in 1888. There have been many eruptions also at which the quantity of broken sedimentary rocks mingled with the ashes is very great; as instances we may cite the volcanoes of the Eifel and the Devonian tuffs, known as "Schalsteins," in Germany. In the Scotch coalfields some old volcanoes are plugged with masses consisting entirely of sedimentary débris: in such a case we must suppose that no lava was ejected, but the cause of the eruption was the sudden liberation and expansion of a large quantity of steam. These accessory or adventitious materials, however, as distinguished from the true ashes, tend to occur in angular fragments; and when they form a large part of the mass the rock is more properly a "volcanic breccia" than a tuff. The ashes vary in size from large blocks twenty feet or more in diameter to the minutest impalpable dust. The large masses are called "bombs"; they have mostly a rounded, elliptical or pear-shaped form, owing to rotation in the air while they were still viscous. Many of them have ribbed or nodular surfaces, and sometimes (at Volcano and Mont Pelé) they have a crust intersected by many cracks like the surface of a loaf of bread. Any ash in which they are very abundant is called an agglomerate (*q.v.*).

In those layers and beds of tuff which have been spread out over considerable tracts of country and which are most frequently encountered among the sedimentary rocks, smaller fragments preponderate greatly and bombs more than a few inches in diameter may be absent altogether. A tuff of recent origin is generally loose and incoherent, but the older tuffs have been, in most cases, cemented together by pressure and the action of infiltrating water, making rocks which, while not very hard, are strong enough to be extensively used for building purposes (*e.g.* in the neighbourhood of Rome). If they have accumulated subaerially, like the ash beds found on Etna or Vesuvius at the present day, tuffs consist almost wholly of volcanic materials of different degrees of fineness with pieces of wood and vegetable matter, land shells, &c. But many volcanoes stand near the sea, and the ashes cast out by them are mingled with the sediments that are gathering at the bottom of the waters. In this way ashy muds or sands or even in some cases ashy limestones are being formed. As a matter of fact most of the tuffs found in the older formations contain admixtures of clay, sand, and sometimes fossil shells, which prove that they were beds spread out under water.

During some volcanic eruptions a layer of ashes several feet in thickness is deposited over a considerable district, but such beds thin out rapidly as the distance from the crater increases, and ash deposits covering many square miles are usually very thin. The showers of ashes often follow one another after longer or shorter intervals, and hence thick masses of tuff, whether of subaerial or of marine origin, have mostly a stratified character. The coarsest materials or agglomerates show this least distinctly; in the fine beds it is often developed in great perfection.

Apart from adventitious material, such as fragments of the older rocks, pieces of trees, &c., the contents of an ash deposit may be described as consisting of more or less crystalline igneous rocks. If the lava within the crater has been at such a temperature that solidification has commenced, crystals are usually present. They may be of considerable size like the grey, rounded leucite crystals found on the sides of Vesuvius. Many of these are very perfect and rich in faces, because they grew in a medium which was liquid and not very viscous. Good crystals of augite and olivine are also to be obtained in the ash beds of Vesuvius and of many other volcanoes, ancient and modern. Blocks of these crystalline minerals (anorthite, olivine, augite and hornblende) are common objects in the tuffs of many of the West Indian volcanoes. Where crystals are very abundant the ashes are called "crystal tuffs." In St Vincent and Martinique in 1902 much of the dust was composed of minute crystals enclosed in thin films of glass, because the lava at the moment of eruption had very nearly solidified as a crystalline mass. Some basaltic volcanoes, on the other hand, have ejected great quantities of black glassy scoria which, after consolidation, weather to a red soft rock known as palagonite; tuffs of this kind occur in Iceland and Sicily. In the Lipari Islands and Hungary there are acid (rhyolitic) tuffs, of pale grey or yellow colour, largely composed of lumps and fragments of pumice. Over a large portion of the sea bottom the beds of fine mud contain small, water-worn, rounded pebbles of very spongy volcanic glass; these have been floated from the shore or cast out by submarine volcanoes, and may have travelled for hundreds of miles before sinking; it has been proved by experiment that some kinds of pumice will float on sea-water for more than a year. The deep sea-deposit known as the "red clay" is largely of volcanic origin and might be suitably described as a "submarine tuff-bed."

For petrographical purposes tuffs are generally classified according to the nature of the volcanic rock of which they consist; this is the same as the accompanying lavas if any of these were emitted during an eruption, and if there is a change in the kind of lava which is poured out, the tuffs also indicate this equally clearly. *Rhyolite tuffs* contain pumiceous, glassy fragments and small scoriae with quartz, alkali felspar, biotite, &c. In Iceland, Lipari, Hungary, Nevada, New Zealand, recent tuffs of this kind occur. The broken pumice is clear and isotropic, and when the particles are very small they have often crescentic, sickle-shaped, or biconcave outlines, showing that they are produced by the shattering of a vesicular glass; this is sometimes described as ash-structure. In the ancient rocks of Wales, Charnwood, the Pentland Hills, &c., similar tuffs are known, but in all cases they are greatly changed by silicification (which has filled them with opal, chalcedony and quartz) and by devitrification. The frequent presence of rounded corroded quartz crystals, such as occur in rhyolitic lavas, helps to demonstrate their real nature. *Trachyte tuffs* contain little or no quartz but much orthoclase and oligoclase felspar with often biotite, augite and hornblende. In weathering they often change to soft red or yellow "clay-stones," rich in kaolin with secondary quartz. Recent trachyte tuffs are found on the Rhine (at Siebengebirge), in Ischia, near Naples, Hungary, &c. *Andesitic tuffs* are exceedingly common. They occur along the whole chain of the Cordilleras and Andes, in the West Indies, New Zealand, Japan, &c. In the Lake district, North Wales, Lorne, the Pentland Hills, the Cheviots and many other districts of Britain, ancient rocks of exactly similar nature are abundant. In colour they are red or brown; their scoriae fragments are of all sizes from huge blocks down to minute granular dust. The cavities are filled up with many secondary minerals, such as calcite, chlorite, quartz, epidote, chalcedony: but in microscopic sections the nature of the original lava can nearly always be made out from the shapes and properties of the little crystals which occur in the decomposed glassy base. Even in the smallest details these ancient tuffs have a complete resemblance to the modern ash beds of Cotopaxi, Krakatoa and Mont Pelée. *Basaltic tuffs* are also of wide spread occurrence both in districts where volcanoes are now active and in lands where eruptions have long since ended. In the British Isles they are found in Skye, Mull, Antrim and other places, where there are Tertiary volcanic rocks; in Scotland, Derbyshire, Ireland among the carboniferous strata; and among the still older rocks of the lake district, southern uplands of Scotland and Wales. They are black, dark green or red in colour; vary greatly in coarseness, some being full of round spongy bombs a foot or more in diameter, and, being often submarine, may contain shale, sandstone, grit and other sedimentary material, and are occasionally fossiliferous. Recent basaltic tuffs are found in Iceland, the Faeroes, Jan Mayen, Sicily, Vesuvius, Sandwich Islands, Samoa, &c. When weathered they are filled with calcite, chlorite, serpentine and, especially where the lavas contain nepheline or leucite, are often rich in zeolites, such as analcite, prehnite, natrolite, scolecite, chabazite, heulandite, &c. *Ultra-basic* tuffs are by no means frequent; their characteristic is the abundance of olivine or serpentine and the scarcity or absence of felspar. In this class the peridotite, breccias or kimberlites of the diamond-fields of South Africa may perhaps be placed (see DIAMOND). The principal rock is a dark bluish green serpentine (blue-ground) which when thoroughly oxidized and weathered becomes a friable brown or yellow mass (the "yellow-ground"). Besides olivine and augite (chrome diopside) there occur crystals of hypersthene, brown mica, garnet (Cape ruby), magnetite, ilmenite and kyanite, together with crystalline blocks of garnet, augite and olivine (which some petrographers have called eclogites). Many lumps of shale are embedded in the breccia, and some have supposed that the diamonds are due to the ultra-basic magma dissolving carbon, which subsequently crystallized as the rock cooled down. Many of the crystals are broken, and as the rock fragments also are angular, rather than rounded, the kimberlite is more properly an ultra-basic breccia than a tuff.

In course of time other changes than weathering may overtake tuff deposits. Sometimes they are involved in folding and become sheared and cleaved. Many of the green slates of the lake district in Cumberland are fine cleaved ashes. In Charnwood forest also the tuffs are slaty and cleaved. The green colour is due to the large development of chlorite. Among the crystalline schists of many regions green beds or green schists occur, which consist of quartz, hornblende, chlorite or biotite, iron oxides, felspar, &c., and are probably recrystallized or metamorphosed tuffs. They often accompany masses of epidiorite and hornblende-schists which are the corresponding lavas and sills. Some chlorite-schists also are probably altered beds of volcanic tuff. The "Schalsteins" of Devon and Germany include many cleaved and partly recrystallized ash-beds, some of which still retain their fragmental structure though their lapilli are flattened and drawn out. Their steam cavities are usually filled with calcite, but sometimes with quartz. The more completely altered forms of these rocks are platy, green chloritic schists; in these, however, structures indicating their original volcanic nature only sparingly occur. These are intermediate stages between cleaved tuffs and crystalline schists.

Tuffs are not of much importance in an economic sense. The peperino, much used at Rome and Naples as a building stone, is a trachyte tuff. Puzzuolana also is a decomposed tuff, but of basic character, originally obtained near Naples and used as a cement, but this name is now applied to a number of substances not always of identical character. In the Eifel a trachytic, pumiceous tuff called trass (*q.v.*) has been extensively worked as a hydraulic mortar.

(J. S. F.)

TUGELA ("Startling"), a river of south-east Africa, the largest in Natal. It drains, with its tributaries, an area of about 8000 sq. m. The river valley is some 190 m. in length, the river, which has an exceedingly sinuous course is fully 300 m. long. It rises, at an altitude of nearly 11,000 ft. in the Drakensberg mountains on the eastern face of the Mont aux Sources, down which it leaps in a nearly perpendicular fall of 1800 ft.

The river, which starts its race to the ocean with a north-east course, soon bends more directly east, and, with many windings north and south, maintains this general direction across the tableland of north Natal until its junction with the Buffalo river, when it turns south. On its northern bank in its upper course are the heights of Spion Kop and Vaal Kranz, and on its southern bank, 56 m. east in a direct line from its source, is the village of Colenso, all three places being the scene of ineffectual attempts (Dec. 1899–Feb. 1900) by the British troops under General Sir Redvers Buller to dislodge the Boers who blocked the road to Ladysmith. Below Colenso are more waterfalls, and above the river is Pieter's Hill, the storming of which by the British, on the 27th of February 1900 at length led to the relief of Ladysmith. Six miles lower down the Tugela receives the Klip, which rises in the Drakensberg near Van Reenen's Pass and flows by Ladysmith. Another northern tributary is the Sunday's river, which rises in the Biggarsberg. From the south the river is increased by several affluents, the chief being the Mooi (Beautiful) river. The Tugela-Mooi confluence is 44 m. south-east of Colenso at the base of the Biggarsberg. Seven miles farther down the Tugela joins the Buffalo river, the united stream retaining, however, the name Tugela. The Buffalo has its origin in the Drakensberg near Majuba Hill and flows south with, also, a general trend to east. In its course, which is very winding, it receives numerous tributaries, one of them being the Ingogo, a small stream whose name recalls the fight on its banks on the 8th of February 1881, between British and Boers. The chief affluents are the Ingagani (from the south-west) and the Blood (from the north-east), the last-named so called after the defeat of the Zulu king Dingaan, on the 16th of December 1838, by the Boers under Andries Pretorius, when the river ran red with the blood of the Zulus. Eighteen miles in a direct line below the Blood confluence is Rorke's Drift, or ford across the river, and some 12 m. south-east of the drift is the hill of Isandhlwana, both places rendered famous in the Zulu War of 1878–79. The junction with the Tugela is 30 m. in a direct line, farther south, the Buffalo river in that distance passing through a wooded and hilly region.

Below the confluence of the two streams the Tugela flows south-east in a deep channel between lofty cliffs, or through wild, stone-strewn valleys until it reaches the narrow coast belt. Its mouth is nearly closed by a sand bar, formed by the action of the ocean. The Tugela is thus useless for navigation. About 6 m. above the mouth are two forts, Pearson and Tenedos, built by the British in 1879, during the war with the Zulus, to guard the passage of the river. Generally fordable in the winter months, the Tugela is, after the heavy rains of summer, a deep and rapid river. It is crossed, some 5 m. above the forts, by a railway bridge—the longest bridge in South Africa. From the junction of the Blood river with the Buffalo, that stream and subsequently the Tugela form the boundary between Natal and Zululand.

TUGGURT, a town in the Wadi Ghir, Algerian Sahara, 127 m. S. of Biskra. Tuggurt, which has a population (1906) of 2073, was formerly surrounded by a moat, which the French filled up. The town is entered by two gates. Just within the northern gate is the market place, which contains the chief mosque. The surrounding oasis is very fertile. It has about 9000 inhabitants and contains about 200,000 date palms. From Tuggurt a road 75 m. long leads across the desert north-east to El Wad (*q.v.*).

Some 12 m. south-west at the desert end of the Wadi Ghir is the oasis and town of Temacin (pop. 2120), one of the chief centres of the Mussulman fraternity of Tidianes.

TUG-OF-WAR, a contest between two teams composed of one or more persons, each team striving to pull the other in its own direction by means of a rope held by the hands alone. Some rules allow the "anchor-men," who hold the ends of the rope, to fasten it to their persons. A ribbon or handkerchief is tied round the middle of the rope, and others at a distance, usually, of one yard on each side of it. That team loses which allows itself to be pulled more than one yard from its original position. The British army teams are usually composed of ten men each, but the number varies in different parts of the world. The rules of the modern Olympic Games recognize teams of five. When a tug-of-war takes place out of doors the men, or at least the "anchors," are allowed to dig holes in the ground for their feet; when indoors cleats are bolted to the floor as braces.

TUGUEGARAO, a town and the capital of the province of Cagayan, Luzon, Philippine Islands, on the Grande de Cagayan River, about 60 m. from its mouth. Pop. (1903), 16,105. Many of Tuguegarao's buildings—government, religious, business and residential—are of stone or brick. There are a Dominican college for boys, a convent school for girls, and good public schools, including a high school. The river is navigable to Tuguegarao for vessels of light draught; the Cagayan Valley is the great tobacco-producing region of the Philippines; and Tuguegarao is an important shipping point for tobacco. Local business is largely in the hands of Chinese merchants; Spanish and German companies control the exportation of tobacco. The town was settled in 1774, and the old church and bell tower are still standing. The local dialects are Cagayan, and, of less importance, Ilocano and Tagalog.

TUKE, the name of an English family, several generations of which were celebrated for their efforts in the cause of philanthropy.

William Tuke (1732–1822) was born at York on the 24th of March 1732. His name is connected with the humane treatment of the insane, for whose care he projected in 1792 the Retreat at York, which became famous as an institution in which a bold attempt was made to manage lunatics without the excessive restraints then regarded as essential. The asylum was entirely under the management of the Society of Friends. Its success led to more stringent legislation in the interests of the insane.

His son Henry Tuke (1755–1814) co-operated with his father in the reforms at the York Retreat. He was the author of several moral and theological treatises which have been translated into German and French.

Henry's son Samuel Tuke (1784–1857), born at York on the 31st of July 1784, greatly advanced the cause of the amelioration of the condition of the insane, and devoted himself largely to the York Retreat, the methods of treatment pursued in which he made more widely known by his *Description of the Retreat near York*, &c. (York, 1813). He also published *Practical Hints on the Construction and Economy of Pauper Lunatic Asylums* (1815). He died at York on the 14th of October 1857.

Samuel's son James Hack Tuke (1819–1896) was born at York on the 13th of September 1819. He was educated at the Friends' school there, and after working for a time in his father's wholesale tea business, became in 1852 a partner in the banking firm of Sharples and Co., and went to live at Hitchin in Hertfordshire. For eighteen years he was treasurer of the Friends' Foreign Mission Association, and for eight years chairman of the Friends' Central Education Board. But he is chiefly remembered for his philanthropic work in Ireland, which was in a great measure the result of a visit to Connaught in 1847, and of the scenes of distress which he there witnessed. In 1880, accompanied by W. E. Forster, he spent two months in the West of Ireland distributing relief which had been privately subscribed by Friends in England. Letters descriptive of the state of things he saw were published in *The Times*, and in his pamphlet, *Irish Distress and its Remedies* (1880), he pointed out that Irish distress was due to economic rather than political difficulties, and advocated state-aided land purchase, peasant proprietorship, light railways, government help for the fishing and local industries, and family emigration for the poorest peasants. From 1882 to 1884 he worked continuously in Ireland superintending the emigration of poor families to the United States and the Colonies. The failure of the potato crop in Ireland in 1885 again called forth Tuke's energy, and on the invitation of the government, aided by public subscription, he purchased and distributed seed potatoes in order to avert a famine. To his reports of this distribution and his letters to *The Times*, which were reprinted under the title *The Condition of Donegal* (1889), were due in a great measure the bill passed for the construction of light railways in 1889 and the Irish Land Act which established the Congested Districts Board in 1891. He died on the 13th of January 1896.

See *Report of the Select Committee of the House of Commons* (1815–1816); Dr Conolly, *Treatment of the Insane without Mechanical Restraints* (1856); Dr Hack Tuke, *Chapters in the History of the Insane in the British Isles* (1882).

Daniel Hack Tuke (1827–1895), younger brother of James Hack Tuke, was born at York on the 19th of April 1827. In 1845 he entered the office of a solicitor at Bradford, but in 1847 began work at the York Retreat. Entering St Bartholomew's Hospital in London in 1850, he became a member of the Royal College of Surgeons in 1852, and graduated M.D. at Heidelberg in 1853. In 1858, in collaboration with J. C. Bucknill, he published a *Manual of Psychological Medicine*, which was for many years regarded as a standard work on lunacy. In 1853 he visited a number of foreign asylums, and later returning to York he became visiting physician to the York Retreat and the York Dispensary, lecturing also to the York School of Medicine on mental diseases. In 1859 ill health obliged him to give up his work, and for the next fourteen years he lived at Falmouth. In 1875 he settled in London as a specialist in mental diseases. In 1880 he became joint editor of the *Journal of Mental Science*. He died on the 5th of March 1895.

Among his works were *Illustrations of the Influence of the Mind on the Body* (1872); *Insanity in Ancient and Modern Life* (1878); *History of the Insane in the British Isles* (1882); *Sleepwalking and Hypnotism* (1884); *Past and Present Provision for the Insane Poor in Yorkshire* (1889); *Dictionary of Psychological Medicine* (1892).

TUKULOR (Tuculers), the name, by some said to be the French *tout-couleur*, for the negro half-castes of Senegal, who are principally of Fula-Wolof descent. By others the word is identified with Tacurol, an old name of the country, which took the form of Tacurores in the Portuguese writers of the 16th century. The Tukulor are settled chiefly in the Damga, Futa, Toro and Dimar districts of Senegal, and are remarkable for their fanaticism as Mahommedans. An intelligent, energetic and fierce people, they offered strenuous opposition to the conquest of their country by the French in the latter half of the 19th century.

TULA, a government of central Russia, bounded by the governments of Moscow on the N., Ryazañ on the E., Tambov and Orel on the S., and Kaluga on the W. Area, 11,950 sq. m.; pop. (1906 estimate), 1,662,600. It is intersected from S.W. to N.E. by a gently undulating plateau, 950 to 1020 ft. in altitude, which separates the drainage area of the Oka from that of the Don.

The government is divided into twelve districts, the chief towns of which are Tula, Bogoroditsk, Alexin, Byelev, Epifan, Efremov, Kashira, Krapivna, Novosil, Odoyev, Chern and Venev. Only 2.4% of the aggregate area is considered as unavailable for cultivation, the remainder being distributed as follows: peasants, 48½%; nobility, 32½%; other private landowners, 11%; crown, towns, &c., 2%. Agriculture is the chief occupation. Petty trades and domestic industries (*e.g.* the making of tea-urns, brass wares, harmoniums, &c.) have always flourished. The principal factory establishments are machinery works, hardware factories, flour-mills, sugar works and distilleries. Coal is extracted, as also pyrites and iron ore. Metallurgy is a growing industry.

Before the Slav immigration the territory of Tula was inhabited by Mordvinians in the north and by Meshcheryaks in the south. The Slavs who occupied the Oka were soon compelled to pay tribute to the Khazars. Subsequently the territory on the Oka belonged to the principality of Chernigov. In the 14th century part fell under the rule of Ryazañ and

Moscow, while the rest was under Lithuanian dominion till the 15th century.

TULA, a town of Russia, capital of the government of the same name, 120 m. by rail S. of Moscow, in the broad but low, marshy and unhealthy valley of the Upa. Pop. (1882), 63,500; (1901), 109,352. It is an old town of Old Russia, but its growth began only towards the end of the 18th century after the manufacture of arms had commenced. The chief branch of industry is the making of rifles; next in importance comes the manufacture of *samovars* (tea-urns). Tula is an episcopal see of the Orthodox Greek Church. The public buildings include two cathedrals and an industrial museum.

The town is first mentioned in 1147; but its former site seems to have been higher up the Tulitsa. Its wooden fort was replaced in 1514–1521 by a stone *kreml*, or citadel, which still exists. Tsar Boris Godunov founded a gun factory here in 1595, and in 1632 a Dutchman, Winius, established an iron foundry. Tsar Michael Alexis and Peter the Great, especially the last-named, took great interest in the gun factories, and large establishments were built in 1705 and 1714.

TULCEA, or TULTCHA, the capital of the department of Tulcea, Rumania, on the right bank of the Danube, 42 m. from its mouth at Sulina. Pop. (1900), 18,800; including many Russians, Turks, Greeks and Jews. There is no railway within 20 m., and the surrounding country is barren and desolate. The principal commerce is in fish and grain. Wool is also exported to France, and hides to Turkey. Sheep-farming is carried on among the mountains.

TULIP (*Tulipa*), a genus of bulbous herbs belonging to the Liliaceae. The species are found wild along the northern shores of the Mediterranean, in the Levant, Armenia, Caucasus, Northern Africa, Persia, and sporadically across North and Central Asia to Japan. The cup-shaped flowers have six regular segments in two rows, as many free stamens, and a three-celled ovary with a sessile stigma, which ripens into a leathery many-seeded capsule. The species are numerous, and are distinguished one from another by the scales of the bulb being woolly or smooth on the inner surface, by the character of the flower-stalks, by the filaments being hairy or otherwise, and by other characters. Owing to the great beauty of the flowers they have been favourites in European gardens for two or three centuries, and have been crossed and recrossed till it has become almost impossible to refer the plants to their original types. The early flowering "Van Thol" tulips, the segments of which are mostly scarlet with yellow edges, are derived from *T. suaveolens*, a native of the Caspian region. *T. Gesneriana*, a native of Armenia and central Russia, is the origin of some of the later flowering varieties. *T. pubescens*, which is probably a hybrid between the two species just named, is the source of some of the early flowering kinds known as Pottebakker, &c. *T. oculus-solis* and *T. Clusiana* are lovely species, natives of southern Europe, and *T. silvestris*, with elegant yellow flowers, is a doubtful native of England. More recently, owing to the exertions of Russian naturalists, a large number of new species have been discovered in Turkestan, and introduced into Europe. Some of these are very beautiful, and render it probable that by intercrossing with the older species still further difficulties will be presented in the way of identification. These difficulties are further enhanced by the fact that, quite apart from any cross-breeding, the plants, when subjected to cultivation, vary so greatly in the course of two or three years from the original species from which they are directly descended that their parentage is scarcely recognizable. This innate power of variation has enabled the florist to obtain, and ultimately to "fix," so many remarkable varieties. At the present day tulips of all kinds are much more extensively grown than at any previous period. Not only are millions of bulbs cultivated in Holland for export every year, but thousands are now also grown for the same purpose in the Channel Islands, more particularly in Guernsey. Of late years tulips have become very popular in America, and an extensive trade is now done between the U.S.A. and Europe. The enormous prices once given for rare varieties of tulip bulbs no longer obtain, though, even now, two and three guineas are asked for special bulbs. It must, however, be remembered that the "tulipomania" of the 17th century was really a form of gambling, in which admiration of the flower and interest in its culture were very secondary matters. Tulips were introduced into the Low Countries in the 16th century from Constantinople and the Levant.

The florists' varieties of tulips, which have sprung from *Tulipa Gesneriana*, are arranged in separate classes named bizarres, bybloemens and roses, according to their colour and marking. Tulips are readily raised from seeds, and the seedlings when they first flower (after about 7 years cultivation) are of one colour—that is, they are self-coloured. Judged by the florists' rules, they are either good or bad in form, and pure or stained (white or yellow) at the base; the badly formed and stained flowers are thrown away, while the good and pure are grown on, these being known as "breeder" tulips. The breeder bulbs and their offsets may grow on for years producing only self-coloured flowers, but after a time, which is varied and indefinite, some of the progeny "break," that is, produce flowers with the variegation which is so much prized. The flower is then said to be "rectified"; it is a *bizarre* when it has a yellow ground marked with purple or red, a *bybloemen* when it has a white ground marked with violet or purple, or a *rose* when it has a white ground marked with rose colour. One of the most important of the properties of a fine florists' tulip is that the cup should form, when expanded, from half to a third of a hollow ball, the six divisions of the perianth being broad at the ends, and smooth at the edges, so that the divisions may scarcely show on indenture. Another is that the ground colour should be clear and distinct, whether white or yellow. The least stain at the base of the flower, technically called the "bottom," would render a tulip comparatively valueless. What are called "feathered" flowers are those which have an even close feathering, forming an unbroken edging of colour all round, "flamed" flowers being those which have a beam or bold mark down the centre, not reaching to the bottom of the cup.

Tulips flourish in any good garden soil that has been deeply dug or trenched and manured the previous season. To secure perfect drainage and greater warmth a fair quantity of sand or grit should be present. Fresh manure should be avoided, but the remains from an old hot-bed or mushroom bed may be incorporated. The best time to plant is in September and October, the bulbs being buried about 6 in. deep and the same distance apart. The best effects are produced in formal beds by planting the same variety in each, to secure the plants being of the same height and in flower simultaneously. In mixed flower borders, mixed varieties may be planted. After planting the space between the rows of tulips may be planted with such plants as forget-me-nots, wallflowers, silenes, violas, double white arabis, polyanthuses, &c., to obtain beautiful colour combinations in spring.

Propagation.—Tulips are usually increased by offsets, which most varieties produce in fairly large numbers. These are taken off and sown in drills, like seed. They are usually strong enough to flower the third year from this sowing. Some varieties produce offsets sparingly and must be increased by seed—a slow and uncertain method. New varieties are raised from seed. (The colour variation in the flowers of seedlings is discussed above.) Seeds are sown in boxes or cold frames, in light sandy soil, and the young plants are allowed to remain undisturbed until the second year. They are then lifted and treated like offsets, being sown thinly in beds out of doors. They usually flower in about the seventh year. The soil in which tulips are propagated should be sandy, free working and thoroughly drained. A warm sheltered position is a necessity.

Cultivation Out of Doors.—Planting is best effected during September, October and early November. It is usual thoroughly to dig and manure the ground in preparation. Holes 6 to 8 in. apart and 5 in. deep are then made with a dibber. Sometimes a little loose earth or sand is put in to the depth of about 1 in., and the bulbs laid singly thereon, the holes being closed by the dibber and the whole raked over. Valuable varieties are planted at about the same depth, with a trowel, a little sand being placed around them.

Unless seed is required, the young capsules should be removed as soon as the perianth has withered, to conserve the strength of the bulb. The plants should be left until the leaves begin to wither, unless it becomes necessary to lift them to make way for other plants. When lifted they should be laid thinly in a well shaded, airy spot to dry. The tops can then be removed and the bulbs sorted and stored thinly in trays in a cool dry place. Rare bulbs may be wrapped singly in tissue paper for storing.

In Pots and Forcing.—The early flowering varieties should be potted as early in September as practicable, later batches for succession being potted during October. Pots 5 and 6 in. in diameter are the most convenient. The tops should be covered with ½ in. of soil, and about half an inch left for water. The soil should be a light and fairly rich compost, comprising about 2 parts loam, 1 part decayed manure or horse droppings that have been thoroughly sweetened, 1 part leaf mould and half a part of sand. Pot firmly, and plunge the pots in several inches of ashes out of doors, to protect the bulbs from frost. As soon as growth commences at the top and a fair amount of roots are formed they may be introduced into gentle heat, in batches according to the need and the amount of stock available. For market a slightly different method is adopted. The bulbs are placed in long shallow boxes, plunged in soil or ashes in the open air, and are later introduced as required into heat in semi-darkness, and are afterwards transferred to benches in the forcing houses where they flower. Bulbs which have been forced are of no further value for that particular purpose. If planted in borders and shrubberies, however, they will continue to bear fairly good blossoms in the open air for several seasons.

Varieties.—The following varieties are among the most useful for bedding and pot culture.

Early Single Flowering Kinds:—

Name.	Colour.	Height.
Duc van Thol	Various	6 in.
Adelaine	Rose Carmine	7 „
Artus	Dark Scarlet	8 „
Bacchus	Dark Crimson	7 „
Belle Alliance	Crimson Scarlet	8 „
Canary Bird	Yellow	10-12
Chrysolora	Yellow	9 „
Cottage Maid	Pink and White	12 „
Duchess de Parma	Orange Crimson	10 „
Gold Finch	Golden Yellow	12 „
Joost van Vondel	Crimson, flaked White	9 „
Keisers Kroon	Scarlet and Yellow, superb flower	10 „
La Reine	White (when forced) and Pink.	9 „
Lac van Rhijn	Rosy Violet	9 „
Ophir d'Or	Golden Yellow	8 „
Pottebakker	Scarlet, White, Yellow vars.	12 „
Primrose Queen	Primrose.	9 „
Proserpine	Rosy Carmine, superb flower	9 „
Rose Gris de lin	White and Pink	9 „
Thomas Moore	Terra-cotta	9 „
White Hawk	Pure White	10 „
Yellow Prince	Yellow	8 „

Early Double Flowering Kinds:—

Name.	Colour.	Height.
Duc van Thol	Red, edged Yellow	6 in.
Alba Maxima	Pure White	9 „
Couronne d'Or	Yellow and Orange	9 „
Gloria Solis	Orange Crimson	9 „
Imperator rubrorum	Crimson Scarlet	9 „
La Candeur	Pure White	9 „
Leonardo da Vinci	Crimson and Gold	8 „
Tournesol	Scarlet and Yellow	8 „

Late Single Flowering Kinds:—

These are tall-growing hardy kinds, suitable for herbaceous borders where they can be left undisturbed. With them may be associated what are now popularly known as "Darwin" tulips, beautiful long-stemmed kinds with self colours, and the "Cottage" or "May-flowering" tulips, all easily grown in ordinary garden soil.

Name.	Colour.	Name.	Colour.
Bouton d'Or	Golden Yellow.	Gesneriana	Bright Scarlet.
Caledonia	Orange Scarlet.	Gesneriana lutea	Yellow.
Columbus	Yellow and Vermilion.	Picotee	White, edged Pink.
Fulgens	Violet Crimson.	The Fawn	Dove Colour.

Parrot Tulips.—This late flowering group is supposed to be derived from the curious green and yellow striped *T. viridiflora*. The flowers are mostly heavy and drooping, petals brightly coloured, the edges being curiously notched and waved.

Name.	Colour.	Name.	Colour.
Rubra Major	Dark Red.	Lutea Major	Yellow, Crimson and Green.
Mark Graaf	Yellow, striped Scarlet.	Monstre Rouge	Crimson.
Perfecta	Yellow, Scarlet and Green.		

TULIP-TREE, *Liriodendron tulipifera* (Nat. Ord. Magnoliaceae), a North American tree of great beauty, with peculiarly four-lobed, truncate leaves and solitary tulip-like sweet-scented flowers, variegated with green, yellow and orange. It is hardy in England, but while young it requires protection from cold, cutting winds. In habit it resembles a somewhat stiff-growing plane tree, and becomes fully as large. It does not flourish in the atmosphere of towns. It thrives best in deep sandy loam, and is propagated by seeds.

TULL, JETHRO (1674–1741), English agricultural writer and farmer, was born at Basildon, Berkshire, in 1674, probably in March. He entered St John's College, Oxford, in 1691, and was called to the bar at Gray's Inn in 1699 but never practised. In that year he married and began farming on his father's land at Howberry, near Wallingford, and here about 1701 he invented and perfected his machine drill and began experiments in his new system of sowing in drills or rows sufficiently wide apart to allow for tillage by plough and hoe during almost the whole period of growth. In 1709 he moved to a farm near Hungerford and from 1711 to 1714 travelled in France and Italy, making careful observations of the methods of agriculture in those countries which aided and confirmed his theories as to the true use of manure and the importance of "pulverizing" the soil. He did not publish any account of his agricultural experiments or theories until 1731, when his *Horse-hoeing Husbandry* appeared. This was followed by *The Horse-hoeing Husbandry, or an Essay on the Principles of Tillage and Vegetation*, by J. T., in 1733. He was attacked in the agricultural periodical *The Practical Husbandman and Farmer* and accused of plagiarizing from such earlier writers as Sir A. Fitzherbert, Sir Hugh Plat (1552–1611?), Gabriel Plattes (*fl.* 1638) and John Worlidge (*fl.* 1669–1698). Tull answered in various smaller works forming additions to his main work. He died on the 21st of February 1741.

Many editions of his *Horse-hoeing Husbandry* were published subsequently, and in 1822 William Cobbett edited it. It was translated into French, notably by H. L. Duhamel Dumonceau (1700–1782), the naturalist and agriculturalist, in 1753–1757 (see AGRICULTURE).

TULLAMORE, a market town and the county town of King's County, Ireland, on the Grand Canal and a branch of the Great Southern & Western railway, by which it is 58 m. W. by S. of Dublin. Pop. (1901), 4639. The town is the seat of the county assizes, has a court house and other county buildings, and is governed by an urban district council. There is considerable trade in agricultural produce, and brewing and distilling are carried on. Charleville park is a fine demesne, and there are several small ruined castles in the neighbourhood, notably Shragh Castle, dating from 1588.

TULLE, a town of central France, capital of the department of Corrèze, 58 m. S.S.E. of Limoges by rail. Pop. (1906), of the town, 11,741; of the commune, 17,245. The town extends along the narrow valley of the Corrèze, its streets here and there ascending the hill-slopes on either side by means of stairways. Tulle is the seat of a bishop. Of its 12th-century cathedral, once attached to an abbey, only the porch and nave remain, the choir and transept having been destroyed in 1793, but there is a tower of the 13th century with a fine stone steeple of the 14th century. The neighbouring cloister (12th and 13th century) has been restored. The abbot's house (15th century) has a carved doorway and well-preserved windows. Other curious old houses are to be seen in the vicinity of the cathedral. The prefecture of Tulle is a sumptuous building of 1869 surrounded by gardens. The town has tribunals of first instance and of commerce, a lycée for boys, training colleges for both sexes, a chamber of commerce and a branch of the Bank of France. Its principal industry is the manufacture of small-arms, established in 1690, and now carried on by the state under the direction of the artillery authorities. At its busiest times the factory has employed 3000 hands. The well-known cascades of Gimel formed by the Montane are near Tulle.

Tulle (*Tutela*) owed its importance in the middle ages to the abbey of St Martin, founded in the 7th or 8th century. The abbacy was raised to the rank of bishopric in 1317. The town was taken by the English in 1346 and was subsequently ravaged by the Black Death. It was again conquered by the English in 1369; but, when the inhabitants succeeded in freeing themselves, they were exempted from all imposts by Charles V. The Protestants tried in vain to seize Tulle in 1577, but were successful in 1585.

TULLE, a term restricted in England to a fine bobbin-net of silk, used for veils, scarves, millinery purposes, and trimmings of ladies' dresses, &c. The French used the word to mean all machine-made lace the basis of which is the intertwisted network made on the bobbin-net machine. The word is derived from the town of Tulle in France.

TULLOCH, JOHN (1823–1886), Scottish theologian, was born at Bridge of Earn, Perthshire, in 1823, and received his university education at St Andrews and Edinburgh. In 1845 he became minister of St Paul's, Dundee, and in 1849 of Kettins, in Strathmore, where he remained for six years. In 1854 he was appointed principal of St Mary's College, St Andrews. The appointment was immediately followed by the appearance of his Burnet prize essay on *Theism*. At St Andrews, where he held also the post of professor of systematic theology and apologetics, his work as a teacher was distinguished by several features which at that time were new. He lectured on comparative religion and treated doctrine historically, as being not a fixed product but a growth. From the first he secured the attachment and admiration of his students. In 1862 he was appointed one of the clerks of the General Assembly, and from that time forward he took a leading part in the councils of the Church of Scotland. In 1878 he was chosen moderator of the Assembly. He did much to widen the national church. Two positions on which he repeatedly insisted have taken a firm hold—first, that it is of the essence of a church to be comprehensive of various views and tendencies, and that a national church especially should seek to represent all the elements of the life of the nation; secondly, that subscription to a creed can bind no one to all its details, but only to the sum and substance, or the spirit, of the symbol. For three years before his death he was convener of the church interests committee of the Church of Scotland, which had to deal with a great agitation for disestablishment. He was also deeply interested in the reorganization of education in Scotland, both in school and university, and acted as one of the temporary board which settled the primary school system under the Education Act of 1872. He died at Torquay on the 13th of February 1886.

Tulloch's best-known works are collections of biographical sketches of the leaders of great movements in church history, such as the Reformation and Puritanism. His most important book, *Rational Theology and Christian Philosophy* (1872), is one in which the Cambridge Platonists and other leaders of dispassionate thought in the 17th century are similarly treated. He delivered the second series of the Croall lectures, on the *Doctrine of Sin*, which were afterwards published. He also published a small work, *The Christ of the Gospels and the Christ of History*, in which the views of Renan on the gospel history were dealt with; a monograph on *Pascal* for Blackwood's Foreign Classics series; and a little work, *Beginning Life*, addressed to young men, written at an earlier period.

See the *Life* by Mrs Oliphant.

TULLUS HOSTILIUS, third legendary king of Rome (672–640 B.C.). His successful wars with Alba, Fidenae and Veii shadow forth the earlier conquests of Latian territory and the first extension of the Roman domain beyond the walls of Rome. It was during his reign that the combat between the Horatii and Curiatii, the representatives of Rome and Alba, took place. He is said to have been struck dead by lightning as the punishment of his pride.

Tullus Hostilius is simply the duplicate of Romulus. Both are brought up among shepherds, carry on war against Fidenae and Veii, double the number of citizens, organize the army, and disappear from earth in a storm. As Romulus and Numa represent the Ramnes and Tities, so, in order to complete the list of the four traditional elements of the nation, Tullus was made the representative of the Luceres, and Ancus the founder of the Plebs. The distinctive event of this reign is the destruction of Alba, which may be regarded as an historical fact. But when and by whom it was destroyed is uncertain—probably at a later date, by the Latins, and not by the Romans, who would have regarded as impious the destruction of their traditional mother-country.

See Livy i. 22–31; Dion. Halic. iii. 1–35; Cicero, *de Republica*, ii. 17. For a critical examination of the story see Schwegler, *Römische Geschichte*, bk. xii.; Sir G. Cornewall Lewis, *Credibility of early Roman History*, ch. 11; W. Ihne, *Hist. of Rome*, vol. i.; E. Pais, *Storia di Roma*, vol. i. (1898); O. Gilbert, *Geschichte und Topographie der Stadt Rom im Altertum*, ii. (1885); G. F. Schömann, "De Tullo Hostilio rege romano" in his *Opuscula*, i. 18-49; also ROME: *Ancient History*.

TULSA, a city (and co-extensive township) and the county-seat of Tulsa county, Oklahoma, U.S.A., on the Arkansas river, about 110 m. N.E. of Guthrie. Pop. (1900), 1390; (1907), 7298 (638 negroes); (1910) 18,182. Tulsa is served by the Atchison, Topeka & Santa Fé, the St Louis & San Francisco, the Midland Valley, the Missouri, Kansas & Texas, and the Arkansas Valley & Western railways. The city is situated on the old boundary line between Indian Territory and Oklahoma Territory, where the boundaries of the Cherokee, Creek and Osage nations intersected. It is on an elevation from the rolling prairie, which commands a fine view over the valley of the Arkansas. Tulsa is the seat of Henry Kendall College (Presbyterian, 1894), removed hither from Muskogee in 1907; it was named in honour of Henry Kendall (1815–1892), who from 1861 until his death was secretary of the board of Home Missions of the Presbyterian Church. The city is a trading centre for a rich oil, gas and coal region and a grain, cotton and live-stock country. Natural gas is used for manufacturing purposes; among the manufactures are glass and cotton-seed oil products. Tulsa was founded in 1887, was first chartered as a city in 1902, and in 1908 adopted a commission form of government.

TULSĪ DĀS (1532–1623), the greatest and most famous of Hindī poets, was a Sarwariyā Brahman, born, according to tradition, in A.D. 1532, during the reign of Humāyūn, most probably at Rājāpur in the Bāndā District south of the Jumna. His father's name was Ātmā Rām Sukal Dubē; that of his mother is said to have been Hulasī. A legend relates that, having been born under an unlucky conjunction of the stars, he was abandoned in infancy by his parents, and was adopted by a wandering *sādhū* or ascetic, with whom he visited many holy places in the length and breadth of India; and the story is in part supported by passages in his poems. He studied, apparently after having rejoined his family, at Sūkarkhēt, a place generally identified with Sōrōṅ in the Etah district of the United Provinces, but more probably the same as Varāhakshētra[1] on the Gogra River, 30 m. W. of Ajōdhyā (Ayōdhyā). He married in his father's lifetime, and begat a son. His wife's name was Ratnāwalī, daughter of Dīnabandhu Pāṭhak, and his son's Tārak. The latter died at an early age, and Tulsī's wife, who was devoted to the worship of Rāma, left her husband and returned to her father's house to occupy herself with religion. Tulsī Dās followed her, and endeavoured to induce her to return to him, but in vain; she reproached him (in verses which have been preserved) with want of faith in Rāma, and so moved him that he renounced the world, and entered upon an ascetic life, much of which was spent in wandering as a preacher of the necessity of a loving faith in Rāma. He first made Ajōdhyā (the capital of Rāma and near the modern Fyzābād) his headquarters, frequently visiting distant places of pilgrimage in different parts of India. During his residence at Ajōdhyā the Lord Rāma is said to have appeared to him in a dream, and to have commanded him to write a *Rāmāyana* in the language used by the common people. He began this work in the year 1574, and had finished the third book (*Āraṇya-kāṇḍ*), when differences with the Vairāgī Vaishnavas at Ajōdhyā, to whom he had attached himself, led him to migrate to Benares, where he settled at Asī-ghāṭ. Here he died

[1] This is the view of Baijnāth Dās, author of the best life of Tulsī Dās. At Sōrōṅ there is no tradition connecting it with the poet. Varāhakshētra and Sūkar-khēt have the same meaning (*Varāha* = *Sūkara*, a wild boar).

in 1623, during the reign of the emperor Jahāngīr, at the great age of 91.

The period of his greatest activity as an author synchronized with the latter half of the reign of Akbar (1556–1605), and the first portion of that of Jahāngīr, his dated works being as follows: commencement of the *Rāmāyan*, 1574; *Rām-satsaī*, 1584; *Pārbatī-mangal*, 1586; *Rāmāgyā*, 1598; *Kabitta Rāmāyan*, between 1612 and 1614. A deed of arbitration in his hand, dated 1612, relating to the settlement of a dispute between the sons of a land-owner named Ṭōḍar, who possessed some villages adjacent to Benares, has been preserved, and is reproduced in facsimile in Dr Grierson's *Modern Vernacular Literature of Hindustan*, p. 51. Ṭōḍar (who was not, as formerly supposed, Akbar's finance minister, the celebrated Rāja Ṭōḍar Mall) was his attached friend, and a beautiful and pathetic poem[1] by Tulsī on his death is extant. He is said to have been resorted to, as a venerated teacher, by Mahārāja Mān Singh of Jaipur (d. 1618), his brother Jagat Singh, and other powerful princes; and it appears to be certain that his great fame and influence as a religious leader, which remain pre-eminent to this day, were fully established during his lifetime.

Tulsī's great poem, popularly called *Tulsī-krit Rāmāyan*, but named by its author *Rām-charit-mānas*, "the Lake of Rāma's deeds," is perhaps better known among Hindūs in upper India than the Bible among the rustic population in England. Its verses are everywhere, in this region, popular proverbs; an apt quotation from them by a stranger has an immediate effect in producing interest and confidence in the hearers. As with the Bible and Shakespeare, his phrases have passed into the common speech, and are used by every one (even in Urdū) without being conscious of their origin. Not only are his sayings proverbial: his doctrine actually forms the most powerful religious influence in present-day Hinduism; and, though he founded no school and was never known as a *guru* or master, but professed himself the humble follower of his teacher, Narhari-Dās,[2] from whom as a boy in Sūkar-khēt he heard the tale of Rāma's doings, he is everywhere accepted as an inspired and authoritative guide in religion and conduct of life.

The poem is a rehandling of the great theme of Vālmīkī, but is in no sense a translation of the Sanskrit epic. The succession of events is of course generally the same, but the treatment is entirely different. The episodes introduced in the course of the story are for the most part dissimilar. Wherever Vālmīkī has condensed, Tulsī Dās has expanded, and wherever the elder poet has lingered longest, there his successor has hastened on most rapidly. It consists of seven books, of which the first two, entitled "Childhood" (*Bāl-kāṇḍ*) and "Ayōdhyā" (*Ayōdhyā-kāṇḍ*), make up more than half the work. The second book is that most admired. The tale tells of King Dasarath's court, the birth and boyhood of Rāma and his brethren, his marriage with Sītā, daughter of Janak king of Bidēha, his voluntary exile, the result of Kaikēyī's guile and Dasarath's rash vow, the dwelling together of Rāma and Sītā in the great central Indian forest, her abduction by Rāvan, the expedition to Lankā and the overthrow of the ravisher, and the life at Ajōdhyā after the return of the reunited pair. It is written in pure Baiswārī or Eastern Hindī, in stanzas called *chaupāīs*, broken by *dōhās* or couplets, with an occasional *sōraṭhā* and *chhand*—the latter a hurrying metre of many rhymes and alliterations. Dr Grierson well describes its movement:—

"As a work of art, it has for European readers prolixities and episodes which grate against occidental tastes, but no one can read it in the original without being impressed by it as the work of a great genius. Its style varies with each subject. There is the deep pathos of the scene in which is described Rāma's farewell to his mother: the rugged language depicting the horrors of the battle-field—a torrent of harsh sounds clashing against each other and reverberating from phrase to phrase; and, as occasion requires, a sententious, aphoristic method of narrative, teeming with similes drawn from nature herself, and not from the traditions of the schools. His characters, too, live and move with all the dignity of an heroic age. Each is a real being, with a well-defined personality. Rāma, perhaps too perfect to enlist all our sympathies; his impetuous and loving brother Lakshman; the tender, constant Bharat; Sītā, the ideal of an Indian wife and mother; Rāvan, destined to failure, and fighting with all his demon force against his destiny—the Satan of the epic—all these are characters as lifelike and distinct as any in occidental literature."

A manuscript of the *Ayōdhyā-kāṇḍ*, said to be in the poet's own hand, exists at Rājāpur in Bānda, his reputed birthplace. One of the *Bāl-kāṇḍ*, dated *Sambat* 1661, nineteen years before the poet's death, and carefully corrected, it is alleged by Tulsī Dās himself, is at Ajōdhyā. Another autograph is reported to be preserved at Malihābād in the Lucknow district, but has not, so far as known, been seen by a European. Other ancient MSS. are to be found at Benares, and the materials for a correct text of the Rāmāyan are thus available. Good editions have been published by the *Khaḍga Bilās* press at Bānkipur (with a valuable life of the poet by Baijnāth Dās), and by the *Nāgarī Prachārinī Sabhā* at Allahabad (1903). The ordinary bāzār copies of the poem, repeatedly reproduced by lithography, teem with interpolations and variations from the poet's language. An excellent translation of the whole into English was made by the late Mr F. S. Growse, of the Indian Civil Service (5th edition, Cawnpore, 1891).

Besides the "*Lake of Rāma's deeds*," Tulsī Dās was the author of five longer and six shorter works, most of them dealing with the theme of Rāma, his doings, and devotion to him. The former are (1) the *Dōhābalī*, consisting of 573 miscellaneous *dōhā* and *sōraṭhā* verses; of this there is a duplicate in the *Rām-satsaī*, an arrangement of seven centuries of verses, the great majority of which occur also in the *Dōhābalī* and in other works of Tulsī; (2) the *Kabitta Rāmāyan* or *Kabittābalī*, which is a history of Rāma in the *kabitta*, *ghanāksharī*, *chhappāī* and *sawaiyā* metres; like the *Rām-charit-mānas*, it is divided into seven *kāṇḍs* or cantos, and is devoted to setting forth the majestic side of Rāma's character; (3) the *Gīt-Rāmāyan*, or *Gītābalī*, also in seven *kāṇḍs*, aiming at the illustration of the tender aspect of the Lord's life; the metres are adapted for singing; (4) the *Krishnāwali* or *Krishna gītābalī*, a collection of 61 songs in honour of Krishna, in the Kanaujī dialect: the authenticity of this is doubtful; and (5) the *Binay Pattrikā*, or "Book of petitions," a series of hymns and prayers of which the first 43 are addressed to the lower gods, forming Rāma's court and attendants, and the remainder, Nos. 44 to 279, to Rāma himself. Of the smaller compositions the most interesting is the *Vairāgya Sandīpanī*, or "Kindling of continence," a poem describing the nature and greatness of a holy man, and the true peace to which he attains. This work has been translated by Dr Grierson in the *Indian Antiquary*, xxii. 198–201.

Tulsī's doctrine is derived from Rāmānuja through Rāmānand. Like the former, he believes in a supreme personal God, possessing all gracious qualities (*saguṇa*), not in the quality-less (*nirguṇa*) neuter impersonal *Brahman* of Sankarāchārya; this Lord Himself once took the human form, and became incarnate, for the blessing of mankind, as Rāma. The body is therefore to be honoured, not despised. The Lord is to be approached by *faith* (*bhakti*)—disinterested devotion and surrender of self in perfect love, and all actions are to be purified of self-interest in contemplation of Him. "Show love to all creatures, and thou wilt be happy; for when thou lovest all things, thou lovest the Lord, for He is all in all." The soul is from the Lord, and is submitted in this life to the bondage of works (*karma*); "Mankind, in their obstinacy, keep binding themselves in the net of actions, and though they know and hear of the bliss of those who have faith in the Lord, they attempt not the only means of release. Works are a spider's thread, up and down which she continually travels, and which is never broken; so works lead a soul downwards to the Earth, and upwards to the Lord." The bliss to which the soul attains, by the extinction of desire, in the supreme home, is not absorption in the Lord, but union with Him in abiding individuality. This is emancipation (*mukti*) from the burthen of birth and rebirth, and the highest happiness.[3]

Tulsī, as a *Smārta Vaishnava* and a Brahman, venerates the whole Hindu pantheon, and is especially careful to give Śiva or Mahādēva, the special deity of the Brahmans, his due, and to point out that there is no inconsistency between devotion to Rāma and attachment to Śiva (*Rāmāyan, Lankākāṇḍ, Dōhā* 3). But the practical end of all his writings is to inculcate *bhakti* addressed to Rāma as the great means of salvation—emancipation from the chain of births and deaths—a salvation which is as free and open to men of the lowest caste as to Brahmans.

The best account of Tulsī Dās and his works is contained in the papers contributed by Dr Grierson to vol. xxii. of the *Indian Antiquary* (1893). In Mr Growse's translation of the *Rām-charit-Mānas* will be found the text and translation of the passages in the *Bhaktamālā* of Nābhājī and its commentary, which are the main original authority for the traditions relating to the poet. Nābhājī had himself met Tulsī Dās; but the stanza in praise of the poet gives no facts relating to his life; these are stated in the *ṭīkā* or gloss of Priyā Dās, who wrote in A.D. 1712, and much of the material is legendary and untrustworthy. Unfortunately, the biography of the poet, called *Gōsāīn-charitra*, by Bēnīmādhab Dās, who was a personal follower and constant companion of the Master, and died in 1642, has disappeared, and no copy of it is known to exist. In the introduction to the edition of the *Rāmāyan* by the *Nāgarī Prachārinī Sabhā* all the known facts of Tulsī's life are brought together and critically discussed. For an exposition of his religious position,

[1] See *Indian Antiquary*, xxii. 272 (1893).

[2] Narhari-Dās was the sixth in spiritual descent from Rāmānand, the founder of popular Vaishnavism in northern India (see article HINDOSTANI LITERATURE).

[3] The summary given above is condensed from the translation by Dr Grierson, at pp. 229–236 of the *Indian Antiquary*, vol. xxii., of the fifth *sarga* of the *Satsaī*, in which work Tulsī unfolds his system of doctrine.

and this place in the popular religion of northern India, see Dr Grierson's paper in the *Journal of the Royal Asiatic Society*, July 1903, pp. 447-466. (C. J. L.)

TULU, or TULUVA, a language of the Dravidian family, found chiefly in the South Kanara district of Madras. It has no literature, nor has it been adopted for official use even where it is spoken by the majority of the population. In 1901 the total number of speakers of Tulu exceeded half a million.

TUMBLER, that which "tumbles," *i.e.* falls or rolls over or down. The O. Eng. *tumbiare*, of which Mid. Eng. *tumblere* is a frequentative form, appears also in Du. *tuimelen*, Ger. *taumeln*, to stagger, tumble about; Fr. *tomber*, to fall, is Teutonic in origin. As applied to a person, "tumbler" is another word for an acrobat, one who shows his agility by turning somersaults, standing on his head, walking or dancing on his hands, &c. It is interesting to note that Herodias' daughter Salome is described as a *tumbestere* in Harl. MS., 1701, f. 8, quoted by Halliwell (*Dict. of Archaic Words*), and in the margin of Wycliffe's Bible (Matt. xiv. 6) *tumblide* is given as a variant of daunside (danced). Similarly, in early pictures of her dancing before Herod, she is represented sometimes as standing on her head. The common drinking-glass known as a "tumbler," which now is the name given to a plain cylindrical glass without a stem or foot, was originally a glass with a rounded or pointed base, which could only stand on being emptied and inverted (see DRINKING VESSELS, Plate I., fig. 3).

TUMBLE-WEED, a botanical term for a plant which breaks loose when dry, and is blown about, scattering its seeds by the way.

TUMKUR, or TOOMKOOR, a town and district of southern India, in the west of Mysore state. The town has a station on the Madras & Southern Mahratta railway, 43 m. N.W. from Bangalore. The area of the district is 4158 sq. m. It consists chiefly of elevated land intersected by river valleys. A range of hills rising to nearly 4000 feet crosses it from north to south, forming the waterparting between the systems of the Krishna and the Cauvery. The principal streams are the Jayamangala and the Shimsha. The mineral wealth of Tumkur is considerable; iron is obtained in large quantities from the hill-sides; and excellent building-stone is quarried. The slopes of the Devaray-durga hills, a tract of 18 sq. m., are clothed with forests, in which large game abounds, including tigers, leopards, bears and wild hog. The climate of Tumkur is equable and healthy; the annual rainfall averages 39 in.

The population in 1901 was 679,162, showing an increase of 17% in the decade. The cultivated products consist chiefly of millets, rice, pulses and oil seeds. The chief industries are the making of coarse cotton cloths, woollen blankets and ropes.

TUMMEL, a river of Perthshire, Scotland. Discharging from Loch Rannoch, it flows eastward to a point near the Falls of Tummel, where it bends to the S.E., a direction which it maintains until it falls into the Tay, just below Logierait, after a course of 58 m. from its source in Stob Ghabbar (3565 ft.). Its only considerable affluent is the Garry, 24 m. long, an impetuous river which issues from Loch Garry ($2\frac{1}{2}$ m. long, $\frac{1}{4}$ m. wide, and 1334 ft. above the sea). About midway in its course the Tummel expands into Loch Tummel ($2\frac{3}{4}$ m. long, $\frac{1}{2}$ m. wide, 128 ft. deep, and 500 ft. above the sea), between which and the confluence with the Garry occur the Pass and Falls of the Tummel, which are rather in the nature of rapids, the descent altogether amounting to 15 ft. The scenery throughout this reach is most picturesque, culminating at the point above the eastern extremity of the loch, known as Queen Victoria's View. The chief places of interest on the river are Kinloch Rannoch; Dunalastair, a rocky hill in well-wooded grounds, the embellishment of which was largely due to Alexander Robertson of Struan (1670-1749), the Jacobite and poet, from whom the spot takes its name ("the stronghold of Alexander"); Foss; Faskally House (beautifully situated on the left bank); Pitlochry; and Ballinluig.

TUMOUR (Lat. *tumor*, a swelling), a term applied, from the earliest period of medical literature, to any swelling of which the nature and origin were unknown. Thus used in its most literal sense, the word is of purely clinical derivation and has no pathological significance of any kind. Consequently a very heterogeneous collection of swellings have been described as tumours, including such diverse conditions as an abscess, a tubercular gland, the enlarged spleen of malaria or a cancer. With the progress of bacteriology and the improved technique of histology it has been found possible, however, to separate these various "swellings" into certain groups: (1) *Inflammatory or Infective Tumours*; (2) *Tumours due to Hypertrophy*; (3) *Cysts*; (4) *Spontaneous Tumours, or Tumours proper*. The tendency of modern convention is to restrict the use of the term "tumour" to the last group, but for the sake of completeness it is necessary to touch briefly on the distinguishing features of the first three groups.

1. *Inflammatory or Infective Tumours.*—These have certain characteristics which separate them sharply from other classes of tumour. In the first place all of them are due to the irritative action of some micro-organism (see PATHOLOGY). Inflammation due to microbial action always follows a typical course. First, a number of wandering cells derived from the blood, the lymph or the connective tissues make their way to the site of irritation, and thus produce the red, painful swelling with which every one is familiar. A struggle now ensues between these cells and the invading bacteria; if the victory rests with the former, the inflammation gradually subsides, and the swelling disappears in course of time. But if the bacteria gain the upper hand a number of the cells are killed, undergo liquefaction and are converted into pus, so that an abscess results. Thus an inflammatory swelling may be solid or fluid according to the severity of the irritant. The common inflammatory bacteria—staphylococcus and streptococcus—cause suppuration in the majority of cases, but there are a few organisms such as streptothrix, spirochaeta pallida, and in many instances the tubercle bacillus, which set up an inflammation of an extremely chronic type, rarely progressing to the formation of pus, but leading rather to the development of a hard, solid mass of very slow growth, that may persist for months or even years.

To the naked eye these solid inflammatory swellings may closely simulate the spontaneous tumours with which they have been often confused, but a microscopical examination will correct the mistake in nearly every case. For the minute structure of the infective tumours, whatever their situation, is almost identical; they consist merely of an irregular collection of inflammatory cells; and this of itself is sufficient to mark them off quite distinctly from the group of tumours proper, which, as will presently be seen, vary widely in structure according to the tissue from which they spring, and show a resemblance to the parent type at once characteristic and peculiar. To this statement there is one exception, for a form of malignant tumour, known as a sarcoma, may bear a very deceptive likeness to an inflammatory swelling.

2. *Hypertrophic Tumours.*—A tissue or organ is said to be hypertrophied when it is increased in size but remains normal in structure. The most familiar example is the hypertrophy of the skeletal muscles that follows increased use, or the hypertrophy of the heart muscle which helps to compensate the faulty action of the valves. But neither of these constitutes a hypertrophic tumour. For an instance of this we must turn to the enlargement of the spleen that occurs in malaria and certain forms of anaemia, of the thyroid gland in goitre, and of the lymphatic glands in Hodgkin's disease. In each of these conditions there is merely an increase of apparently normal tissue, and from a microscopical examination of the hypertrophied organ it would be impossible to say that it was other than healthy.

The enlargement of the spleen and of the thyroid in these cases are overshadowed by certain changes in the blood and in the nervous system which constitute a distinct disease; but in Hodgkin's disease there are no specific symptoms apart from the swelling of the glands, and it has been suggested that this may be due either to the action of some micro-organism which has hitherto escaped detection, or to a widely diffused growth of a sarcomatous type. If the former supposition be correct these glandular swellings must be classed with the infective tumours; if the latter they should be regarded as spontaneous tumours. There is, at present, no agreement on this point, and they have, therefore, been described here as hypertrophic tumours.

3. *Cysts.*—A cyst may be defined as a collection of fluid surrounded by a wall or capsule. The nature of the fluid varies according to the site and origin of the cyst; the cyst-wall is usually composed of a tough layer of fibrous tissue. Cysts arise by the dilatation of a pre-existing space with fluid; and when, as often happens, the cyst-wall is tensely stretched by the pressure of the fluid within, they may easily be mistaken for solid tumours.

The number and variety of cysts are very great, and they are only mentioned here on account of the errors in diagnosis for which they are often responsible. For further details the reader should consult the special textbooks.

4. *Spontaneous Tumours, or Tumours Proper* (*synonyms: Neoplasm, New Growth*).—The following definition of a spontaneous tumour suggested by Ziegler is perhaps the most satisfactory: "A neoplasm or tumour is a new formation of tissue, which is atypical in structure, serves no useful purpose to the whole economy, and the growth of which has no typical termination." In this definition the words "new formation of tissue" exclude the cystic swellings; the attribute "atypical in structure" excludes hypertrophies; and the final clause "the growth of which has no typical termination" excludes all swellings of an inflammatory nature which progress, however slowly, towards either suppuration or resolution and recovery.

These tumours arise by the exaggerated and abnormal proliferation of a single cell, or a group of cells. They increase in size solely by the multiplication of their own cells, and the only contribution which the surrounding tissues make to the progress is the formation of a "stroma," or supporting framework of fibrous tissue; and even that is wanting in many cases. Inasmuch as the newly-formed cells of the tumour take on the likeness of the parent from which they are sprung, it follows that the minute structure of such a tumour, whatever its situation, will be a more or less exact copy of that of the tissue whence it originated. A tumour growing from the skin will therefore imitate the cell-structure of the normal skin; the resemblance of a breast tumour to the healthy breast is often so close as to make it a hard task to distinguish the one from the other; whilst the similarity of bony and cartilaginous tumours to true bone and cartilage is evident to all.

This imitation of the parent type by the spontaneous tumours is one of their most remarkable characteristics, and provides a reliable criterion by which they may be separated from the inflammatory new growths, which are all built up on the same general plan. Consequently it is almost always possible to determine the origin of a tumour from an examination of its histological appearances; and conversely we know that an epithelial tumour will never spring from a connective tissue nor a connective tissue tumour from an epithelium.

Another outstanding feature of the neoplastic tumours is that they lead an entirely independent existence subject to none of the restraints to which the normal cell must needs submit. These normal cells are, indeed, possessed of certain limited powers of multiplication, by which they are enabled to replace the slight loss of tissue which the wear and tear of life perpetually entails; or, again, they can on occasion make good a greater loss of substance, as in the healing of an ulcer, or the regeneration of a skin wound. But these powers are confined within certain well-marked bounds, which may not be transgressed. Contrast with this the tumour cell, emancipated from all control and owning to no restraint. It is true that the simple tumours often remain stationary after attaining a certain size, but the general tendency of all tumours is towards persistent and unlimited growth, and the cancer cell continues its career unchecked by everything save death.

The spontaneous tumours are seen in every tissue and organ of the body, though in some they are relatively infrequent. Nor are they confined to man, for they have been found throughout the vertebrate kingdom. It is often stated that a higher state of civilization has inflicted on European races a greater susceptibility to tumour formation. As to this, reliable evidence is hard to obtain, but such a statement would seem to be only partially true, and the apparent immunity of certain native races is to some extent due to lack of sufficient observations.

It is usual to separate these tumours into two groups: the *Non-malignant, Innocent or Benign*, and the *Malignant or Cancerous*. Of these two groups the latter are the more familiar and have attracted much more attention and study than the former, on account of the danger to life which they involve, but in point of numbers they are greatly outweighed by the first group. Two or more non-malignant tumours, of the same or different varieties, are often found in the same individual; but with the cancers this is a rare occurrence, and such growths are usually single.

The non-malignant tumours are usually rounded in shape. In size they vary enormously; a fibroid tumour may be as small as a pea; a fatty tumour may weigh forty pounds. Often they cease growing after attaining a certain size, but there are very many exceptions to this, and it is seldom possible to predict the subsequent course of one of these growths. They possess, however, four constant characteristics by which they may be distinguished from the malignant variety.

1. A non-malignant tumour, whatever its size, remains localized to the part from which it originates. It is not an "infiltrating" growth, that is to say it does not eat its way into the surrounding tissues, but rather pushes them aside, and so may be called "expansive." Moreover, it is separated from them by a thin but usually well-marked layer of fibrous tissue known as the "capsule" of the tumour, which seems to be formed as the result of a slight inflammation that the presence of the tumour always causes among the healthy tissues surrounding it, and may be regarded as a protest on their part against the invasion of the tumour.

2. Non-malignant tumours are not of themselves dangerous to life. They may, however, cause a great deal of pain and even death, when situated in some sensitive or delicate organ. For instance, a small tumour may cause intense pain by pressing on a nerve, or dropsical swelling of a limb by obstructing a vein, or death from suffocation by blocking the larynx. Nevertheless it remains true that any evil effects are due not to the nature of the tumour, but to its situation, whereas a cancer causes death whatever its position.

3. These tumours never reproduce themselves in distant parts of the body. More than one may be present in the same individual, but each arises independently, and the widespread dissemination so typical of a cancerous growth is never seen.

4. An innocent growth never recurs after operation. The boundaries of the growth are so well defined that complete removal is usually easy, and the operation is a simple and satisfactory proceeding.

Malignant Tumours, or Cancers.—There are two varieties of malignant tumour: the *Sarcomata*, arising from the connective tissues; the *Carcinomata*, arising from epithelial tissues. It is customary to describe them both as cancers. The main features of these tumours are as follows:—

1. *The Infiltrating Nature of a Malignant Tumour.*—A cancer follows a course very different from that of an innocent tumour. Its growth has no appointed termination, but continues with unabated vigour until death; moreover, it is more rapid than that of the innocent tumours, and so does not permit of the formation of a capsule by the neighbouring tissues. In consequence such a tumour shows no well-defined boundary, but from its margin fine tendrils of cancer cells make their way in all directions into the surrounding parts, which gradually become more and more involved in the process. Thus a cancer of the breast will attack both the skin covering it and the underlying muscle and bone; a cancer of the intestine will eat its way into the liver, spleen and kidney, until these organs become to a great extent replaced by cancer cells, and can no longer perform their proper functions.

2. *Formation of Secondary Growths, or Metastases.*—In addition to this spread of growth by direct extension, another characteristic of malignant tumours is a tendency to dissemination, that is, to reproduce themselves in various parts of the body far removed from the original site; so that it is not unusual to find after death that a cancer of the breast has given rise to secondary, or metastatic, deposits in the lymphatic glands, the lungs, the ribs and other bones, the brain and the abdominal organs. These secondary deposits are due to the tumour cells making their way through the walls of the small lymph and blood vessels and becoming detached by the force of the circulation, by which they are carried to some distant part of the body, there to continue their career of uncontrolled growth.

The sarcomata and carcinomata differ somewhat as regards the path of dissemination. The former are vascular tumours, well supplied with blood-vessels; consequently dissemination usually occurs by way of the blood-stream rather than by the lymphatic circulation, and the commonest site for the secondary deposits of sarcoma is the lung. The carcinomata are less vascular, and the tendency of the growth is to invade the small lymph channels, so that the first signs of metastases are to be looked for in the lymphatic glands; at a later date these deposits may be spread throughout the body, particularly in the liver and other abdominal organs, the lungs and the bones.

The formation of metastases is of the utmost importance from a clinical point of view, as the success of an operation depends on the removal of all the secondary deposits as well as of the original growth. For instance, a few months after the first appearance of a cancer of the breast the axillary lymph glands will be found to be hard and enlarged. This means that some of the cells of the primary growth have been carried in the lymph stream to these glands, and have begun to grow there; consequently any operation for the removal of the cancer of the breast must include the removal of these glands. If the breast tumour only be taken away the growth will continue unchecked in the glands. It is a matter of great difficulty to determine by the naked eye or the touch whether a gland is infected or not. In many cases where there is no evident enlargement the microscope will show the presence of cancer cells; and a certain opinion can only be given after a microscopical examination.

In operations for cancer of the breast or tongue the modern practice is to regard the lymphatic glands of the axilla or neck respectively as infected in every case, however early it be, and to remove them accordingly. In other parts of the body where the glands are inaccessible, the only solution of the difficulty is to urge the removal of the tumour at the earliest possible moment, before lymphatic infection has had time to occur.

The frequency and rapidity of metastasis formation varies greatly. As a general rule cancer of the breast is more liable than other forms of growth to be followed by widespread secondary deposits. On the other hand, in cases of cancer of the skin secondary infection is usually confined to the neighbouring lymphatic glands, and seldom occurs in any of the internal organs.

3. *Termination of Malignant Tumours.*—In one or two well authenticated cases a malignant tumour has disappeared of its

own accord without any treatment, and a natural cure may be said to have occurred. But these form such an infinitesimal proportion of the whole that they do not affect the general truth of the statement that the universal tendency of a malignant tumour is to cause death.

Although the separation of the new growths into two groups is supported by certain fairly definite characteristics, both clinical and histological, yet it seems likely that the difference between them is one of degree rather than of kind. There is every reason to believe that the same perverted impulse may give rise either to an innocent or a cancerous growth, the issue depending in part on the intensity of the impulse, and in part on the resisting powers of the tissues in which the incipient tumour cells lie. Such a hypothesis is supported by the analogy of the microbial infections, where the final outcome of life or death depends no less on the defensive mechanism of the individual than on the virulence of the infecting organism. Again, it is beyond doubt that occasionally a tumour, which for years has been void of the least taint of malignancy, may become converted into an active cancer. Moreover, certain tumours seem to lie on the border line, for example, rodent ulcers and cancers of the parotid gland. These are malignant in that they are undoubtedly infiltrating tumours, they are innocent in that they never form metastatic deposits. Therefore it seems that malignancy or the reverse is not to be regarded as an absolute and constant attribute of any particular tumour or class of tumours, but rather as an expression of the balance struck in the conflict between the opposing forces of the tumour and its host.

Histology of Tumours.—On examining a microscopical preparation of an epithelial tumour it is found to be built up of two distinct elements. There are the epithelial cells, which form the essential part of the tumour; there is a network of fibrous connective-tissue cells, which acts as a supporting framework to the epithelial elements, and is known as the stroma of the tumour. This twofold structure is seen in all the epithelial tumours, both non-malignant and malignant, and in the case of the latter it is a general rule that the greater the proportion of epithelial to connective-tissue elements the faster will the tumour grow. On the other hand in the connective-tissue tumours (with the exception of the sarcomata) this compound structure is absent and there is only one type of cell present; thus a fatty tumour consists merely of fat cells; a bony tumour of bone cells, and so on.

To understand clearly the differences and likenesses that obtain between the malignant and the non-malignant new growths it is necessary to compare the histology of the two groups.

Figs. 1*a*, 1*b* represent an innocent tumour (adenoma) of the breast. Figs. 2*a*, 2*b* a cancer (spheroidal-celled carcinoma) of the breast. Fig. 3 an innocent tumour (papilloma) of the skin. Fig. 4 a cancer of the skin.

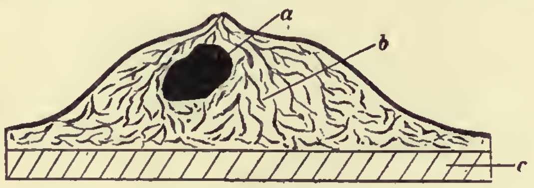

FIG. 1*a*.—Diagram to show the relations of an innocent tumour (adenoma) of the breast.

a, Tumour; *b*, normal breast tissue; *c*, underlying muscular tissue.

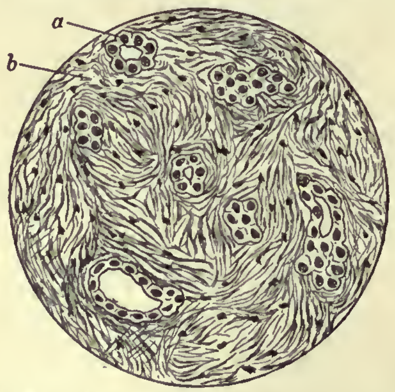

FIG. 1*b*.—Microscopical appearances of an adenoma of the breast. (Drawn from an actual specimen. × 200).

a, Tumour cells; *b*, fibrous connective tissue.

In the adenoma the individual cells bear the closest resemblance to the glandular cells of the normal breast from which they are derived. In addition they tend to follow the normal very closely in their arrangement, so that at times it is difficult or impossible to decide which is tumour and which is healthy breast substance. Finally the growth is surrounded by a well defined capsule of fibrous tissue.

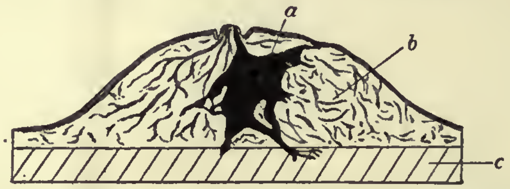

FIG. 2*a*.—Diagram to show the relations of a malignant tumour (spheroidal cell carcinoma) of the breast. Note the indrawing of the nipple by the growth and the infiltration of the underlying muscle.

a, Tumour; *b*, normal breast tissue; *c*, muscle.

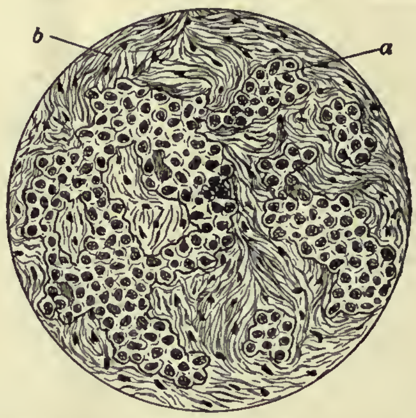

FIG. 2*b*.—Microscopical appearances of a carcinoma of the breast. (Drawn from an actual specimen. × 200).

a, Tumour cells; *b*, stroma.

In the carcinoma, the individual resemblance is present, though less conspicuous, as many of the cells are irregular in size and shape. But the similarity of the arrangement is very hard to make out or even absent. The cells are arranged in disorderly masses; they are not enclosed by any semblance of a capsule, but tend to transgress their proper boundaries and invade the underlying muscles. Figs. 3 and 4 show analogous changes in an innocent and in a malignant tumour of the skin.

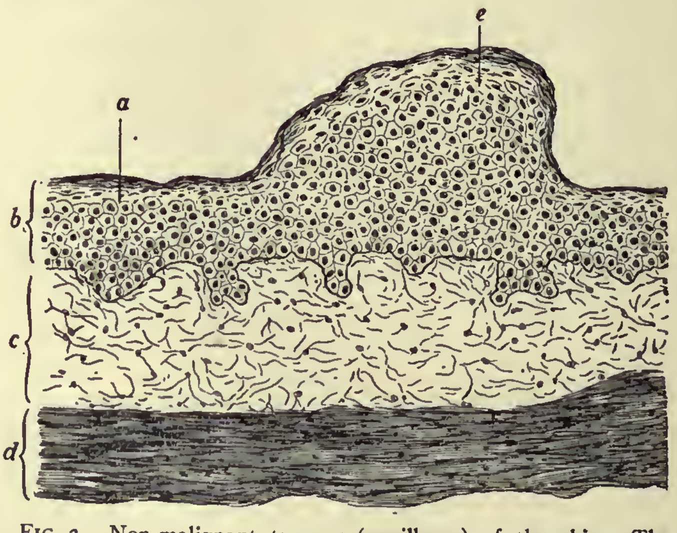

FIG. 3.—Non-malignant tumour (papilloma) of the skin. The tumour is formed by an outward proliferation of the cells of the epidermis, but these cells show no tendency to invade the underlying connective tissue or muscle. (Semidiagrammatic. × 150.)

a, Normal skin. *b*, Epithelium or epidermis. *c*, Connective tissue. *d*, Muscular tissue. *e*, Papilloma.

Speaking generally it may be said that the cells of an adenoma are fully differentiated and typical of the normal, whereas the cells of a carcinoma show less perfect differentiation, are in some degree atypical and resemble rather the actively growing cells found at an early stage of embryonic life. But it is in the cells of a sarcoma that the widest departure from type is seen. A sarcoma is a malignant growth arising from connective tissue, but the resemblance to adult connective tissue is almost non-existent and the cells are essentially of an embryonic type. These differences between the innocent and the malignant cell bear out the well-established physiological rule that the less the functional development of a cell or tissue the greater its power of growth. The primitive impulse is growth, which gives place at a later stage to the development of function.

FIG. 4.—Malignant tumour (epithelioma, squamous-celled carcinoma) of the skin. The cells of the epidermis have proliferated both outwardly and inwardly and have invaded and replaced the underlying tissues. An ulcer has been formed on the surface by the necrosis of the superficial cells. (Semidiagrammatic. × 150.)

In theory it is always possible to distinguish with certainty between an innocent tumour and a cancer by means of the microscope. In practice this is, unfortunately, not the case. There are some tumours whose histological appearances seem to be on the borderline between the two conditions, and often these are the very cases in which the clinical features give no direct clue to their nature. In such circumstances it is only by taking into consideration every detail, both clinical and pathological, that an opinion can be formulated, and even then it remains to some extent a matter of guesswork.

The Causation of Tumours.—An enormous number of suggestions as to the causation of tumours have been put forward from time to time. Many of these were at the outset quite untenable, and reference can only be made here to the more important.

First in point of time came *Virchow's hypothesis* that tumours arise as the direct result of irritation or injury. Many examples of such a sequence of events are familiar to everybody. A cancer of the lip or tongue will often follow the irritation of a clay pipe or a jagged tooth; a tumour of the breast is often attributed to a blow. But, on the other hand, there must be innumerable instances in which such a cause of irritation has not been followed by a tumour; and it is necessary to discount the natural anxiety of mankind to seek a cause for every unexplained occurrence, so that a slight injury which under ordinary circumstances would be forgotten is branded as the undoubted cause of any tumour that may subsequently make its appearance. As a complete explanation Virchow's hypothesis is insufficient, but it is quite probable that irritation may have an accessory or predisposing influence in tumour formation, and that it may be enough finally to upset the balance of a group of cells, which for some other reason were already hovering on the brink of abnormal growth.

There is one peculiar form or irritation that demands special attention, that is exposure to the X rays. It is beyond doubt that exposure to these rays will cause cancerous ulceration of the skin; though what is the constituent of the rays that produces this effect is not known. Fortunately the danger can be obviated by the use of rubber gloves.

Cohnheim's Hypothesis of Embryonic Remnants.—According to Cohnheim more cells are produced in embryonic life than are required for the development of the body, and a remnant is left unappropriated. Owing to their embryonic nature, these cells possess an exaggerated power of proliferation, and if at a later period of life this should be roused into activity by some mechanical or other form of stimulus, their rate of growth will outstrip that of the adult cells and a tumour will develop. As with Virchow's so with Cohnheim's hypothesis. It is at best only a partial explanation which may be applicable to a small proportion of tumours; and it could never account for X-ray cancer, or the inoculability of mouse cancer.

The *Parasitic hypothesis* is still a matter of keen debate. In some degree cancer with its localized primary growth and widespread secondary deposits resembles certain infective diseases of microbial origin, such as pyaemia, where from a small primary site of infection the bacteria become disseminated throughout the body. From this analogy it was argued that tumour formation was due to the activity of some parasite. But if the mode of dissemination of a cancer and of a micro-organism be carefully examined this analogy is found to be false. When a micro-organism lodges in a gland or other part of the body, by its irritative action it stimulates the cells of that gland to increased activity, and any swelling that occurs is produced by the proliferation of those cells. But when a group of cancer-cells is deposited in a gland the subsequent growth arises entirely from the multiplication of those cancer-cells, and the gland cells take no part whatever in its formation.

A very large number of organisms both animal and vegetable have been described as occurring in tumours; and some of these have been cultivated on artificial media outside the body; but to none of them can any direct causal relationship with cancer be attributed. One of the best authenticated, a small coccus, known as *Micrococcus neoformans* can certainly be cultivated from many tumours malignant and innocent, and it has been suggested that it may be responsible for the slight inflammatory changes that occur in the neighbourhood of most new growths. The final and critical test of the connexion of an organism with some diseased condition is the production of a similar condition in animals by inoculation of that organism, and this experiment has signally failed with all the suggested cancer parasites. Another very cogent argument against the infective hypothesis is the fact that although tumours of identical structure are found throughout the vertebrate kingdom, it has never yet been found possible artificially to transmit these tumours from one species to another. If they were of an infective nature it is almost inconceivable that the gap between two allied species should be such an insuperable bar to transmission.

Quite recently Borrel of the Pasteur Institute has stated that certain animal parasites from the skin are often to be found buried in the cell masses of cancers of the skin and breast, and he thinks that these parasites may be the carriers of some as yet unknown cancer virus, just as the mosquito is the carrier of malaria.

Ribbert has suggested that tumour formation may be due to "alteration of tissue tension." In his opinion the various cells of the body are normally held in a state of equilibrium by some condition of mutual interdependence amongst themselves. Should this equilibrium be disturbed some of these cells may escape from the controlling influence usually exercised upon them by their neighbours, and become endowed with greatly enhanced powers of growth.

Adami considers that every cell possesses two distinct properties, a property of function and a property of growth, and he regards these as incompatible, that is to say, a cell cannot at the same time be carrying out a specific function and also undergoing active growth. He believes that on occasion some of these cells may abandon their "habit of work" and assume a "habit of growth," and this will lead to the development of a tumour.

Neither of the two latter explanations brings us very much nearer the solution of the question—they merely place the unknown factor one step farther back; but they serve to emphasize the biological aspect of the problem. At the present time the general weight of evidence seems to favour the idea that tumour formation is due to some intrinsic cause, whereby the normal processes of growth are disturbed, rather than to any extrinsic cause such as microbial infection. Therefore it is from a careful study of the laws of growth, and from research directed along broad biological lines that the best results are to be looked for in the future.

Classification of Spontaneous Tumours.—So little is known as to the nature of these tumours that a satisfactory classification on a scientific basis is not yet within reach. The following is merely suggested as convenient:—

I.—*Connective-tissue Tumours.*

Innocent.	*Malignant.*
Lipoma (fatty tumour).	
Fibroma (fibrous tumour).	Sarcoma.
Myoma (muscular tumour).	Endothelioma.
Osteoma (bony tumour).	
Chondroma (cartilaginous tumour).	
Odontoma (tumour in connexion with teeth).	
Myxoma (mucoid tumour).	
Neuroma (tumour in connexion with nerves).	
Glioma (neuroglial tumour).	
Endothelioma (endothelial tumour).	
Angioma (tumour composed of blood vessels).	

II.—*Epithelial Tumours.*

Innocent.	*Malignant.*
Papilloma.	Carcinoma.
Adenoma.	Rodent Ulcer.

I. *Connective-tissue Tumours.*[1]—*Lipoma* (fig. 5).—Of the connective-tissue group the fatty tumours are the most common. They often arise from the layer of fat beneath the skin, and a usual site for these subcutaneous lipomata is the back of the trunk, though at times they are found on the limbs and elsewhere. They

[1] Figs. 5, 6, 7, 8, 9, 14, 15 and 17 have been redrawn from Bland Sutton's *Tumours*, by permission; figs. 10, 11, 12 and 13 are from Rose & Carless, *Surgery*, by permission.

are soft, painless swellings, sometimes of great size; though usually single, as many as a dozen may be present in the same individual. Lipomata are also found in the abdominal cavity, growing from the subperitoneal layer of fat.

FIG. 5.—Lipoma of the palm.

What is known as a *diffuse lipoma* (fig. 6) consists of a generalized overgrowth of the subcutaneous fat of the neck, and this may be so extensive as to obliterate the outline of the jaw.

FIG. 6.—Diffuse lipoma of the neck.

Fibroma (fig. 7).—Of tumours containing fibrous tissue, by far the most important are the fibroids of the uterus. A better name for these tumours would be Fibromyomata, as they always contain a varying proportion of muscle fibres. They originate in the wall of the uterus, but generally come to project either internally into the cavity of the uterus, or externally into the peritoneal cavity; and often their sole connexion with the uterine wall is a stalk or pedicle formed from the capsule of the tumour. Fibromyomata of the uterus are most common from 35 to 45 years of age; in girls under 20 they are almost unknown. They may attain a great size and are often multiple. They seem to be equally common in married and unmarried women. Not every fibroid is a source of danger or discomfort, for in the majority of cases they are discovered by chance or not until after death. On the other hand they may give rise to severe symptoms, and that in many different ways. First, they may cause haemorrhage prolonged over years so that the health is entirely ruined. Secondly, they may become inflamed and septic, and lead to severe blood-poisoning. Next, for some unknown reason, a fibroid tends to prevent conception, whilst, should pregnancy occur, labour is greatly impeded. Finally, it seems to be established that a fibroid may occasionally become converted into a sarcoma.

FIG. 7.—Uterus in sagittal section showing interstitial and submucous fibroids.

Examples of *pure* fibrous tissue tumours are the small multiple growths of the subcutaneous tissue, known as *Painful subcutaneous nodule*, and the irregular outgrowth from the gum known as *Epulis*.

A *Myoma* is composed of unstriped muscle fibres. It is a rare tumour sometimes found in the oesophagus, stomach and bladder.

Osteoma (fig. 8).—Bony tumours not infrequently arise from the bones of the head or face. They grow very slowly, and are so hard that surgical removal may be very difficult. They also occur as irregular outgrowths from the bones of the limbs, and are then known as *Exostoses* (fig. 9). A common site for these is the inner and lower end of the femur, at the point of attachment of the adductor muscle, and such a tumour seems to originate from an ossification of the tendon of this muscle.

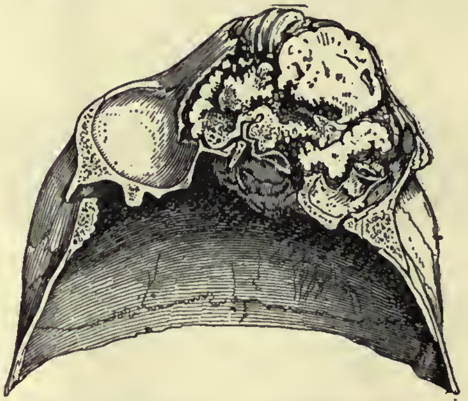

FIG. 8.—Osteoma of the left frontal sinus (seen from below).

FIG. 9.—Exostosis of the femur produced by the ossification of the tendon of the adductor magnus.

FIG. 10.—Multiple chondromata of the fingers.

Chondroma (fig. 10).—Cartilaginous tumours are often found in children and young people growing from the bones of the limbs in the neighbourhood of the joints. They are frequently multiple, especially in the hands and feet. These tumours grow slowly and are quite painless. Should removal be necessary, it is usually an easy matter.

Odontoma.—Several varieties of this tumour have been described arising in connexion with the teeth and due to delayed or faulty development. They may cause great deformity of the jaw.

A *Myxoma* is composed of loose, gelatinous connective tissue similar to that found in the umbilical cord. Some nasal polypi seem to be of this nature, but true myxomatous tumours are rare. It is, however, not uncommon for a fibroma or a sarcoma to be converted by degeneration into myxomatous-like tissue.

Neuroma.—A pure neuroma is very uncommon, but a tumour known as a *Pseudo-neuroma* (fig. 11) is often found in the course of a nerve. This is formed by a localized overgrowth of the fibrous tissue of the nerve sheath.

Glioma.—This variety of tumour arises from the neuroglia, the supporting tissue of the brain and spinal cord. Consequently gliomata are only found in these two structures.

FIG. 11.—Pseudo-neuroma: fibrous tumour growing from nerve sheath, and causing the fibres to be stretched over it.

Endothelioma.—Of late years a small class of tumour has been described as originating apparently from the endothelium lining the lesser blood and lymph channels. Many of the recorded examples have been connected with the mouth, the tongue, the palate or the parotid gland. Some of these tumours are quite innocent, others are typically malignant.

An *Angeioma* consists of a meshwork of blood-vessels bound together by a small amount of fat and fibrous tissue. Two varieties are described: (*a*) The *simple naevus*, or *port-wine stain*, scarcely deserves to be called a tumour. It appears as a reddish-blue discolouration of the skin due to over growth and dilatation of the underlying blood-vessels. This condition is most commonly found on the face or scalp, and may be of congenital origin. (*b*) In the *cavernous naevus* the vascular hypertrophy is on a larger scale, and may produce a definite pulsating tumour. Here, again, the head is the usual situation.

Sarcoma.—This is the malignant type of the connective-tissue tumour. The general arrangement of a sarcoma shows a mass of atypical cells loosely bound together by a small amount of connective tissue. The cells vary greatly in size and shape in different tumours, and in accordance with the prevailing type the following varieties of sarcoma have been described: (i.) *round-cell sarcoma*, (ii.) *spindle-cell sarcoma*, (iii.) *melanotic sarcoma*, (iv.) *myeloid sarcoma*. The first two groups contain the great majority of all sarcomata, and may occur in almost any part of the body, but they are especially liable to attack the bones (fig. 12). A sarcoma of bone may be either *periosteal* when it grows from the periosteum covering the outer surface of the bone, or *endosteal* when it lies in the medullary cavity. A peculiar form of sarcoma is found in the parotid and other salivary glands. The cells are usually spindle-shaped, and among them lie scattered masses of cartilage and fibrous tissue. These tumours are seldom very malignant, and dissemination is rare (fig. 13). The *melanotic sarcoma* is of a brown or black colour owing to the presence of granules of pigment (melanin) in and among the tumour cells. A melanotic sarcoma may arise from a pigmented wart or mole, or from the pigmented layers of the retina. The primary growth is usually small, but dissemination occurs with great rapidity throughout the body. The *myeloid sarcoma*, or *myeloma* (fig. 14), is composed of very large cells like those of bone-marrow from which it is probably derived. It is only found in the interior of bones, chiefly in those of the arm and leg. The degree of malignancy is low, dissemination never occurs, and recurrence after operation is rare.

FIG. 13.—Malignant tumour of the parotid gland.

FIG. 14.—Lower end of a femur in longitudinal section, showing a myeloma.

II.—*Epithelial Tumours.*

Papilloma.—The familiar example of a papilloma is the simple wart, which is formed by a proliferation of the squamous epithelium of the skin (fig. 3). It seems probable that some warts are of an infective nature, for instances of direct contagion are not uncommon. Occasionally warts are pigmented, and are then liable to be the seat of a melanotic sarcoma. Papillomata are also found in the bladder (fig. 15), as long delicate filaments growing from the bladder wall. These consist of a connective-tissue core covered by a thin layer of epithelium.

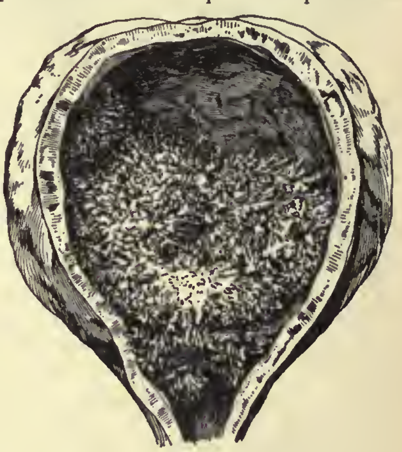

FIG. 15.—Villous papilloma of the bladder.

Adenoma.—(Figs. 1*a* and 1*b*). The glandular tumours are of very common occurrence in the breast, the ovary and the intestinal canal. The structure of an adenoma of the breast has already been described (*vide supra*), and the structure of other adenomata is on the same general plan. The main features of an innocent glandular tumour are: (*a*) the presence of a rounded, painless swelling with a well-defined margin; (*b*) the swelling is freely movable in the surrounding tissues, and if it lies close beneath the skin it is not attached thereto; (*c*) there is no enlargement of the neighbouring lymphatic glands.

Carcinoma.—The following varieties of carcinoma are described:—

i. *Squamous-cell carcinoma* (fig. 4), arising from those parts of the body covered by squamous epithelium, namely the skin, the mouth, the pharynx, the upper part of the oesophagus and the bladder.

ii. *Spheroidal-cell carcinoma* (figs. 2*a* and 2*b*), arising from spheroidal epithelium, as in the breast, the pylorus, the pancreas, the kidney and the prostrate.

iii. *Columnar-cell carcinoma* (figs. 16 and 17), arising from columnar epithelium, as in the intestine.

The general histology of these tumours corresponds to that of a spheroidal-cell carcinoma already described (*vide supra*), the only variation between the three groups being in the shape of the cells. The clinical characteristics of a carcinoma, whatever its situation, are: (*a*) the presence of a swelling which has no well defined margin, but fades away into the surrounding tissues to which it is fixed; (*b*) when the tumour lies near the skin (*e.g.* a carcinoma of the breast) it becomes fixed to this at an early date; (*c*) the tumour is painful and tender, the degree of pain varies widely,

FIG. 17.—Cancer of the sigmoid flexure of the colon.

and in the early stages there may be none; (*d*) the neighbouring lymphatic glands soon become enlarged and tender, showing that they are the seat of metastatic deposits; (*e*) in squamous carcinoma of the skin, ulceration speedily occurs.

Rodent Ulcer.—This shows itself as a slowly progressing ulceration of the skin, and is especially common on the face near the eye or ear. The condition is one of purely local malignancy, and dissemination does not occur. It is believed to be a carcinoma of the sebaceous glands of the skin. (L. C.*)

TUMULUS, a Latin word meaning a heap or mound, also used in classical writings in the secondary sense of a grave. In Roman epitaphs we meet with the formula *tumulum faciendum curavit,* meaning the grave and its monument; and on the inscribed monumental stones placed over the early Christian graves of Gaul and Britain the phrase *in hoc tumulo jacet* expresses the same idea. But among archaeologists the word is usually restricted in its technical modern application to a sepulchral mound of greater or less magnitude. The mound may be of earth, or of stones with a covering of earth, or may be entirely composed of stones. In the latter case, if the tumulus of stones covers a megalithic cist or a sepulchral chamber with a passage leading into it from the outside, it is often called a dolmen. (See STONE MONUMENTS, BARROW and CAIRN.) The custom of constructing sepulchral tumuli was widely prevalent throughout the prehistoric ages and is referred to in the early literature of various races as a fitting commemoration of the illustrious dead. Prehistoric tumuli are found abundantly in almost all parts of Europe and Asia from Britain to Japan. They occur with frequency also in northern Africa, and in many parts of North and South America the aboriginal populations have practised similar customs. Sepulchral tumuli, however, vary so much in shape and size that the external appearance is no criterion of age or origin. In North America, especially in the Wisconsin region, there are numerous mounds made in shapes resembling the figures of animals, birds or even human forms. These have not been often found to be sepulchral, but they are associated with sepulchral mounds of the ordinary form, some of which are as much as 300 ft. in diameter and 90 ft. in height. Perhaps the largest tumulus on record is the tomb of Alyattes, king of Lydia, situated near Sardis, constructed in his own lifetime, before 560 B.C. It is a huge mound, 1180 ft. in diameter and 200 ft. high. In south-eastern Europe, and especially in southern Russia, the sepulchral tumuli are very numerous and often of great size, reaching occasionally to 400 ft. in circumference and over 100 ft. in height. These are mostly of the period of the Greek colonies of the Tauric Chersonese, dating from about the 5th century B.C. to about the 2nd century A.D., and their contents bear striking testimony to the wealth and culture of the people who reared them.

TUN, a town in the province of Khorasan, Persia, situated about 150 m. S. of Nishapur in 34° N., 58° 7′ E., at an elevation of 1200 ft. The town, which has a population of 7000, is surrounded by a wall, 20 ft. in height, raised on a high rampart of mud. It has three gates, handsome bazaars, good caravanserais and numerous large gardens and fields producing opium, tobacco and cotton. Some silk is also grown.

TUNBRIDGE WELLS, a municipal borough and inland watering-place of England, chiefly in the Tonbridge parliamentary division of Kent, but extending into the eastern division of Sussex, 34½ m. S.E. by S. of London by the South Eastern & Chatham railway, served also by a branch of the London Brighton & South Coast line. Pop. (1891), 29,296; (1901), 33,373. It owes its popularity to its chalybeate spring and its beautiful situation in a hilly wooded district. The wells are situated by the Parade (or Pantiles), a walk associated with fashion since the time of their discovery. It was paved with pantiles in the reign of Queen Anne. Reading and assembly rooms adjoin the pump-room. The town is built in a picturesquely irregular manner, and a large part of it consists of districts called "parks" occupied by villas and mansions. On Rusthall Common about a mile from the town is the curiously shaped mass of sandstone known as the Toad Rock, and a mile and a half south-west is the striking group called the High Rocks. The Tunbridge Wells sanatorium is situated in grounds sixty acres in extent. Five miles south-east of Tunbridge Wells is Bayham Abbey, founded in 1200, where ruins of a church, a gateway, and dependent buildings adjoin the modern Tudor mansion. Three miles south, in Sussex, the village of Frant stands on a hill which is perhaps the finest of the many view-points in this district, commanding a wide prospect over some of the richest woodland scenery in England. The vicinity of Tunbridge Wells is largely residential. To the north lies the urban district of SOUTHBOROUGH (pop. 6977). There is a large trade in Tunbridge ware, which includes work-tables, boxes, toys, &c., made of hard woods, such as beech, sycamore, holly, and cherry, and inlaid with mosaic. Tunbridge Wells was incorporated in 1889, and is governed by a mayor, 8 aldermen and 24 councillors. Area, 3991 acres.

The town owes its rise to the discovery of the medicinal springs by Dudley, Lord North, in 1606. Henrietta Maria, wife of Charles I., retired to drink the waters at Tunbridge Wells after the birth of her eldest son Charles. Soon after the Restoration it was visited by Charles II. and Catherine of Braganza. It was a favourite residence of the princess Anne previous to her accession to the throne, and from that time became one of the chief resorts of London fashionable society. In this respect it reached its height in the second half of the 18th century, and is specially associated with Colley Cibber, Samuel Johnson, Cumberland the dramatist, David Garrick, Samuel Richardson, Sir Joshua Reynolds, Beau Nash, Miss Chudleigh and Mrs Thrale. The Tunbridge Wells of that period is sketched with much graphic humour in Thackeray's *Virginians.*

TUNDRA (a Russian word, signifying a marshy plain), in physical geography, the name applied to the treeless and often marshy plains which border the arctic coasts of Europe, Asia and North America. The Russian tundra, apart from the arctic conditions of climate and flora, may be compared with the steppes farther south.

TUNGABHADRA, a river of southern India, the chief tributary of the Kistna. It is formed by the junction of two streams, the Tunga and the Bhadra, which both rise in Mysore in the Western Ghats. The united river for nearly all its course forms the boundary between Madras and the dominions of the nizam of Hyderabad. On its right bank stood the capital of the ancient Hindu dynasty of Vijayanagar, now a wilderness of ruins. From of old its waters have been utilized for irrigation. Near its confluence with the Kistna it supplies the Kurnool-Cuddapah Canal. A project has been recently under consideration to dam the river higher up, and there construct an artificial lake that would have an area of 160 sq. m., the cost of this scheme being roughly estimated at nearly £6,000,000.

T'UNG-CHOW, a sub-prefectural city in Chih-li, the metropolitan province of China, on the banks of the Peiho in 39° 54′ N. 116° 41′ E., 12 m. E. of Peking. Its population is estimated at about 50,000.

T'ung-Chow marks the highest point at which the Peiho is navigable, and here merchandise for Peking is transferred to a canal. The city, which is faced on its eastern side by the river, and on its other three sides is surrounded by populous suburbs, is upwards of 3 m. in circumference. The walls are about 45 ft. in height and about 24 ft. wide at the top. They are being allowed to fall into decay. Two main thoroughfares connect the north and south gates and the east and west gates. The place derives its importance from the fact that it is the port of Peking. Like most Chinese cities, T'ung-Chow has appeared in history under various names. By the founder of the Han dynasty (206 B.C.) it was called Lu-Hien; with the rise of the T'ang dynasty (618 A.D.) its name was changed to Hūan-Chow; and at the beginning of the 12th century, with the advent of the Kin dynasty to power, Hūan-Chow became T'ung-Chow. It was at T'ung-Chow that Sir Harry Parkes, Sir Henry Loch and their escort were treacherously taken prisoners by the Chinese when they were sent forward by Lord Elgin to negotiate terms of peace after the troubles of 1860. During the Boxer outbreak in 1900 T'ung-Chow was occupied by the allied armies, and a light railway connecting the city with Peking was constructed by German military engineers.

TUNGSTEN [symbol W, atomic weight 184·0 (O=16)], a metallic chemical element found in the minerals wolfram, an iron and manganese tungstate, scheelite, a calcium tungstate, stolzite, a lead tungstate, and in some rarer minerals. Its presence in scheelite was detected by Scheele and Bergman in 1781, and in 1783 Juan, José and d'Elhuyar showed the same substance occurred in wolfram; they also obtained the metal. Tungsten may be prepared from wolfram by heating the powdered ore with sodium carbonate, extracting the sodium carbonate with water, filtering and adding an acid to precipitate tungstic acid, H_2WO_4. This is washed and dried and the oxide so obtained reduced to the metal by heating with carbon to a high temperature (Hadfield, *Journ. Iron and Steel Inst.*, 1903, ii. 38). On a small scale it is obtained by reducing the trioxide in a current of hydrogen, or the chloride by sodium vapour, or the oxide with carbon in the electric furnace; in the last case the product is porous and can be welded like iron. In the form of a powder, it is obtained by reducing the oxide with zinc and extracting with soda, or by dissolving out the manganese from its alloys with tungsten. The metal may be used uncombined, but large quantities of ferrotungsten are made in the electric furnace; other alloys are prepared by acting on a mixture of the oxides with aluminium. Tungsten has been applied in the manufacture of filament electric lamps. The metal has a crystalline structure, and melts at about 2800°. The powdered metal burns at a red heat to form the trioxide; it is very slowly attacked by moist air. It combines with fluorine with incandescence at ordinary temperatures, and with chlorine at 250–300°; carbon, silicon, and boron, when heated with it in the electric furnace, give crystals harder than the ruby. It is soluble in a mixture of nitric and hydrofluoric acids, and the powdered metal, in aqua regia, but slowly attacked by sulphuric, hydrochloric and hydrofluoric acids separately; it is also soluble in boiling potash solution, giving a tunstate and hydrogen.

Tungsten dioxide, WO_2, formed on reducing the trioxide by hydrogen at a red heat or a mixture of the trioxide and hydrochloric acid with zinc, or by decomposing the tetrachloride with water, is a brown strongly pyrophoric powder, which must be cooled in hydrogen before being brought into contact with air. It is slightly soluble in hydrochloric and sulphuric acids, giving purple solutions. It dissolves in potash, giving potassium tungstate and hydrogen, and is readily oxidized to the trioxide.

Tungsten trioxide, WO_3, occurs in nature as wolframine, a yellow mineral found in Cumberland, Limoges, Connecticut and in North Carolina. It is prepared as shown above, or by other methods. It is a canary-yellow powder, which becomes a dark orange on heating; the original colour is regained on cooling. On exposure to light it assumes a greenish tinge. A crystalline form was obtained by Debray as olive-green prisms by igniting a mixture of sodium tungstate and carbonate in a current of hydrochloric acid gas, and by Nordenskjold by heating hydrated tungstic acid with borax. Partial reduction of tungsten trioxide gives blue or purple-red products which are intermediate in composition between the dioxide and trioxide. Tungsten trioxide forms two acids, tungstic acid, H_2WO_4, and metatungstic acid, $H_2W_4O_{13}$; it also gives origin to several series of salts, to which the acids corresponding are unknown. Thus we have salts of the following types $M_2O(WO_3)_n$, where $n=1$, 2, 3, 4, 5, 6, 7, 8, and also $(M_2O)_m(WO_3)_n$, where m, $n=2$, 5; 3, 7; 4, 3; 5, 12; M standing for a monovalent metal. The $(M_2O)_5(WO_3)_{12}$ or $M_{10}W_{12}O_{41}$ salts are called paratungstates. *Tungstic acid*, H_2WO_4, is obtained as $H_2WO_4{\cdot}H_2O$ by precipitating a tungstate with cold acid; this substance has a bitter taste and its aqueous solution reddens litmus. By using hot acid the yellow anhydrous tungstic acid is precipitated, which is insoluble in water and in all acids except hydrofluoric. It may be obtained in a flocculent form by exposing the hexachloride to moist air. *Metatungstic acid*, $H_2W_4O_{13}{\cdot}7H_2O$, is obtained by decomposing the barium salt with sulphuric acid or the lead salt with hydrochloric acid. It forms yellow octahedra, which become anhydrous at 100°, and are converted into the trioxide on ignition. It is readily soluble in water, and on boiling the aqueous solution a white hydrate is first deposited which after a time is converted into the trioxide. Graham obtained a colloidal tungstic acid by dialysing a dilute solution of sodium tungstate and its equivalent of hydrochloric acid; on concentrating in a vacuum a gummy product is obtained, which still remains soluble after heating to 200°, but it is converted into the trioxide on heating to redness. When moistened it becomes adhesive. The solution has a bitter taste and does not gelatinize, even under the influence of boiling acids.

Of the salts, the normal tungstates are insoluble in water with the exception of the alkaline tungstates; they are usually amorphous, but some can be obtained in the crystalline form. The metatungstates of the alkalis are obtained by boiling normal tungstates with tungstic acid until the addition of hydrochloric acid to the filtrate gives no precipitate. The most important tungstate is the so-called tungstate of soda, which is sodium paratungstate, $Na_{10}W_{12}O_{41}{\cdot}28H_2O$. This salt is obtained by roasting wolfram with sodium carbonate, lixiviating, neutralizing the boiling filtrate with hydrochloric acid and crystallizing at ordinary temperatures. The salt forms large monoclinic prisms; molecules containing 25 and 21 H_2O separate from solutions crystallized at higher temperatures. The salt is used as a mordant in dyeing and calico printing, and also for making textiles non-inflammable. Several other sodium tungstates are known, as well as potassium and ammonium tungstates. Many salts also occur in the mineral kingdom: for example, scheelite is $CaWO_4$, stolzite is $PbWO_4$, farberite is $FeWO_4$, wolfram is $(Fe,Mn)WO_4$, whilst hübnerite is $MnWO_4$.

By partial reduction of the tungstates under certain conditions products are obtained which are insoluble in acids and alkalis and present a bronze-like appearance which earned for them the name of tungsten bronzes. The sodium compound was first obtained by Wöhler on reducing sodium tungstate with hydrogen; coal-gas, zinc, iron or tin also effect the reduction. It forms golden cubes which are unattacked by alkalis or by any acid except hydrofluoric. It appears to be a mixture of which the components vary with the materials and methods used in its production (Philipp, *Ber.*, 1882, 15, p. 499). A blue bronze, $Na_2W_5O_{15}$, forming dark blue cubes with a red reflex, is obtained by electrolysing fused sodium paratungstate; a purple-red variety, $Na_2W_3O_9$, and a reddish yellow form result when sodium carbonate and sodium tungstate are heated respectively with tungsten trioxide and tinfoil. Similar potassium tungsten bronzes are known.

Tungstic acid closely resembles molybdic acid in combining with phosphoric, arsenious, arsenic, boric, vanadic and silicic acids to form highly complex acids of which a great many salts exist. Of the phosphotungstic acids the most important is phosphoduodecitungstic acid, $H_3PW_{12}O_{40}{\cdot}nH_2O$, obtained in quadratic pyramids by crystallizing mixed solutions of orthophosphoric and metatungstic acids. Two sodium salts, viz. $Na_2HPW_{12}O_{40}\cdot nH_2O$ and $Na_2PW_{12}O_{40}\cdot nH_2O$, are obtained by heating sodium hydrogen phosphate with a tungstate. The most important silicotungstic acids are silicodecitungstic acid $H_8W_{10}SiO_{36}\cdot 3H_2O$, tungstosilicic acid, $H_6W_{12}SiO_{42}\cdot 20H_2O$, and silicoduodecitungstic or silicotungstic acid, $H_8W_{12}SiO_{42}\cdot 29H_2O$. On boiling gelatinous silica with ammonium polytungstate and evaporating with the occasional addition of ammonia, ammonium silicodecitungstate is obtained as short rhombic prisms. On adding silver nitrate and decomposing the precipitated silver salt with hydrochloric acid, a solution is obtained which on evaporation in a vacuum gives the free acid as a glassy mass. If this be dissolved in water and the solution concentrated, some silicic acid separates and the filtrate deposits triclinic prisms of tungstosilicic acid. Silicotungstic acid is obtained as quadratic pyramids from its mercurous salt which is prepared from mercurous nitrate and the salt formed on boiling gelatinous silicic acid with a polytungstate of an alkali metal.

Pertungstic Acid, HWO_4.—The sodium salt, $NaWO_4\cdot H_2O$, is obtained by evaporating in a vacuum the product of boiling a solution of sodium paratungstate with hydrogen peroxide. Its solution liberates chlorine from hydrochloric acid and iodine from potassium iodide.

Halogen Compounds.—Although the trioxide is soluble in hydrofluoric acid, evaporation of the solution leads to the recovery of the oxide unchanged. A double salt of the oxyfluoride, viz. $2KF\cdot WO_2F_2\cdot H_2O$, is obtained as crystalline scales by dissolving normal potassium tungstate in hydrofluoric acid and adding potassium hydroxide till a permanent precipitate is just formed. Other oxyfluorides are known. The hexafluoride, WF_6, is a very active gaseous compound, which attacks glass and metals, obtained from tungsten hexachloride and hydrofluoric acid (Ruff and Eisner, *Ber.*, 1905, 38, p. 742). Oxyfluorides of the formulae WOF_4 and WO_2F_2 are also known. Tungsten forms four chlorides, viz. WCl_2, WCl_4, WCl_5, WCl_6. The dichloride, WCl_2, is an amorphous grey powder obtained by reducing the hexachloride at a high temperature in hydrogen, or, better, by heating the tetrachloride in a current of carbon dioxide. It changes on exposure to air and dissolves slightly in water to give a brown solution, the insoluble portion gradually being converted into an oxide with evolution of hydrogen. The tetrachloride, WCl_4, is obtained by partial reduction of the higher chlorides with hydrogen; a mixture of the penta- and hexa-chloride is distilled in a stream of hydrogen or carbon dioxide, and the pentachloride which volatilizes returned to the flask several times. This gives the tetrachloride as a greyish-brown crystalline powder. It is very hygroscopic and with cold water gives the oxide and hydrochloric acid. On heating it gives the di- and penta-chlorides. At a high temperature hydrogen reduces it to the metal partly in the form of a black pyrophoric powder. The pentachloride, WCl_5, is obtained as a product in the preparation of the tetrachloride. It forms black lustrous crystals, or when quickly condensed, a dark green crystalline powder. It melts at 248° and boils at 275·6°; the vapour density corresponds to the above formula. It is more hygroscopic than the tetrachloride; and when treated with much water the bulk is at once decomposed into the blue oxide and hydrochloric acid, but an olive-green solution is also produced. The hexachloride, WCl_6, is obtained by heating the metal in a current of dry chlorine in the absence of oxygen or moisture, otherwise some oxychloride is formed; a sublimate of dark violet crystals appear at first, but as the hexachloride increases in quantity it collects as a very dark red liquid. When perfectly pure, the hexachloride is stable even in moist air, but the presence of an oxychloride brings about energetic decomposition; similarly water has no action on the pure compound, but a trace of the oxychloride occasions sudden decomposition into a greenish oxide and hydrochloric acid. It melts at 275° and boils at 346·7° (759·5 mm.). Vapour density determinations indicate that dissociation occurs when the vapour is heated above the boiling point.

Several oxychlorides are known. The monoxychloride, $WOCl_4$, is obtained as red acicular crystals by heating the oxide or dioxychloride in a current of the vapour of the hexachloride, or from the trioxide and phosphorus pentachloride. It melts at 210·4° and boils at 227·5° forming a red vapour. Moist air brings about the immediate formation of a yellowish crust of tungstic acid. The dioxychloride, WO_2Cl_2, is obtained as a light lemon-yellow sublimate on passing chlorine over the brown oxide. It is unaffected by moist air or cold water, and even when boiled with water the decomposition is incomplete. Tungsten combines directly with bromine to give, when the bromine is in excess, the penta- and not a hexabromide. This substance forms crystals resembling iodine, which melt at 276° and boil at 333°. It slowly evolves bromine on standing, and is at once decomposed by water into the blue oxide and hydrobromic acid. The dibromide, WBr_2, is a non-volatile bluish-black powder obtained by reducing the pentabromide with hydrogen. By passing bromine vapour over red-hot tungsten dioxide a mixture of WO_2Br_2 and $WOBr_4$ is obtained, from which the latter can be removed by gently heating when it volatilizes. The dioxybromide forms light red crystals or a yellow powder; it volatilizes at a red heat, and is not acted upon by water. The monoxybromide forms brownish-black needles, which melt at 277° and boil at 327·5; it is decomposed by water. The di-iodide is obtained as green metallic scales on passing iodine over red-hot tungsten.

Tungsten disulphide, WS_2, is obtained as soft black acicular crystals by the action of sulphur, sulphuretted hydrogen or carbon bisulphide on tungsten. The trisulphide, WS_3, is obtained by dissolving the trioxide in ammonium sulphide or by passing sulphuretted hydrogen into a solution of a tungstate and precipitating by an acid in both cases. When dry it is a black mass which yields a liver-coloured powder. It is sparingly soluble in cold water, but is easily dissolved by potassium carbonate or ammonia. By dissolving it in a hydrosulphide a sulphotungstate is produced; these salts can also be obtained by passing sulphuretted hydrogen into a solution of a tungstate.

A *nitride*, W_2N_3, is obtained as a black powder by acting with ammonia on the oxytetrachloride or hexachloride; it is insoluble in sodium hydroxide, nitric and dilute sulphuric acids; strong sulphuric acid, however, gives ammonia and tungstic acids. Ammonia does not react with tungsten or the dioxide, but with trioxide at a red heat a substance of the formula $W_6H_6N_3O_6$ is obtained, which is insoluble in acids and alkalis and on ignition decomposes, evolving nitrogen, hydrogen and ammonia. Phosphorus combines directly with the metal to form W_2P_4; another phosphide, W_2P, results on igniting a mixture of phosphorus pentoxide and tungsten trioxide.

The atomic weight has been determined by many investigators; the chief methods employed being the analysis and synthesis of the trioxide and the analysis of the hexachloride. The former was employed by Pennington and Smith and Desi (*Zeit. anorg. Chem.*, 1895, 8, pp. 198, 205) who obtained the value 183·42.

TUNGUSES, a widespread Asiatic people, forming a main branch of the Mongol division of the Mongol-Tatar family. They are the *Tung-hu* of the Chinese, probably a corrupt form of *tonki* or *donki*, that is, "men" or "people." The Russian form *Tungus*, wrongly supposed to mean "lake people," appears to occur first in the Dutch writer Massa (1612); but the race has been known to the Russians ever since they reached the Yenisei. The Tungus domain, covering many hundred thousand square miles in central and east Siberia and in the Amur basin, stretches from the Yenisei eastwards to the Pacific, where it occupies most of the seaboard between Korea and Kamchatka. It also reaches the Arctic Ocean at two points, in the Nisovaya tundra, west of the Khatanga River, and in a comparatively small enclosure in the Yana basin over against the Lyakhov (New Siberia) Archipelago. But the Tunguses proper are chiefly centred in the region watered by the three large eastern tributaries of the Yenisei, which from them take their names of the Upper, Middle or Stony, and Lower Tunguska. Here the Tunguses are known to the Samoyedes by the name of *Aiya* or "younger brothers," implying a comparatively recent immigration (confirmed by other indications) from the Amur basin, which appears to be the original home both of the Tunguses and of the closely allied Manchus. The Amur is still mainly a Tungus river almost from its source to its mouth: the Oroches (Orochus), Daurians, Birars, Golds, Manegrs, Sanagirs, Ngatkons, Nigidals, and some other aboriginal tribes scattered along the main stream and its affluents—the Shilka, Sungari and Usuri—are all of Tungus stock and speech. On the Pacific the chief subdivisions of the race are the Lamuts, or "sea people," grouped in small isolated hunting communities round the west coast of the Sea of Okhotsk, and farther south the Tazi between the Amur delta and Korea. The whole race, exclusive of Manchus, numbers probably little more than 50,000, of whom some 10,000 are in the Amur basin, the rest in Siberia.

The Tungus type is essentially Mongolic, being characterized by broad flat features, small nose, wide mouth, thin lips, small black and somewhat oblique eyes, black lank hair, dark olive or bronze complexion, low stature, averaging not more than 5 ft. 4 in.; they are distinguished from other Mongolic peoples by the square shape of the skull and the slim, wiry, well-proportioned figure. This description applies more especially to the Tunguska tribes, who may be regarded as typical Tunguses, and who, unlike most other Mongols, betray no tendency to obesity. They are classed by the Russians, according to their various pursuits, as Reindeer, Horse, Cattle, Dog, Steppe and Forest Tunguses. A few have become settled agriculturists; but the great bulk of the race are still essentially forest hunters, using the reindeer both as mounts and as pack animals. Nearly all lead nomad lives in pursuit of fur-bearing animals, whose skins they supply to Russian and Yakut traders in exchange for provisions, clothing and other necessaries of life. The picturesque and even elegant national costume shows in its ornamentation and general style decided Japanese influence, due no doubt to long-continued intercourse with that nation at some period previous to the spread of the race from the Amur valley to Siberia. Many of the Tungus tribes have been baptized, and are, therefore, reckoned as "Greek Christians"; but Russian orthodoxy has not penetrated far below the surface, and most of them are still at heart Shamanists and nature-worshippers, secretly keeping the teeth and claws of wild animals as idols or amulets, and observing Christian rites only under compulsion. But, whether Christians or pagans, all alike are distinguished above other Asiatics, perhaps above all other peoples, for their truly noble moral qualities. All observers describe them as "cheerful under the most depressing circumstances, persevering, open-hearted, trustworthy, modest yet self-reliant, a fearless race of hunters, born amidst the gloom of their dense pine forests, exposed from the cradle to every danger from wild beasts, cold and hunger. Want and hardships of every kind they endure with surprising fortitude, and nothing can induce them to take service under the Russians or quit their solitary woodlands" (Keane's *Asia*, p. 479). Their numbers are steadily decreasing owing to the ravages of small-pox, scarlet fever, and especially famine, their most dreaded enemy. Their domain is also being continually encroached upon by the aggressive Yakuts from the north and east, and from the south by the Slavs, now settled in compact bodies in the province of Irkutsk about the upper course of the Yenisei. It is remarkable that, while the Russians often show a tendency to become assimilated to the Yakuts, the most vigorous and expansive of all the Siberian peoples, the Tunguses everywhere yield before the advance of their more civilized neighbours or become absorbed in the surrounding Slav communities. In the Amur valley the same fate is overtaking the kindred tribes, who are disappearing before the great waves of Chinese migration from the south and Russian encroachments both from the east and west.

TUNIC (O. Eng. *tunice*, *tunical*, taken, before the Norman conquest, directly from Lat. *tunica*, of which the origin is unknown), properly the name given in Latin to the principal undergarment of men and women, answering to the chiton (χιτών) of the Greeks, and covered by the outer garment, the *palla* (Gr. ἱμάτιον), in the case of women, and by the peculiar Roman garment, the *toga*, in the case of men. The male *tunica* differed from the χιτών in usually having short sleeves (see further COSTUME: § *Ancient Greek and Roman*). The term, more often in the form "tunicle" (Lat. dim. *tunicula*), is applied, in ecclesiastical usage, to a vestment worn over the alb by the sub-deacon in the celebration of the Mass. In general current usage it is used of any loose short garment, girt at the waist and reaching from the neck to some distance above the knee. It is thus the name of the fatigue coat of a soldier of the British army. There are numerous uses of "tunic" or "tunica" in anatomy, zoology and botany in the sense of a covering or integument.

TUNICATA. This group of marine animals was formerly regarded as constituting, along with the Polyzoa and the Brachiopoda, the invertebrate class Molluscoidea. It is now known to be a degenerate branch of the Chordata, and to be more nearly related to the Vertebrata than to any group of the Invertebrata. The Tunicata are found in all seas, from the littoral zone down to abyssal depths. They occur either fixed or free, solitary, aggregated or in colonies. The fixed forms are the "simple" and "compound" Ascidians. The colonies are produced by budding and the members are conveniently known as Ascidiozooids. Some Tunicata undergo alternation of generations, and most of them show a retrograde metamorphosis in their life-history.

HISTORY[1]

More than two thousand years ago Aristotle gave a short account of a simple Ascidian under the name of *Tethyum*. Schlosser and Ellis, in a paper on *Botryllus*, published in the *Philosophical Transactions* of the Royal Society for 1756, first brought the compound Ascidians into notice; but it was not until the commencement of the 19th century, as a result of the careful anatomical investigations of G. Cuvier (1) upon the simple Ascidians and of J. C. Savigny (2) upon the compound, that the close relationship between these two groups of the Tunicata was conclusively demonstrated. Lamarck (3) in 1816 instituted the class Tunicata, which he placed between the Radiara and the Vermes in his system of classification. The Tunicata included at that time, besides the simple and the compound Ascidians, the pelagic forms *Pyrosoma*, which had been first made known by F. Péron in 1804, and *Salpa*, described by P. Forskål in 1775.

A. v. Chamisso, in 1819, made the important discovery that *Salpa* in its life-history passes through the series of changes which were afterwards more fully described by J. J. S. Steenstrup in 1842 as "alternation of generations"; and a few years later Kuhl and Van Hasselt's investigations upon the same animal resulted in the discovery of the alternation in the directions in which the wave of contraction passes along the heart and in which the blood circulates through the body. It has since been found that this observation holds good for all groups of the Tunicata. In 1826 H. Milne-Edwards and Audouin made a series of observations on living compound Ascidians, and amongst other discoveries they found the free-swimming tailed larva, and traced its development into the young Ascidian.

In 1845 Carl Schmidt (6) first announced the presence in the test of some Ascidians of "tunicine," a substance very similar to cellulose, and in the following year Löwig and A. v. Kölliker (7) confirmed the discovery and made some additional observations upon this substance and upon the structure of the test in general. T. H. Huxley (8), in an important series of papers published in the *Transactions* of the Royal and Linnean Societies of London from 1851 onwards, discussed the structure, embryology and affinities of the pelagic Tunicates *Pyrosoma*, *Salpa*, *Doliolum* and *Appendicularia*. These important forms were also investigated about the same time by C. Gegenbaur, C. Vogt, H. Müller, A. Krohn and F. S. Leuckart. The most important epoch in the history of the Tunicata is the date of the publication of A. Kowalevsky's celebrated memoir upon the development of a simple Ascidian (9). The tailed larva had been previously investigated; but its minute structure had not been sufficiently examined, and the meaning of what was known of it had not been understood. It was reserved for Kowalevsky in 1866 to demonstrate the striking similarity in structure and in development between the larval Ascidian and the vertebrate embryo. He showed that the relations between the nervous system, the notochord and the alimentary canal are the same in the two forms, and have been brought about by a very similar course of embryonic development. This discovery clearly indicated that the Tunicata are closely allied to *Amphioxus* and the Vertebrata, and that the tailed larva represents the primitive or ancestral form from which the adult Ascidian has been evolved by degeneration, and this led naturally to the view usually accepted at the present day, that the group is a degenerate side-branch from the lower end of the phylum Chordata, which includes the Tunicata (Urochorda), *Balanoglossus*, &c. (Hemichorda), *Amphioxus* (Cephalochorda) and the Vertebrata. Kowalevsky's great discovery has since been confirmed and extended to all other groups of the Tunicata by C. v. Kupffer (12), A. Giard (13 and 15), and others.

In 1872 H. Fol (14) added largely to the knowledge of the Appendiculariidae, and Giard (15) to that of the compound Ascidians. The most important additions which have been made to the latter since have been those described by Von Drasche (16) from the Adriatic and those discovered by the "Challenger" and other expeditions (17). The structure and the systematic arrangement of the simple Ascidians have been mainly discussed of recent years by J. Alder and A. Hancock (18), C. Heller (19), H. de Lacaze-Duthiers (20), M. Traustedt (21), L. Roule, R. Hartmeyer, C. P. Sluiter, W. Michaelsen and W. A. Herdman (17, 22). In 1874 Ussoff (23) investigated the minute structure of the nervous system and of the underlying gland (first discovered by Hancock), and showed that the duct communicates with the front of the branchial sac or pharynx by an aperture in the dorsal (or "olfactory") tubercle. In 1880 C. Julin (24) drew attention to the similarity in structure and relations between this gland and the *hypophysis cerebri* of the vertebrate brain, and insisted upon their homology. M. M. Metcalf has since added to our knowledge of these structures. The Thaliacea have of late years been the subject of several very important memoirs. The researches of F. Todaro, W. K. Brooks (25), W. Salensky (26), O. Seeliger, Korotneff and others have elucidated the embryology, the gemmation and the life-history of the Salpidae; and K. Grobben, Barrois (27), and more especially Uljanin (28), have elaborately worked out the structure and the details of the complicated life-history of the Doliolidae. Finally, we owe to the successive memoirs of J. Hjort, O. Seeliger, W. E. Ritter, E. van Beneden, C. Julin, C. P. Sluiter, R. Hartmeyer and others the description of many new forms and much information as to the development and life-history of the group.

The new forms described from Puget Sound and Alaska have drawn renewed attention to the similarity of the fauna in that region of the North Pacific and the fauna of north-west Europe. There is probably a common circumpolar Tunicate fauna which sends extensions downwards in both Atlantic and Pacific. As the result of the careful quantitative work of the German Plankton expedition, A. Borgert thinks that the temperature of the water has more to do with both the horizontal and the vertical distribution of pelagic

[1] Only the more important works can be mentioned here. For a more detailed account of the history of the group and a full bibliography see (17) and (35) in the list of works at the end of this article.

Tunicata in the sea than any other factor. It is probable that the occasional phenomenal swarms of *Doliolum* which have been met with in summer in the North Atlantic are a result of the curious life-history which, in favourable circumstances, allows a small number of budding forms to produce from the numerous minute buds an enormous number of the next generation. The great increase in the number of species known from nearly all seas during the last twelve or fifteen years of the 19th century enables us now to form a truer estimate of the geographical distribution of the group than was possible when the "Challenger," collections were described, and shows that the Tunicata at least give no support to the "bi-polar theory" of the distribution of animals.

Anatomy

As a type of the Tunicata, *Ascidia mentula*, one of the larger species of the simple Ascidians, may be taken. This species is found in most of the European seas, in shallow water. It has an irregularly ovate form, of a dull grey colour, and is attached to some foreign object by one end (fig. 1). The opposite end of the body has a terminal opening surrounded by eight rounded lobes. This is the mouth or branchial aperture, and it indicates the anterior end of the animal. About half-way back from the anterior end is the atrial or cloacal aperture, surrounded by six lobes and placed upon the dorsal edge. When the Ascidian is living and undisturbed, water is being constantly drawn in through the branchial aperture and passed out through the atrial. If coloured particles be placed in the water near the apertures, they are seen to be sucked into the body through the branchial aperture, and after a short time some of them are ejected with considerable force through the atrial aperture. The current of water passing in is for respiratory purposes, and it also conveys food into the animal. The atrial current is mainly the water which has been used in respiration, but it also contains all excretions from the body, and at times the ova and spermatozoa or the embryos.

at, Atrial aperture; *br*, branchial aperture; *t*, test.

The Test.

The outer grey part of the body, which is attached at or near its posterior end and penetrated by the two apertures, is the "test." This is a firm gelatinous cuticular secretion upon the outer surface of the ectoderm, which is a layer of flat cells. Although at first produced as a cuticle, the test soon becomes organized by the migration into it of cells derived from the mesoderm. A. Kowalevsky has shown that cells of the mesenchyme of the larva make their way through the ectoderm to the exterior during the metamorphosis, and become the first cells of the young test. Some of the cells in the adult test may, however, be ectodermal in origin (see fig. 2). These test cells may remain as rounded or fusiform or stellate cells embedded in the gelatinous matrix, to which they are constantly adding by secretions on their surfaces; or they may develop vacuoles which become larger and fuse so that each cell has an ovate clear cavity (a bladder cell), surrounded by a delicate film of protoplasm with the nucleus still visible at one point; or they may form pigment granules in the protoplasm; or, lastly, they may deposit carbonate of lime, so that one or several of them together produce a calcareous spicule in the test. Only the unmodified test cells and the bladder cells are found in *Ascidia mentula* (fig. 3).

Calcareous spicules are found chiefly in the Didemnidae amongst compound Ascidians; but pigmented cells may occur in the test of almost all groups of Tunicata. The matrix in which these structures are embedded is usually clear and apparently homogeneous; but in some cases it becomes finely fibrillated, especially in the family Cynthiidae. It is this matrix which contains tunicine. At one point on the left side near the posterior end a tube enters the test, and then splits up into a number of branches, which extend in all directions and finally terminate in rounded enlargements or bulbs, situated chiefly in the outer layer of the test. These tubes are known as the "vessels" of the test, and they contain blood. Each vessel is bounded by a layer of ectoderm cells lined by connective tissue (fig. 4, B), and is divided into two tubes by a septum of connective tissue. The septum does not extend into the terminal bulb, and consequently the two tubes communicate at their ends (fig. 4, A). The vessels are formed by an outgrowth of a blood sinus (derived originally from the blastocoele of the embryo) from the body wall (mantle) into the test, the wall of the sinus being formed by connective tissue and pushing out a covering of ectoderm in front of it (fig. 2, *s'*). The test is turned inwards at the branchial and atrial apertures to line two funnel-like tubes—the branchial siphon leading to the branchial sac, and the atrial siphon leading to the atrial or peribranchial cavity.

Mantle, Body Wall and Body Cavities.

The body wall, inside the test and the ectoderm, is formed of a layer (the somatic layer of mesoderm) of connective tissue, enclosing muscle fibres, blood sinuses, and nerves. This layer (the mantle) has very much the shape of the test outside it, but at the two apertures it is drawn out to form the branchial and atrial siphons (fig. 5). In the walls of these siphons the muscle fibres form powerful circular bands, the sphincter muscles. Throughout the rest of the mantle the bands of muscle fibres form a rude irregular network. They are numerous on the right side of the body, and almost totally absent on the left. The muscles are all formed of very long fusiform non-striped fibres. The connective tissue of the mantle is chiefly a clear gelatinous matrix, containing cells of various shapes; it is frequently pigmented, giving brilliant red or yellow colours to the body, and is penetrated by numerous lacunae, in which the blood flows. Inside the mantle, in all parts of the body, except along the ventral edge, there is a cavity—the atrial or peribranchial cavity—which opens to the exterior by the atrial aperture. This cavity is lined by a layer of cells derived originally from the ectoderm[1]

[1] According to E. van Beneden and Julin (30) only the outer wall of the atrium is lined with epiblast, the inner wall being derived from the hypoblast of the primitive branchial sac.

and directly continuous with that layer through the atrial aperture (fig. 6); consequently the mantle is covered both externally and internally by ectodermal cells.

There is no true body cavity or coelom in the mesoderm; and yet the Tunicata are Coelomata in their structure and affinities, although it is very doubtful whether the enterocoele which has been described in the development is really found. In any case the coelom if formed is afterwards suppressed, and in the adult is only represented by the pericardium and its derivatives and the small cavities of the renal and reproductive organs.

Branchial Sac and Neighbouring Organs.

The branchial aperture (mouth) leads into the branchial siphon (buccal cavity or stomodaeum), and this opens into the anterior end of a very large cavity (the branchial sac) which extends nearly to the posterior end of the body (see figs. 5 and 6). This branchial sac is an enlarged and modified pharynx, and is therefore properly a part of the alimentary canal. The oesophagus opens from it far back on the dorsal edge (see below). The wall of the branchial sac is pierced by a large number of vertical slits—the stigmata—placed in numerous transverse rows (secondary or subdivided gill-slits). These slits place the branchial sac in communication with the peribranchial or atrial cavity, which lies outside it (fig. 6). Between the stigmata the wall of the branchial sac is traversed by blood-vessels, which are arranged in three regular series (fig. 7)—(1) the transverse vessels, which run horizontally round the wall and open at their dorsal and ventral ends into large longitudinal vessels, the dorsal and ventral sinuses; (2) the fine longitudinal vessels, which run vertically between adjacent transverse vessels and open into them, and which bound the stigmata; and (3) the internal longitudinal bars, which run vertically in

a plane internal to that of the transverse and fine longitudinal vessels. These bars communicate with the transverse vessels by short side branches where they cross, and at these points are prolonged into the lumen of the sac in the form of hollow papillae. The edges of the stigmata are richly set with cilia, which drive the water from the branchial sac into the peribranchial cavity, and so cause the currents that flow in through the branchial aperture and out through the atrial.

Endostyle.

Along its ventral edge the wall of the branchial sac is continuous externally with the mantle (fig. 6), while internally it is thickened to form two parallel longitudinal folds bounding a groove, the "endostyle" or ventral furrow (figs. 5, 6, 8, *end*.) corresponding to the hypopharyngeal groove of *Amphioxus* and the median part of the thyroid gland of Vertebrata. The endoderm cells which line the endostyle are greatly enlarged at the bottom, where they bear very long cilia, and on parts of the sides of the furrow so as to form projecting glandular pads (fig. 8, *gl*.).

It is generally supposed that this organ is a gland for the production of the mucous secretion which is spread round the edges of the branchial sac and catches the food particles in the passing current of water. It has, however, been pointed out that there are comparatively few gland cells in the epithelium of the endostyle, and that it is possible that this furrow is merely a ciliated path along which the mucous secretion (produced in part by the subneural gland) is conveyed posteriorly along the ventral edge of the branchial sac. There are sensory bipolar cells in the lateral walls of the endostyle. At its anterior end the edges of the endostyle become continuous with the right and left halves of the posterior of two circular ciliated ridges—the peripharyngeal bands—which run parallel to one another round the front of the branchial sac. The dorsal ends of the posterior peripharyngeal band bend posteriorly (enclosing the epibranchial groove), and then join to form the anterior end of a fold which runs along the dorsal edge of the branchial sac as far as the oesophageal aperture. This fold is the dorsal lamina (figs. 5, 6, *dl*).

Peripharyngeal Bands.

Dorsal Lamina.

It probably serves to direct the stream of food particles entangled in a string of mucus from the anterior part of the dorsal lamina to the oesophagus. In many Ascidians this organ, instead of being a continuous membranous fold as in *A. mentula*, is represented by a series of elongated triangular processes—the dorsal languets—one attached in the dorsal median line opposite to each transverse vessel of the branchial sac. The anterior peripharyngeal band is a complete circular ridge, having no connexion with either the endostyle or the dorsal lamina. In front of it lies the prebranchial zone, which separates the branchial sac behind from the branchial siphon in front. The prebranchial zone is bounded anteriorly by a muscular band—the posterior edge of the sphincter muscle—which bears a circle of long delicate processes, the tentacles (figs. 5, 9, 10, *tn*). These project inwards at right angles so as to form a network across the entrance to the branchial sac. Each tentacle consists of connective tissue covered with epithelium (endoderm), and contains two or more cavities which are continuous with blood sinuses in the mantle.

Dorsal Languets.

Subneural Gland.

In the dorsal median line near the anterior end of the body, and embedded in the mantle on the ventral surface of the nerve ganglion, there lies a small glandular mass—the subneural gland—which, as Julin has shown (24), there is reason to regard as the homologue of the *hypophysis cerebri* of the vertebrate brain. Julin and E. van Beneden have suggested that the function of this organ may possibly be renal. The subneural gland, which was first noticed by Hancock, communicates anteriorly, as Ussoff (23) pointed out, by means of a narrow duct with the front of the branchial sac (pharynx). The opening of the duct is enlarged to form a funnel-shaped cavity, which may be folded upon itself, convoluted, or even broken up into a number of smaller openings, so as to form a complicated projection, called the dorsal tubercle, situated in the dorsal part of the prebranchial zone. (fig. 9). The dorsal tubercle in *A mentula* is somewhat horseshoe-shaped (fig. 10); it varies in form in most Ascidians according to the genus and species, and in some cases in the individual also. The function of the neural gland must still be regarded as doubtful. The secretion is formed by the degeneration and disintegration of cells proliferated from the walls of the duct or its branches, and no concretions are found. The ciliated funnel of the dorsal tubercle is a sense-organ, innervated by a large nerve from the ganglion; it may be a sense-organ for testing the quality of the water entering the branchial sac.

Dorsal Tubercle.

The single elongated ganglion in the median dorsal line of the mantle between the branchial and atrial siphons is the only nerve-centre in *A. mentula* and most other Tunicata. It is the degenerate remains of the anterior part of the cerebro-spinal nervous system of the tailed larval Ascidian (see below). The posterior or spinal part has entirely disappeared in most Tunicata. It persists, however, in the Appendiculariidae and traces of it are found in some Ascidians (*e.g. Clavelina*). The ganglion gives off distributory nerves at both ends, which run through the mantle to the neighbourhood of the apertures, where they divide and subdivide. The only sense-organs are the pigment spots between the branchial and atrial lobes, the tentacles at the base of the branchial siphon, the dorsal tubercle, and possibly the languets or dorsal lamina. These are all in a lowly developed condition. Nerve-endings have also been found in the endostyle, the peripharyngeal bands and other parts of the wall of the pharynx. The larval Ascidians, on the other hand, have well-developed intracerebral optic and otic sense-organs; and in some of the pelagic Tunicata otocysts and pigment spots or eyes are found in connexion with the ganglion. Atrial tentacles (which may also be sensory) have now been found in a number of the gregarious Cynthiidae and Polystyelidae.

Nervous System.

Sense-Organs.

The mouth and the pharynx (branchial sac) have already been described. The remainder of the alimentary canal is a bent tube which in *A. mentula* and most other Ascidians lies embedded in the mantle on the left side of the body, and projects into the peribranchial cavity. The oesophagus leaves the branchial sac in the dorsal middle line near the posterior end of the dorsal lamina (see fig. 5, *œa*). It is a short curved tube which leads ventrally to the large fusiform thick-walled stomach. The intestine emerges from the ventral end of the stomach, and soon turns anteriorly, then dorsally, and then

Alimentary Canal.

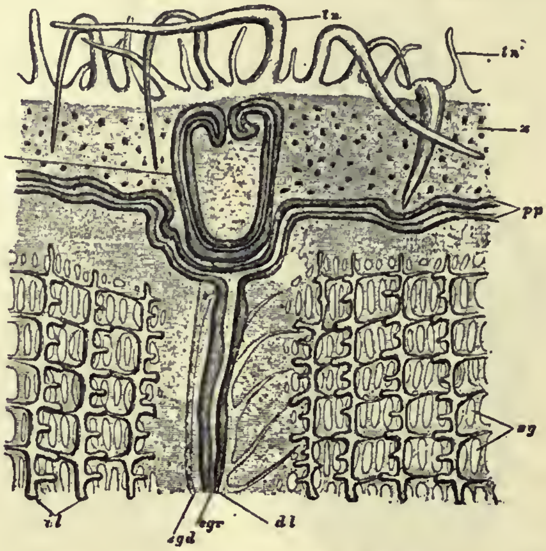

FIG. 10.—Dorsal Tubercle and neighbouring organs of *A. mentula*. Lettering as before.
egr, Epibranchial groove; *z*, prebranchial zone.

posteriorly so as to form a curve—the intestinal loop—open posteriorly. The intestine now curves anteriorly again, and from this point runs nearly straight forward as the rectum, thus completing a second curve—the rectal loop—open anteriorly (see fig. 5). The wall of the intestine is thickened internally to form the typhlosole, a pad which runs along its entire length. The anus opens into the dorsal part of the peribranchial cavity near to the atrial aperture. The walls of the stomach are glandular; and a system of delicate tubules with dilated ends, which ramifies over the outer wall of the intestine and communicates with the cavity of the stomach by means of a duct, is probably a digestive gland.

A mass of large clear vesicles which occupies the rectal loop, and may extend over the adjacent walls of the intestine, is a renal organ without a duct. Each vesicle is the modified remains of a part of the primitive coelom or body cavity, and is formed of cells which eliminate nitrogenous waste matters from the blood circulating in the neighbouring blood lacunae and deposit them in the cavity of the vesicle, where they form a concentrically laminated concretion of a yellowish or brown colour. These concretions contain uric acid, and in a large Ascidian are very numerous. The nitrogenous waste products are thus deposited and stored up in the renal vesicles in place of being excreted from the body. In other Ascidians the renal organ may differ from the above in its position and structure; but in no case has it an excretory duct, unless the subneural gland is to be regarded as an additional renal organ.

Excretory Organs.

The heart is an elongated fusiform tube placed on the ventral and posterior edge of the stomach, in a space (the pericardium) which is part of the original coelom or body cavity, the rest of which exists merely in the form of lacunae and of the cavities of the reproductive organs and renal vesicles in the adult Ascidian. The wall of the heart is formed of a layer of epithelio-muscular cells, the inner ends of which are cross-striated; and waves of contraction pass along it from end to end, first for a certain number of beats in one direction and then in the other, so as to reverse the course of circulation periodically. At each end the heart is continued into a vessel (see fig. 11), which is merely a large sinus or lacuna lined with a delicate endothelial layer. The sinus leaving the ventral end of the heart is called the branchio-cardiac vessel,[1] and the heart itself is merely the differentiated posterior part of this sinus and is therefore a ventral vessel. The branchio-cardiac vessel, after giving off a branch which, along with a corresponding branch from the cardio-visceral vessel, goes to the test, runs along the ventral edge of the branchial sac externally to the endostyle, and communicates laterally with the ventral ends of all the transverse vessels of the branchial sac. The sinus leaving the dorsal end of the heart is called the cardio-visceral vessel, and this, after giving off to the test the branch above mentioned, breaks up into a number of sinuses, which ramify over the alimentary canal and the other viscera. These visceral lacunae finally communicate with a third great sinus, the

Blood Vascular System and Coelom.

[1] On account of the periodic reversal of the circulation none of the vessels can be called arteries or veins.

viscero-branchial vessel, which runs forward along the dorsal edge of the branchial sac externally to the dorsal lamina and joins the dorsal ends of all the transverse vessels of the branchial sac. Besides these three chief systems, there are numerous lacunae in all parts

of the body, by means of which anastomoses are established between the different currents of blood. All these blood spaces and lacunae are to be regarded as derived from the blastocoele of the embryo, and not, as has been usually supposed, from the coelom (30). When the heart contracts ventro-dorsally the course of the circulation is as follows: the blood which is flowing through the vessels of the branchial sac is collected in an oxygenated condition in the branchio-cardiac vessel, and, after receiving a stream of blood from the test, enters the heart (*ht*). It is then propelled from the dorsal end of the heart into the cardio-visceral vessels, and so reaches the test and digestive and other organs; then, after circulating in the visceral lacunae, it passes into the branchio-visceral vessel in an impure condition, and is distributed to the branchial vessels (fig. 11, *da*) to be purified again. When the heart on the other hand contracts dorso-ventrally, this course of the circulation is reversed. As the test receives a branch from each end of the heart, it follows that it has afferent and efferent vessels whichever way the blood is flowing. In some Ascidians the vessels in the test become very numerous and their end branches terminate in swollen bulbs close under the outer surface of the test. In this way an accessory respiratory organ is probably formed in the superficial layer of the test. The blood corpuscles are chiefly colourless and amoeboid; but in most if not all Ascidians there are also some pigmented corpuscles in the blood. These are generally of an orange or reddish brown tint, but may be opaque white, dark indigo-blue, or even of other colours. Precisely similarly pigmented cells are found throughout the connective tissue of the mantle and other parts of the body.

Course of Circulation.

A. mentula is hermaphrodite, and the reproductive organs lie, with the alimentary canal, on the left side of the body. The ovary is a ramified gland which occupies the greater part of the intestinal loop (see fig. 5). It contains a cavity which, along with the cavities of the testis, is derived from a part of the original coelom, and the ova are formed from its walls and fall when mature into the cavity. The oviduct is continuous with the cavity of the ovary and leads forwards alongside the rectum, finally opening near the anus into the peribranchial cavity. The testis is composed of a great number of delicate branched tubules, which ramify over the ovary and the adjacent parts of the intestinal wall. Those tubules terminate in ovate swellings. Near the commencement of the rectum the larger tubules unite to form the vas deferens, a tube of considerable size, which runs forwards alongside the rectum, and, like the oviduct, terminates by opening into the peribranchial cavity close to the anus. The lumen of the tubules of the testis, like the cavity of the ovary, is a part of the original coelom, and the spermatozoa are formed from the cells lining the wall. In some Ascidians reproductive organs are present on both sides of the body, and in others (*Polycarpa*) there are many complete sets of both male and female systems, attached to the inner surface of the mantle on both sides of the body and projecting into the peribranchial cavity.[1]

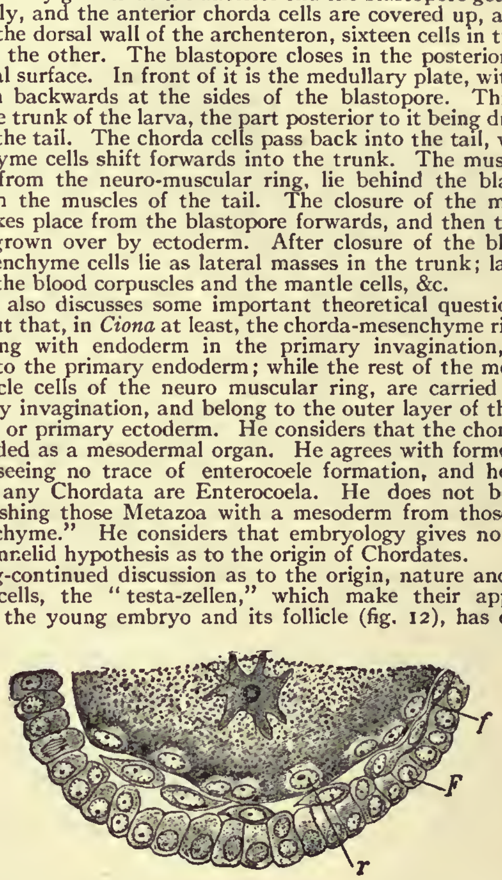
Reproductive Organs.

Embryology [2] and Life-History

We owe to W. E. Castle (1896) the most complete account which has yet been given of the early stages of development in an Ascidian. His careful study of the cell lineage in *Ciona* has made it clear that some of the conflicting statements of his predecessors arose from incorrect orientation of the embryos. One of the most important of his conclusions is that the mesoderm of Ascidians, and probably that of the archaic Vertebrates, is derived from both primary layers, ectoderm and endoderm. Further, he finds that *Ciona* produces both ova and spermatozoa at the same time, but self-fertilization very rarely occurs. The eggs are laid just before dawn, and the larva is hatched during the following night. The test cells adhering to the young homogeneous test have, it is now well known, no connexion with the cells found later in the adult test. The larvae are free-swimming for from one to several days. They avoid the light. The spermatozoon enters at the ventral hemisphere, and that point determines the median plane and the posterior end of the embryo. The ventral is the animal pole. The cleavage is from the beginning bilateral. The first cleavage plane is vertical, and separates the right and left halves of the embryo. The four smaller dorsal cells with yolk give rise to the endodermal hemisphere; the four larger, more protoplasmic, cells form the ventral ectodermal hemisphere. The cells of the latter hemisphere divide more rapidly, and form the future aboral surface. When the dorsal hemisphere has twenty-two cells the ventral has fifty-four. The gastrulation is a combination of epiboly and invagination. The ventral ectoderm grows over, so as to envelop the dorsal hemisphere, while the latter sinks down and becomes saucer-shaped. In the centre of the dorsal surface ten cells form the future endoderm. Round these comes a ring of cells, the chordamesenchyme ring, from which the notochord and mesenchyme arise. Outside this ring is a row of cells, the neuro-muscular ring. The more anterior of these cells form the medullary plate, the more posterior the longitudinal musculature of the larva. The remainder of the cells (in the 112-cell stage) form ectoderm. By growth at the anterior end the blastopore gets pushed posteriorly, and the anterior chorda cells are covered up, and come to lie in the dorsal wall of the archenteron, sixteen cells in two rows, one over the other. The blastopore closes in the posterior part of the dorsal surface. In front of it is the medullary plate, with a continuation backwards at the sides of the blastopore. This region forms the trunk of the larva, the part posterior to it being drawn out to form the tail. The chorda cells pass back into the tail, while the mesenchyme cells shift forwards into the trunk. The muscle cells, derived from the neuro-muscular ring, lie behind the blastopore, and form the muscles of the tail. The closure of the medullary canal takes place from the blastopore forwards, and then the nerve cord is grown over by ectoderm. After closure of the blastopore the mesenchyme cells lie as lateral masses in the trunk; later they become the blood corpuscles and the mantle cells, &c.

Castle also discusses some important theoretical questions. He points out that, in *Ciona* at least, the chorda-mesenchyme ring takes part along with endoderm in the primary invagination, and so belongs to the primary endoderm; while the rest of the mesoderm, the muscle cells of the neuro muscular ring, are carried in by a secondary invagination, and belong to the outer layer of the young gastrula, or primary ectoderm. He considers that the chorda must be regarded as a mesodermal organ. He agrees with former observers in seeing no trace of enterocoele formation, and he doubts whether any Chordata are Enterocoela. He does not believe in distinguishing those Metazoa with a mesoderm from those with a "mesenchyme." He considers that embryology gives no support to the Annelid hypothesis as to the origin of Chordates.

A long-continued discussion as to the origin, nature and fate of certain cells, the "testa-zellen," which make their appearance between the young embryo and its follicle (fig. 12), has ended in



(After Pizon.)

FIG. 12.—Portion of Mature Ovum of Ascidian, showing F, follicle, and *f*, *r*, "test-cells."

practical agreement that these small cells are derived from the follicle-cells, and have nothing to do with the test. In *Salpa*, however, certain follicle-cells enter the embryo, and perform important functions in guiding the development for a time.

In most Ascidians the eggs are fertilized in the peribranchial cavity, and undergo most of their development before leaving the parent; in some cases, however, the eggs are laid, and fertilization takes place in the surrounding water. The segmentation is complete and regular (fig. 13, A) and results in the formation of a spherical blastula, which then undergoes invagination (fig. 13, B). The embryo elongates, and the blastopore or invagination opening comes to be placed on the dorsal edge near the posterior end (fig. 13, C). The hypoblast cells lining the archenteron are columnar in form, while the epiblast cells are more cubical (fig. 13, B, C, D). The dorsal surface of the embryo now becomes flattened and then depressed to form a longitudinal groove, extending forwards from the blastopore to near the front of the body. This "medullary groove" now becomes converted into a closed

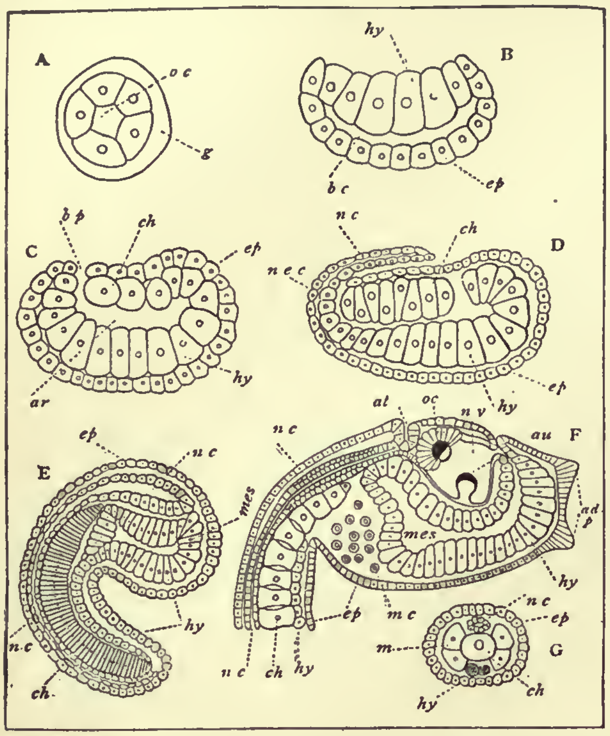
canal by its side walls growing up, arching over, and coalescing in the median dorsal line (fig. 13, D). This union of the *laminae dorsales* to form the neural canal commences at the posterior end behind the blastopore and gradually extends forwards. Consequently the blastopore comes to open into the posterior end of the neural canal (fig. 13, D), while the anterior end of that cavity remains



(After Kowalevsky.)

open to the exterior. In this way the archenteron communicates indirectly with the exterior. The short canal leading from the neural canal to the archenteron is known as the neurenteric canal (fig. 13, D, *nec*). Previous to this stage some of the hypoblast cells at the front edge of the blastopore and forming part of the dorsal wall of the archenteron (fig. 13, C, *ch*) have become separated off, and then arranged to form an elongated band, two cells wide, underlying the posterior half of the neural canal (fig. 13, D, E, *ch*). This is the origin of the notochord. Outgrowths from the sides of the archenteron give rise to laterally placed masses of cells, which are the origin of the mesoblast. These masses show no trace of metameric segmentation. The cavities (reproductive and renal vesicles) which are formed later in the mesoblast represent the coelom. Consequently the body cavity of the Tunicata is a modified form of enterocoele. The anterior part of the embryo, in front of the notochord, now becomes enlarged to form the trunk, while the posterior part elongates to form the tail (fig. 13, E). In the trunk the anterior part of the archenteron dilates to form the mesenteron, the greater part of which becomes the branchial sac; at the same time the anterior part of the neural canal enlarges to form the cerebral vesicle, and the opening to the exterior at the front end of the canal now closes. In the tail part of the embryo the neural canal remains as a narrow tube, while the remains of the wall of the archenteron—the dorsal part of which becomes the notochord—are converted into lateral muscle bands (fig. 13, G) and a ventral cord of cells, which eventually breaks up to form blood corpuscles. As the tail grows longer, it becomes bent round the trunk of the embryo inside the egg-membrane. About this period the epiblast cells begin to form the test as a cuticular deposit upon their outer surface. The test is at first devoid of cells and forms a delicate gelatinous investment, but it shortly afterwards becomes cellular by the migration into it of test cells formed by proliferation from the epiblast.[1]

Larval Stage.

The embryo is hatched about two or three days after fertilization, in the form of a tadpole-like larva, which swims actively through the sea by vibrating its long tail. The anterior end of the body is provided with three adhering papillae (fig. 13, F, *adp.*) in the form of epiblastic thickenings. In the free-swimming tailed larva the nervous system, formed from the walls of the neural canal, becomes considerably differentiated. The anterior part of the cerebral vesicle remains thin-walled (fig. 13, F), and two unpaired sense-organs develop from its wall and project into the cavity. These are a dorsally and posteriorly placed optic organ, provided with retina, pigment layer, lens and cornea, and a ventrally placed auditory organ, consisting of a large spherical partially pigmented otolith, attached by delicate hair-like processes to the summit of a hollow *crista acoustica* (fig. 13, F, *au*). The posterior part of the cerebral vesicle thickens to form a solid ganglionic mass traversed by a narrow central canal: this becomes the ganglion of the adult Ascidian. The wall of the neural canal behind the cerebral vesicle becomes differentiated into an anterior thicker region, placed in the posterior part of the trunk and having a superficial layer of nerve fibres, and a posterior narrower part which traverses the tail, lying on the dorsal surface of the notochord, and gives off several pairs of nerves to the muscles of the tail. Just in front of the anterior end of the nervous system a dorsal involution of the epiblast breaks through into the upturned anterior end of the mesenteron and thus forms the mouth opening. Along the ventral edge of the mesenteron, which becomes the branchial sac, the endostyle is formed as a narrow groove with thickened side walls. It probably corresponds to the median portion of the thyroid body of Vertebrata. A curved outgrowth from the posterior end of the mesenteron forms the alimentary canal (oesophagus, stomach and intestine), which at first ends blindly. An anus is formed later by the intestine opening into the left of two lateral epiblastic involutions (the atria), which rapidly become larger and fuse dorsally to form the peribranchial cavity. Outgrowths from the wall of the branchial sac meet these epiblastic involutions and fuse with them to give rise to the first formed pair of stigmata, which thus come to open into the peribranchial cavity; and these alone correspond to the gill clefts of *Amphioxus* and the Vertebrata.

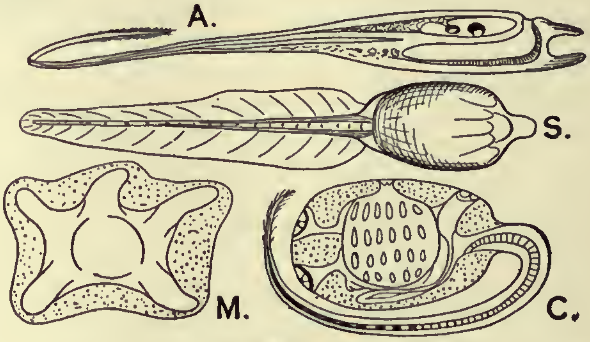

FIG. 14.—Sketches of Ascidian Larvae.
A, *Ascidia*; S, *Styela*; M, *Anurella*; C, Compound Ascidian.

Fig. 14 shows a few characteristic forms of Ascidian "tadpoles," or free-swimming larvae. A and S are typical simple Ascidians; M is the aberrant tailless form found in some *Molgulidae*; and C is the larva of a typical compound Ascidian.

Metamorphosis to Adult Form.

After a short free-swimming existence the fully developed tailed larva fixes itself by its anterior adhering papillae to some foreign object, and then undergoes a remarkable series of retrogressive changes, which convert it into the adult Ascidian. The tail atrophies, until nothing is left but some fatty cells in the posterior part of the trunk. The adhering papillae disappear and are replaced functionally by a growth of the test over neighbouring objects. The nervous system with its sense organs atrophies until it is reduced to the single small ganglion, placed on the dorsal edge of the pharynx, and a slight nerve cord running for some distance posteriorly (van Beneden and Julin). Changes in the shape of the body and a further growth and differentiation of the branchial sac, peribranchial cavity and other organs now produce gradually the structure found in the adult Ascidian.

The most important points in connexion with this process of development and metamorphosis are the following: (1) In the

[1] Some of the first test cells are also probably derived from the epithelium of the egg follicle.

Ascidian embryo all the more important organs (*e.g.* notochord, neural canal, archenteron) are formed in essentially the same manner as they are in *Amphioxus* and other Chordata. (2) The free-swimming tailed larva possesses the essential characters of the Chordata, inasmuch as it has a longitudinal skeletal axis (the notochord) separating a dorsally placed nervous system (the neural canal) from a ventral alimentary canal (the archenteron); and therefore during this period of its life-history the animal belongs to the Chordata. (3) The Chordate larva is more highly organized than the adult Ascidian, and therefore the changes by which the latter is produced from the former may be regarded as a process of degeneration (31). The important conclusion drawn from all this is that the Tunicata are the degenerate descendants of a group of primitive Chordata (see below).

FIG. 16.—Sketch of the chief kinds of Tunicata found in the sea.

CLASSIFICATION AND CHARACTERS OF GROUPS

ORDER I.—LARVACEA

Characters of Larvacea.

Free-swimming pelagic forms provided with a large locomotory appendage (the tail), in which there is a skeletal axis (the urochord). A relatively large test (the "house") is formed with great rapidity as a secretion from the ectoderm; it is merely a temporary structure, which is cast off and replaced by another. The branchial sac is simply an enlarged pharynx with two ventral ciliated openings (stigmata) leadin to the exterior. There is no separate peribranchial cavity. The nervous system consists of a large dorsally placed ganglion and a long nerve cord, which stretches backwards over the alimentary canal to reach the tail, along which it runs on the left side of the urochord. The anus opens ventrally on the surface of the body in front of the stigmata. No reproduction by gemmation or metamorphosis is known in the life-history.

(After Fol.)

FIG. 17.—*Oikopleura cophocerca* in "House," seen from right side, magnified six times. The arrows indicate the course of the water.

x, Lateral reticulated parts of "House."

Structure of Appendicularia.

This is one of the most interesting groups (fig. 16) of the Tunicata, as it shows more completely than any of the rest the characters of the original ancestral forms. It has undergone little or no degeneration, and consequently corresponds more nearly to the tailed-larval condition than to the adult forms of the other groups. The order includes a single family, the Appendiculariidae, all the members of which are minute and free-swimming. They occur on the surface of the sea in most parts of the world. They possess the power to form with great rapidity an enormously large investing gelatinous layer (fig. 11), which corresponds to the test of other groups. This was first described by von Mertens and by him named "Haus." It is only loosely attached to the body and is frequently thrown off soon after its formation and again reformed. H. Lohmann has made a careful study of the mode of formation of this "house" from certain large ectoderm cells, the "oikoplasts," and he considers that it probably fulfils the following functions: Its complicated apparatus of passages with partial septa form a finely perforated network, through which a relatively large volume of water is strained so as to entrap microscopic food particles; it helps in locomotion by its hydrostatic effect, and it is also a protection to the animal, which may escape from enemies by throwing off the house, which is many times its own size. The tail in the Appendiculariidae is attached to the ventral surface of the body (fig. 18), and usually points more or less anteriorly. The supposed traces of vertebration in the muscle bands and the nerve cord are probably artifacts, and do not indicate true metameric segmentation. Near the base of the tail there is a distinct elongated ganglion (fig. 18, *ng'*). The anterior (cerebral) ganglion has connected with it an otocyst, a pigment spot, and a tubular process opening into the branchial sac and representing the dorsal tubercle and associated parts of an ordinary Ascidian. The branchial aperture or mouth leads into the branchial sac or pharynx. There are no tentacles. The endostyle is short. There is no dorsal lamina, and the peripharyngeal bands run dorsally and posteriorly. The wall of the branchial sac has only two ciliated apertures (fig. 19). They are homologous with the primary stigmata of the typical Ascidians and the gill clefts of vertebrates. They are placed far back on the ventral surface, one on each side of the middle line, and lead into short funnel-shaped tubes which open on the surface of the body behind the anus (fig. 18, *at*). These tubes correspond to the right and left atrial involutions

which, in an ordinary Ascidian, fuse to form the peribranchial cavity. The heart, according to Lankester, is formed of two cells, which are placed at the opposite ends and connected by delicate contractile protoplasmic fibrils. The large ovary and testis are placed at the posterior end of the body. The remainder of the structural details can be made out from figs. 18 and 19.

The family Appendiculariidae comprises amongst others the following genera: *Oikopleura* (Mertens), and *Appendicularia* (Cham.), in both of which the body is short and compact and the tail relatively long, while the endostyle is straight; *Megalocercus* (Chun) containing *M. abyssorum*, a huge deep-sea form from the Mediterranean (30 mm. long); *Fritillaria* (Quoy and Gaimard), in which the body is long and composed of anterior and posterior regions, the tail relatively short, the endostyle recurved, and an ectodermal hood is formed over the front of the body; and *Kowalevskia* (Fol), a remarkable form described by Fol (14), in which the heart and endostyle are said to be absent, while the branchial sac is provided with four rows of ciliated tooth-like processes.

Order II.—Thaliacea

Thallacea.

Free-swimming pelagic forms which may be either simple or compound, and the adult of which is never provided with a tail or a notochord. The test is permanent and may be either well developed or very slight. The musculature of the mantle is in the form of more or less complete circular bands, by the contraction of which locomotion is effected. The branchial sac has either two large or many small apertures, leading to a single peribranchial cavity, into which the anus opens. Blastogenesis takes place from a ventral endostylar stolon. Alternation of generations occurs in the life-history, and may be complicated by polymorphism. The Thaliacea comprises two groups Cyclomyaria and Hemimyaria.

Sub-order 1.—Cyclomyaria.

Characters of Cyclomyaria.

Free-swimming pelagic forms which exhibit alternation of generations in their life-history but never form permanent colonies. The body is cask-shaped, with the branchial and atrial apertures at the opposite ends. The test is more or less well developed. The mantle has its musculature in the form of circular bands surrounding the body. The branchial sac is fairly large, occupying the anterior half or more of the body. Stigmata are usually present in its posterior part only. The peribranchial cavity is mainly posterior to the branchial sac. The alimentary canal is placed ventrally close to the posterior end of the branchial sac. Hermaphrodite reproductive organs are placed ventrally near the intestine.

This group forms one family, the Doliolidae, including three genera, *Doliolum* (Quoy and Gaimard), *Dolchinia* (Korotneff) and *Anchinia* (C. Vogt).

Structure of Doliolum.

Doliolum, of which about a dozen species are known from various seas, has a cask-shaped body, usually from 1 to 2 cm. in length. The terminal branchial and atrial apertures (fig. 20) are lobed and the lobes are provided with sense organs. The test is very slightly developed and contains no cells. The mantle has eight or nine circular muscle bands surrounding the body. The most anterior and posterior of these form the branchial and atrial sphincters. The wide branchial and atrial apertures lead into large branchial and peribranchial cavities, separated by the posterior wall of the branchial sac, which is pierced by stigmata; consequently there is a free passage for the water through the body along its long axis, and the animal swims by contracting its ring-like muscle bands, so as to force out the contained water posteriorly. Stigmata may also be found on the lateral walls of the branchial sac, and in that case there are corresponding anteriorly directed diverticula of the peribranchial cavity. There is a distinct endostyle on the ventral edge of the branchial sac and a peripharyngeal band surrounding its anterior end, but there is no representative of the dorsal lamina on its dorsal edge. The oesophagus commences rather on the ventral edge of the posterior end of the branchial sac, and runs backwards to open into the stomach, which is followed

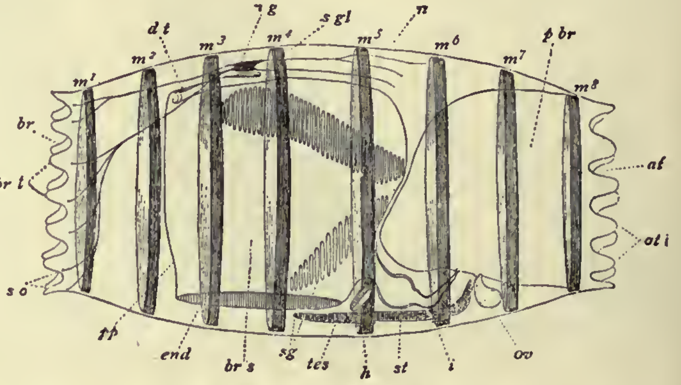

Fig. 20.—*Doliolum denticulatum*, sexual generation, from the left side. Lettering as for fig. 18.

by a curved intestine opening into the peribranchial cavity. The alimentary canal as a whole is to the right of the middle line. The hermaphrodite reproductive organs are to the left of the middle line alongside the alimentary canal. They open into the peribranchial cavity. The ovary is nearly spherical, while the testis is elongated, and may be continued anteriorily for a long distance. The heart is placed in the middle line ventrally, between the posterior end of the endostyle and the oesophageal aperture. The nerve ganglion lies about the middle of the dorsal edge of the body, and gives off many nerves. Under it is placed the subneural gland, the duct of which runs forward and opens into the anterior end of the branchial sac by a simple aperture, surrounded by the spirally twisted dorsal end of the peripharyngeal band (fig. 20., *dt*).

Development of Doliolum. The ova of the sexual generation produce tailed larvae; these develop into forms known as "nurses," which are asexual, and are characterized by the possession of nine muscle bands, an auditory sac on the left side of the body, a ventrally-placed stolon near the heart, upon which buds are produced and a dorsal outgrowth near the posterior end of the body. The nurse after producing the buds becomes a degenerate form with very wide muscle bands. The buds give rise eventually to the sexual generation, which is polymorphic, having three distinct forms, in two of which the reproductive organs remain undeveloped. The buds while still very young migrate from their place of origin on the stolon, divide by fission, and become attached to the dorsal outgrowth of the body of the nurse, where they develop. The three forms produced are as follows. (1) Nutritive forms (trophozooids), which remain permanently attached to the nurse and serve to provide it with food; they have the body elongated dorso-ventrally, and the musculature is very slightly developed. (2) Foster forms (phorozooids), which, like the preceding, do not become sexually mature, but, unlike them, are set free as cask-shaped bodies with eight muscle bands and a ventral outgrowth, which is formed of the stalk by which the body was formerly united to the nurse. On this outgrowth the (3) forms (gonozooids) which become sexually mature are attached while still young buds, and after the foster forms are set free these reproductive forms gradually attain their complete development and are eventually set free and lose all trace of their connexion with the foster forms. They resemble the foster forms in having a cask-shaped body with eight muscle bands, but differ in having no outgrowth or process, and in having the reproductive organs fully developed.[1]

Anchinia. *Anchinia*, of which only one species is known, *A. rubra*, from the Mediterranean, has the sexual forms permanently attached to portions of the dorsal outgrowth from the body of the unknown nurse. The body is elongated dorso-ventrally. The test is well developed and contains branched cells. The musculature is not so well developed as in *Doliolum*. There are two circular bands at the anterior end and two at the posterior, and two on the middle of the body. The stigmata are confined to the obliquely placed posterior end of the branchial sac. The alimentary canal forms a U-shaped curve. The reproductive organs are placed on the right side of the body. The life-history is still imperfectly known. As in the case of *Doliolum* the sexual generation is polymorphic, and has three forms, two of which remain in a rudimentary condition so far as the reproductive organs are concerned. In *Anchinia*, however, the three forms do not occur together on one stolon or outgrowth, but are produced successively, the reproductive forms of the sexual generation being independent of the "foster forms" (see Barrois, 27).

Sub-order 2.—Hemimyaria.

Free-swimming pelagic forms which exhibit alternation of generations in their life-history and in the sexual condition form colonies.

Characters of Hemimyaria. The body is more or less fusiform, with the long axis antero-posterior, and the branchial and atrial apertures nearly terminal. The test is well developed. The musculature of the mantle is in the form of a series of transversely-running bands, which do not form complete independent rings as in the Cyclomyaria. These transverse muscles are probably to be regarded as branchial and atrial sphincters which have spread over the body. The branchial and peribranchial cavities form a continuous space in the interior of the body, opening externally by the branchial and atrial apertures, and traversed obliquely from the dorsal and anterior end to the ventral and posterior by a long narrow vascular band, which represents the dorsal lamina, the dorsal blood-vessel, and the neighbouring part of the dorsal edge of the branchial sac of an ordinary Ascidian. The alimentary canal is placed ventrally. It may either be stretched out (ortho-enteric) so as to extend for some distance anteriorly, or—as is more usual—be concentrated (caryo-enteric) to form along with the reproductive organs a rounded opaque mass near the posterior end of the body known as the visceral mass or "nucleus." The embryonic development is direct, no tailed larva being formed.

Salpidae. This sub-order contains one family, the Salpidae, including the single genus *Salpa* (Forskål), which, however, may be divided into two well-marked groups of species—(1) those, such as *S. pinnata*, in which the alimentary canal is stretched out along the ventral surface of the body, and (2) those, such as *S. fusiformis* (fig. 21, A), in which the alimentary canal forms a compact globular mass, the "nucleus," near the posterior end of the body. About fifteen species

[1] For further details see Uljanin (28) and Neumann, *Doliolum*, in *Deutsch. Tief-See Exped.* (Jena, 1905).

altogether are known; they are all pelagic forms and are found in nearly all seas. Each species occurs in two forms—the solitary asexual (*proles solitaria*) and the aggregated sexual (*proles gregaria*)—which are usually quite unlike one another. The solitary form (fig. 21, B) gives rise by internal gemmation to a complex tubular stolon, which contains processes from all the more important organs of the parent body and which becomes segmented into a series of buds or embryos. As the stolon elongates, the embryos near the free end which have become advanced in their development are set free in groups, which remain attached together by processes of the test, each enclosing a diverticulum from the mantle so as to form "chains" (fig. 22). Each member of the chain is a *Salpa* of the sexual or aggregated form, and when mature may—either still attached to its neighbours or separated from them (fig. 21, A)—produce one or several embryos, which develop into the solitary *Salpa*. Thus the two forms alternate regularly.

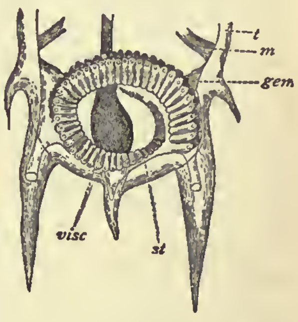

FIG. 22.—Posterior part of solitary form of *Salpa democratica-mucronata*, showing a chain of embryos nearly ready to be set free.
gem, Young aggregated *Salpae* forming the chain.
st, Stolon.
m, Muscle band of the mantle.

Structure of Salpa. The more important points in the structure of a typical *Salpa* are shown in fig. 23. The branchial and atrial apertures are at opposite ends of the body, and each leads into a large cavity, the branchial and peribranchial sacs, which are in free communication at the sides of the obliquely-running dorsal lamina or "gill." The test is well developed and adheres closely to the surface of the mantle. The muscle bands of the mantle do not completely encircle the body. They are present

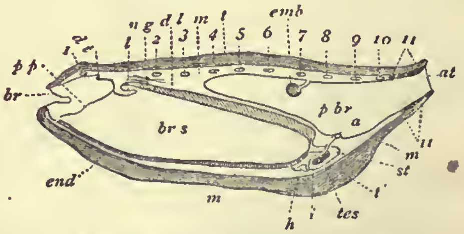

FIG. 23.—Semi-diagrammatic representation of *Salpa* from left side. Lettering as before.

m,	Mantle.	*dl*,	Gill or branchia.
l,	Languet.	1–11,	Muscle bands of mantle.

dorsally and laterally, but the majority do not reach the ventral surface. In many cases neighbouring bands join in the median dorsal line (fig. 21). The anterior end of the dorsal lamina is prolonged to form a prominent tentacular organ, the languet, projecting into the branchial sac. The nerve ganglion (which represents the ganglion of the Ascidian along with the subneural gland), dorsal lamina, peripharyngeal bands and endostyle, are placed in their usual positions; but in place of any distinct subneural gland there are two lateral neural glandular masses first described by Metcalf. These have no connexion with the ciliated funnel, but open by lateral ducts into the branchial cavity. Median and lateral eyes are also found in connexion with the ganglion. The large spaces at the sides of the dorsal lamina (often called the gill or branchia of *Salpa*), by means of which the cavity of the branchial sac is placed in free communication with the peribranchial cavity, are to be regarded as gigantic *stigmata* formed by the suppression of the lateral walls of the branchial sac. Fig. 23 represents an aggregated or sexual *Salpa* which was once a member of a chain, since it shows a testis and a developing embryo. The ova (always few in number, usually only one) appear at a very early period in the developing chain *Salpa*, while it is still a part of the gemmiparous stolon in the body of the solitary *Salpa*. This gave rise to the view put forward by Brooks (25), that the ovary really belongs to the solitary *Salpa*, which is therefore a female producing a series of males by asexual gemmation, and depositing in each of these an ovum, which will afterwards, when fertilized, develop in the body of the male into a solitary or female *Salpa*. This idea would of course entirely destroy the view that *Salpa* is an example of alternation of generations. The sexual or chain *Salpa*, although really hermaphrodite, is always protogynous; *i.e.* the female elements or ova are produced at an earlier period than the male organ or testis. This prevents self-fertilization. The ovum is fertilized by the spermatozoa of an older *Salpa* belonging to another chain, and the embryo is far advanced in its development before the testis is formed.

Development of Salpa.

Follicular cells, known as kalymmocytes, migrate into the ovum and for a time play an important part in moulding the development and nourishing the blastomeres. At an early period in its development a part of the embryo becomes separated off, along with a part of the wall of the cavity in which it lies, to form the "placenta," in which the embryonic and the maternal blood streams circulate in close proximity (or actually coalesce during one period) and so allow of the passage of nutriment to the developing embryo. At a somewhat later stage a number of cells placed at the posterior end of the body alongside the future nucleus become filled up with oil-globules to form a mass of nutrient material—the elaeoblast—which is used up later on in the development. Many suggestions have been made as to the homology of the elaeoblast. The most probable is that it is the disappearing rudiment of the tail found in the larval condition of most Ascidians.

Addendum.

Octacnemidae.

The family Octacnemidae includes the single remarkable genus *Octacnemus*, found during the "Challenger" expedition, and first described by Moseley (29). It is now known in both a solitary and an aggregated form, and was regarded by Herdman as a deep-sea representative of the pelagic Salpidae, possibly fixed; or, better, as related to the primitive fixed forms from which Salpidae have been derived. Metcalf, however, has shown that the aggregated form of *O. patagoniensis*, which he has described, is more nearly related to the Clavelinidae amongst Ascidiacea. The body is somewhat discoid, with its margin prolonged to form eight tapering processes (fig. 24), on to which the muscle bands of the mantle are continued. The alimentary canal

forms a compact nucleus (fig. 24, A); the endostyle is very short; and the dorsal lamina is also reduced. The reproduction and life-history are entirely unknown. *Octacnemus bythius* was found by the "Challenger" expedition in the South Pacific at depths of 1070 and 2160 fathoms, and Metcalf has since described a new species, *O. patagoniensis* from 1050 fathoms off the Patagonian coast, in which there is an aggregated form (fig. 24, B) consisting of individuals united by a stolon composed of test and body-walls.

ORDER III.—ASCIDIACEA

Ascidiacea.

Fixed or free-swimming simple or compound Ascidians which in the adult are never provided with a tail and have no trace of a notochord. The free-swimming forms are colonies, the simple Ascidians being always fixed. The test is permanent and well developed; as a rule it increases with the age of the individual. The branchial sac is large and well developed. Its walls are perforated by numerous slits (stigmata) opening into the peribranchial cavity, which communicates with the exterior by the atrial aperture. Many of the forms reproduce by gemination, and in most of them the sexually-produced embryo develops into a tailed larva.

The Ascidiacea includes three groups—the simple Ascidians, the compound Ascidians and the free-swimming colonial *Pyrosoma.*

Sub-Order 1.—Ascidiae simplices.

Simple Ascidians.

Fixed Ascidians which are solitary and very rarely reproduce by gemmation; if colonies are formed, the members are not buried in a common investing mass, but each has a distinct test of its own. No strict line of demarcation can be drawn between the simple and the compound Ascidians, and one of the families of the former group, the Clavelinidae (the social Ascidians), forms a transition from the typical simple forms, which never reproduce by gemmation, to the compound forms, which always do. The Ascidiae Simplices may be divided into the following families:—

Family I., Clavelinidae.—Simple Ascidians which reproduce by gemmation to form small colonies in which each ascidiozooid has a distinct test, but all are connected by a common blood system, and by prolongations of "epicardiac tubes" from the branchial sacs. Buds formed on stolons which are vascular outgrowths from the posterior end of the body, containing prolongations from the ectoderm, mesoderm and endoderm of the ascidiozooid. Branchial sac not folded; internal longitudinal bars usually absent; stigmata straight; tentacles simple. This family contains, amongst others, the following three genera: *Ecteinascidia* (Herdman), with internal longitudinal bars in branchial sac; *Clavelina* (Savigny), with intestine extending behind branchial sac; and *Perophora* (Wiegmann), with intestine alongside branchial sac.

Family II., Ascidiidae.—Solitary fixed Ascidians with gelatinous test; branchial aperture usually eight-lobed, atrial aperture usually six-lobed. Branchial sac not folded; internal longitudinal bars usually present; stigmata straight or curved; tentacles simple. This family is divided into three sections:—

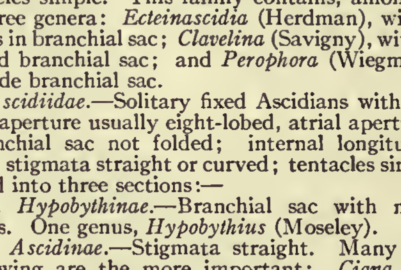
Sub-family 1, Hypobythinae.—Branchial sac with no internal longitudinal bars. One genus, *Hypobythius* (Moseley).

Sub-family 2, Ascidinae.—Stigmata straight. Many genera, of which the following are the more important: *Ciona* (Fleming), dorsal languets present; *Ascidia* (Linnaeus, = *Phallusia*, Savigny), dorsal lamina present (see figs. 1 to 10); *Rhodosoma* (Ehrenberg), anterior part of test modified to form operculum; *Abyssascidia* (Herdman), intestine on right side of branchial sac.

Sub-family 3, Corellinae.—Stigmata curved. Three chief genera: *Corella* (Alder and Hancock), test gelatinous, body sessile; *Corynascidia* (Herdman), test gelatinous, body pedunculated; *Chelyosoma* (Brod. and Sow.), test modified into horny plates.

Family III., Cynthiidae.—Solitary fixed Ascidians, usually with leathery test; branchial and atrial apertures both four-lobed. Branchial sac longitudinally folded (fig. 26); stigmata straight; tentacles simple or compound. This family is divided into three sections:—

Sub-family 1, Styelinae.—Not more than four folds on each side of branchial sac (fig. 26, S) tentacles simple. The more important genera are: *Styela* (Macleay), stigmata normal, and *Bathyoncus* (Herdman), stigmata absent or modified.



(After Herdman, "*Challenger*" *Report.*)

at,	Atrial aperture.	*i l*,	Internal longitudinal bar.
br,	Branchial aperture.	*mh*,	Mesh.
ped,	Peduncle.	*sp*,	Calcareous spicules in vessels.
		tr,	Transverse vessels.

Sub-family 2, Cynthinae.—More than eight folds in branchial sac (fig. 26, C); tentacles compound; body sessile. The chief genus is *Cynthia* (Savigny), with a large number of species.

Sub-family 3, Bolteninae.—More than eight folds in branchial sac; tentacles compound; body pedunculated (fig. 25, A). The chief genera are: *Boltenia* (Savigny), branchial aperture four-lobed, stigmata normal; and *Culeolus* (Herdman), branchial aperture with less than four lobes, stigmata absent or modified (fig. 25, B). This last is a deep-sea genus discovered by the "Challenger" expedition (see 17).

Family IV., Molgulidae.—Solitary Ascidians, sometimes not fixed; branchial aperture six-lobed, atrial four-lobed. Test usually incrusted with sand. Branchial sac longitudinally folded; stigmata more or less curved, usually arranged in spirals; tentacles compound. The chief genera are: *Molgula* (Forbes), with distinct folds in the branchial sac, and *Eugyra* (Ald. and Hanc.), with no distinct folds, but merely broad internal longitudinal bars in the branchial sac. In some of the Molgulidae (genus *Anurella*, Lacaze-Duthiers, 20) the embryo (fig. 14, M) does not become converted into a tailed larva, the development being direct, without metamorphosis. The embryo when hatched assumes gradually the adult structure, and never shows the features characteristic of larval Ascidians, such as the urochord and the median sense-organs. Bourne has described an aberrant Molgulid, *Oligotrema*, from the Loyalty Islands, with a reduced branchial sac and enlarged pinnate muscular branchial lobes, apparently used for catching food!

Figs. 26 and 27 illustrate some details of structure of branchial sac and of stomach in various simple and compound Ascidians, which are made use of in classification, and in the definitions of genera and larger groups.

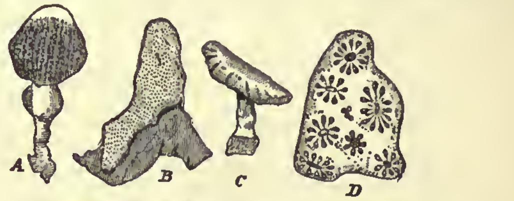
Sub-Order 2.—Ascidiae Compositae.

Compound Ascidians. Fixed Ascidians which reproduce by gemmation, so as to form colonies in which the ascidiozooids are buried in a common investing mass and have no separate tests. This is probably a somewhat artificial assemblage formed of two or three groups of Ascidians which produce colonies in which the ascidiozooids are so intimately united that they possess a common test or investing mass. This is the only character which distinguishes them from the Clavelinidae, but the property of reproducing by gemmation separates them from the rest of the Ascidiae Simplices. The Ascidiae Compositae may be divided into seven families, which fall into two well-marked groups: (1) the Chalarosomata, including the first five families, with extended body, divided into two or three regions, and more nearly related to the Clavelinidae; and (2) the Pectosomata, including the Botryllidae and Polystyelidae, with a compact body, not divided into regions, and evidently related to the Cynthiidae amongst simple Ascidians.

Family I., Distomidae.—Ascidiozooids divided into two regions, thorax and abdomen; testes numerous; vas deferens not spirally coiled. The chief genera are: *Distoma* (Gaertner); *Distaplia* (Della Valle); *Colella* (Herdman), forming a pedunculated colony (see fig. 28, A) in which the ascidiozooids develop incubatory pouches, connected with the peribranchial cavity, in which the embryos undergo their development (17); and *Chondrostachys* (Macdonald).

Family II., Coelocormidae.—Colony not fixed, having a large axial cavity with a terminal aperture. Branchial apertures five-lobed. This includes one species, *Coelocormus huxleyi* (Herdman), which is, in some respects, a transition form between the ordinary compound Ascidians (*e.g.* Distomidae) and the Ascidiae Luciae (*Pyrosoma*).

Family III., Didemnidae.—Colony usually thin and incrusting test containing stellate calcareous spicules. Testis single, large; vas deferens spirally coiled. The chief genera are—*Didemnum* (Savigny), in which the colony is thick and fleshy and there are only three rows of stigmata on each side of the branchial sac; and *Leptoclinum* (Milne-Edwards), in which the colony is thin and incrusting (fig. 28, B) and there are four rows of stigmata on each side of the branchial sac.



(After Herdman, "*Challenger*" *Report.*)

B, *Leptoclinum neglectum.*
C, *Pharyngodictyon mirabile.*
D, *Botryllus*, showing arrangement of ascidiozooids in circular systems, each of which has a central common cloaca.

Family IV., Diplosomidae.—Test reduced in amount, rarely containing spicules. Vas deferens not spirally coiled. In *Diplosoma* (Macdonald), the most important genus, the larva is gemmiparous.

Family V., Polyclinidae.—Ascidiozooids divided into three regions—thorax, abdomen and post-abdomen. Testes numerous; vas deferens not spirally coiled. The chief genera are: *Pharyngodictyon* (Herdman), with stigmata absent or modified, containing one species, *Ph. mirabile* (fig. 28, C), the only compound Ascidian known from a depth of 1000 fathoms; *Polyclinum* (Savigny), with a smooth-walled stomach; *Aplidium* (Savigny), with the stomach wall longitudinally folded (fig. 27); and *Amaroucium* (Milne-Edwards), in which the ascidiozooid has a long post-abdomen and a large atrial languet.

Family VI., Botryllidae.—Ascidiozooids having the intestine and reproductive organs alongside the branchial sac. Dorsal lamina present; internal longitudinal bars present in branchial sac. The chief genera are: *Botryllus* (Gaertn. and Pall.), with simple stellate systems (fig. 28, D), and *Botrylloides* (Milne-Edwards), with elongated or ramified systems. It is well known that in the family Botryllidae, amongst compound Ascidians, the ectodermal vessels containing

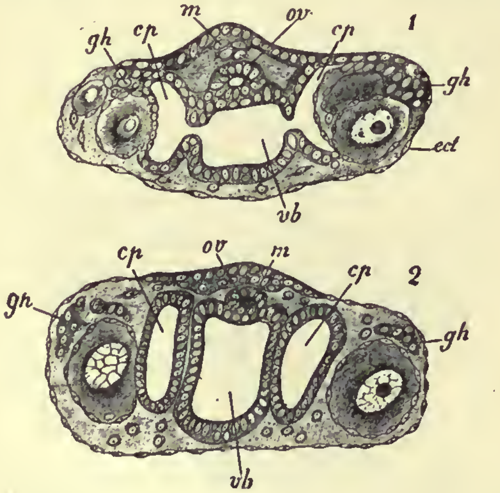
blood, which ramify through the common test and serve to connect the vascular systems of the various members of the colony, have numerous large ovate dilatations, the ampullae, upon their terminal twigs (fig. 29). Various functions have been assigned to these ampullae in the past, and Bancroft has shown that in addition to acting as storage reservoirs for blood, organs for the secretion of test matrix, and accessory organs of respiration, they are also organs for blood propulsion. The ampullae execute co-ordinated pulsations, the co-ordination being due to variations in the blood-pressure. It was actually found that the ampullae could keep up the circulation for some time in a portion of a colony independently of the hearts of the ascidiozooids. All the hearts in a colony of *Botryllus* contract simultaneously and in the same direction. The reversal of the circulation may be regarded as due to the engorgement of the ampullae in the superficial parts of the colony. These when distended overcome the resistance of the heart's action, and cause it to stop and then reverse.

Family VII., Polystyelidae.—Ascidiozooids not grouped in systems. Branchial and atrial apertures four-lobed. Branchial sac may be folded; internal longitudinal bars present. The chief genera are: *Thylacium* (Carus), with ascidiozooids projecting above general surface of colony; *Goodsiria* (Cunningham), with ascidiozooids completely imbedded in investing mass; and *Chorizocormus* (Herdman), with ascidiozooids united in little groups which are connected by stolons. Several of the species show transitions between the other Polystyelidae and the Styelinae amongst simple Ascidians.

Gemmation and Growth of Colonies.—A number of new observations have been made in recent years upon the budding of compound Ascidians, some of which are very puzzling and contradictory in their results. Metschnikoff, Kowalevsky, Giard, Hjort, Pizon, Seeliger, Ritter, van Beneden and Julin have all in turn added to our knowledge of the details of development and life-history, of the various processes of gemmation and of the formation of colonies. It is impossible as yet to reconcile all the conflicting accounts, but the following points at least seem pretty clear.

Gemmation may be very different in its details in closely related compound Ascidians. There are, however, two main types of budding, to one or other of which most of the described methods may be referred. There is first the "stolonial" or "epicardiac" type, seen in the Chalarosomata, typically in Distomidae and Polyclinidae, and comparable with the gemmation in Clavelinidae, Pyrosomidae and Thaliacea outside this group. Secondly, there is the "parietal" or "peribranchial" type, seen in the Pectosomata, typically in the Botryllidae. The remarkable process of gemmation seen in the families Didemnidae and Diplosomidae may probably be regarded as a modification of the stolonial type. The double embryo in the Diplosomidae is probably to be interpreted as precocious budding (rather than as embryonic fission), due to acceleration in development (tachygenesis). The type of budding, and even details such as the length of the stolon, have much to do with differences in the nature and appearance of the colonies produced. The stolon, which has a wall continuous with the body-wall of the parent, contains an endodermal element in the form of the so-called "epicardium," and also a prolongation of the ovary, or at least a string of migrating germ-cells, so that the reproductive elements are also handed on. Still, it is clear from recent researches



(After Pizon.)

FIG. 30.—Young buds of *Botryllus* sectioned to show the separation of the branchial (*vb*) from the peribranchial (*cp*) cavities.

ov, Dorsal tube. *gh*, Germ cells.
m, Mesoderm cells. *ect*, Ectoderm.

that the development of the bud (blastozooid) and that of the embryo (oozooid) do not proceed along parallel lines. It is impossible to harmonize the facts of gemmation with the germ-layer theory, and attempts to explain budding in Ascidians as a process of regeneration, by which the organs of the parent or their germ-layers give rise to the corresponding organs in the bud, have signally failed.

Figs. 29 and 30 show the buds in the Botryllidae, after Pizon, who has followed day by day the changes of growth in young colonies of Botryllidae, tracing the rise of successive generations of buds and the degeneration of their parents. The buds are parietal, arising from the walls of the peribranchial cavities (fig. 29), and at an early period they acquire the structure shown in fig. 30, where there are two vesicles undergoing further subdivision and differentiation, but investigators still differ as to whether the inner, which gives rise to the branchial sac and alimentary canal, is not produced along with the outer from the ectoderm of the parent.

Reproduction by Gemmation and the Formation of Colonies.

A remarkable case of polymorphism has been found by M. Caullery in the buds of the compound Ascidian *Colella*. Some of the buds have an abundant store of reserve materials in their outer layer of cells, while others are without this supply. The former are placed deeply in the stalk, develop slowly, and probably serve to regenerate the colony when the head portion has been removed or has died down. In these cases where the ectoderm has taken on the function of storing the reserve material, it is found that all the organs of the bud are formed from the cells of the endodermic vesicle. The first ascidiozooid of the colony produced by the tailed larva does not form sexual reproductive organs, but reproduces by gemmation so as to make a colony. Thus there is alternation of generations in the life-history. In the most completely formed colonies (*e.g. Botryllus*) the ascidiozooids are arranged in groups (systems or coenobii), and in each system are placed with their atrial apertures towards one another, and all communicating with a common cloacal cavity which opens to the exterior in the centre of the system (fig. 28, D).

Sub-Order 3.—Ascidiae Luciae.

Free-swimming pelagic colonies having the form of a hollow cylinder closed at one end. The ascidiozooids forming the colony are embedded in the common test in such a manner that the branchial apertures open on the outer surface and the atrial apertures on the inner surface next to the central cavity of the colony. The ascidiozooids are produced by gemmation from a rudimentary larva (the cyathozooid) developed sexually.

Ascidiae Luciae.

FIG. 31.—*Pyrosoma elegans.* (Natural size.)
A, Side view of entire colony.
B, End view of open extremity.

Structure of Pyrosoma.

This sub-order includes a single family, the Pyrosomidae, containing one well-marked genus, *Pyrosoma* (Péron), with half a dozen species. They are found swimming near the surface of the sea, chiefly in tropical latitudes, and are brilliantly phosphorescent. A fully developed *Pyrosoma* colony may be from an inch or two to upwards of twelve feet in length. The shape of the colony is seen in fig. 31. It tapers slightly towards the closed end, which is rounded. The opening at the opposite end is reduced in size by the presence of a membranous prolongation of the common test (fig. 31, B). The branchial apertures of the ascidiozooids are placed upon short papillae projecting from the general surface, and most of the ascidiozooids have long conical processes of the test projecting outwards beyond their branchial apertures (figs. 31, 32 and 33). There is only a single layer of ascidiozooids in the *Pyrosoma* colony, as all the fully developed ascidiozooids are placed with their antero-posterior axes at right angles to the surface and communicate by their atrial apertures with the central cavity of the colony (fig. 32). Their dorsal surfaces are turned towards the open end of the colony. The more important points in the structure of the ascidiozooid of *Pyrosoma* are shown in fig. 33. A circle of tentacles, of which one, placed ventrally (fig. 33, *tn*), is larger than the rest, is found just inside the branchial aperture. From this point a wide cavity, with a few circularly placed muscle bands running round its walls, leads back to the large branchial sac, which occupies the greater part of the body. The stigmata are elongated transversely and crossed by internal longitudinal bars. The dorsal lamina is represented by a series of eight languets (*l*). The nerve ganglion (on which is placed a small pigmented sense organ), the subneural gland, the dorsal tubercle, the peripharyngeal bands, and the endostyle are placed in the usual positions. On each side of the anterior end of the branchial sac, close to the peripharyngeal bands, is a mass of rounded gland cells which are the source of the phosphorescence. The alimentary canal is placed

posteriorly to the branchial sac, and the anus opens into a large peribranchial (or atrial) cavity, of which only the median posterior part is shown (*p.br.*) in fig. 33. The reproductive organs are developed in a diverticulum of the peribranchial cavity, and consist of a lobed testis and a single ovum at a time. The development takes place in a part of the peribranchial cavity (fig. 32, *em*). The segmentation is meroblastic, and an elongated embryo is formed on the surface of a mass of yolk. The embryo, after the formation of an alimentary cavity, a tubular nervous system, and a pair of laterally placed atrial tubes, divides into an anterior and a posterior part. The anterior part then segments into four pieces, which afterwards develop into the first ascidiozooids of the colony, while the posterior part remains in a rudimentary condition, as the "cyathozooid"; it eventually atrophies. As the four ascidiozooids increase in size, they grow round the cyathozooid and soon encircle it (fig. 32, *asc* and *cy*). The cyathozooid absorbs the nourishing yolk upon which it lies, and distributes it

to the ascidiozooids by means of a heart and system of vessels which have been meanwhile formed. When the cyathozooid atrophies and is absorbed, its original atrial aperture remains and deepens to become the central cavity of the young colony, which now consists of four ascidiozooids placed in a ring, around where the cyathozooid was, and enveloped in a common test. The colony gradually increases by the formation of buds from these four original ascidiozooids.

PHYLOGENY

The accompanying diagram (fig. 34) shows graphically the probable origin and course of evolution of the various groups of Tunicata, and therefore exhibits their relations to one another much more correctly than any system of linear classification can do. The ancestral Proto-Tunicata are here regarded[1] as an offshoot from the Proto-Chordata—the common

Phylogeny

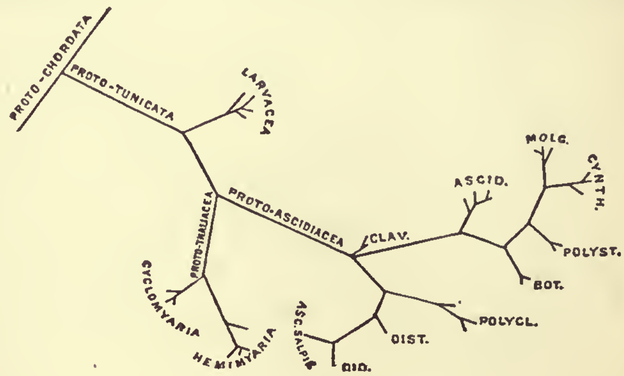

FIG. 34.

ancestors of the Tunicata (Urochorda), *Amphioxus* (Cephalochorda) and the Vertebrata. The ancestral Tunicata were probably free-swimming forms, not very unlike the existing Appendiculariidae, and are represented in the life-history of nearly all sections of the Tunicata by the tailed larval stage. The Larvacea are the first offshoot from the ancestral forms which gave rise to the two lines of descendants, the Proto-Thaliacea and the Proto-Ascidiacea. The Proto-Thaliacea then split into the ancestors of the existing Cyclomyaria and Hemimyaria. The Proto-Ascidiacea gave up their pelagic mode of life and became fixed. This ancestral process is repeated at the present day when the free-swimming larva of the simple and compound Ascidians becomes attached. The Proto-Ascidiacea, after the change, are probably most nearly represented by the existing genus *Clavelina*. They have given rise directly or indirectly to the various groups of simple and compound Ascidians and the Pyrosomidae. These groups form two lines, which appear to have diverged close to the position of the family Clavelinidae. The one line leads to the more typical compound Ascidians, and includes the Polyclinidae, Distomidae, Didemnidae, Diplosomidae, Coelocormidae, and finally the Ascidiae Luciae or Salpiformes. The second line gave rise to the simple Ascidians, and to the Botryllidae and Polystyelidae, which are, therefore, not closely allied to the other compound Ascidians. The later Proto-Ascidiacea were probably colonial forms, and gemmation was retained by the Clavelinidae and by the typical compound Ascidians (Distomidae, &c.) derived from them. The power of forming colonies by budding was lost, however, by the primitive simple Ascidians, and must, therefore, have been regained independently by the ancestral forms of the Botryllidae and the Polystyelidae. If this is a correct interpretation of the course of evolution of the Tunicata, we arrive at the following important conclusions. (1) The Tunicata, as a whole, form a degenerate branch of the Proto-Chordata; (2) the Ascidiae Luciae (*Pyrosoma*) are much more closely related to the typical compound Ascidians than to the other pelagic Tunicata, viz. the Larvacea and the Thaliacea; and (3) the Ascidiae Compositae form a polyphyletic group, the sections of which have arisen at several distinct points from the ancestral simple Ascidians.

TUNICLE (Lat. *tunicella*), a liturgical vestment of the Christian church, proper to subdeacons. It is practically the same vestment as the dalmatic (*q.v.*).

TUNING FORK, a small bar of cast steel with tolerably defined edges, bent into a fork with two prongs, with a handle of the same metal extending from the bend of the fork and serving as a sound-post to transmit the vibrations to any resonance board or body convenient for reinforcing the sound. The fork is set in vibration by striking one of the prongs against a hard substance, or pressing the prongs together if they are light ones, or if heavy drawing a bow across. The tuning fork was invented by John Shore, royal trumpeter in 1711, sergeant trumpeter at the entry of George I. in 1714, and lutanist to the Chapel Royal in 1715. It is used for determining musical pitch (see Pitch), and also in certain physical experiments (see Sound).

TUNIS, capital of Tunisia, the largest city in North Africa outside Egypt, in 36° 48′ N., 10° 12′ E. Tunis is situated on an isthmus between two salt lakes, the marshy Sebkha-el-Sejumi to the south-west, and the shallow el-Bahira (little sea), or Lake of Tunis, to the north-east. An artificially deepened channel through the Bahira into the Gulf of Tunis has converted the city into a seaport (see below). North-west and south-west the city is commanded by hills, on which are forts, that on Sidi bel Hassan to the south dating from the middle ages. The city, which was formerly strongly fortified, is built in the shape of an amphitheatre, with the kasbah, or citadel, at its highest point. The old town (Medina), the walls of which have in great part disappeared, lies between two suburbs, the Ribat-el-Sowika on the north and the Ribat Bab-el-Jezira on the south. These suburbs were also surrounded by a wall, now pulled down, leaving the gates of the city isolated. An outer wall, however, encloses the Medina and its suburbs. Beyond the Bab-el-Bahar (sea-gate), now called Porte de France, on the level ground by the Bahira, is the marine town, or Quartier Franc, built since the French occupation in 1881. No attempt has been made by the French to modernize the ancient city.

The European Quarter.—From the landing stage a short street leads into the broad Avenue Jules Ferry or de la Marine running east to west and ending in the Place de la Résidence, on the north side of which is the Roman Catholic cathedral and on the south side the palace of the French resident-general, with a large garden. The main thoroughfare is continued westwards by the Avenue de France, which leads to the Porte de France. Beyond the gate is the small Place de la Bourse, in which is the British consulate. From the Porte electric trams run to the harbour and also in a circle round the native city. From the Place de la Résidence cross-roads run north and south. The northern road, the Rue de Rome, led to the Gare du Nord, the station for Carthage, Goletta and La Marsa. This line was replaced in 1908 by an electric tramway built along the northern bank of the canal connecting Tunis and Goletta. The southern road, the Rue-es-Sadikia, leads to the Gare du Sud, the station for Susa, Kairawan, &c., and also for Algiers. The Avenue Jules Ferry is intersected by a north-to south street running in a straight line over two miles. The northern section is called the Avenue de Paris; the southern Avenue de Carthage. By these avenues, served by electric trams, access is gained to the suburbs of the city. In the Avenue de France or Avenue Jules Ferry are the chief hotels and cafés, the casino-theatre, the principal banks and the finest shops. In the Rue d'Italie, running south from the Avenue de France, are the post office, market buildings, and French Protestant church. There is an English church in the Rue d'Espagne. Behind the cathedral is a disused cemetery with a chapel, where the Christian slaves are supposed to have worshipped. The coffins in the vaults have been removed to the Chapel of St Louis at Carthage. Among them was that of M. de Lesseps, French consul-general (d. 1832), father of the maker of the Suez Canal. Next to the cemetery is the old Greek church. North of the Avenue de France is a district, inhabited chiefly by Maltese, which has obtained the name of Malta-es-Segheira (Little Malta).

The Native Town.—To the visitor from Europe the attraction of Tunis lies in the native city, where, in the Rue al Jezira, along which runs electric trams, he can see hundreds of camels in the morning bearing charcoal to market; where he may witness the motley life of the bazaars, or, by the Bab-Jedid, watch the snake-charmers and listen to the Moorish story-tellers. Christians are forbidden to enter the mosques. From various points the traveller can look over the city, with its great citadel, its many minarets and its flat-topped houses. Many of the dwellings of the richer residents are adorned with arcades, the marble columns of which were taken from the ruins of Carthage. The Porte de France is the threshold of the ancient city. Two narrow streets climb the hill towards the citadel. That to the right, the Rue de la Kasbah, opens into a small square (Suk-el-Islam or Place de la Kasbah), on the left of which is the Dar-el-Bey (palace of the bey), while beyond it rise the walls of the citadel. That to the left leads to the chief mosque of the city, the Jamaa-al-Zeituna (mosque of the Olive Tree), founded in A.D. 698. It has many domes and a spacious cloister, and its central court can be seen from the neighbouring streets. Attached to the mosque is a college attended by several hundreds of Moslem youths. The Dar-el-Bey contains numerous rooms beautifully decorated in the Moorish style of the 18th century; and the judgment hall has a domed roof adorned with the delicate arabesque plaster-work known as *Nuksh hadida*. The kasbah, which forms the western side of the Suk-el-Islam, includes within the circuit of its walls a mosque built about A.D. 1232 by Abu Zakariya the Hafsite. Of the ancient kasbah nothing but the walls remain, the old buildings having been demolished to make way for barracks for the French troops. Besides being a fortress the kasbah formerly contained a palace of the beys, barracks for janissaries and bagnios for the Christian slaves. When in July 1535 the Spaniards under Charles V. attacked Tunis, the Christians in the kasbah, said to number 10,000, rose against their keepers and helped to secure the victory of the emperor. The Spaniards during their occupancy of Tunis strengthened the kasbah and built an aqueduct to supply it with water. Immediately north of the kasbah are the buildings of the Sadiki College, and north of the college is the Palais de Justice, a building completed in 1901. It stands between the line of the ancient wall and the enceinte. Its walls are decorated with faience taken from an ancient Tunisian palace. North-east of the Palais de Justice, which like the Sadiki College is built in the Moorish style, rises the great dome, surrounded by smaller cupolas, of the largest mosque in the city, that named after Sidi Mahrez, a renowned saint of the 5th century of the Mahommedan era, whose tomb makes it a sanctuary for debtors. East of the mosque, which dates from the 17th century, and just without the inner city walls, here demolished, is the Protestant cemetery of St George, used during the 17th, 18th and the greater part of the 19th centuries. Here are buried several British consuls. Here also was the grave of John Howard Payne, author of "Home, Sweet Home" and consul for the United States, who died at Tunis in 1852. In 1883 the body was disinterred and removed to America, but a monument has been placed on the spot similar to that erected over the new tomb at Washington.

The Bazaars.—The native city to the north of the Rue de la Kasbah includes the Jewish quarter and the synagogue. The Jews of Tunis adopt a special costume, the women wearing gaily coloured vests and close-fitting white trousers. Beyond the Jewish quarter, in the Ribat-el-Soweika, is the Place el Halfa-Ouine, a favourite rendezvous of the poorer Moslem population, wherein are many native cafés. South of the Rue de la Kasbah is the bazaar quarter. Here the streets are very narrow and tortuous, some being vaulted and many covered in with planking. They are known as suks (markets), and each suk is devoted to one particular trade. Beyond paving the streets the French have made no alteration in the suks, which retain their original character unimpaired. The shops consist of small cubes, open in the front, in which the trader squats cross-legged amidst his wares. The principal suks are el-Attarin (market of the perfumers), el-Farashin (carpets and cloths), el-Serajin (saddlery) and el-Birka (jewelry). The suk el-Birka was formerly the slave market. Near by are the green-tiled domes and walls enriched with rose-coloured marbles of the mausoleum of the beys.

Public Institutions, &c.—Tunis is furnished with well-equipped hospitals and a large asylum for aged people kept by the Little Sisters of the Poor. The principal educational establishments, besides that of the mosque of the Olive Tree, are the Sadiki College, founded in 1875, for free instruction in Arabic and European subjects, the Lycée Carnot in the Avenue de Paris, formerly the College of St Charles (founded by Cardinal Lavigerie), open to Christians and Moslems alike, and the normal school, founded in 1884 by the reigning bey, for the training of teachers in the French language and European ideas. The Dames de Sion have a large establishment for the teaching of small children of both sexes, and there is a secondary school for girls. All the schools are well attended. About a mile and a half north of the centre of the European quarter, on the slopes of a hill rising 270 ft., is the Parc du Belvedère covering some 240 acres and commanding extensive views. Water is supplied to the city, with its numerous fountains, from Jebel Zaghwan (*vide infra*) by the Roman aqueduct repaired, at a cost of half a million sterling, by the bey Mahommed al-Sadik (d. 1882).

The Port.—The canal which traverses the shallow Bahira, and connects Tunis with the Mediterranean, is nearly seven miles long. By means of breakwaters it is continued beyond the coast-line and is at its mouth 328 ft. wide. It has a uniform depth of 21½ ft., but its width within the lake is reduced to 98 ft. In the centre, however, the canal is widened to 147 ft. to allow vessels to pass. There is a harbour at the entrance (see GOLETTA). That at the Tunis end of the canal is 1312 ft. long by 984 ft. broad, and is of the same depth as the canal. The canal was begun in 1885 and was opened to navigation in June 1893. An additional basin, south-east of the main harbour, was opened in 1905 and is used for the exportation of phosphates. Of the ships using the harbour more than half are French, and one-third Italian, British vessels coming next. British goods, however, are largely carried in French bottoms, and next to France the United Kingdom and Malta take most of the trade of the port. The exports are chiefly phosphates and other minerals, cereals, olive oil, cattle, hides, sponges and wax. The imports are cotton goods, flour, hardware, coal, sugar, tea, coffee, &c. The figures of trade and shipping are included in those of the trade of the regency (see TUNISIA), of which Tunis and Goletta take about a third.

Population.—The population of the city at the census of 1906 was returned at 227,519. The "natives"—Arabs, Berbers, "Moors," Turks and negroes—were estimated at 100,000, Tunisian Jews at 50,000, French 18,000, Italians 52,000, Maltese 6000, Greeks 500 and Levantines 1000. The French language is predominant in the European quarter.

Environs: The Bardo Palace, Zaghwan, &c.—The environs of Tunis are picturesque and afford many beautiful views, the finest being from the hill on the south-east, crowned by a French fort, and from the Belvedère already mentioned. About a mile and a quarter from the Bab Bu Saadun, the north-west gate of the city, is the ancient palace called the Bardo, remarkable for the "lion court," a terrace to which access is gained by a flight of steps guarded by marble lions, and for some apartments in the Moorish style. The finest of these apartments, containing beautiful arabesque plaster work, formed the old Harem, and are now part of the Musée Alaoui, which occupies a considerable portion of the Bardo. In this museum M. Paul Gauckler, the director of the department of art and antiquities in the Tunisian government, has formed a magnificent collection of Carthaginian and Roman antiquities, especially Roman mosaics. In the Musée Arabe, which occupies an adjacent small palace built about 1830, are treasures illustrative of the Arab-Berber or Saracenic art of Tunisia.

South-east of the city, along the valley of the Wadi Melain, are hundreds of large stone arches, magnificent remains of the Roman aqueduct from Zaghwan to Carthage. At Zaghwan (38 m. by rail from Tunis), over the spot whence the spring which supplies the aqueduct issues from the hill, are the ruins of a beautiful Temple of the Waters. The spring is now diverted direct into the aqueduct and is not visible at the surface. Between Zaghwan and Tunis, and accessible by the same railway, is Wadna, the Roman Uthina, where, besides numerous other ruins, are the fairly preserved arches of a large amphitheatre. The ruins of Carthage (*q.v.*) lie a few miles north of Goletta.

History.—Tunis is probably of greater antiquity than Carthage, of which city however it became a dependency, being repeatedly mentioned in the history of the Punic Wars. Strabo speaks of its hot baths and quarries. The importance of Tunis dates from the Arab conquest, when, as Carthage sank, Tunis took its place commercially and politically. It became the usual port for those going from the sacred city of Kairawan to Spain, and was one of the residences of the Aghlabite dynasty (800–909). In the 10th century it suffered severely, being repeatedly pillaged in the wars of the Fatimite caliphs Al-Qaim and Abu Tahir Isma'il el Mansur with the Sunnite leader Abu Yazid and the Zenata Berbers.

For its later fortunes, see TUNISIA, of which regency, since the accession of the Hafsites, Tunis has been the capital.

TUNISIA (Regency of Tunis), a country of North Africa, under the protection of France, bounded N. by the Mediterranean, W. by Algeria, E. by Tripoli and S. by the Sahara. Tunisia reaches farther north than any other part of Africa, Ras-al-Abiadh (Cape Blanc)[1] being in 37° 20′ N. On the south the boundary of the Tunisian Sahara is undetermined, but it may be roughly placed at 31° N. This would give, therefore, a greatest length of something like 440 m. The country lies between 11° 40′ E. and 7° 35′ E. The average length is about 300 m., and the average breadth 150 m.; consequently the area may be estimated at 50,000 sq. m. (For map, see ALGERIA.)

Physical Features.—Geographically speaking, Tunisia is merely the eastern prolongation of the Mauretanian projection of northern Africa, of that strip of mountainous, fertile and fairly well-watered country north of the Sahara desert, which in its flora and its fauna, and to some extent in its human race, belongs rather to Europe than to Africa. Tunisia is divided into the following four fairly distinct regions:—

1. On the north and north-west the Aures mountains of Algeria are prolonged into Tunisia, and constitute the mountainous region of the north, which lies between the Majerda river and the sea, and also includes the vicinity of the city of Tunis and the peninsula of the Dakhelat el Mawin, which terminates in Ras Addar (Cape Bon). This first division is called by the French "the Majerda Mountains." It includes within its limits the once famous district of the "Kroumirs,"[2] a tribe whose occasional thefts of cattle across the frontier gave the French an excuse to invade Tunisia in 1881. The highest point which the mountains attain in this division of Tunisia is about 4125 ft., near Ain Draham in Kroumiria. The country, however, about Bizerta is very mountainous, though the summits do not attain a greater altitude than about 3000 ft. The district between Bizerta and the Gulf of Tunis is a most attractive country, resembling greatly the mountainous regions of South Wales. It is well watered by streams more or less perennial. The principal river, the Majerda, is formed by the junction of the Wad Malleg and the Wad Kkallad. It and its

[1] It is possible that Ras-ben-Sekka, a little to the west of Cape Blanc, may be actually the most northerly point.

[2] The French seem systematically unable to master certain sounds foreign to their own language, or sounds which they suppose to be foreign. Thus the "w," though constantly represented in French by "ou," is continually changed by them into "v" when they transcribe foreign languages, just as the Greek χ and the German and Scottish "ch" is almost invariably rendered by the French in Algeria and Tunis as "kr." Add to this the insertion of vowel sounds where they are lacking in the Arabic and you derive from the real word *Khmir* the modern French term of Kroumir. In like manner *sebkha*, a salt lake, is constantly written by the French as *sebkra*.

tributaries rise in the Majerda and Aures mountains. Flowing north-east the Majerda forms an extensive plain in its lower course, reaching the sea near the ruins of Utica. Vegetation is abundant, and recalls that of the more fertile districts of southern Spain and of Italy. On the higher mountains the flora has a very English character, though the actual species of plants may not be the same.

2. The central plateau region, stretching between the Majerda valley and the mountains of Gafsa. The average elevation of this country is about 2000 ft. The climate, therefore, in parts is exceedingly cold and bleak in winter, and as it is very wind-swept and parched in summer by the terrible *qibli* or "sirocco" it is much less attractive in appearance than the favoured region on the northern littoral. Although it is almost always covered with some kind of vegetation, trees are relatively rare. A few of the higher mountains have the Aleppo pine and the juniper; elsewhere only an infrequent wild terebinth is to be seen. In these two regions the date palm is never met with growing naturally wild. Its presence is always due to its having been planted by man at some time or another, and therefore it is never seen far from human habitations. These central uplands of Tunisia in an uncultivated state are covered with alfa or esparto grass; but they also grow considerable amounts of cereals—wheat in the north, barley in the south. The range of the Saharan Atlas of Algeria divides (roughly speaking) into two at the Tunisian frontier. One branch extends northwards up this frontier and north-eastwards across the central Tunisian table-land, and the other continues south-eastwards between Gafsa and the salt lakes of the Jerīd. The greatest altitudes of the whole of Tunisia are attained on this central table-land, where Mt Sidi Ali bu Musin ascends to about 5700 ft. About 30 m. south of the city of Tunis is the picturesque mountain of Zaghwan, approximately 4000 ft. in altitude, and from whose perennial springs comes the water-supply of Tunis to-day as it did in the time of the Carthaginians and Romans. North-east of Zaghwan, and nearer Tunis, is the Jebel Resās, or Mountain of Lead, the height of which is just under 4000 ft.

3. The Sahel. This well-known Arab term for coast-belt (which in the plural form reappears as the familiar "Swahili" of Zanzibar) is applied to a third division of Tunisia, viz. the littoral region stretching from the Gulf of Hammamet to the south of Sfax. It is a region varying from 30 to 60 m. in breadth, fairly well watered and fertile. In a less marked way this fertile coast region is continued southwards in an ever-narrowing belt to the Tripolitan frontier. This region is relatively flat, in some districts slightly marshy, but the water oozing from the soil is often brackish, and in places large shallow salt lakes are formed. Quite close to the sea, all along the coast from Hammamet to Sfax, there are great fertility and much cultivation; but a little distance inland the country has a rather wild and desolate aspect, though it is nowhere a desert until the latitude of Sfax has been passed.

4. The Tunisian Sahara. This occupies the whole of the southern division of Tunisia, but although desert predominates, it is by no means all desert. At the south-eastern extremity of Tunisia there is a clump of mountainous country, the wind-and-water-worn fragments of an ancient plateau, which for convenience may be styled the Matmata table-land. Here altitudes of over 3000 ft. are reached in places, and in all the upper parts of this table-land there is fairly abundant vegetation, grass and herbage with low junipers, but with no pine trees. Fairly high mountains (in places verging on 4000 ft.) are found between Gafsa and the salt lakes of the Jerīd.

The Shats.

These salt lakes are a very curious feature. They stretch with only two short breaks in a line from the Mediterranean at the Gulf of Gabes to the Algerian frontier, which they penetrate for a considerable distance. They are called by the French (with their usual inaccuracy of pronunciation and spelling) "chotts"; the word should really be the Arabic *shat*, an Arab term for a broad canal, an estuary or lake. These shats however are, strictly speaking, not lakes at all at the present day. They are smooth depressed areas (in the case of the largest, the Shat el Jerīd, lying a few feet below the level of the Mediterranean), which for more than half the year are expanses of dried mud covered with a thick incrustation of white or grey salt. This salt covering gives them at a distance the appearance of big sheets of water. During the winter, however, when the effect of the rare winter rains is felt, there may actually be 3 or 4 ft. of water in these shats, which by liquefying the mud makes them perfectly impassable. Otherwise, for about seven months of the year they can be crossed on foot or on horseback. It would seem probable that at one time these shats (at any rate the Shat el Jerīd) were an inlet of the Mediterranean, which by the elevation of a narrow strip of land on the Gulf of Gabes has been cut off from them. It is, however, a region of past volcanic activity, and these salt depressions may be due to that cause. Man is probably the principal agent at the present day in causing these shats to be without water. All round these salt lakes there are numerous springs, gushing from the sandy hillocks. Almost all these springs are at a very hot temperature, often at boiling point. Some of them are charged with salt, others are perfectly fresh and sweet, though boiling hot. So abundant is their volume that in several places they form actual ever-flowing rivers. Only for the intervention of man these rivers would at all times find their way into the adjoining depressions, which they would maintain as lakes of water. But for a long period past the freshwater streams (which predominate) have been used for irrigation to such a degree that very little of the precious water is allowed to run to waste into the lake basins; so that these latter receive only a few salt streams, which deposit on their surface the salt they contain and then evaporate. This abundant supply of fresh warm water maintains oases of extraordinary luxuriance in a country where rain falls very rarely. Perennial streams of the description referred to are found between the Algerian frontier and Gabes on the coast. The town at Gabes itself is on the fringe of a splendid oasis, which is maintained by the water of an ever-running stream emptying itself into the sea at Gabes after a course of not more than 20 m.

The Jerid.

All this region round the shats has been called the "Jerīd" from the time of the Arab occupation. "Jerīd" means in Arabic a "palm frond" and inferentially "a palm grove." The fame of this Belad-el-Jerīd, or "Country of the Date Palms," was so exaggerated during the 17th and 18th centuries that the European geographers extended the designation from this small area in the south of Tunisia to cover much of inner Africa. With this country of Jerīd may be included the island of Jerba, which lies close to the coast of Tunisia in the Gulf of Gabes. The present writer believes that the date palm was really indigenous to this district of the Jerīd, as it is to countries of similar description in southern Morocco, southern Algeria, parts of the Tripolitaine, Egypt, Mesopotamia, southern Persia and north-western India; but that north of the latitude of the Jerīd the date did not grow naturally in Mauretania, just as it was foreign to all parts of Europe, in which, as in true North Africa, its presence is due to the hand of man. To some extent it may be said that true North Africa lies to the north of the Jerīd country, which, besides its Saharan, Arabian and Persian affinities, has a touch about it of real Africa, some such touch as may be observed in the valley of the Jordan. In the oases of the Jerīd are found several species of tropical African mammals and two or three of Senegalese birds, and the vegetation seems to have as much affinity with tropical Africa as with Europe. In fact, the country between the Matmata highlands and the strait separating Jerba from the mainland is singularly African in the character and aspect of its flora. To the south of the Jerīd the country is mainly desert—vast unexplored tracts of shifting sand, with rare oases. Nevertheless, all this southern district of Tunisia bears evidence of once having been subject to a heavy rainfall, which scooped out deep valleys in the original table-land, and has justified the present existence of immense watercourses—watercourses which are still, near their origin, favoured with a little water.

Mineral Springs.

Hot and mineral springs may be almost said to constitute one of the specialities of Tunisia. They offered a singular attraction to the Romans, and their presence in remote parts of the country no doubt was often the principal cause of Roman settlement. Even at the present day their value is much appreciated by the natives, who continue to bathe in the ruined Roman baths. The principal mineral springs of medicinal value are those of Korbus and Hammam Lif (of remarkable efficacy in rheumatic and syphilitic affections and certain skin diseases), of the Jerīd and Gafsa, of El Hamma, near Gabes, and of various sites in the Kroumir country.

Climate.—The rainfall in the first geographical division is pretty constant, and may reach a yearly average of about 22 in. Over the second and third divisions the rainfall is less constant, and its yearly average may not exceed 17 in. The mean annual temperature at Sūsa is 75° F., the mean of the winter or rainy season 60° and of the hot season 97°. At Tunis the temperature rarely exceeds 90°, except with a wind from the Sahara. The prevailing winds from May to September are east and north-east and during the rest of the year north-west and east. A rainy season of about two months usually begins in January; the spring season of verdure is over in May; summer ends in October with the first rains. Violent winds are common at both equinoxes. In the Tunisian Sahara rain is most uncertain. Occasionally two or three years may pass without any rainfall; then may come floods after a heavy downfall of a few weeks. Perhaps if an average could be struck it would amount to 9 or 10 in. per annum.

[*Geology.*—The greater part of Tunisia is composed of sandstones, marls and loosely stratified deposits belonging to the Pliocene and Quaternary periods. The oldest strata, consisting of gypsiferous marls, are referred to the Muschelkalk and show an alternation of lagoon with marine conditions. The Lias and Oolite formations are well represented, but the Sequanian and Kimmeridgian subdivisions are absent. Lower Cretaceous rocks, consisting of thick limestones, shales and marls, occur in Central Tunisia. The fossils show many notable affinities with those in the Lower Cretaceous of the Pyrenees. Limestones and marls represent the stages Cenomanian to Upper Senonian. The fossils of the Cenomanian have affinities with those in the Cenomanian of Spain, Egypt, Madagascar, Mozambique and India. The Senonian consists of a central facies with *Micraster peini*; a meridional facies with *Ostrea*; and a northern facies developed round Tunisia with large forms of *Inoceramus* and echinoids. Phosphatic deposits are well developed among the Lower Eocene rocks. The Middle Eocene is characterized by the presence of *Ostrea bogharensis* and the Upper Eocene by highly fossiliferous sandstones and marls. The Oligocene and Miocene formations are present, but the Upper Miocene is confined to the coast. Quaternary deposits cover much of the desert regions.[1]]

Minerals.—Coal has been discovered in the Khmir (" Kroumir ") country, but the principal mines at present worked in Tunisia are those of copper, lead and zinc. Zinc is chiefly found in the form of calamine. Iron is worked in the Kef district. Valuable deposits of phosphates are present, chiefly in the south-west of Tunisia, in the district of Gafsa. Marble is found in the valley of the Majerda (at Shemtu), at Jebel Ust (about 35 m. south of Tunis), and at Jebel Dissa, near Gabes. The marbles of Shemtu are the finest pink Numidian marbles, which were much esteemed by the Carthaginians and Romans. It has been sought to work again the ancient quarries of Shemtu, but it was found that the marble had been spoilt by ferruginous and calcareous veins.

Flora.—The flora of Tunisia is very nearly identical with that of Algeria, though it offers a few species either peculiar to itself or not found in the last-named country. On the whole its character is less Saharan than that of parts of Algeria, for the influences of the desert do not penetrate so far north in Tunisia as they do in Algeria. There are very few patches of real forest outside the Khmir country, though it is probable that in the time of the Romans the land was a good deal more covered with trees than at the present day. Some authorities, however, dispute this, in a measure, by saying that it was not naturally forested, and that the trees growing represented orchards of olives or other fruit trees planted by the Romans or romanized Berbers. But in the Majerda Mountains there are dense primeval forests lingering to the present day, and consisting chiefly of the cork oak (*Quercus ruber*), and two other species of oak (*Quercus mirbeckii* and *Q. kermes*), the pistachio or terebinth tree, the sumach (*Rhus pentaphila*), and other species of *Rhus* which are widely spread. In the mountains of Khmiria and the central plateau there are also the alder, the poplar, the Aleppo pine, the caroub, the tamarisk, the maple, the nettle-tree, several willows and junipers. The jujube-tree (*Zizyphus*) is found at various places along the eastern littoral. The retama shrub is met with in sandy districts, especially in the Sahara, but also right up to the north of Tunisia. The wild olive, the wild cherry, two species of wild plums, the myrtle, the ivy, arbutus, and two species of holly are found in the mountains of Khmiria, at various sites at high elevation near Tunis and Bizerta, and along the mountainous belt of the south-west which forms the frontier region between Tunisia and Algeria. The present writer, riding up to these frontier mountains from the thoroughly Saharan country round Gafsa, found himself surrounded by a flora very reminiscent of Switzerland or England. On the other hand, the flora of the shat region, of the south-eastern littoral, and of the Kerkena islands opposite Sfax, is thoroughly Saharan, with a dash, as it were, in places of an African element. The date palm grows wild, as has been already related, in Jerba. The only other species of palm found wild in Tunisia is the *Chamaerops humilis*, or dwarf palm, which is found on the mountains of the north at no very great altitude. The wild flowers of the north of Tunisia are so extremely beautiful during the months of February, March and April as to constitute a distinct attraction in themselves.[2]

Fauna.—The fauna of Tunisia at the present day is much impoverished as regards mammals, birds and reptiles. In 1880 the present writer saw lions killed in the north-west of Tunisia, but by 1902 the lion was regarded as practically extinct in the regency, though occasional rumours of his appearance come from the Khmir Mountains and near Feriana. Leopards of large size are still found in the north-west of central Tunisia. The cheetah lingers in the extreme south of the Jerid; so also does the caracal lynx. The pardine lynx is found fairly abundantly in the west of Tunisia in the mountains and forest. The striped hyena is scattered over the country sparsely. The genet and the common jackal are fairly abundant. The common ichneumon is rare. The zorilla, another purely African species, is found in the south of Tunisia. The Barbary otter is present in the Majerda and in some of the salt lakes. The Tunisian hedgehog is peculiar to that country and to Algeria. There is a second species (*Erinaceus deserti*) which is common to all North Africa. In the south of Tunisia, especially about the shats, the elephant-shrew (*Macroscelides*) is found, an animal of purely African affinities. Tunisia does not appear to possess the Barbary ape, which is found in Algeria and Morocco. Natives of Morocco and of the Sahara oases occasionally bring with them young baboons which they assert are obtained in various Sahara countries to the south and south-west of Tunisia. These baboons appear to belong to the Nubian species, but they cannot be considered indigenous to any part of Tunisia. The porcupine and a large Octodont rodent (*Ctenodactylus*), the jerboa (two species), the hare, and various other rodents are met with in Tunisia. The wild boar inhabits the country, in spite of much persecution at the hands of " chasseurs." The forested regions shelter the handsome Barbary red deer, which is peculiar to this region and the adjoining districts of Algeria. In the extreme south, in the Sahara desert, the addax antelope is still found. The hartebeest appears now to be quite extinct; so also is the leucoryx, though formerly these two antelopes were found right up to the centre of Tunisia, as was also the ostrich, now entirely absent from the country. In the marshy lake near Mater (north Tunisia), round the mountain island of Jebel Ashkel, is a herd of over 50 buffaloes; these are said to resemble the domestic (Indian) buffalo of the Levant and Italy, and to have their origin in a gift of domestic buffaloes from a former king of Naples to a bey or dey of Tunis. Others again assert the buffaloes to have been there from time immemorial; in which case it is very desirable that a specimen should be submitted for examination. [An allied form with gigantic horns is found fossil in Algeria.] They are the private property of the bey, who very properly preserves them. Far down in the Sahara, to the south of Tunisia, the Arabs report the existence of a wild ass, apparently identical with that of Nubia. Roman mosaics show representations not only of this ass, but of the oryx, hartebeest, and perhaps of the addax. The dorcas gazelle is still common in the south of Tunisia; but perhaps the most interesting ruminant is the magnificent udad, or Barbary sheep, which is found in the sterile mountainous regions of south Tunisia. The birds have been ably illustrated by Mr Whitaker in the *Ibis* magazine of the British Ornithological Union. They are, as a rule, common to the south Mediterranean region. A beautiful little bird almost peculiar to the south of Tunisia and the adjoining regions of Algeria, is a species of bunting (*Fringilla*), called by the Arabs *bu-habibi*.[3] This little bird, which is about the size of the linnet, has the head and back silvery blue, and the rest of the plumage chocolate red-brown. It is of the most engaging tameness, being fortunately protected by popular sentiment from injury. It inhabits the Jerid, and extends thence across the Algerian frontier. Among reptiles the Egyptian cobra seems to be indigenous in the south, where also is found the dreaded horned viper. Some nine or ten other species of snakes are present, together with an abundance of lizards, including the *Varanus*, and most species of Mediterranean tortoises are represented. The coasts are very rich in fish, and the tunny fisheries of the north are one of the principal sources from which the world's supply of tunny is derived.

Inhabitants.—The natives of Tunisia at the present day belong mainly to two stocks, which may be roughly classified as the Berber (*q.v.*) and the Arab (*q.v.*), about two-thirds being of Berber and the remaining third of Arab descent. But the Berbers of to-day are little more than an incomplete fusion of some four earlier and once independent stocks. These four divisions taken in the order of their assumed priority of invasion or habitation are: (1) the " Neanderthal " type, which is found in the districts of the shats and the adjoining Matmata table-land in the south, and in the " Kroumir " country of the

Rolland, " Carte géologique du littoral nord de la Tunisie," *Bull. soc. géol. de la France* (1888), vol. xvii.; H. H. Johnston, "A Journey through the Tunisian Sahara," *Geog. Journ.* (1898), vol. xi.; *Carte géologique de la régence de Tunis*, 1:800,000 with notes (Tunis, 1892).

[2] List of Plants commonly met with in northern Tunisia:—

Adonis microcarpa, DC.
Nigella damascena, L.
Fumaria spicata, L.
Cistus halimifolius, L.
Silene rubella, L.
Oxalis cernua, Thunb.
Geranium tuberosum, L.
Malva sylvestris, L.
Tetragonolobus purpureus, Moench.
Retama retam, Webb.
Fedia cornucopiae, Gaertn.
Helichrysum Stoechas, DC.
Centaurea (*Seridia*), sp.
Urospermum Dalechampi, Desf.
Scorzonera alexandrina, Boiss.
Stachys hirta, L.
Stachys, sp. not identified.
Anagallis collina, Schousb.
Convolvulus tricolor, L.
Solenanthus lanatus, DC.
Lycium europaeum, L.
Solanum sodomaeum, L.
Celsia cretica, L.
Linaria, sp. allied to *L. reflexa*, Desf.
Linaria triphylla, L. var.
Orobanche, sp.
Trixago apula, Stev.
Cynomorium coccineum.
Plantago albicans, L.
Euphorbia serrata, L.
Ophrys fusca, Link.
Orchis papilionacea, L.
Romulea bulbocodium, Sebast. and Mauri.
Gladiolus byzantinus, Mill.
Ornithogalum umbellatum, L.
Allium roseum, L.
Asphodelus fistulosus, L.
Muscari comosum, Mill.
Echium sericeum, Vahl.
Echium maritimum, Willd.
Anchusa italica, Retz.
Arum italicum, Mill.
Lagurus ovatus, L.

To this list should also be added the common wild tulip, the Italian cyclamen, the common scarlet poppy, the fennel, wild carrot and many varieties of thistle, some of gorgeous colouring.

[3] " Father of my friend."

north-west;[1] (2) ordinary Berbers, dolichocephalous, and of brown complexion, found over the greater part of Tunisia, especially in the east and south centre; (3) the short-headed Berbers, found in part of the Matmata country, part of the Sahara, the island of Jerba, the Cape Bon Peninsula, and the vicinity of Susa, Kairwan, and Sfax; (4) Berbers of a blond type, that is to say, with a tendency to brown or yellow moustaches, brown beard and head hair, and grey eyes. These are met with in the west and north-west of Tunisia, and in one patch on the coast of the Cape Bon Peninsula, near Nabeul.

The Arabs of more or less unmixed descent are purely nomads. They are met with in a long strip of country south of the Majerda, between the Algerian frontier and the sea-coast north of Susa; also inland, to the south-west of Susa, and near Kef; also in another long strip between the vicinity of Sfax on the north and the Jerīd on the south. They are descended from the second Arab invasion which began in the 11th century (see *History*). The extreme south of Tunis is ranged over by Berber Tawareq[2] or Tamasheq. Berber dialects are still spoken in Tunisia in the island of Jerba, in the Matmata country, and in the Tunisian Sahara. Elsewhere to a remarkable degree the Arabic language has extinguished the Berber tongue, though no doubt in vulgar Tunisian a good many Berber words remain. Short vocabularies of the Berber spoken in the Tunisian Sahara have been published by Sir H. H. Johnston in the *Geog. Journ.* (1898), vol. xi., and by Mr G. B. Michell in the *Journ. African Soc.* (1903). The Berbers are organized in tribes with purely democratic government and laws of their own, which are not those of the Koran.

On the north-eastern littoral of Tunisia the population is very mixed. The inhabitants of the Cape Bon Peninsula show evident signs of Greek blood arising from Greek invasions, which began in prehistoric times and finished with the downfall of the Byzantine Empire in North Africa. The presence of the Romans, and the constant introduction of the Italians, first as slaves, and quite recently as colonists, has also added an Italian element to the north Tunisian population. But from the fact that the bulk of the Tunisian population belongs to the Iberian section of the Berbers, and to this being no doubt the fundamental stock of most Italian peoples, the intermixture of the Italianized Berber with his African brother has not much affected the physique of the people, though it may have slightly tinged their mental characteristics.

The Phoenicians have left no marked trace of their presence; but inasmuch as they were probably of nearly the same race as the Arabs, it would not be easy to distinguish the two types. Arab and Berber have mingled to some extent, though no considerable fusion of the two elements has taken place. In fact, it is thought by some French students of the country that the Arab element will probably be eliminated from Tunisia, as it is the most unsettled. It is considered that these nomads will be gently pushed back towards the Sahara, leaving cultivable Tunisia to the settled Berber stock, a stock fundamentally one with the peoples of Mediterranean Europe.

The inhabitants of the coast towns belong, in large part, to the class generally known as "Moors." The pure Turks and the Kuluglis (sons of Turkish fathers by Moorish women or slave girls) are no longer numerous. Among the "Moors" the descendants of the Andalusian refugees form an exclusive and aristocratic class.

The present population of Tunisia numbers approximately 2,000,000, and consists of:—

Berbers, more or less of pure race, say	620,000
Arabs, " " " " "	500,000
Mixed Arab and Berber peoples, say	520,000
"Moors" (chiefly the population of the principal cities, of mixed Roman, Berber, Spanish, Moor and Christian races), say	110,000
Sudanese negroes and natives of Morocco, Tripoli and Turkey, say	40,000
Jews (mostly natives of Tunis, indeed, some descended from families settled at Carthage before the destruction of Jerusalem)	68,000
Europeans (Christians)[3]	163,000

Towns.—Besides the capital, Tunis, the chief towns of Tunisia are Sfax, Susa and Kairwan. These places are noticed separately, as are also Goletta (formerly the port of Tunis), Bizerta (a naval port and arsenal), Kef, Porto Farina, and the ruins at Carthage and Sbeitla (Sufetula). Other towns of Tunisia are, on the east coast, Nabeul, pop. about 5000, the ancient Neapolis, noted for the mildness of its climate and its pottery manufactures; Hammamet with 3700 inhabitants; Monastir (the Ruspina of the Romans), a walled town with 5600 inhabitants and a trade in cereals and oils; Mahdiya or Mahdia (*q.v.*; in ancient chronicles called the city of Africa and sometimes the capital of the country) with 8500 inhabitants, the fallen city of the Fatimites, which since the French occupation has risen from its ruins, and has a new harbour (the ancient *Cothon* or harbour, of Phoenician origin, cut out of the rock is nearly dry but in excellent preservation); and Gabes (Tacape of the Romans, Qabis of the Arabs) on the Syrtis, a group of small villages, with an aggregate population of 16,000, the port of the Shat country and a dépôt of the esparto trade. The chief town of the Majerda basin is Beja (pop. 5000), the ancient Vaga, an important corn market. The principal mosque at Beja was originally a Christian basilica, and is still dedicated to Sidna Aissa (our Lord Jesus). Gafsa, in the south of Tunisia, is a most interesting old Roman town, with hot springs. It is in railway communication with Sfax. West of Gafsa are immense beds of phosphates. Almost all the towns of Tunisia were originally Roman or romanized Berber settlements; consequently the remains of Roman buildings form a large part of the material of which their existing structures are composed.

Antiquities and Art.—The principal Roman and other ruins in the regency are the aqueducts near the capital (Tunis) and the temple at Zaghwan, described under Tunis city; the great reservoir near Carthage (*q.v.*); the amphitheatre at El Jem (see SUSA); the temples and other ruins of Sbeitla (*q.v.*); the ruins of Dugga, near Tebursuk, in the north-west of the regency (the amphitheatre of Dugga, the ancient Thugga, is a magnificent spectacle); the baths, amphitheatre and temples of Feriana (the ancient Thelepte); the whole route between Feriana (which is in the south of Tunisia, 33 m. north-west of Gafsa) and Tebessa in Algeria is strewn on both sides with Roman ruins; the old houses and other ruins at and near Thala; the baths and other ruins of Gafsa; the baths at Tuzer, El Hamma and Gabes. There is an interesting Phoenician burial-ground near Mahdia. There are Roman ruins, scarcely known, in the vicinity of Beja and the country of the Mogods (the district behind Cape Serrat). In short, Tunisia is as much strewn with Roman remains as is Italy itself.

Saracenic art has perhaps not attained here the high degree it reached in western Algeria, Spain and Egypt; still it presents much that is beautiful to see and worthy to be studied. One of the most ancient, as it is one of the loveliest fragments, strange to say, is found at Tuzer, in the Jerīd, the *mahrab* of a ruined mosque.[4] There are some very beautiful doorways to mosques and other specimens of Moorish art at Gabes. Examples of this art found at Tunis and Kairwan have been noticed under those headings. But the visible remains of Saracenic art in Tunis and its vicinity are of relatively recent date, the few mosques which might offer earlier examples not being open to inspection by Christians. It may be noted, however, as a general condition that the native towns and villages of Tunisia, where they have not been spoiled by the shocking tastelessness of Mediterranean Europe, are exceedingly picturesque, and offer exceptional attractions to the painter.

Industries.—Agriculture is the principal industry. Oats, wheat and barley are the chief crops in the north. In the central region

[1] In this Matmata country are the celebrated Troglodytes, people living in caves and underground dwellings now, much as they did in the days when the early Greek geographers alluded to them. See "A Journey in the Tunisian Sahara," by Sir H. H. Johnston, in the *Geog. Journ.* (June 1898).

[2] Tawareq (Tuareg) is the Arab designation of the Libyan or Desert Berbers. It is the plural form of *Tarqi*, "a raider." The Tawareq call themselves by some variant of the root *Masheq*—*Tamasheq*, *Imoshagh*, &c.

[3] Of recent introduction for the most part, consisting (census of 1906) of 81,156 Italians, 34,610 French, 10,330 Maltese, about 1000 Greeks and the remainder British, German, Austrian, &c. The French army of occupation (20,360 men) is not included in these figures.

[4] Since this was written the *mahrab* in question has been removed to Paris.

the olive is largely cultivated, in the south the date-palm. Viticulture is also of importance; almonds, oranges, lemons, &c., are also grown for export. The alfa and cork industries employ large numbers of persons, as do also the sardine, anchovy and tunny fisheries. The fisheries are in the hands of Italians, Maltese and Greeks. There are large herds of cattle and flocks of sheep and goats. About 60,000 acres are cultivated by French immigrants and about 15,000 acres by Italians.

Among native industries may be mentioned the spinning and weaving of wool for clothing, carpet-weaving, the manufacture of pottery, slippers and matting, saddle-making and leather embroidery. Silk-weaving, formerly important, is declining.

In 1907 the number of mines working was 32. The export of phosphates rose from 445,000 tons in 1904 to 1,267,000 tons in 1908. The export of coal in that year was 74,000 tons, and copper ore 937 tons (*vide supra*, § *Minerals*).

Commerce.—The commerce of Tunisia has thriven under the French protectorate, having risen from an annual total of about £1,700,000 in 1881 to £8,687,000 in 1908. British trade with Tunisia has nearly tripled since the establishment of the French protectorate. It stood at over £600,000 in annual value during the year 1898. In 1908 the total trade with Great Britain and Malta amounted to £914,000. In the same year the imports from France exceeded £2,750,000 and the exports to France £1,685,000. From Algeria the imports were £656,000; to Algeria the exports were £185,000. The principal exports are olive oil, wheat, esparto grass, barley, sponges, dates, fish (especially tunny), hides, horses, wool, phosphates, copper, zinc and lead. The imports consist mainly of European manufactured goods (especially British cotton), machinery, flour, alcohol, sugar, timber, coal and petroleum. About half the shipping trade is in the hands of the French; in 1908, of the total tonnage of ships entered, 4,155,000, French vessels represented 1,905,000 tons, Italian vessels 1,422,000 tons and British vessels 299,000 tons.

Communications.—The French have made since 1882 about 2000 m. of good roads. The first railway built (1871–1872) was that between Goletta and Tunis. This line, with the extensions to La Marsa and Bardo, is 21½ m. in length. It was constructed by an English company, which in 1880 sold it to an Italian company, despite the keen competition of French rivals (see *History*, below). The conversion of Tunis into a seaport (1893) destroyed the importance of this line, which was then sold to the French Bone-Guelma Company (Bone-Guelma et Prolongements), which owns the majority of the railways in Tunisia.

The second railway connects the capital with the frontier of Algeria, where, at Suk Ahras, it joins the main line to Constantine, Algiers, &c. This line was built by the Bone-Guelma Company. The concession was obtained in 1877, and the line, 191 m. long, was finished in 1880. A branch line (8 m.) connected Beja with this railway, and another (11 m.) ran from Tunis to Hamman-el-Enf, a favourite seaside resort of the Tunisians.

For the next twelve years there was a pause in railway construction followed by the opening, in 1892, of the line between Susa and Moknine (30 m.). Then came the continuation of the line from Hamman-el-Enf to Hammamet and along the Sahel to Susa (93 m.), and the building of a line from Susa to Kairwan, 31 m. (the last-named line superseded a horse-tramway built by the French army during the campaign of 1881). A branch line to Bizerta (43½ m.) from Jedeida on the main Algeria-Tunis line was also built as well as one from Tunis to Zaghwan (44 m.). A short line, branching from the Tunis-Zaghwan line, was carried south-west to Pont du Fahs. These with a few short branch lines were built between 1892 and 1900 by the Bone-Guelma Company. In 1906 was opened a continuation of the line from Pont du Fahs to Kef and thence south-west to Kalaat-es-Senam, a place midway between Kef and Tebessa, the centre of the Algerian phosphate region. A branch from the Kef line runs to the phosphate mines of Kalaa-Jerda.

Another railway (completed by 1900) runs from Sfax, along the coast to Mahres, thence inland to Gafsa and the phosphate mines of Metalwi. This line, 151 m. long, was for some years isolated from the general Tunisian system. The total mileage of the Tunisian railways was computed to be 1060 m. by the finishing of the Susa-Sfax, Gabes-Tebessa lines in 1909. Extensions of the railway system are contemplated to Gabes and, beyond, to the Tripolitan frontier. In the south communication is maintained chiefly by camel caravans.

Posts and Telegraphs.—The whole of Tunisia is covered with a network of telegraph lines (2500 m.), and there are telephones working in most of the large towns. The telegraph system penetrates to the farthest French post in the Sahara, is connected with the Turkish system on the Tripolitan frontier and with Algeria, and by cable with Sicily, Malta, Sardinia and Marseilles. There is an efficient post office service, with about 400 post offices.

Finance.—The principal bank is the Banque de Tunisie. The coinage formerly was the caroub and piastre (the latter worth about 6d.), but in 1891 the French reformed the coinage, substituting the franc as a unit, and having the money minted at Paris. The values of the coinage are pieces of 5 and 10 centimes in bronze, of 50 centimes, 1 franc and 2 francs in silver, of 10 francs and 20 francs in gold. The inscriptions are in French and Arabic. The public debt was consolidated in 1884 into a total of £5,702,000, guaranteed by France, and bearing 4% interest. In 1888 it was converted into a loan paying 3½% interest, and in 1892 another conversion reduced the rate of interest to 3%. In 1902 a new loan of £1,800,000 was issued at 3%. At the beginning of 1907 the total Tunisian debt was £9,287,260; in that year the government was authorized to contract another loan of £5,000,000 at 3% (£3,000,000 being guaranteed by France) for railways, roads and colonization. The weights and measures are those of France. The revenue for the year 1900 was £1,456,640, and the expenditure was £1,452,597. In 1910 receipts and expenditure balanced at about £1,888,000 each. The principal sources of revenue are direct taxation, stamp and death duties, customs, port and lighthouse dues, octroi and tithes, tobacco, salt and gunpowder monopolies, postal and telegraph receipts, and revenue from the state domains (lands, fisheries, forests, mines). The civil list paid to the Bey of Tunis amounts to £36,000 per annum, and the endowment of the princes and princesses of the beylical family to £31,200 a year more.

Administration.—From a native's point of view Tunisia still appears to be governed by the Bey of Tunis, his Arab ministers and his Arab officials, the French only exercising an indirect—though a very real—control over the indigenous population (Mahommedans and Jews). But all Christians and foreigners are directly governed by the French, and the native administration is supervised by a staff of thirteen French *contrôleurs* and their French and Tunisian subordinates. Seven of the departments of state have Frenchmen at their head, the other two, Tunisians: thus the larger proportion of the Bey's ministers are French. France is directly represented in Tunisia by a minister resident-general, and by an assistant resident. The French resident-general is the virtual viceroy of Tunisia, and is minister for foreign affairs. Besides Mussulman (native) schools there were in the regency, in 1906, 158 public schools, 5 lycées and colleges and 21 private schools. At these schools were 22,000 pupils (13,000 boys), all save 3500 Mussulmans being Europeans or Jews.

History.—The history of Tunisia begins for us with the establishment of the Phoenician colonies (see PHOENICIA and CARTHAGE). The Punic settlers semitized the coast, but left the Berbers of the interior almost untouched. The Romans entered into the heritage of the Carthaginians and the vassal kings of Numidia, and Punic speech and civilization gave way to Latin, a change which from the time of Caesar was helped on by Italian colonization; to this region the Romans gave the name of "Africa," apparently a latinizing of the Berber term "Ifriqa," "Ifrigia" (in modern Arabic, *Ifriqiyah*).

The Province of "Africa."

Rich in corn, in herds, and in later times also in oil, and possessing valuable fisheries, mines and quarries, the province of Africa, of which Tunisia was the most important part, attained under the empire a prosperity to which Roman remains in all parts of the country still bear witness. Carthage was the second city of the Latin part of the empire, "after Rome the busiest and perhaps the most corrupt city of the West, and the chief centre of Latin culture and letters." In the early history of Latin Christianity Africa holds a more important place than Italy. It was here that Christian Latin literature took its rise, and to this province belong the names of Tertullian and Cyprian, of Arnobius and Lactantius, above all of Augustine. Lost to Rome by the invasion of the Vandals, who took Carthage in 439, the province was recovered by Belisarius a century later (533–34), and remained Roman till the Arab invasions of 648–69. The conqueror, 'Oqba-bin-Nafa, founded the city of Kairwan (673) which was the residence of the governors of "Ifriqiyah" under the Omayyads and thereafter the capital of the Aghlabite princes, the conquerors of Sicily, who ruled in merely nominal dependence on the Abbasids.

The Latin element in Africa and the Christian faith almost disappeared in a single generation;[1] the Berbers of the

[[1] The North African Church was not utterly swept away by the Moslem conquest, though its numbers at that time were very greatly diminished, and thereafter fell gradually to vanishing point, partly by emigration to Europe. Its episcopate in the 10th century still numbered thirty members, but in 1076 the Church could not provide three bishops to consecrate a new member of the episcopate, and for that purpose Gregory VII. named two bishops to act with the archbishop of Carthage. In the 13th century the native episcopate had disappeared. Abd ul-Mumin, the Almohade conqueror of Tunisia, compelled many of the native Christians to embrace Islam, but when Tunis was captured by Charles V. in 1535, there were still found in the city native Christians, the last remnants of the mountains, who had never been latinized and never really christianized, accepted Islam without difficulty, but showed their stubborn nationality, not only in the character of their Mahommedanism, which has always been mixed up with the worship of living as well as dead saints (marabouts) and other peculiarities, but also in political movements. The empire of the Fātimites (*q.v.*) rested on Berber support, and from that time forth till the advent of the Turks the dynasties of North Africa were really native, even when they claimed descent from some illustrious Arab stock. When the seat of the Fātimite Empire was removed to Egypt, the Zīrites, a house of the Sanhaja Berbers, ruled as their lieutenants at Mahdia, and about 1050 Mo'izz the Zīrite, in connexion with a religious movement against the Shi'ites, transferred his very nominal allegiance to the Abbasid caliphs. The Fātimites in revenge let loose upon Africa about A.D. 1045 a vast horde of Beduins from Upper Egypt (Beni Hilāl and Solaim), the ancestors of the modern nomads of Barbary. All North Africa was ravaged by the invaders, who, though unable to found an empire or overthrow the settled government in the towns, forced the agricultural Berbers into the mountains, and, retaining from generation to generation their lawless and predatory habits, made order and prosperity almost impossible in the open parts of the country until its effective occupations by the French. The Zīrite dynasty was finally extinguished by Roger I. of Sicily, who took Mahdia in 1148 and established his authority over all the Tunisian coast. Even Moslem historians speak favourably of the Norman rule in Africa; but it was brought to an early end by the Almohade caliph Abd ul-Mumin, who took Mahdia in 1160.

Arab Conquest and Berber Dynasties.

The Almohade Empire soon began to decay, and in 1336 Abū Zakarīyā, prince of Tunis, was able to proclaim himself independent and found a dynasty, which subsisted till the advent of the Turks. The Hafsites (so called from Abū Ḥafṣ, the ancestor of Abū Zakarīyā, a Berber chieftain who had been one of the intimate disciples of the Almohade mahdi) assumed the title of Prince of the Faithful, a dignity which was acknowledged even at Mecca, when in the days of Mostanṣir, the second Hafsite, the fall of Bagdad left Islam without a titular head. In its best days the empire of the Hafsites extended from Tlemçen to Tripoli, and they received homage from the Merinids of Fez; they held their own against repeated Frankish invasions, of which the most notable were that which cost St Louis of France his life (1270), and that of the duke of Bourbon (1390), when English troops took part in the unsuccessful siege of Mahdia. They adorned Tunis with mosques, schools and other institutions, favoured letters, and in general appear to have risen above the usual level of Moslem sovereigns. But their rule was troubled by continual wars and insurrections; the support of the Beduin Arabs was imperfectly secured by pensions, which formed a heavy burden on the finances of the state;[1] and in later times the dynasty was weakened by family dissensions. Leo Africanus, writing early in the 16th century, gives a favourable picture of the "great city" of Tunis, which had a flourishing manufacture of fine cloth, a prosperous colony of Christian traders, and, including the suburbs, nine or ten thousand hearths; but he speaks also of the decay of once flourishing provincial towns, and especially of agriculture, the greater part of the open country lying waste for fear of the Arab marauders. Taxation was heavy, and the revenue very considerable: Don Juan of Austria, in a report to Philip II., states that the land revenue alone under the last Hafsite was 375,935 ducats, but of this a great part went in tribute to the Arabs.

The Hafsites.

The conquest of Algiers by the Turks gave a dangerous neighbour to Tunisia, and after the death of Mohammed the Hafsite in 1525 a disputed succession supplied Khair-ad-Dīn Barbarossa with a pretext for occupying the city in the name of the sultan of Constantinople. Al-Ḥasan, the son of Mahommed, sought help from the emperor, and was restored in 1535 as a Spanish vassal, by a force which Charles V. commanded in person, while Andrea Doria was admiral of the fleet. But the conquest was far from complete, and was never consolidated. The Spaniards remained at Goletta and made it a strong fortress, they also occupied the island of Jerba and some points on the south-east coast; but the interior was a prey to anarchy and civil war, until in 1570 'Alī-Pasha of Algiers utterly defeated Ḥāmid, the son and successor of Ḥasan, and occupied Tunis. In 1573 the Turks again retreated on the approach of Don Juan, who had dreams of making himself king of Tunis; but this success was not followed up, and in the next year Sultan Selim II. sent a strong expedition which drove the Spaniards from Tunis and Goletta, and reduced the country to a Turkish province. Nevertheless the Spanish occupation left a deep impression on the coast of Tunis, and not a few Spanish words passed into Tunisian Arabic. After the Turkish conquest, the civil administration was placed under a pasha; but in a few years a military revolution transferred the supreme power to a Dey elected by the janissaries, who formed the army of occupation. The government of the Deys lasted till 1705, but was soon narrowed or overshadowed by the authority of the Beys, whose proper function was to manage the tribes and collect tribute. From 1631 to 1702 the office of Bey was hereditary in the descendants of Murād, a Corsican renegade, and their rivalry with the Deys and internal dissensions kept the country in constant disorder. Ibrahīm, the last of the Deys (1702–1705), destroyed the house of Murād, and absorbed the beyship in his own office; but, when he fell in battle with the Algerians, Ḥussein b. 'Alī, the son of a Cretan renegade, was proclaimed sovereign by the troops under the title of "Bey," and, being a prince of energy and ability, was able to establish the hereditary sovereignty, which has lasted without change of dynasty to the present time.[2]

Turkish Conquest.

Rise of the Beys.

Frequent wars with Algiers form the chief incidents in the internal history of Tunisia under the Beys. Under Deys and Beys alike Tunisia was essentially a pirate state. Occasionally acts of chastisement, of which the bombardment of Porto Farina by Blake in 1655 was the most notable, and repeated treaties, extorted by European powers, checked from time to time, but did not put an end to, the habitual piracies, on which indeed the public revenue of Tunis was mainly dependent. The powers were generally less concerned for the captives than for the acquisition of trading privileges, and the Beys took advantage of the commercial rivalry of England and France to play off the one power against the other. The release of all Christian slaves was not effected till after the bombardment of Algiers; and the definite abandonment of piracy may be dated from the presentation to the Bey in 1819 of a collective note of the powers assembled at Aix-la-Chapelle. The government had not elasticity enough to adapt itself to so profound a change in its ancient traditions; the finances became more and more hopelessly embarrassed, in spite of ruinous taxation; and attempts at European innovations in the court and army made matters only worse, so long as no attempt was made to improve

once powerful Church. Traces of Christianity remained among the Kabyles till after the conquest of Granada (1492), when the influx of Andalusian Moors from Spain completed the conversion of those tribes. It may be added that down to the early years of the 19th century it was alleged that some of the Tuareg tribes in the Sahara professed Christianity (see *e.g.* Hornemann's *Travels*). For the North African Church after the Moslem conquest, see Migne, *Pat. lat.*; and Mas Latrie, *Afrique septentrionale*. Their information is summarized in the introduction to vol. ii. of Azurara's *Discovery and Conquest of Guinea*, Hakluyt Society's edition (1899).—ED.]

[1] In the 13th and 14th centuries the Hafsites also paid tribute to Sicily for the freedom of the sea and the right to import Sicilian corn—a clear proof of the decline of Tunisian agriculture.

[2] Muhammad VI. es Sadok, the reigning Bey at the time of the French occupation, died in October 1882, and was succeeded by his brother 'Ali IV. This prince reigned until 1902, the throne then passing to his son Muhammad VII. el Hadi, who died in 1906, when his cousin Muhammad VIII. en Nasr (b. 1855) became Bey.

the internal condition of the country. In the third quarter of the 19th century not more than a tenth part of the fertile land was under cultivation, and the yearly charge on the public debt exceeded the whole annual revenue. In these circumstances only the rivalry of the European powers that had interests in Tunisia protracted from year to year the inevitable revolution. The French began to regard the dominions of the Bey as a natural adjunct to Algeria, but after the Crimean War Turkish rights over the regency of Tunis were revived. After the Franco-German War the embarrassed Bey turned towards Great Britain for advice, and a British protectorate—suggested by the proximity of Malta—was not an impossibility under the remarkable influence of the celebrated Sir Richard Wood, British diplomatic agent at the court of Tunis from 1855 to 1879. The railways, lighthouses, gas and waterworks and other concessions and industries were placed in British hands. But in 1878, at the Congress of Berlin, Lord Salisbury agreed to allow France a "free hand" in Tunisia in return for French acquiescence in the British lease of Cyprus.

Occupation by the French. After 1862, however, the kingdom of Italy began to take a deep interest in the future of Tunisia. When the country went bankrupt in 1869, a triple control was established over Tunisian finances, with British, French and Italian "controllers." In 1880 the Italians bought the British railway from Tunis to Goletta. This and other actions excited the French to act on the secret understanding effected with the British foreign minister at the Berlin Congress. In 1881 a French force crossed the Algerian frontier under pretext of chastising the independent Khmir or Kroumir tribes on the north-east of the regency, and, quickly dropping the mask, advanced on the capital and compelled the Bey to accept the French protectorate. The actual conquest of the country was not effected without a serious struggle with Moslem fanaticism, especially at Sfax; but all Tunisia was brought completely under French jurisdiction and administration, supported by military posts at every important point. In 1883 the new situation under the French protectorate was recognized by the British government withdrawing its consular jurisdiction in favour of the French courts, and in 1885 it ceased to be represented by a diplomatic official. The other powers followed suit, except Italy, which did not recognize the full consequences of the French protectorate until 1896. In 1884 a thorough reform of the government and administration of the country was begun under the direction of a succession of eminent French residents-general. In 1897 Great Britain surrendered her commercial treaty with Tunisia and agreed (subject to a special temporary privilege regarding cotton goods) to allow her commerce and all other relations with Tunisia to be subjected to the same conditions as those affecting all such relations between Britain and France.

Relations with Turkey. The French protectorate over Tunisia, based on the treaty signed by the Bey at Bardo on the 12th of May 1881 and confirmed by the treaty of La Marsa (June 8, 1883), was not recognized by Turkey, which claimed the regency as part of the Ottoman dominions. The protests of the Porte were ignored by the French, and in 1892 Turkey so far recognized the actual situation as to determine the Tunisia-Tripoli frontier as far south as Ghadames. South of that point the Saharan frontiers of Algeria, Tunisia and Tripoli remained undefined. Working eastward from Tunisia and Algeria the French occupied several points to which Turkey laid claim. Thus the oasis of Janet, S.S.W. of Rhat, was occupied in 1906. The action of France led to counter-action by Turkey and to various frontier incidents. Janet was re-occupied by Ottoman troops in the summer of 1910, but in deference to French protests the troops were withdrawn pending the delimitation of the frontier. At the same time Turkey maintained the claim that Tunisians were Ottoman subjects.

Frontier troubles had however little effect on the remainder of the protectorate. In 1904–1905 there were famines and some native discontent in the south of Tunisia; but in general the country has prospered amazingly under the French protectorate. The native dynasty has been strengthened rather than weakened, and Tunisia may be pointed out as the best and wisest example of French administration over an alien land and race. Though on a smaller scale it is worthy to be set as a pendant to the British work in Egypt.

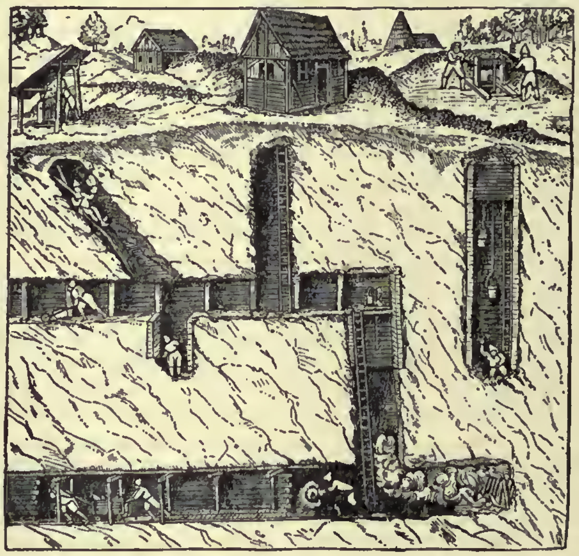
Bibliography.—Of Arabic sources accessible in translations the geographical works of Yaʻkubī (*Descriptio al Magribi*, by De Goeje, Leiden, 1860), Al-Bakrī (*Descr. de l'Afrique septentrionale*, by De Slane, Paris, 1859; Arabic text, ibid. 1857) and Idrisi (*Descr. de l'Afrique*, &c., by Dozy and De Goeje, Leiden, 1866) belong to the 10th, 11th and 12th centuries respectively; the history of Ibn Khaldūn (*Hist. des Berbères*, by De Slane, 4 vols., Algiers, 1852–1856) includes the earlier Hafsites, that of Al-Kairawānī (*Hist. de l'Afrique*, by Pelissier and Rémusat, Paris, 1845, in *Expl. scient. de l'Algérie*, vol. vii.; Arabic text, Tunis, 1286 A.H.) deals especially with Tunisia and goes down to 1681. Especially valuable and lucid are the following works: Ernest Mercier, *Histoire de l'Afrique septentrionale* (*Berberie*) (3 vols., Paris, 1891), and *Histoire de l'établissement des Arabes dans l'Afrique septentrionale selon les auteurs arabes* (Paris, 1875); Stanley Lane Poole, *The Barbary Corsairs* ("Story of the Nations Series," London, 1890), deals in part with the history of Tunisia. Other works which should be studied are: Dr Thos. Shaw's *Travels* (1757); Leo Africanus's description of Africa in *Ramusio* and in *Purchas's Pilgrims*; Rousseau, *Annales tunisiennes* (Algiers, 1864); the late Sir R. Lambert Playfair, *In the Footsteps of Bruce* (London, 1887); A. M. Broadley, *Tunis, Past and Present* (Edinburgh, 1882); Guérin, *Voyage archéologique* (Paris, 1862); D'Hérisson, *Mission archéologique en Tunisie* (Paris, 1884); E. D. Schoenfield, *Aus den Staaten der Barbaresken* (Berlin, 1902); Sir Harry Johnston, *The Colonization of Africa* (Cambridge, 1905); Gaston Loth, *La Tunisie et l'œuvre du protectorat français* (Paris, 1907); Professor Arthur Girault, *Principes de colonisation et de législation coloniale*, vol. iii. (3rd ed., Paris, 1908). Lists of all the rulers of Tunisia will be found in A. M. H. J. Stokvis, *Manuel d'histoire*, vol. i. (Leiden, 1898). The geography of Tunisia was first treated scientifically by E. Pélissier in the 16th volume of his *Explor. scient. de l'Algérie* (Paris, 1853); and by C. Tissot, *Explor. scient. de la Tunisie: Géog. comparée de la province romaine d'Afrique* (2 vols., Paris, 1884–1888); also in Murray's *Handbook*, by Sir R. L. Playfair (1887). The works of Canon Tristram on the Sahara describe southern Tunisia in the 'sixties of the 19th century. Two important articles on Tunisia appeared in Nos. 22 and 23 of the *Revue générale des sciences* (Paris, Nov. 30 and Dec. 15, 1896). Still more valuable is *La Tunisie française*, in two volumes, a government publication (Paris, 1896). An article on the *Tunisian Sahara, the Tunisian Cave-Dwellers and Berber Languages*, &c., by Sir H. H. Johnston, was published in the *Geog. Journ.* for June 1898. Other articles by the same author appeared in the *Graphic* during the years 1899, 1900 and 1902. An interesting dissertation on the question of the Berber race is given in Professor A. H. Keane's *Man, Past and Present.* Numerous other works in English and French have been published on Tunisia from the tourist's point of view; the best of these is by Douglas Sladen, *Carthage and Tunis* (2 vols., 1908). Gaston Boissier, *L'Afrique romaine* (1895), is a picturesque but somewhat superficial *aperçu* of the principal Roman ruins. Flaubert's *Salammbô* ought always to be read by those who visit Carthage and Tunisia. It was mainly written at La Marsa, near Carthage. See also H. S. Ashbee, *Bibliography of Tunisia* (London, 1889). (H. H. J.)

TUNNEL (Fr. *tonnel*, later *tonneau*, a diminutive from Low Lat. *tonna*, *tunna*, a tun, cask), a more or less horizontal underground passage made without removing the top soil. In former times any long tube-like passage, however constructed, was called a tunnel. At the present day the word is sometimes popularly applied to an underground passage constructed by trenching down from the surface to build the arching and then refilling with the top soil; but a passage so constructed, although indistinguishable from a tunnel when completed, is more correctly termed a "covered way," and the operations "cutting" and "covering," instead of tunnelling. Making a small tunnel, afterwards to be converted into a larger one, is called "driving a heading," and in mining operations small tunnels are termed "galleries," "driftways" and "adits." If the underground passage is vertical it is a shaft; if the shaft is begun at the surface the operations are known as "sinking"; and it is called a "rising" if worked upwards from a previously constructed heading or gallery.

Tunnelling has been effected by natural forces to a far greater extent than by man. In limestone districts innumerable swallow-holes, or shafts, have been sunk by the rain water following joints and dissolving the rock, and from the bottom of these shafts tunnels have been excavated to the sides of hills in a manner strictly analogous to the ordinary method of executing a tunnel by sinking shafts at intervals and driving headings therefrom. Many rivers find thus a course underground. In Asia Minor one of the rivers on the route of the Mersina railway extension pierces a hill by means of a natural tunnel, whilst a little south at Seleucia another river flows through a tunnel, 20 ft. wide and 23 ft. high, cut 1600 years ago through rock so hard that the chisel marks are still discernible. The Mammoth Cave of Kentucky and the Peak caves of Derbyshire are examples of natural tunnelling. Mineral springs bring up vast quantities of matter in solution. It has been estimated that the Old Well Spring at Bath has discharged since the beginning of the 19th century solids equivalent to the excavation of a 6 ft. by 3 ft. heading 9 m. long; and yet the water is perfectly clear and the daily flow is only the 150th part of that pumped out of the great railway tunnel under the Severn. Tunnelling is also carried on to an enormous extent by the action of the sea. Where the Atlantic rollers break on the west coast of Ireland, or on the seaboard of the western Highlands of Scotland, numberless caves and tunnels have been formed in the cliffs, beside which artificial tunnelling operations appear insignificant. The most gigantic subaqueous demolition hitherto carried out by man was the blowing up in 1885 of Flood Rock, a mass about 9 acres in extent, near Long Island Sound, New York. To effect this gigantic work by a single instantaneous blast a shaft was sunk 64 ft. below sea-level, from the bottom of which 4 m. of tunnels or galleries were driven so as to completely honeycomb the rock. The roof rock ranged from 10 ft. to 24 ft. in thickness, and was supported by 467 pillars 15 ft. square; 13,286 holes, averaging 9 ft. in length and 3 ins. in diameter, were drilled in the pillars and roof. About 80,000 cub. yds. of rock were excavated in the galleries and 275,000 remained to be blasted away. The holes were charged with 110 tons of "rackarock," a more powerful explosive than gunpowder, which was fired by electricity, when the sea was lifted 100 ft. over the whole area of the rock. Where natural forces effect analogous results, the holes are bored and the headings driven by the chemical and mechanical action of the rain and sea, and the explosive force is obtained by the expansive action of air locked up in the fissures of the rock and compressed to many tons per square foot by impact from the waves. Artificial breakwaters have often been thus tunnelled into by the sea, the compressed air blowing out the blocks and the waves carrying away the débris.

With so many examples of natural caves and tunnels in existence it is not to be wondered at that tunnelling was one of the earliest works undertaken by man, first for dwellings and tombs, then for quarrying and mining, and finally for water-supply, drainage, and other requirements of civilization. A Theban king on ascending the throne began at once to drive the tunnel which was to form his final resting-place, and persevered with the work until death. The tomb of Mineptah at Thebes was driven at a slope for a distance of 350 ft. into the hill, when a shaft was sunk and the tunnel projected a farther length of about 300 ft., and enlarged into a chamber for the sarcophagus. Tunnelling on a large scale was also carried on at the rock temples of Nubia and of India, and the architectural features of the entrances to some of these temples might be studied with advantage by the designers of modern tunnel fronts. Flinders Petrie has traced the method of underground quarrying followed by the Egyptians opposite the Pyramids. Parallel galleries about 20 ft. square were driven into the rock and cross galleries cut, so that a hall 300 to 400 ft. wide was formed, with a roof supported by rows of pillars 20 ft. square and 20 ft. apart. Blocks of stone were removed by the workmen cutting grooves all round them, and, where the stone was not required for use, but merely had to be removed to form a gallery, the grooves were wide enough for a man to stand up in. Where granite, diorite and other hard stone had to be cut the work was done by tube drills and by saws supplied with corundum, or other hard gritty material, and water—the drills leaving a core of rock exactly like that of the modern diamond drill. As instances of ancient tunnels through soft ground and requiring masonry arching, reference may be made to the vaulted drain under the south-east palace of Nimrod and to the brick arched tunnel, 12 ft. high and 15 ft. wide, under the Euphrates. In Algeria, Switzerland, and wherever the Romans went, remains of tunnels for roads, drains and water-supply are found. Pliny refers to the tunnel constructed for the drainage of Lake Fucino as the greatest public work of the time. It was by far the longest tunnel in the world, being more than 3½ m. in length, and was driven under Monte Salviano, which necessitated shafts no less than 400 ft. in depth. Forty shafts and a number of "cuniculi," or inclined galleries, were sunk, and the excavated material was drawn up in copper pails, of about ten gallons capacity, by windlasses. The tunnel was designed to be 10 ft. high by 6 ft. wide, but its actual cross-section varied. It is stated that 30,000 labourers were occupied eleven years in its construction. With modern appliances such a tunnel could be driven from the two ends without intermediate shafts in eleven months.

No practical advance was made on the tunnelling methods of the Romans until gunpowder came into use. Old engravings of mining operations early in the 17th century show that excavation was still accomplished by pickaxes or hammer and chisel, and that wood fires were lighted at the ends of the headings to split and soften the rock in advance (see fig. 1).



(From Agricola's *De re metallica*, Basel, 1621.)

Fig. 1.—Method of mining, 1621.

Crude methods of ventilation by shaking cloths in the headings and by placing inclined boards at the top of the shafts are also on record. In 1766 a tunnel 9 ft. wide, 12 ft. high and 2880 yds. long was begun on the Grand Trunk Canal, England, and completed eleven years later; and this was followed by many others. On the introduction of railways tunnelling became one of the ordinary incidents of a contractor's work; probably upwards of 4000 railway tunnels have been executed.

Tunnelling under Rivers and Harbours.—In 1825 Marc Isambard Brunel began, and in 1843 completed, the Thames tunnel between Rotherhithe and Wapping now used by the East London railway. He employed a peculiar "shield," made of timber, in several independent sections. Part of the ground penetrated was almost liquid mud, and the cost of the tunnel was about £1300 per lineal yard. In 1818 he took out a patent for a tunnelling process, which included a shield, and which mentioned cast iron as a surrounding wall. His shield foreshadowed the modern shield, which is substituted for the ordinary timber work of the tunnel, holds up the earth of excavation, affords space within its shelter for building the permanent walls, overlaps these walls in telescope fashion, and is moved forward by pushing against their front ends. The advantages of cast-iron walls are that they have great strength in small space as soon as the segments are bolted together, and they can be caulked water-tight.

In 1830 Lord Cochrane (afterwards 10th earl of Dundonald) patented the use of compressed air for shaft-sinking and tunnelling in water-bearing strata. Water under any pressure can be kept out of a subaqueous chamber or tunnel by sufficient air of a greater pressure, and men can breathe and work therein—for a time—up to a pressure exceeding four atmospheres. The shield and cast-iron lining invented by Brunel, and the compressed air of Cochrane, have with the aid of later inventors largely removed the difficulties of subaqueous tunnelling. Cochrane's process was used for the foundation of bridge piers, &c., comparatively early, but neither of these devices was employed for tunnelling until half a century after their invention. Two important subaqueous tunnels in the construction of which neither of these valuable aids was adopted are the Severn and the Mersey tunnels.

The Severn tunnel (fig. 16), 4⅜ m. in length for a double line of railway, begun in 1873 and finished in 1886, Hawkshaw, Son, Hayter & Richardson being the engineers and T. A. Walker the contractor, is made almost wholly in the Trias and Coal Measure formations, but for a short distance at its eastern end passes through gravel. At the lowest part the depth is 60 ft. at low water and 100 ft. at high water, and the thickness of sandstone over the brickwork is 45 ft. Under a depression in the bed of the river on the English side there is a cover of only 30 ft. of marl. Much water was met with throughout. In 1879 the works were flooded for months by a land spring on the Welsh side of the river, and on another occasion from a hole in the river bed at the Salmon Pool. This hole was subsequently filled with clay and the works completed beneath. Two preliminary headings were driven across the river to test the ground. "Break-ups" were made at intervals of two to five chains and the arching was carried on at each of these points. All parts of the excavation were timbered, and the greatest amount excavated in any one week was 6000 cub. yds. The total amount of water raised at all the pumping stations is about 27,000,000 gallons in twenty-four hours.

The length of the Mersey tunnel (fig. 15) between Liverpool and Birkenhead between the pumping shafts on each side of the river is one mile. From each a drainage heading was driven through the sandstone with a rising gradient towards the centre of the river. This heading was partly bored out by a Beaumont machine to a diameter of 7 ft. 4 in. and at a rate attaining occasionally 65 lineal yds. per week. All of the tunnel excavation, amounting to 320,000 cub. yds., was got out by hand labour, since heavy blasting would have shaken the rock. The minimum cover between the top of the arch and the bed of the river is 30 ft. Pumping machinery is provided for 27,000,000 gallons per day, which is more than double the usual quantity of water. Messrs Brunlees & Fox were the engineers, and Messrs Waddell the contractors for the works, which were opened in 1886, about six years after the beginning of operations.

In 1869 P. W. Barlow and J. H. Greathead built the Tower foot-way under the Thames, using for the first time a cast-iron lining and a shield which embodied the main features of Brunel's design. Barlow had patented a shield in 1864, and A. E. Beach one in 1868. The latter was used in a short masonry tunnel under Broadway, New York City, at that time. In 1874 Greathead designed and built a shield, to be used in connexion with compressed air, for a proposed Woolwich tunnel under the Thames, but it was never used. Compressed air was first used in tunnel work by Hersent, at Antwerp, in 1879, in a small drift with a cast-iron lining.

In the same year compressed air was used for the first time in any important tunnel by D. C. Haskin in the famous first Hudson River tunnel, New York City. This was to be of two tubes, each having internal dimensions of about 16 ft. wide by 18 ft. high. The excavation as fast as made was lined with thin steel plates, and inside of these with brick. In June 1880 the northerly tube had reached 360 ft. from the Hoboken shaft, but a portion near the latter, not of full size, was being enlarged. Just after a change of shifts the compressed air blew a hole through the soft silt in the roof at this spot, and the water entering drowned the twenty men who were working therein. From time to time money was raised and the work advanced. Between 1888 and 1891 the northerly tunnel was extended 2000 ft. to about three-fourths of the way across, with British capital and largely under the direction of British engineers—Sir Benjamin Baker and E. W. Moir. Compressed air and a shield were used, and the tunnel walls were made of bolted segments of cast iron. The money being exhausted, the tunnel was allowed to fill with water, and it so remained for ten years. Both tubes were completed in 1908.

The use of compressed air in the Hudson tunnel, and of annular shields and cast-iron lined tunnel in constructing the City & South London railway (1886 to 1890) by Greathead, became widely known and greatly influenced subaqueous and soft-ground tunnelling thereafter. The pair of tunnels for this railway from near the Monument to Stockwell, from 10 ft. 2 in. to 10 ft. 6 in. interior diameter, were constructed mostly in clay and without the use of compressed air, except for a comparatively short distance through water-bearing gravel. In this gravel a timber heading was made, through which the shield was pushed. The reported total cost was £840,000. Among the tunnels constructed after the City & South London work was well advanced, lined with cast-iron segments, and constructed by means of annular shields and the use of compressed air, were the St Clair (Joseph Hobson, engineer) from Sarnia to Port Huron, 1889–1890, through clay, and for a short distance through water-bearing gravel, 6000 ft., 18 ft. internal diameter; and the notable Blackwall tunnel under the Thames (Sir Alexander Binnie, engineer, and S. Pearson & Sons, contractors), through clay and 400 ft. of water-saturated gravel, 1892–1897, about 3116 ft. long, 24 ft. 3 in. in internal diameter. The shield, 19 ft. 6 in. long, contained a bulkhead with movable shutters, as foreshadowed in Baker's proposed shield (fig. 2). Numerous tunnels of small diameter have been similarly constructed under the Thames and Clyde for electric and cable ways, several for sewers in Melbourne, and two under the Seine at Paris for sewer siphons.

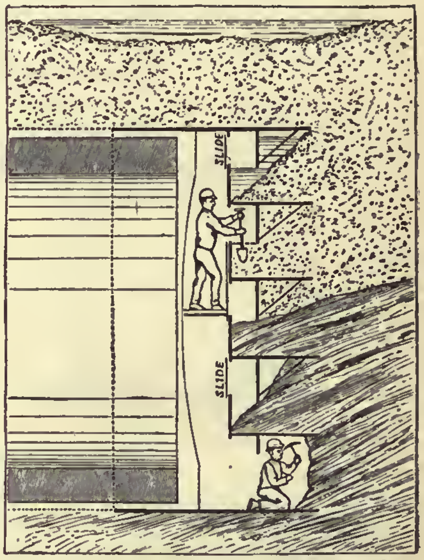


Fig. 2.—B. Baker's pneumatic shield.

The Rotherhithe tunnel, under the Thames, for a roadway, with a length of 4863 ft. between portals, of which about 1400 ft. are directly under the river, has the largest cross-section of any subaqueous tube of this type in the world (see fig. 3). It was begun in 1904 and finished in 1908, Maurice Fitzmaurice being the engineer of design and construction, and Price & Reeves the contractors. It penetrates sandy and shelly clay overlying a seam of limestone, beneath which are pebbles and loamy sand. A preliminary tunnel for exploration, 12 ft. in diameter, was driven across the river, the top being within 2 ft. of the following main tunnel. The top of the main tunnel excavation in the middle of the river was only 7 ft. from the bed of the Thames, and a temporary blanket of filled earth, usually allowed in similar cases, was prohibited owing to the close proximity of the docks. The maximum progress in one day was 12·5 ft., and the average in six days 10·4 ft. The air compressors were together capable of supplying 1,000,000 cub. ft. of air per hour.

Some tunnels of marked importance of this type—to be operated solely with electric cars—have been built under the East and Hudson rivers at New York. Two tubes of 15 ft. interior diameter and 4150 ft. long penetrate gneiss and gravel directly under the East River between the Battery and Brooklyn. They were begun in 1902, with Wm. B. Parsons and George S. Rice as engineers, and were finished in December 1907, under the direction of D. L. Hough of the

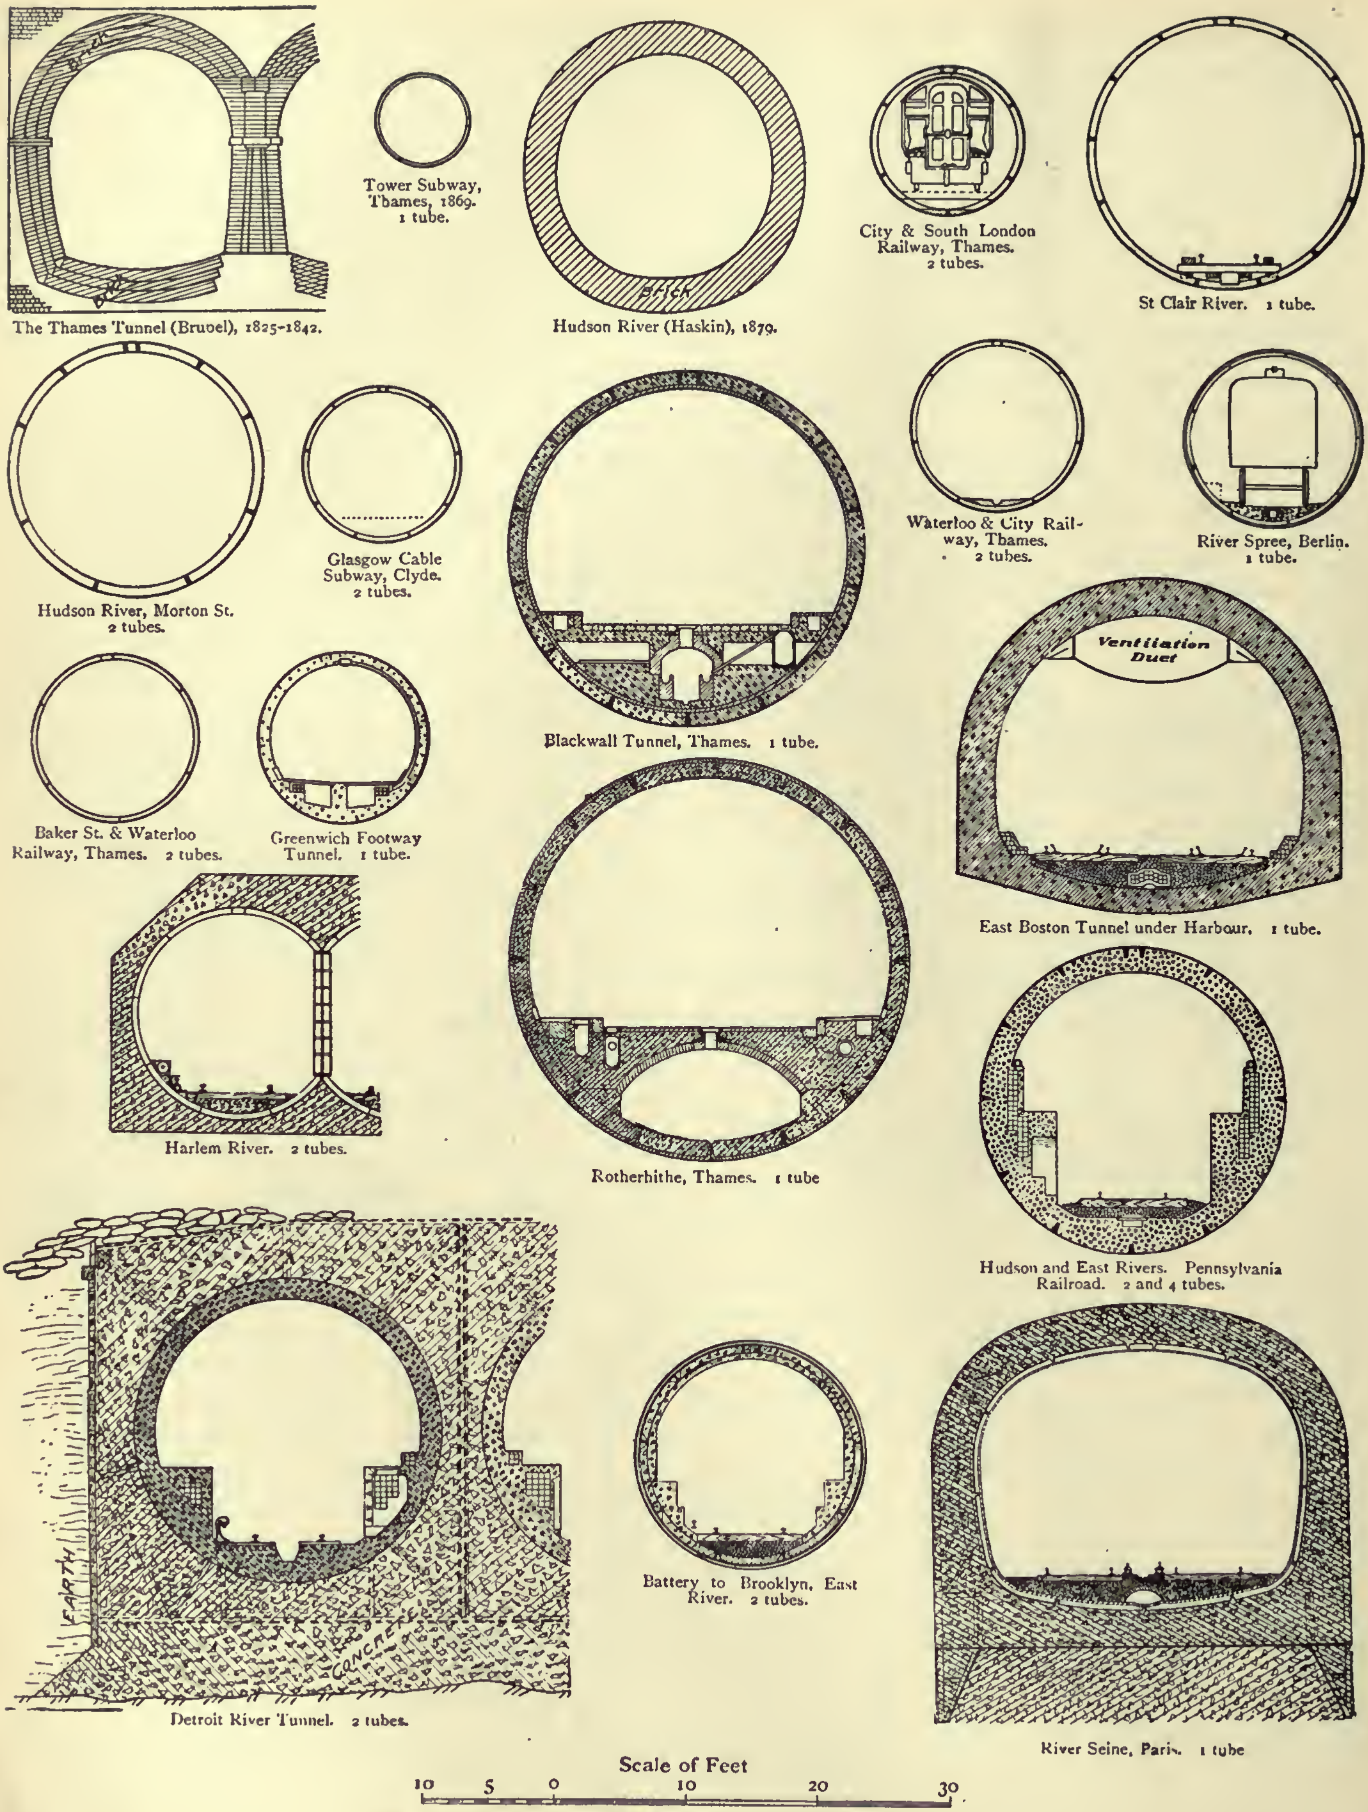

Fig. 3.—Cross Sections of Tunnels under Rivers and Harbours.

New York Tunnel Company. They carry subway trains. In one of the blow-outs of compressed air a workman was blown through the gravel roof into the river above. He lived until the next day. Two other tubes of the same size built also through gneiss and gravel between 1905 and 1907 by the Degnon Contracting Company, with R. A. Shailer as the contractors' engineer, go from 42nd Street to Long Island City.

Four much larger tubes (see fig. 3) built in 1904 to 1909, for the Pennsylvania railroad, with Alfred Noble as chief engineer, S. Pearson & Son as contractors, and E. W. Moir as general manager, cross from 32nd and 33rd Streets to Long Island. The maximum average progress per day (one heading) for the best month's work was: rock, 4·1 ft.; rock and earth, 3·8 ft.; earth, with full sand face, 12·8 ft. The best methods of preventing blow-outs were found to consist of employing clay blankets (sometimes 25 ft. thick) on the river bed, which could be carried up to 20 ft. depth of water, and of filling the pores of the sand and gravel with blue lias lime or cement grout. The maximum air pressure was 38 ℔ per sq. in. In the case of sand face with poor leaky cover the usual practice was to make the air pressure equal to that of water from the surface down to about a quarter the distance below the top of the shield. The average amount of free air supplied per man per hour was approximately 2300 cub. ft. On the Hudson river side two tubes of the same size as those in the East River are for the Pennsylvania trains to New Jersey. Two tubes from Morton Street to New Jersey, begun by Haskin, already referred to, are for subway trains, and so are the most southerly of all on the Hudson side, viz. the two from Cortlandt Street to under the Pennsylvania station in Jersey City.

The two tubes from Morton Street were completed under the direction of Charles M. Jacobs, who was also chief engineer of the four other Hudson River tubes. The contractors for the Hudson tubes for the Pennsylvania road were the O'Rourke Contracting Company. Skilful treatment was required to overcome the difficulties on the New York side of the Hudson in all the tubes where the face excavation was partly in rock and partly in soft earth. Most of their length, however, was through silt, and in this the tunnelling was the easiest and most rapid that has ever been carried out in subaqueous work, 50 lineal ft. per day being sometimes accomplished. A large proportion of the silt which under ordinary processes would be taken into the tunnel through the shield, carried to the shore and got rid of by expensive methods, was by the latter process merely displaced as the shield with nearly or quite closed diaphragm was pushed ahead.

The East Boston tunnel, the first important example of a shield-built monolithic concrete arch, from the Boston Subway to East Boston, is 1·4 m. long, 3400 ft. being under the harbour. One mile was excavated by tunnelling with roof shields about 29 ft. wide, through clay containing pockets of sand and gravel. The engineer was H. A. Carson, and the contractors the Boston Tunnel Construction Company and Patrick McGovern.

Some 25 m. of waterworks brick-lined tunnels have been built since 1864, mostly in clay, under the Great Lakes, without the use of shields, though in the later ones compressed air was utilized. A large portion of the latest Cleveland tunnel, 9 ft. interior diameter, was built at the rate of 17 ft. per day at a cost of about $18 per ft. During this work three explosions of inflammable gases occurred, in which nineteen men were killed and others were injured. Later a fire at the shaft in the lake caused the death of ten men. Work was thereafter completed under the engineering direction of G. H. Benzenberg. Less serious accidents, principally explosions of marsh gas, occurred in many of the other tunnels. In one case (at Milwaukee under Benzenberg) drift material was penetrated, with large boulders and coarse and fine gravel, and without any sand or clay filling, apparently in direct communication with the lake bottom. At times the necessary air pressure was 42 ℔ per sq. in.

Subaqueous Tunnels made by sinking Tubes, Caissons, &c.—In 1845 De la Haye, in England, doubtless having in mind the tedious and difficult work of the Thames tunnel, proposed to make tunnels under water by sinking large tubes on a previously prepared bed and connecting them together. Since then many inventors have proposed similar schemes. In 1866 Belgrand sank twin plate-iron pipes, 1 metre diameter and 156 metres long, under the Seine at Paris for a sewer siphon, and there have since been numerous examples of sunk cast-iron subaqueous water-pipes. It is believed that the first tunnel of this class, large enough for men to move upright in, was by H. A. Carson, assisted by W. Blanchard and F. D. Smith, in 1893–1894, in the outer portion of Boston harbour, for the metropolitan sewer outlet. The later tubes were about 9 ft. exterior diameter, in sections each 52 ft. long, weighing about 210,000 ℔, made of brick and concrete, with a skin of wood and water-tight bulkheads at each end. A trench was dredged in the harbour bed and saddles were accurately placed to support the tubes. The latter, made in cradles above water alongside a wharf, were lowered by long vertical screws moved by steam power, and were towed ½ to ¾ m. to their final positions. After sufficient water had been admitted they were lowered to their saddles by travelling shears on temporary piles. The temporary joints between consecutive sections were made by rubber gaskets between flanges which were bolted together by divers. The later operations were backfilling the trench over the pipes, and in each section pumping out the water, removing its bulkheads, and making good the masonry between consecutive bulkheads, this masonry being inside the flanges. This work, about 1500 ft. in length, was done without contractors, by labourers and foremen under the immediate control of the engineers, and was found perfectly tight, straight and sound.

The double-track railroad tunnel at Detroit, made in 1906–1909, under the direction of an advisory board consisting of W. J. Wilgus (chairman), H. A. Carson and W. S. Kinnear (the last-named being chief engineer), is 1½ m. long, with a portion directly under the river of ½ m. The method used under the river (proposed by Wilgus) is an important variation on the Boston scheme. A trench was dredged with a depth equal to the thickness of the tunnel below the river bed and about 70 ft. below the river surface, and grillages were accurately placed in it to support the ends of thin steel tube-forms, inside of which concrete was to be moulded and outside of which deposited. These tubes, each about 23 ft. in diameter and 262·5 ft. long, were in pairs (one tube for each track), and were connected sidewise and surrounded by thin steel diaphragms 12 ft. apart. Planking, to limit the concrete, was secured outside the diaphragms (see fig. 3). The forms were made tight, bulkheaded at their ends, floated into place, sunk by admitting water, set on the grillages, and the ends of successive pairs connected together by bolts through rubber gaskets and flanges. The succeeding pair of tubes was not lowered until concrete had been deposited through the river around the tubes of the preceding pair. The following steps were to remove the water from one pair of tubes, mould inside a lining of concrete 20 in. thick, remove the contiguous bulkheads, and repeat again and again the processes described until the subaqueous tunnel was complete.

The New York Rapid Transit tunnel under Harlem river, built 1904–1905, has two tubes, each about 15 ft. diameter and 400 ft. long, with a surrounding shell of cast iron itself surrounded by concrete. The outside width of concrete is about 33 ft. Its top is 28 ft. below high water and about 3 ft. below the bed of the river. D. D. McBean, the sub-contractor, dredged a trench in the river to within 7 or 8 ft. of the required depth. He then enclosed a space of the width of the tunnel from shore to mid-stream with 12-in. sheet piling, which was evenly cut off some 2 ft. above the determined outside top of the tunnel. On top of this piling he sank and tightly fitted a flat temporary roof of timber 3 ft. thick in sections, and covered this with about 5 ft. of dredged mud. Water was expelled from this subaqueous chamber by compressed air, after which the remaining earth was easily taken out, and the iron and concrete tunnel walls were then built in the chamber. For the remaining part of the river the foregoing process was varied by cutting off the sheet piling at mid-height of the tunnel and making the upper half of the tunnel, which was built above and lowered in sections through the water, serve as the roof of the chamber in which the lower half of the tunnel was built.

The tunnels of the Métropolitain railway of Paris (F. Bienvenüe, engineer-in-chief) under the two arms of the Seine, between Place Chatelêt and Place Saint Michel, were made by means of compressed-air caissons sunk beneath the river bed, were next made by the aid of temporary small caissons sunk through about 26 ft. of earth under the river. The tops of the side walls were made even with the end walls. A steel rectangular coffer-dam (figs. 5 and 6) was sunk to rest with rubber or clay joint on these surrounding walls. The coffer-dam had shafts reaching above the surface of the water, so that the earth core was easily taken out (after removing the water) in free air. The adjacent chambers under the caissons were then connected together. Three caissons, of a total length of 396 ft., were used under the larger arm, and two, of an aggregate length

Mountain Tunnels for Railways.

Tunnel.	Location.	Length. (miles)	Internal Width and Height.	Material penetrated.	Average progress per day = 24 hrs. (lin. yds.).	Approximate cost per lin. yd.

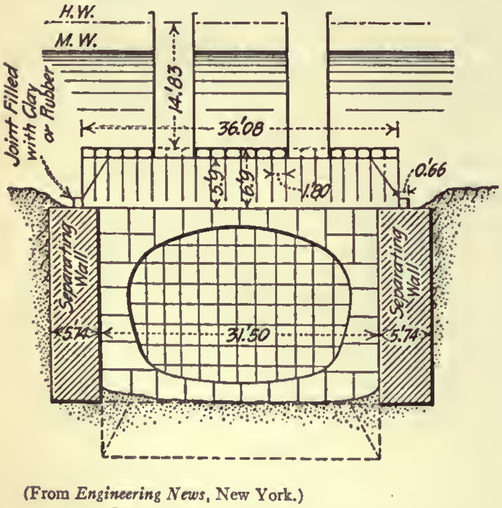
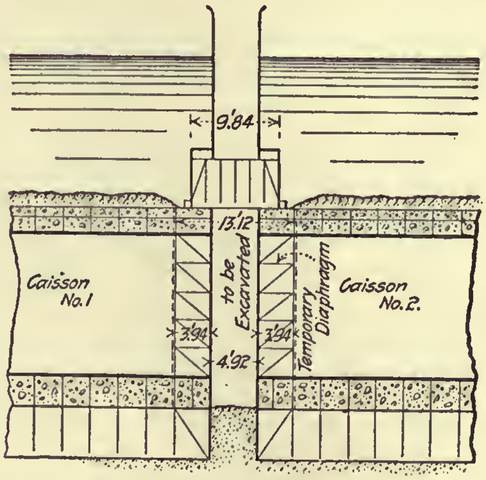
of 132 ft., under the smaller arm of the Seine. The cost of the tunnel was 7000 francs per lineal metre.

William Sooy Smith published in Chicago, in 1877, a description of a scheme for building a tunnel under the Detroit river by sinking caissons end to end, each caisson to be secured to the adjoining one by tongued and grooved guides, and a nearly water-tight connexion between the two to be made by means of an annular inflated hose.

Tunnelling through Mountains.—Where a great thickness of rock overlies a tunnel through a mountain, it may be necessary to do the work wholly from the two ends without intermediate shafts. The problem largely resolves itself into devising the most expeditious way of excavating and removing the rock. Experience has led to great advances in speed and economy, as may be seen from examples in the above table.

In 1857 the first blast was fired in connexion with the Mont Cenis works; in 1861 machine drilling was introduced; and in 1871 the tunnel was opened for traffic. With the exception of about 300 yds. the tunnel is lined throughout with brick or stone. During the first four years of hand labour the average progress was not more than 9 in. per day on each side of the Alps; but with compressed air rock-drills the rate towards the end was five times greater.





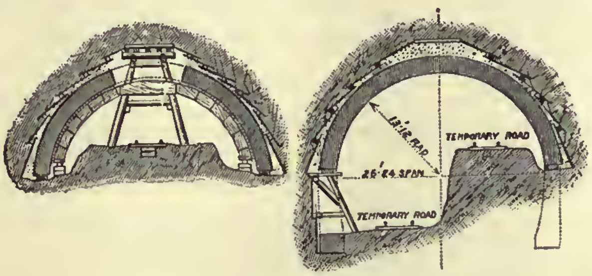
(From *Engineering News*, New York.)

FIG. 5.—Transverse Section. FIG. 6.—Longitudinal Section.

Coffer-dam superimposed over joints between caissons in tunnels for the Métropolitain under the Seine at Paris.

In 1872 the St Gotthard tunnel was begun, and in 1881 the first locomotive ran through it. Mechanical drills were used from the beginning. Tunnelling was carried on by driving in advance a top heading about 8 ft. square, then enlarging this sideways, and finally sinking the excavation to invert level (see figs. 7 and 8). Air for working the rock-drills was compressed to seven atmospheres by turbines of about 2000 horse-power.

The driving of the Arlberg tunnel was begun in 1880 and the work was completed in little more than three years. The main heading was driven along the bottom of the tunnel and shafts were opened up 25 to 70 yds. apart, from which smaller headings were driven right and left. The tunnel was enlarged to its full section at different points simultaneously in lengths of 8 yds., the excavation of each occupying about twenty days, and the masonry fourteen days. Ferroux percussion air-drills and Brandt rotary hydraulic drills were used, the performance of the latter being especially satisfactory. After each blast a fine spray of water was injected, which assisted the ventilation



FIGS. 7 and 8.—Method of excavation in St Gotthard Tunnel.

materially. In the St Gotthard tunnel the discharge of the air-drills was relied on for ventilation. In the Arlberg tunnel over 8000 cub. ft. of air per minute were thrown in by ventilators. To keep pace with the miners, 900 tons of excavated material had to be removed, and 350 tons of masonry introduced, daily at each end of the tunnel, which necessitated the transit of 450 wagons. The cost per lineal yard varied according to the thickness of masonry lining and the distance from the mouth of the tunnel. For the first thousand yards from the entrance the prices per lineal yard were £11 8s. for the lower heading; £7 12s. for the upper one; £30 10s. for the unlined tunnel; £45 for the tunnel with a thin lining of masonry; and £124 5s. with a lining 3 ft. thick at the arch, 4 ft. at the sides, and 2 ft. 8 in. at the invert.

The Simplon tunnel was begun in 1898 and completed in 1905. It is over 30 % longer than the St Gotthard, and the greatest depth below the surface is 7005 ft. A novel method was introduced in the shape of two parallel bores (56 ft. apart, connected at intervals of 660 ft. by oblique galleries), which greatly facilitated ventilation, and resulted in increased economy and rapidity of construction, while ensuring the health of the men. One of these galleries was made large enough for a single-track railroad, and the second is to be enlarged and similarly used. The death-rate in the Simplon tunnel was decreased as compared with the St Gotthard from 800 in eight years to 60 in seven years. Had one wide tunnel been made instead of two narrow ones, it would have been difficult to maintain its integrity; even with the narrow cross-section employed the floor was forced up at points in the solid rock from the great weight above, and had to be secured by building heavy inverts of masonry. Temperatures were reduced to 89° F. by spraying devices, although the rock temperatures ranged from 129° to 130° F. At one point 4374 yds. from the portal of Iselle the "Great Spring" of cold water was struck; it yielded 10,564 gallons per minute at 600 lb pressure per sq. in., and reduced the temperature to 55·4° F., the lowest point recorded. A spring of hot water was met on the Italian side which discharged into the tunnel 1600 gallons per minute with a temperature of 113° F. The maximum flow of cold water was 17,081 gallons per minute, and of hot water 4330 gallons per minute. These springs often necessitated a temporary abandonment of the work. Water power from the Rhone at the Swiss and from the Diveria at the Italian end provided the power for operating all plant during the construction of most of the work. Among the able engineers connected with this work must be mentioned Alfred Brandt, a man of remarkable energy and ability, whose drills were used with much success. He died early in the work, of injuries received from falling rock.

A group of tunnels—the Tauern, Bärengraben, Wocheiner and Bosrück—was undertaken by the Austrian government in connexion with new Alpine railroads to increase the commercial territory tributary to the seaport of Trieste, which at one time was greater than Hamburg. The principal tunnel of this group is under the main body of the Tauern mountain. The bottom drifts met on the 21st of July 1907. The difficulties resulted mostly from mountain débris and springs. There are four minor tunnels between Schwarzach, St Veit, and the north portal of the Tauern, and nineteen between the south portal and the south slope at Möllbrücken.

The electric railway from the Eiger glacier to near the summit of the Jungfrau includes a tunnel $1\frac{1}{2}$ m. long, 3·6 metres wide and 3·8 metres high, with a midway station, from which a large part of northern Switzerland can be seen. From the Jungfrau terminus, at an elevation of 13,428 ft., the summit, 242 ft. higher, will be reached by an elevator.

The Hoosac tunnel was the first prominent tunnel in America. It was begun in 1855 and finished in 1876, after many interruptions. It was memorable for the original use in America of air-drills and nitroglycerin. The Pennsylvania railroad tunnels crossing New York City under 32nd and 33rd Streets are of unusual size. Owing to the close proximity of large buildings and other structures special methods were adopted for mining the rock to lessen the vibrations by explosions. At 33rd Street and 4th Avenue the tunnels pass directly under two of the Rapid Transit system, above which there is another belonging to the Metropolitan Traction Company, so that there are three tunnels at different levels under the street.

Among other rock tunnels may be mentioned the Albula, through a granite ridge of the Rhaetian Alps, for a single-track narrow-gauge railroad, 3·6 m. long; tunnels on the Midland railway, near Totley in Derbyshire, over 3·5 m. long, largely in shale, and at Cowburn, over 2 m. long, in shale and harder rock, each 27 ft. wide and 20·5 ft. high inside; the Suram, on the Trans-Caucasus railway, for double track, 2·47 m. long, through soft rock; the tail-race tunnel for the Niagara Falls Water Power Company, 1·3 m. long, 19 ft. wide and 21 ft. high, through argillaceous shale and limestone, costing about $1,250,000; the Tequixquiac outlet to the drainage system for the city of Mexico, costing $6,760,000; the Cascade, Washington, part of the Great Northern railroad system, saving 9 m. in distance; and the Gunnison, irrigating 147,000 acres in Colorado.

Tunnelling in Towns.—Where tunnels have to be carried through soft soil in proximity to valuable buildings special precautions have to be taken to avoid settlement. A successful example of such work is the tunnel driven in 1886 for the Great Northern Railway Company under the Metropolitan Cattle

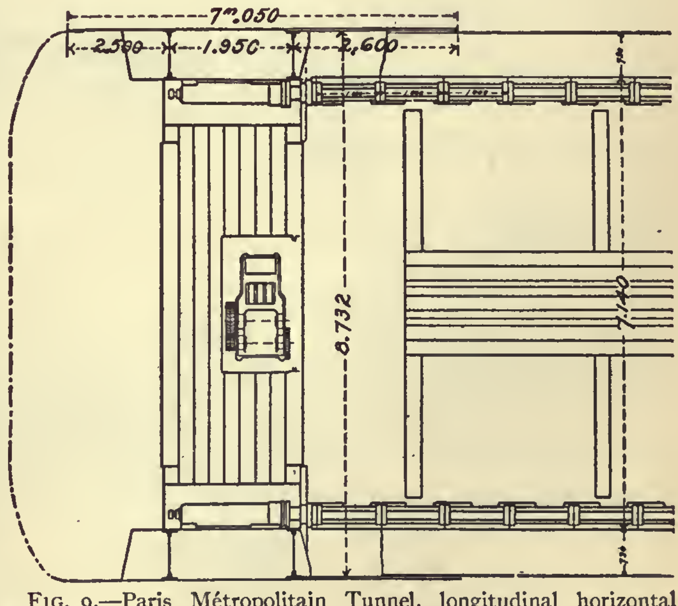


FIG. 9.—Paris Métropolitain Tunnel, longitudinal horizontal section.

Market, London. This was done by the crown-bar method, the bars being built in with solid brickwork. The subsidence in the ground was from 1 to about $3\frac{1}{2}$ in. Several buildings were tunnelled under without any structural damage.

London has now some 90 m. of tunnels for railways, mostly operated by electric traction. Most of those which have been constructed since 1890 have been tunnelled by the use of cylindrical shields and walls of cast iron. Shields about 23 ft. in diameter were used in constructing the stations on the Central London railway, and one 32 ft. 4 in. in diameter and only 9 ft. 3 in. long was used for a short distance on the Clapham extension of the City and South London railway.

general, the upper half of the tunnel was executed first (figs. 9 and 10) and the lower part completed by underpinning.

Figs. 11, 12 and 13 illustrate a case of tunnelling near important buildings in Boston in 1896, with a roof-shield 29 ft. 4 in. in external diameter. The vertical sidewalls were first made in small drifts, the roof-shield running on top of these, and the core was taken out later and the invert or floor of the tunnel put in last. Each hydraulic press of the shield reacted against a small continuous cast-iron rod imbedded in the brick arch. In some large sewerage tunnels in Chicago the shields were pushed from a wall of oak planks, 8 in. thick, surrounding the brick walls of the sewer.

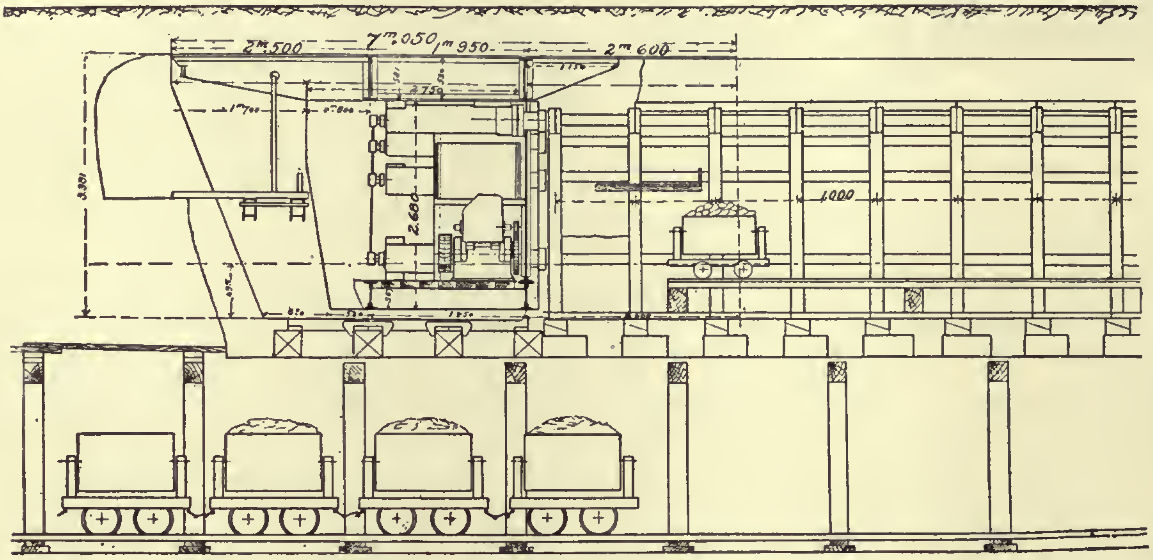

Fig. 10.—Paris Métropolitain Tunnel, longitudinal vertical section.

Paris has an elaborate plan for underground railways some 50 m. in length, a considerable number of which have been constructed since 1898 under the engineering direction of F. Bienvenüe. Instead of using completely cylindrical shields and cast-iron walls, as in London, roof-shields (*boucliers de voûte*) were employed for the construction of the upper half of the tunnel, and masonry walls were adopted throughout. In

Ventilation of Tunnels.—The simplest method for ventilating a railway tunnel is to have numerous wide openings to daylight at frequent intervals. If these are the full width of the tunnel, at least 20 ft. in length, and not farther apart than 200 yds., it can be naturally ventilated. Such arrangements are, however, frequently impracticable, and then recourse must be had to mechanical means.

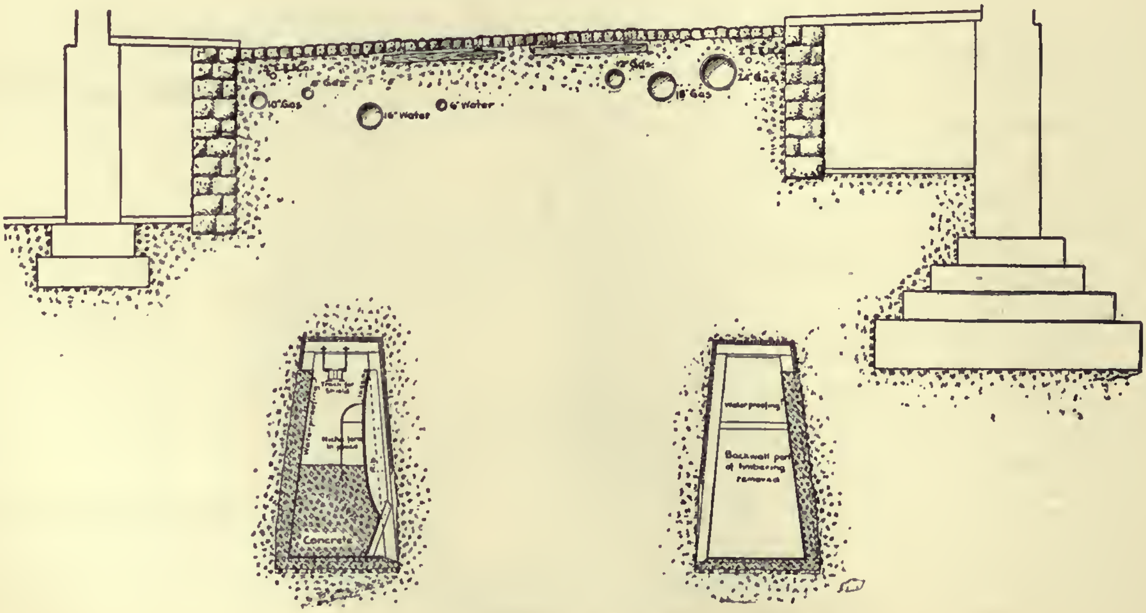

Fig. 11.—Boston Subway, first and second phases.

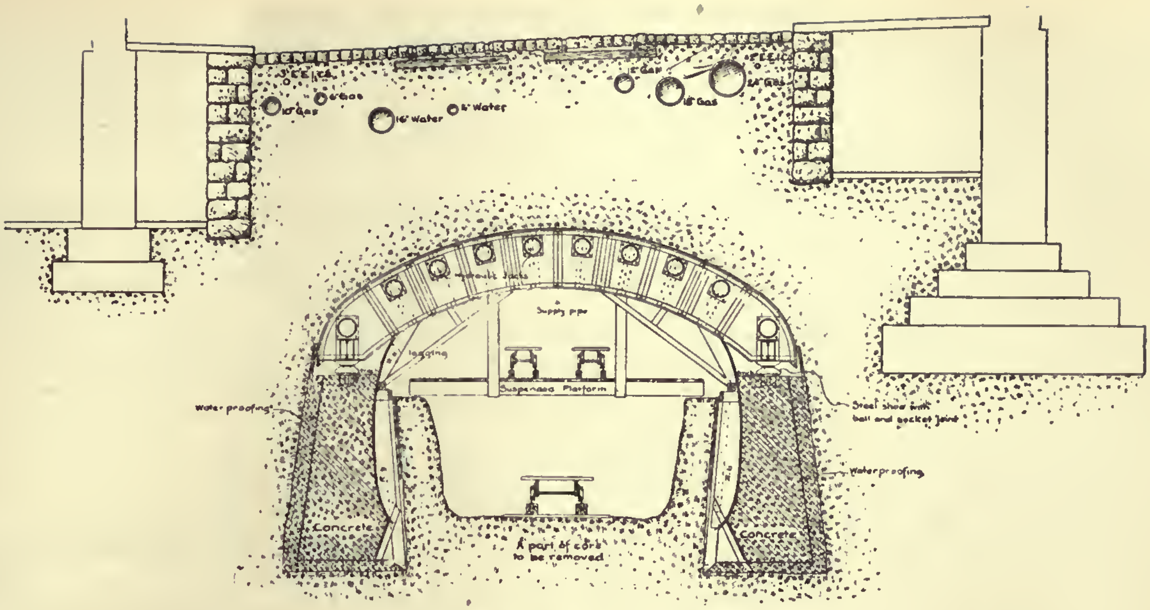

FIG. 12.—Boston Subway, third phase.

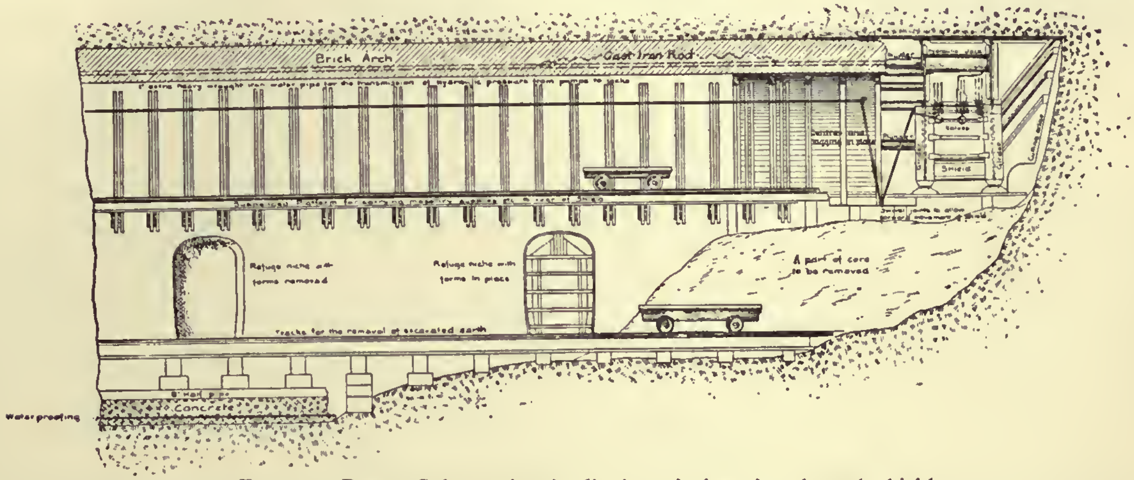

FIG. 13.—Boston Subway, longitudinal vertical section through shield.

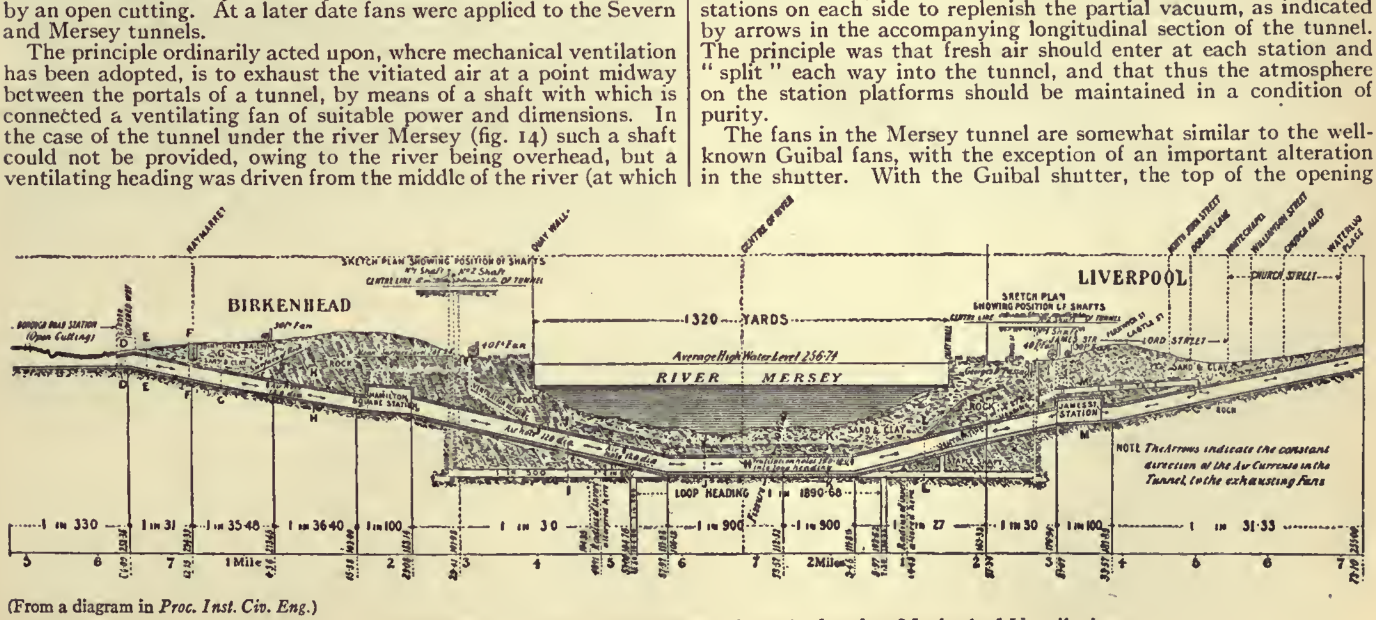
The first application of mechanical or fan ventilation to railway tunnels was made in the Lime Street tunnel of the London and North-Western railway at Liverpool, which has since been replaced by an open cutting. At a later date fans were applied to the Severn and Mersey tunnels.

The principle ordinarily acted upon, where mechanical ventilation has been adopted, is to exhaust the vitiated air at a point midway between the portals of a tunnel, by means of a shaft with which is connected a ventilating fan of suitable power and dimensions. In the case of the tunnel under the river Mersey (fig. 14) such a shaft could not be provided, owing to the river being overhead, but a ventilating heading was driven from the middle of the river (at which point entry into the tunnel was effected) to each shore, where a fan 40 ft. in diameter was placed. In this way the vitiated air is drawn from the lowest point of the railway, while fresh air flows in at the stations on each side to replenish the partial vacuum, as indicated by arrows in the accompanying longitudinal section of the tunnel. The principle was that fresh air should enter at each station and "split" each way into the tunnel, and that thus the atmosphere on the station platforms should be maintained in a condition of purity.

The fans in the Mersey tunnel are somewhat similar to the well-known Guibal fans, with the exception of an important alteration in the shutter. With the Guibal shutter, the top of the opening



(From a diagram in *Proc. Inst. Civ. Eng.*)

FIG. 14.—Longitudinal Section of the Mersey Tunnel, showing Method of Ventilation.

into the chimney from the fan has a line parallel to that of the fan-shaft and of the fan-blades, and, as a consequence, as each blade passes this shutter, the stoppage of the discharge of the air is instantaneous, and the sudden change of the pressure of the air on the face of the blade whilst discharging and the reversal of the pressure, due to the vacuum inside the fan-casing, cause the vibration hitherto inseparable from this type of ventilator. As an illustration of the effect of the pulsatory action of the Guibal shutters the following figures may be given: a fan having ten arms and running, say, sixty revolutions per minute, and working twenty-four hours per day, gives ($10 \times 60 \times 60 \times 24 =$) 864,000 blows per day transmitted from the tip of the fan-vanes to the fan-shaft; the shaft is thus in a constant state of tremor, and sooner or later reaches its elastic limit, and the consequent injury to the general structure of the fan is obvious. This difficulty is avoided by cutting a Λ-shaped opening in the shutter, thus gradually decreasing the aperture and allowing the air to pass into the chimney in a continuous stream instead of intermittently. The action of this regulating shutter increases the durability and efficiency of the fans in an important degree. In towns like Liverpool and Birkenhead any pulsatory action would be readily felt by the inhabitants, but with the above arrangement it is difficult to detect any sound whatever, even when standing close to the buildings containing the fans. The admission of the air on both sides is found in practice to conduce to smooth running and to the reduction of the side-thrust which occurs when the air is admitted on one side only. The fans are five in number: two are 40 ft. in diameter by 12 ft. wide, and two 30 ft. in diameter by 10 ft. wide, one of each size being erected at Liverpool and at Birkenhead respectively. In addition, there is a high-speed fan 16 ft. in diameter in Liverpool which throws 300,000 cub. ft.

The following table gives the result of experiments made with the ventilating fans of the Mersey railway:—

Fan at	Diameter of Fan in feet.	Width of Blade in feet.	Number of Revolutions per minute.	Area of Drift-way in square feet.	Water-gauge in inches.	Velocity of Air in feet per minute.	Volume of Air in cubic feet per minute.

The central point of the Severn tunnel (fig. 15) lies toward the Monmouthshire bank of the river, and ventilation is effected from that point by means of one fan placed on the surface at Sudbrooke, Monmouth, at the top of a shaft which is connected with a horizontal

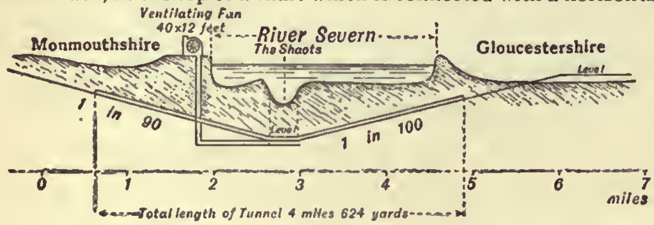

Fig. 15.—Section of Severn Tunnel (Fox).

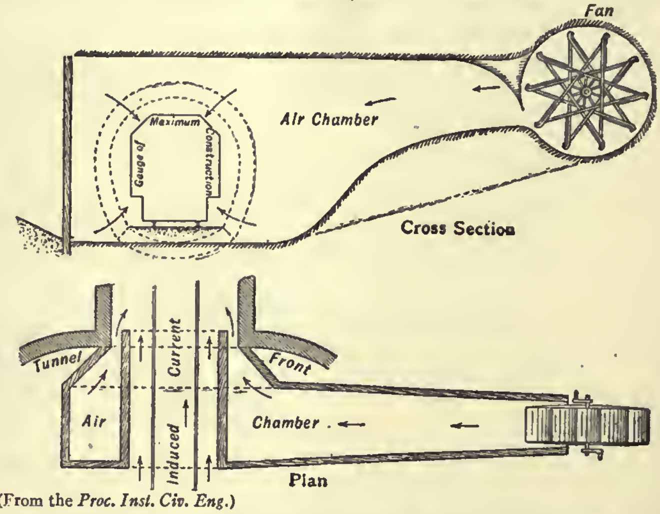
heading leading to the centre. This fan, which is 40 ft. in diameter by 12 ft. in width, removes from the tunnel some 400,000 cub. ft. per minute, and draws in an equivalent volume of fresh air from the two ends.

About 1896 an excellent system was introduced by Signor Saccardo, the well-known Italian engineer, which to a great extent has minimized the difficulty of ventilating long tunnels under mountain-ranges where shafts are not available. This system, which is not applicable to tunnels in which underground stations exist, is illustrated in fig. 16, which represents its application to the single-line tunnel through the Apennines at Pracchia. This tunnel is one of fifty-two single-line tunnels, with a gradient of 1 in 40, on the main line between Florence and Bologna, built by Thomas Brassey. There is a great deal of traffic which has to be worked by heavy locomotives. Before the installation of a ventilating system under any condition of wind the state of this tunnel, about 3000 yds. in length, was bad; but when the wind was blowing in at the lower end at the same time that a heavy goods or passenger train was ascending the gradient the condition of affairs became almost insupportable. The engines, working with the regulators full open, often emitted large quantities of both smoke and steam, which travelled concurrently with the train. The goods trains had two engines, one in front and another at the rear, and when, from the humidity in the tunnel, due to the



(From the *Proc. Inst. Civ. Eng.*)

Fig. 16.—Diagram illustrating the Saccardo System for Ventilating Tunnels.

steam, the wheels slipped and possibly the train stopped, the state of the air was indescribable. A heavy train with two engines, conveying a royal party and their suite, arrived on one occasion at the upper exit of the tunnel with both enginemen and both firemen insensible; and on another occasion, when a heavy passenger train came to a stop in the tunnel, all the occupants were seriously affected.

In applying the Saccardo system, the tunnel was extended for 15 or 20 ft. by a structure either of timber or brickwork, the inside line of which represented the line of maximum construction, and this was allowed to project for about 3 ft. into the tunnel. The space between this line and the exterior constituted the chamber into which air was blown by means of a fan. Considering the length of tunnel it might at first be thought there would be some tendency for the air to return through the open mouth, but nothing of the kind happened. The whole of the air blown by the fan, 164,000 cub. ft. per minute, was augmented by the induced current yielding 46,000 cub. ft. per minute, making a total of 210,000 cub. ft.; and this volume was blown down the gradient against the ascending train, so as to free the driver and men in charge of the train from the products of combustion at the earliest possible moment. Prior to the installation of this system the drivers and firemen had to be clothed in thick woollen garments, pulled on over their ordinary clothes, and wrapped round and round the neck and over the head; but in spite of all these precautions they sometimes arrived at the upper end of the tunnel in a state of insensibility. The fan, however, immensely improved the condition of the air, which is now pure and fresh.

In the case of the St Gotthard tunnel, which is 9⅓ m. in length and 26 ft. wide with a sectional area of 603 sq. ft., the Saccardo system was installed in 1899 with most beneficial results. The railway is double-tracked and worked by steam locomotives, the cars being lighted by gas. The ventilating plant is situated at Göschenen at the north end of the tunnel and consists of two large fans operated by water power. The quantity of air passed into the narrow mouth of the tunnel is 413,000 cub. ft. per minute at a velocity of 686 ft., this velocity being much reduced as the full section of the tunnel is reached. A sample of the air taken from a carriage contained 10·19 parts of carbonic acid gas per 10,000 volumes.

In the Simplon tunnel, where electricity is the motive power, mechanical ventilation is installed. A steel sliding door is arranged at each entrance to be raised and lowered by electric power. After the entrance of a train the door is lowered and fresh air forced into the tunnel at considerable pressure from the same end by fans.

The introduction of electric traction has simplified the problem of ventilating intra-urban railways laid in tunnels at a greater or less distance below the surface, since the absence of smoke and products of combustion from coal and coke renders necessary only such a quantity of air as is required by the passengers and staff. For supplying air to the shallow tunnels which form the underground portions of the Metropolitan and District railways in London, open staircases, blow-holes and sections of uncovered track are relied on. When the lines were worked by steam locomotives they afforded notorious examples of bad ventilation, the proportion of

[1] In the case of this circular drift-way a velocity of 4000 ft. per minute was subsequently attained.

[2] Quick-running fan.

carbonic acid amounting to from 15 or 20 to 60, 70 and even 89 parts in 10,000. But since the adoption of electricity as the motive power the atmosphere of the tunnels has much improved, and two samples taken from the cars in 1905 gave 11·27 and 14·07 parts of carbonic acid in 10,000.

When deep level "tube" railways were first constructed in London, it was supposed that adequate ventilation would be obtained through the lift-shafts and staircases at the stations, with the aid of the scouring action of the trains which, being of nearly the same cross-section as the tunnel, would, it was supposed, drive the air in front of them out by the openings at the stations they were approaching, while drawing fresh air in behind them at the stations they had left. This expectation, however, was disappointed, and it was found necessary to employ mechanical means. On the Central London railway, which runs from the Bank of England to Shepherd's Bush, a distance of 6 m., the ventilating plant installed in 1902 consists of a 300 h.p. electrically driven fan, which is placed at Shepherd's Bush and draws in fresh air from the Bank end of the line and at other intermediate points. The fan is 5 ft. wide and 20 ft. in diameter, and makes 145 revolutions a minute, its capacity being 100,000 cub. ft. a minute. It is operated from 1 to 4 a.m., and the openings at all the intermediate stations being closed it draws fresh air in at the Bank station. The tunnel is thus cleared out about 2¾ times each night and the air is left in the same condition as it is outside. The fan is also worked during the day from 11 a.m. to 5 p.m., the intermediate doors being open; in this way the atmosphere is improved for about half the length of the line and the cars are cleared out as they arrive at Shepherd's Bush. Samples of the air in the tunnel taken when the fan was not running contained 7·07 parts of carbonic acid in 10,000, while the air of a full car contained 10·7 parts. The outside air at the same time contained 4·4 parts. A series of tests made for the London County Council in 1902 showed that the air of the cars contained a minimum of 9·60 parts and a maximum of 14·7 parts. In some of the later tube railways in London—such as the Baker Street and Waterloo, and the Charing Cross and Hampstead lines—electrically driven exhaust fans are provided at about half-mile intervals; these each extract 18,500 cub. ft. of air per minute from the tunnels, and discharge it from the tops of the station roofs, fresh air being conveyed to the points of suction in the tunnels.

The Boston system of electrically operated subways and tunnels is ventilated by electric fans capable of completely changing the air in each section about every fifteen minutes. Air admitted at portals and stations is withdrawn midway between stations. In the case of the East Boston tunnel, the air leaving the tunnel under the middle of the harbour is carried to the shore through longitudinal ducts (fig. 3) and is there expelled through fan-chambers.

In the southerly 5 m. of the New York Rapid Transit railway, which runs in a four-track tunnel of rectangular section, having an area of 650 sq. ft., and built as close as possible to the surface of the streets, ventilation by natural means through the open staircases at the stations is mainly relied upon, with satisfactory results as regards the proportions of carbonic acid found in the air. But when intensely hot weather prevails in New York the tunnel air is sometimes 5° hotter still, due to the conversion of electrical energy into heat. This condition is aggravated by the fine diffusion through the air of oil from the motors, dust from the ballast and particles of metal ground off by the brake shoes, &c.

Volume of Air Required for Ventilation.—The consumption of coal by a locomotive during the passage through a tunnel having been ascertained, and 29 cub. ft. of poisonous gas being allowed for each pound of coal consumed, the volume of fresh air required to maintain the atmosphere of the tunnel at a standard of purity of 20 parts of carbon dioxide in 10,000 parts of air is ascertained as follows: The number of pounds of fuel consumed per mile, multiplied by 29, multiplied by 500, and divided by the interval in minutes between the trains, will give the volume of air in cubic feet which must be introduced into the tunnel per minute. As an illustration, assume that the tunnel is a mile in length, that the consumption of fuel is 32 lb per mile, and that one train passes through the tunnel every five minutes in each direction; then the volume of air required per minute will be

$$\frac{32 \text{ lb} \times 29 \text{ cub. ft.} \times 500}{2\frac{1}{2} \text{ minutes.}} = 185{,}600 \text{ cub. ft.}$$

Corrosion of Rails in Tunnels.—Careful tests made in the Box and Severn tunnels of the Great Western railway, to ascertain if possible the loss that takes place in the weight of rails owing to the presence of corrosive gases, gave the following results:—

Box Tunnel (1 m. 66 chains in length).

Percentage of Wear per annum.

	% = lb per yard per annum.
Down line, gradient falling 1 in 100—	
At east mouth	0·439 = 0·377
28 chains from east mouth	1·800 = 1·540
48 chains from east mouth	2·110 = 1·810
1 m. 8 chains from east mouth	2·880 = 2.480
At west mouth	0·640 = 0·553
Up line, gradient rising 1 in 100—	
At east mouth	0·620 = 0·575
1 m. 8 chains from east mouth	1·500 = 1·380
1 m. 28 chains from east mouth	1·520 = 1·310
At west mouth	0·680 = 0·587

Severn Tunnel (4 m. 28½ chains in length).

Percentage of Wear per annum.

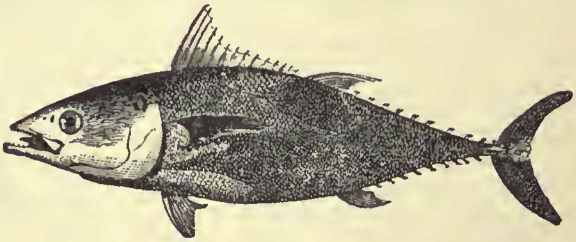
	% = lb per yard per annum.
Down line, outside and quite clear of tunnel, Bristol end, gradient falling 1 in 100	0·280 = 0·240
Up line, outside and quite clear of tunnel, Newport end, gradient falling 1 in 90	0·440 = 0·390
At Bristol mouth, gradient falling 1 in 100	1·200 = 1·020
33 chains from Bristol mouth, gradient falling 1 in 100	2·160 = 1·860
3 m. 75½ chains from Bristol mouth, gradient rising 1 in 90	1·900 = 1·630
At Newport mouth	0·310 = 0·270
Down and up line under main-shaft level	3·200 = 2·750

It will be seen that the maximum wear and corrosion together reached the extraordinary weight of 2½ lb per yard of rail per year—a very serious amount that involved great expenditure The wear occurred over the whole of the rail, but the top, over which the engine and train passed, wore at a greater rate, presumably on account of the surface being kept bright and the gases being able to act on it. The Great Western Company tried the experiment in the Severn tunnel of boxing up the rails, so that the ballast approached their surface within 1 in. or 1½ in. It was found, however, that—in the case, at any rate, of the limestone ballast—the cure was almost worse than the disease, the result being a maximum wear of 2½ lb and an average wear of just under 2 lb per yard of rail per year. The average on the open line would be about 0·25 lb in the same time.

See *Proc. Inst. Civ. Eng.*; also works on tunnelling by Drinker, Simms, Stauffer and Prelini, and on tunnel shields, &c., by Copperthwaite. (H. A. C.)

TUNNEL VAULT, the term in architecture given to the semicircular or elliptical vault over underground passages, in contradistinction to the wagon or barrel vault of edifices above ground.

TUNNY (*Thunnus thynnus*), one of the largest fishes of the family of mackerels, belongs to the genus of which the bonito (*Th. pelamys*) and the albacores (*Th. albacora*, *Th. alalonga*, &c.) are equally well-known members. From the latter the tunny is distinguished by its much shorter pectoral fins, which reach backwards only to, or nearly to, the end of the first dorsal fin. It possesses nine short finlets behind the dorsal, and eight behind the anal fin. Its colour is dark bluish above, and greyish, tinged and spotted with silvery, below. The tunny is a pelagic fish, but periodically approaches the shore, wandering in large shoals, within well-ascertained areas along the coast. It not infrequently appears in small companies or singly in the English Channel and in the German Ocean, probably in pursuit



Tunny.

of the shoals of pilchards and herrings on which it feeds. The regularity of its appearance on certain parts of the coasts of the Mediterranean has led to the establishment of a systematic fishery, which has been carried on from the time of the Phoenicians to the present day. Immense numbers of tunnies were caught on the Spanish coast and in the Sea of Marmora, where, however, this industry has much declined. The Sardinian tunnies were considered to be of superior excellence. The greatest number is now caught on the north coast of Sicily, the fisheries of this island supplying most of the preserved tunny which is exported to other parts of the world. In ancient times the fish were preserved in salt, and that coming from Sardinia, which was specially esteemed by the Romans, was known as

Salsamentum sardicum. At present preference is given to tunny preserved in oil. Many of the fishes, especially the smaller ones, are consumed fresh. The tunny occurs also in the Pacific and is much sought for by anglers on the coast of southern California, where tuna-fishing has become a fashionable sport; but several other species seem to take its place in the Indo-Pacific ocean. It is one of the largest fishes, attaining to a length of ten ft. and to a weight of more than a thousand pounds.

In connexion with the extremely active life of these fishes allusion should be made to the fact, first ascertained in 1839 by John (brother of Sir Humphry) Davy, that the temperature of the blood of a tunny may be considerably higher than that of the surrounding water, a discovery which disposed of the time-honoured division of vertebrate animals into warm-blooded and cold-blooded.

The variations and movements of the tunny and albacores were studied with special care by King Carlos of Portugal, who published in 1899 a large illustrated memoir entitled *A Pesca do atum no Algarve in 1898* (Lisbon). This memoir is accompanied by excellent figures of the different species of *Thunnus* and charts of their distribution in the Atlantic.

TUNSTALL (or TONSTALL), **CUTHBERT** (1474–1559), English prelate, was an illegitimate son of Thomas Tunstall of Thurland Castle, Lancashire, his legitimate half-brother, Brian Tunstall, being killed at Flodden in 1513. Cuthbert seems to have studied at Oxford, at Cambridge and at Padua, and he became a distinguished scholar, winning favourable comment from Erasmus. Having held several livings in quick succession, he became chancellor to William Warham, archbishop of Canterbury, in 1511, and he was soon employed on diplomatic business by Henry VIII. and Wolsey, being sent to Brussels in 1515 and to Cologne in 1519, while he was at Worms during the famous Diet of 1521. In 1516 he had been made master of the rolls; in 1521 he became dean of Salisbury, in 1522 bishop of London, and in 1523 keeper of the privy seal. For Henry VIII. he negotiated with Charles V. after his victory at Pavia in 1525 and he helped to arrange the Peace of Cambrai in 1529. In 1530 he succeeded Wolsey as bishop of Durham. Tunstall's religious views now gave some anxiety. He adhered firmly to the traditional teaching of the Church, but after some slight hesitation he accepted Henry as its head and publicly defended this position. In 1537 the bishop was appointed president of the new council of the north, but although he was often engaged in treating with the Scots he found time to take part in other public business and to attend parliament, where in 1539 he participated in the discussion on the bill of six articles. Although he disliked the religious policy pursued by the advisers of Edward VI. and voted against the first act of uniformity in 1549, he continued to discharge his public duties without molestation until after the fall of the protector Somerset; then in May 1551, he was placed in custody. A bill charging him with treason was introduced, but the House of Commons refused to pass it; he was, however, deprived of his bishopric in October 1552. On the accession of Mary in 1553 he was released and was again bishop of Durham, but during this reign he showed no animus against the Protestants. When Elizabeth came to the throne he refused to take the oath of supremacy, and he would not help to consecrate Matthew Parker as archbishop of Canterbury. He was arrested, and was still a prisoner at Lambeth when he died on the 18th of November 1559.

Among Tunstall's writings are *De veritate corporis et sanguinis domini nostri Jesu Christi in eucharistia* (1554); and *De arte supputandi libri quattuor* (1522). The bishop's correspondence as president of the council of the north is in the British Museum.

TUNSTALL, a market town of Staffordshire, England, on the northern outskirts of the Potteries district, included in the parliamentary borough of Newcastle-under-Lyme, 4 m. N.W. from Stoke-upon-Trent by the North Staffordshire railway. Pop. of urban district (1901), 19,492. The town is of modern growth. The Victoria Institute (1889) includes a library and schools of art and science. The neighbourhood is full of collieries, ironworks and potteries. Kidsgrove, Chatterley and Talk-o'-th'-hill are large neighbouring villages; the mines at the last-named were the scene of a terrible explosion in 1866, by which nearly a hundred lives were lost. There are brick and tile works in Tunstall. The town is included in the large parish of Wolstanton, and in the borough of Stoke-on-Trent (*q.v.*) under the "Potteries Federation" scheme (1908).

TUPIS (Comrades), a tribe and stock of South American Indians of Brazil. They call all other peoples *Tapuyas* (foreigners). Their original home is believed to have been on the Amazon, and from its mouth they spread far southwards along the Brazilian coast. When hard pressed by the Portuguese they retreated to the Andes. Martius gives the Tupi nation a wide range, from the Atlantic to the Andes, and from Paraguay to the Amazon. Of this stock are the Omaguas, Cocomas and other Peruvian tribes. Latham makes the Tupis members of the Guarani stock. The "Lingoa Geral" or trade language between Portuguese and Amazon Indians is a corruption of the Tupi tongue.

TUPPER, SIR CHARLES, BART. (1821–), British colonial statesman, son of the Rev. Charles Tupper, D.D., was born at Amherst, Nova Scotia, on the 2nd of July 1821, and was educated at Horton Academy. He afterwards studied for the medical profession at Edinburgh University, where he received the diplomas of M.D. and L.R.C.S. In 1855 he was returned to the Nova Scotia Assembly for Cumberland county. In 1862 he was appointed, by act of parliament, governor of Dalhousie College, Halifax; and from 1867 till 1870 he was president of the Canadian Medical Association. Mr Tupper was a member of the executive council and provincial secretary of Nova Scotia from 1857 to 1860, and from 1863 to 1867. He became prime minister of Nova Scotia in 1864, and held that office until the Union Act came into force on the 1st of July 1867, when his government retired. He was a delegate to Great Britain on public business from the Nova Scotia government in 1858 and 1865, and from the Dominion government in March 1868. Mr Tupper was leader of the delegation from Nova Scotia to the Union conference at Charlottetown in 1864, and to that of Quebec during the same year; and to the final colonial conference in London, which assembled to complete the terms of union, in 1866–1867. On that occasion he received a patent of rank and precedence from Queen Victoria as an executive councillor of Nova Scotia. He was sworn a member of the privy council of Canada, June 1870, and was president of that body from that date until the 1st of July 1872, when he was appointed minister of inland revenue. This office he held until February 1873, when he became minister of customs under Sir John Macdonald, resigning with the ministry at the close of 1873. On Sir John's return to power in 1878, Mr Tupper became minister of public works, and in the following year minister of railways and canals. At this time he was made K.C.M.G. Mr Tupper was the author of the Public Schools Act of Nova Scotia, and had been largely instrumental in moulding the Dominion Confederation Bill and other important measures. Sir Charles represented the county of Cumberland, Nova Scotia, for thirty-two years in succession—first in the Nova Scotia Assembly, and subsequently in the Dominion parliament until 1884, when he resigned his seat on being appointed high commissioner for Canada in London. Shortly before the Canadian Federal elections of February 1887, Sir Charles re-entered the Conservative cabinet as finance minister. By his efforts the Canadian Pacific railway was enabled to float a loan of $30,000,000, on the strength of which the line was finished several years before the expiration of the contract time. He resigned the office of finance minister in May 1888, when he was reappointed high commissioner for the Dominion of Canada in London. Sir Charles was designated one of the British plenipotentiaries to the Fisheries Convention at Washington in 1887, the result of which conference was the signing of a treaty in February 1888 (rejected by the U.S. Senate) for the settlement of the matters in dispute between Canada and the United States in connexion with the Atlantic fisheries. He was created a baronet in September 1888. When the Dominion cabinet, under Sir Mackenzie Bowell, was reconstituted in January 1896 Sir Charles Tupper accepted office, and in the following April he succeeded Bowell in the premiership. On both patriotic and commercial grounds he urged the adoption of a preferential tariff with Great Britain and the sister colonies. At the general election in the ensuing June the Conservatives were severely defeated, and Sir Charles Tupper and his colleagues resigned, Sir Wilfrid Laurier becoming premier. The Conservative party now gradually became more and more disorganized, and at the next general election, in November 1900, they were again defeated. Sir Charles Tupper, who had long been the Conservative leader, sustained in his own constituency of Cape Breton his first defeat in forty years.

TUPPER, MARTIN FARQUHAR (1810–1889), English writer, the author of *Proverbial Philosophy*, was born in London on the 17th of July 1810. He was the son of Martin Tupper, a doctor, who came of an old Huguenot family. He was educated at Charterhouse and at Christ Church, Oxford, where he gained a prize for a theological essay, Gladstone being second to him. He was called to the bar at Lincoln's Inn, but never practised. He began a long career of authorship in 1832 with *Sacra Poesis*, and in 1838 he published *Geraldine, and other Poems*, and for fifty years was fertile in producing both verse and prose; but his name is indissolubly connected with his long series of didactic moralisings in blank verse, the *Proverbial Philosophy* (1838–1867), which for about twenty-five years enjoyed an extraordinary popularity that has ever since been the cause of persistent satire. The first part was, however, a comparative failure, and N. P. Willis, the American author, took it to be a forgotten work of the 17th century. The commonplace character of Tupper's reflections is indubitable, and his blank verse is only prose cut up into suitable lengths; but the *Proverbial Philosophy* was full of a perfectly genuine moral and religious feeling, and contained many apt and striking expressions. By these qualities it appealed to a large and uncritical section of the public. A genial, warm-hearted man, Tupper's humane instincts prompted him to espouse many reforming movements; he was an early supporter of the Volunteer movement, and did much to promote good relations with America. He was also a mechanical inventor in a small way. In 1886 he published *My Life as an Author*; and on the 29th of November 1889 he died at Albury, Surrey.

TURBAN, the name of a particular form of head-dress worn by men of Mahommedan races. The earlier forms of the word in English are *turbant*, *turband*, and *tolibant* or *tulipant*, the latter showing that variant of the original which survives in the name of the flower, the tulip. All these forms represent the French adaptation of the Turkish *tulbend*, a vulgarism for *dulbend*, from Persian *dulband*, a sash or scarf wound round the head. The Moslem turban is essentially a scarf of silk, fine linen, cotton or other material folded round the head, sometimes, as in Egypt, round the tarbush or close-fitting felt cap; sometimes, as in Afghanistan, round a conical cap; or, as among certain races in India, round the skull-cap or *kullah*. Races, professions, degrees of rank, and the like vary in the style of turban worn; distinctions being made in size, methods of folding, and colour and the like (see INDIA: *Costume*). At the end of the 18th and beginning of the 19th century, a species of head-dress somewhat resembling the true turban in outward form was worn by ladies of western nations, chiefly for use indoors.

TURBERVILLE (or TURBERVILE), **GEORGE** (1540?–1610?), English poet, second son of Nicholas Turberville of Whitchurch, Dorset, belonged to an old Dorsetshire family, the D'Urbervilles of Mr Thomas Hardy's novel, *Tess*. He became a scholar of Winchester College in 1554, and in 1561 was made a fellow of New College, Oxford. In 1562 he began to study law in London, and gained a reputation, according to Anthony à Wood, as a poet and man of affairs. He accompanied Thomas Randolph in a special mission to Moscow to the court of Ivan the Terrible in 1568. Of his *Poems describing the Places and Manners of the Country and People of Russia* (1568) mentioned by Wood, only three metrical letters describing his adventures survive, and these were reprinted in Hakluyt's *Voyages* (1589). His *Epitaphs, Epigrams, Songs and Sonets* appeared "newly corrected with additions" in 1567. In the same year he published translations of the *Heroycall Epistles* of Ovid, and of the *Eglogs* of Mantuan (Gianbattista Spagnuoli, called Mantuanus), and in 1568 *A Plaine Path to Perfect Vertue* from Dominicus Mancinus. The *Book of Falconry or Hawking* and the *Noble Art of Venerie* (printed together in 1575) may both be assigned to Turberville. The title page of his *Tragical Tales* (1587), which are translations from Boccaccio and Bandello, says that the book was written at the time of the author's troubles. What these were is unknown, but Wood says he was living and in high esteem in 1594. He probably died before 1611. He is a disciple of Wyat and Surrey, whose matter he sometimes appropriated. Much of his verse is sing-song enough, but he disarms criticism by his humble estimate of his own powers.

His *Epitaphs* &c. were reprinted in Alexander Chalmers's *English Poets* (1810), and by J. P. Collier in 1867.

TURBET I HAIDARI, a district of the province of Khorasan in Persia, bounded N. by Meshed, E. by Bakharz, S. by Khaf and W. by Turshiz. It has a population of about 30,000, composed chiefly of members of the Turki Karai tribe and Beluchis. The Karais were settled here by Timur in the 14th century and now provide a battalion of infantry and 150 cavalrymen to the army. The district contains about 150 villages and hamlets, most of them situated in its more fertile eastern part, and pays a yearly revenue of £14,000. Much silk was formerly produced, now very little, but there are large crops of grain.

TURBET I HAIDARI, the capital of the district, is 76 m. nearly S. of Meshed, in 35° 17′ N., 59° 11′ E., at an elevation of 4100 ft. The town is picturesquely situated on the bank of a deep and wide ravine in the midst of lofty hills, and surrounded by clusters of villages. Its population amounts to 8000 souls. There is a well-stocked bazaar and a number of Russian traders have established themselves here since 1903, when the place was connected with Meshed on one side and with Seistan on the other side by a telegraph line which, nominally Persian, is worked and maintained by a Russian staff. A British consul has resided here since 1905, and there is also a post-office.

The place was formerly known as Zavah and derives its present name from the turbet or tomb of a holy man named Kutb ed din Haidar, the founder of the ascetic sect of dervishes known as the Haidaris. He died *c.* 1230 and is buried in a large domed building a short distance outside the town.

TURBINE (Lat. *turbo*, a whirlwind, a whirling motion or object, a top), in engineering, a machine which applies the energy of a jet of water or steam to produce the rotation of a shaft. It consists essentially of a wheel or chamber provided with a number of blades or vanes upon which the fluid jet impinges; the impelled fluid causes the blades to rotate and also the shaft to which they are attached. Water turbines are treated under HYDRAULICS, and steam turbines under STEAM ENGINE.

TURBOT[1] (*Rhombus maximus* or *Psetta maxima*), one of the largest and most valuable of the flat-fishes or *Pleuronectidae*. The turbot, which rarely exceeds a length of two feet, has great width of body, and is scaleless, but is covered with conical bony tubercles. The eyes are on the left side of the body, the lower being slightly in advance of the upper; the mouth is large and armed with teeth of uniformly minute size. The turbot is found all round the coasts of Europe (except in the extreme north), preferring a flat sandy bottom with from 10 to 50 fathoms of water. The broad banks off the Dutch coast are a favourite resort. It is a voracious fish, and feeds on other fish, crustaceans and molluscs. It seems to constantly change its abode, wandering northward during the summer, and going into deeper water in the cold season. The eggs of the turbot, like those of the majority of flat-fishes, are pelagic and buoyant. They are small and very numerous, varying from five to ten millions in fish of 18 to 21 lb weight. The young fish are symmetrical and swim

[1] The word "turbot" is of great antiquity, perhaps of Celtic origin; it is preserved in French in the same form as in English, and is composed of two words, of which the second is identical with the "but" in halibut and with the German "Butte," which signifies flat-fish. The German name for the turbot is "Steinbutte."

vertically like the young of other Pleuronectids, but they reach a much larger size before metamorphosis than species of other genera, specimens from ¾ in. to 1 in. in length being frequently taken swimming at the surface of the water and not completely converted into the adult condition. Specimens one year old are from 3 to 4½ in. long, some perhaps larger. About 1860 it was estimated that the Dutch supplied turbot to the London market to the value of £80,000 a year. In 1900 the total weight of turbot landed on English and Welsh coasts for the year was according to the Board of Trade returns 60,715 cwt. valued at £252,680. The turbot is also common, though not abundant, in the Mediterranean, and is replaced in the Black Sea by an allied species with much larger bony tubercles (*Rh. maeoticus*). Both species grow to a large size, being usually sold at from 5 to 10 lb; but the common turbot is stated to attain to a weight of 30 lb.

TUREEN, a deep dish or bowl, round or oval in shape, and with a cover, made to serve soup at table. The word is a corruption of the more correct "terrine," an earthenware vessel (Med. Lat. *terrineus*, made of earth, *terra*). The corruption is due to misspelling in early cookery-books, and an absurd story that the name arose from Marshal Turenne once drinking his soup from his helmet was invented to account for it.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, Vicomte de (1611–1675), marshal of France, second son of Henri, duke of Bouillon and sovereign prince of Sedan, by his second wife Elizabeth, daughter of William the Silent, prince of Orange, was born at Sedan on the 11th of September 1611. He was educated in the doctrines of the Reformed religion and received the usual training of a young noble of the time, but physical infirmity, and particularly an impediment of speech (which he never lost), hampered his progress, though he showed a marked partiality for history and geography, and especial admiration of the exploits of Alexander the Great and Caesar. After his father's death in 1623, he devoted himself to bodily exercises and in a great measure overcame his natural weakness. At the age of fourteen he went to learn war in the camp of his uncle, Maurice of Nassau, and began his military career (as a private soldier in that prince's bodyguard) in the Dutch War of Independence. Frederick Henry of Nassau, who succeeded his brother Maurice in 1625, gave Turenne a captaincy in 1626. The young officer took his part in the siege warfare of the period, and won special commendation from his uncle, who was one of the foremost commanders of the time, for his skill and courage at the celebrated siege of Hertogenbosch (Bois-le-Duc) in 1629. In 1630 Turenne left Holland and entered the service of France. This step was dictated not only by the prospect of military advancement but also by his mother's desire to show the loyalty of the Bouillon dominions to the French crown. Cardinal Richelieu at once made him colonel of an infantry regiment. He still continued to serve at frequent intervals with the prince of Orange, who was the ally of France, and his first serious service under the French flag was at the siege of La Motte in Lorraine by Marshal de la Force (1634), where his brilliant courage at the assault won him immediate promotion to the rank of *maréchal de camp* (equivalent to the modern grade of major-general). In 1635 Turenne served under Cardinal de la Valette in Lorraine and on the Rhine. The siege of Mainz was raised but the French army had to fall back on Metz from want of provisions. In the retreat Turenne measured swords with the famous imperialist General Gallas, and distinguished himself greatly by his courage and skill. The reorganized army took the field again in 1636 and captured Saverne (Zabern), at the storming of which place Turenne was seriously wounded. In 1637 he took part in the campaign of Flanders and was present at the capture of Landrecies (July 26) and in the latter part of 1638, under Duke Bernhard of Saxe-Weimar (1608–1639), he directed the assault of Breisach (reputed the strongest fortress on the upper Rhine), which surrendered on the 17th of December. He had now gained a reputation as one of the foremost of the younger generals of France, and Richelieu next employed him in the Italian campaign of 1639–40 under "Cadet la Perle," Henri de Lorraine, count of Harcourt (1601–1666). On the 19th of November 1639 he fought in the famous rearguard action called the battle of the "Route de Quiers," and during the winter revictualled the citadel of Turin, held by the French against the forces of Prince Thomas of Savoy. In 1640 Harcourt saved Casale and besieged Prince Thomas's forces in Turin, which were besieging in their turn another French force in the citadel. The latter held out, while Prince Thomas was forced to surrender on the 17th of September 1640, a fourth army which was investing Harcourt's lines being at the same time forced to retire. The favourable result of these complicated operations was largely due to Turenne, who had by now become a lieutenant-general. He himself commanded during the campaign of 1641 and took Coni (Cuneo), Ceva and Mondovi. In 1642 he was second in command of the French troops which conquered Roussillon. At this time the conspiracy of Cinq Mars (see France: *History*) in which Turenne's elder brother, the duke of Bouillon, was implicated, was discovered.

The earlier career of Turenne was markedly influenced by the relations of the principality of Sedan to the French crown; sometimes it was necessary to advance the soldier to conciliate the ducal family, at others the machinations of the latter against Richelieu or Mazarin prevented the king's advisers from giving their full confidence to their general in the field. Moreover his steady adherence to the Protestant religion was a further element of difficulty in Turenne's relations with the ministers. Cardinal Richelieu nevertheless entrusted him with the command in Italy in 1643 under Prince Thomas (who had changed sides in the quarrel). Turenne took Trino in a few weeks, but was recalled to France towards the end of the year. He was made a marshal of France (December 19) and was soon sent to Alsace to reorganize the "Army of Weimar"—the remnant of Duke Bernhard of Saxe-Weimar's troops—which had just been severely defeated at Tüttlingen (November 24–25, 1643). He was at this time thirty-two years of age and had served under four famous commanders. The methodical prince of Orange, the fiery Bernhard, the soldierly Cardinal de la Valette and the stubborn and astute Harcourt had each contributed much to the completeness of Turenne's training, and he took the field in 1644 prepared by genius and education for the responsibilities of high command.

The work of reorganization over, Marshal Turenne began the campaign in June by crossing the Rhine at Breisach, but was almost instantly joined by an army under the duc d'Enghien (afterwards the great Condé), who, as a prince of the royal house, took the chief command of the united armies of "France" and "Weimar." The four famous campaigns which followed brought to an end the Thirty Years' War (*q.v.*). The chief event of the first of these was the desperately-fought battle of Freiburg against Count Mercy's Bavarians (August 3, 5 and 9, 1644), after which Philipsburg was successfully besieged. Before the capitulation Enghien withdrew and left Turenne in command. The marshal opened the campaign of 1645 with a strong forward movement, but was surprised and defeated by Mercy at Mergentheim (Marienthal) on the 2nd of May. Enghien was again sent to the front with the army of France and Turenne's army was greatly increased by the arrival of a Swedish force and a contingent from Hesse-Cassel. The Swedes soon departed, but Enghien was at the head of 20,000 men when he met the Bavarians in a battle even more stubbornly contested than Freiburg. Mercy was killed and his army decisively beaten at Allerheim near Nördlingen (August 3, 1645).

Ill-health forced Enghien to retire soon afterwards, and Turenne was for the third time left in command of the French army. He was again unfortunate against the larger forces of the imperialists, but the campaign ended with a gleam of success in his capture of Trier (Trèves). In the following year (1646) he obtained more decided successes, and, by separating the Austrians from the Bavarians, compelled the elector of Bavaria to make peace (signed March 14, 1647). In 1647 he proposed to attack the thus weakened army of the emperor, but was ordered into Flanders instead. Not only was the opportunity thus lost but a serious mutiny broke out amongst the Weimar troops, whose pay was many months in arrear. The marshal's tact and firmness were never more severely tried nor more conspicuously displayed than in his treatment of the disaffected regiments, among whom in the end he succeeded in restoring order with little bloodshed. He then marched into Luxemburg, but was soon recalled to the Rhine, for in 1648 Bavaria had returned to her Austrian alliance and was again in arms. Turenne and his Swedish allies made a brilliant campaign, which was decided by the action of Zusmarshausen (May 17), Bavaria being subsequently wasted with fire and sword until a second and more secure pacification was obtained. This devastation, for which many modern writers have blamed Turenne, was not a more harsh measure than was permitted by the spirit of the times and the circumstances of the case.

The peace of Westphalia (1648) was no peace for France, which was soon involved in the civil war of the Fronde (see FRANCE: *History*). Few of Turenne's actions have been more sharply criticized than his adhesion to the party of revolt. The army of Weimar refused to follow its leader and he had to flee into the Spanish Netherlands, where he remained until the treaty of Rueil put an end to the first war of the Fronde. The second war began with the arrest of Condé and others (January 1650), amongst whom Turenne was to have been included; but he escaped in time and with the duchesse de Longueville held Stenay for the cause of the "Princes"—Condé, his brother Conti, and his brother-in-law the duc de Longueville. Love for the duchess seems to have ruled Turenne's action, both in the first war, and, now, in seeking Spanish aid for the princes. In this war Turenne sustained one of his few reverses at Rethel (December 15, 1650); but the second conflict ended in the early months of the following year with the collapse of the court party and the release of the princes.

Turenne became reconciled and returned to Paris in May, but the trouble soon revived and before long Condé again raised the standard of revolt in the south of France. In this, the third war of the Fronde, Turenne and Condé were opposed to each other, the marshal commanding the royal armies, the prince that of the Frondeurs and their Spanish allies. Turenne displayed the personal bravery of a young soldier at Jargeau (March 28, 1652), the skill and wariness of a veteran general at Gien (April 7), and he practically crushed the civil war in the battle of the Faubourg St Denis (July 2) and the reoccupation of Paris (October 21). Condé and the Spaniards, however, still remained to be dealt with, and the long drawn out campaigns of the "Spanish Fronde" gave ample scope for the display of scientific generalship on the part of both the famous captains. In 1653 the advantage was with Turenne, who captured Rethel, St Menehould and Muzon, while Condé's sole prize was Rocroy. The short campaign of 1654 was again to the advantage of the French; on the 25th of July the Spanish were defeated at Arras. In 1655 more ground was gained, but in 1656 Turenne was defeated at Valenciennes in the same way as he had beaten Condé at Arras. The war was eventually concluded in 1657 by Turenne's victory at the Dunes near Dunkirk, in which a corps of English veterans sent by Cromwell played a notable part (June 3–14); a victory which, followed by another successful campaign in 1658, led to the peace of the Pyrenees in 1659.

On the death of Cardinal Mazarin in 1661 Louis XIV. took the reins of government into his own hands and one of his first acts was to appoint Turenne "marshal-general of the camps and armies of the king." He had offered to revive the office of constable of France (suppressed in 1627) in Turenne's favour if the marshal would become a Roman Catholic. Turenne declined. Born of Calvinist parents and educated a Protestant, he had refused to marry one of Richelieu's nieces in 1639 and subsequently rejected a similar proposal of Mazarin. He had later married a daughter of the Protestant Marshal de la Force, to whom he was deeply attached. But he sincerely deplored the division of the Christian church into two hostile camps. He had always distrusted the influence of many dissident and uncontrolled sects; the history of Independency in the English army and people made a deep impression on his mind, and the same fear of indiscipline which drove the English Presbyterians into royalism drew Turenne more and more towards the Roman Catholic Church. How closely both he and his wife studied such evidence as was available is shown by their correspondence, and, in the end, two years after her death, he was prevailed upon by the eloquence of Bossuet and the persuasions of his nephew, the abbé de Bouillon, to give in his adhesion to the Orthodox faith (October 1668). In 1667 he had returned to the more congenial air of the "Camps and Armies of the King," directing, nominally under Louis XIV., the famous "Promenade militaire" in which the French overran the Spanish Netherlands. Soon afterwards Condé, now reconciled with the king, rivalled Turenne's success by the rapid conquest of Franche Comté, which brought to an end the War of Devolution in February 1668.

In Louis XIV.'s Dutch War of 1672 (see DUTCH WARS) Turenne was with the army commanded by the king which overran Holland up to the gates of Amsterdam. The terms offered by Louis to the prince of Orange were such as to arouse a more bitter resistance. The dikes were opened and the country round Amsterdam flooded. This heroic measure completely checked Turenne, whom the king had left in command. Europe was aroused to action by the news of this event, and the war spread to Germany. Turenne fought a successful war of manœuvre on the middle Rhine while Condé covered Alsace. In January 1673 Turenne assumed the offensive, penetrated far into Germany, and forced the Great Elector of Brandenburg to make peace; later in the year, however, he was completely outmanœuvred by the famous imperial general Montecucculi, who evaded his opponent, joined the Dutch and took the important place of Bonn. In June 1674, however, Turenne won the battle of Sinzheim, which made him master of the Palatinate. Under orders from Paris the French wasted the country far and wide, and this devastation has usually been considered the gravest blot on Turenne's fame, though it is difficult to say that it was more unjustifiable than other similar incidents in medieval and even in modern war. In the autumn the allies again advanced, and though Turenne was again outmanœuvred, his failure on this occasion was due to the action of the neutral city of Strassburg in permitting the enemy to cross the Rhine by the bridge at that place. The battle of Enzheim followed; this was a tactical victory, but hardly affected the situation, and, at the beginning of December, the allies were still in Alsace. The old marshal now made the most daring campaign of his career. A swift and secret march in mid-winter from one end of the Vosges to the other took the allies by surprise. Sharply following up his first successes, Turenne drove the enemy to Turkheim, and there inflicted upon them a heavy defeat (January 5, 1675). In a few weeks he had completely recovered Alsace. In the summer campaign he was once more opposed to Montecucculi, and after the highest display of "strategic chess-moves" by both commanders, Turenne finally compelled his opponent to offer battle at a disadvantage at Sassbach. Here, on the 27th of July 1675, he was killed by almost the first shot fired. The news of his death was received with universal sorrow. Turenne's most eloquent countrymen wrote his *éloges*, and Montecucculi himself exclaimed: "Il est mort aujourd'hui un homme qui faisait honneur à l'homme." His body was taken to St Denis and buried with the kings of France. Even the extreme revolutionists of 1793 respected it, and, when the bones of the sovereigns were thrown to the winds, the remains of Turenne were preserved at the Jardin des Plantes until the 22nd of September 1800, when they were removed by order of Napoleon to the church of the Invalides at Paris, where they still rest.

Turenne was one of the great captains whose campaigns Napoleon recommended all soldiers to "read and re-read." His fame as a general was the highest in Europe at a period when war was studied more critically than ever before, for his military character epitomized the art of war of his time (Prince de Ligne). Strategic caution and logistic accuracy, combined with brilliant dash in small combats and constancy under all circumstances of success or failure may perhaps be considered the salient points of Turenne's genius for war. Great battles he avoided. "Few sieges and many combats" was his own maxim. And, unlike his great rival Condé, who was as brilliant in his first battle as in his last, Turenne improved day by day. Napoleon said of him that his genius grew bolder as it grew older, and a modern author, the duc d'Aumâle (*Histoire des princes de la maison de Condé*), takes the same view when he says: "Pour le connaître il faut le suivre jusqu'à Sulzbach. Chez lui chaque jour marque un progrès." In his personal character Turenne was little more than a simple and honourable soldier, endowed with much tact, but in the world of politics and intellect almost helpless in the hands of a skilful intriguer or casuist. His morals, if not beyond reproach, were at least more austere than those prevalent in the age in which he lived. He was essentially a commander of regular armies. His life was spent with the troops; he knew how to win their affection; he tempered a severe discipline with rare generosity, and his men loved him as a comrade no less than they admired him as a commander. Thus, though Condé's genius was far more versatile, it is Turenne whose career best represents the art of war in the 17th century. For the small, costly, and highly trained regular armies, and the dynastic warfare of the age of Louis XIV., Turenne was the ideal army leader.

The most notable of the numerous portraits of Turenne are those of P. de Champagne at Versailles, and of Senin (dated 1670) in the Jones collection at South Kensington, London. Of the older memoirs of Turenne the most important are those of "Du Buisson," *La Vie du vicomte de Turenne*—the author is apparently Gatien de Sandraz de Courtilz (Paris, the Hague, and Cologne, 1688–1695); Abbé Raguenet, *Histoire du vicomte de Turenne* (Paris, 1741) and especially Ramsay, *Histoire d'Henry de la Tour d'Auvergne, vicomte de Turenne* (Paris, 1735), the second volume of which contains the marshal's memoirs of 1643–1658. These memoirs, of which the Prince de Ligne wrote that "ce ne sont pas de conseils, ce sont des ordres . . . 'faites' . . . 'allez,' &c."—were written in 1665, but were first published (*Mémoires sur la guerre, tirés des originaux*, &c.) in 1738, reprinted in Michaud, *Mémoires sur l'histoire de France*, 3rd series, vol. iii., and Liskenne and Sauvan's *Bibliothèque historique et militaire*, vol. iv. (Paris, 1846). A manuscript *Maximes de M. de Turenne* (1644) exists in the Staff Archives at Vienna, and of other documentary collections may be mentioned Grimoard, *Collections de lettres et mémoires trouvés dans la portefeuille de M. de Turenne* (Paris, 1782); *Recueil de lettres écrites au vicomte de Turenne par Louis XIV. et ses ministres*, &c. (Paris, 1779); *Correspondance inédite de Turenne avec Le Tellier et Louvois*, ed. Barthélemy (Paris, 1874). See also the *Observations on the Wars of Marshal Turenne*, dictated by Napoleon at St Helena (1823); Puységur, *La Guerre par principes et règles* (Paris, 1748); Précis in *Bibliothèque internationale d'hist. milit.* (Brussels, 1883); Duruy, *Histoire de Turenne* (Paris, 1880); Roy, *Turenne, sa vie et les institutions militaires de son temps* (Paris, 1884); Hardÿ de Périni, *Turenne et Condé* (Paris, 1907); Neuber, *Turenne als Kriegstheoretiker und Feldherr* (Vienna, 1869); Sir E. Cust, *Lives of the Warriors of the 17th Century* (London, 1867); T. O. Cockayne, *Life of M. de Turenne* (founded on Ramsay's work; London, 1853); G. B. Malleson, *Turenne*. *Marshal Turenne*, by "the author of the Life of Sir Kenelm Digby" (London, 1907), is a valuable work by a civilian, and is based in the main on Ramsay's work, the memoirs of Cardinal de Retz, James, duke of York, &c., and on Napoleon's commentaries. A remarkable parallel between Turenne and Condé, in Saint-Evremont's *éloge* of the latter, will be found in Carrion-Nisas, *Essai sur l'histoire général de l'art militaire*, ii. 83 (Paris, 1824). (C. F. A.)

TURF, the top or surface of earth when covered with grass, forming a coherent mass of mould or soil in which the roots of grasses and other plants are embedded. This is capable of being cut out in solid mat-like blocks, known by the same name. Similarly "peat" (*q.v.*) when cut in pieces for fuel or other purposes is also styled "turf." The term is applied widely to any stretch or sward of trimmed grass-land, and thus by metonymy, to horse-racing and all connected with it, from the owning and running of race-horses to betting. The word "turf" is common to Teutonic languages, cf. Du. *turf*, Ger. *Torf*, Dan. *törv*, &c. It has been connected with Skt. *darbha*, grass, so called from being matted or twisted together, *darbh*, to wind. The Teutonic word was adapted in Med. Lat., as *turba* (cf. Fr. *tourbe*, Ital. *torba*), whence was formed *turbaria*, turbary, the right of digging and cutting turf in common with the owner of the land. (See COMMONS.)

TURGAI, a province of Russian Central Asia, formerly a part of the Kirghiz steppe, and now included in the governor-generalship of the Steppes, bounded by the province of Uralsk and the governments of Orenburg and Tobolsk on the W. and N., by Akmolinsk on the E., and by Syr-darya and the Sea of Aral on the S. This territory, which has an area of 176,219 sq. m.—nearly as large as that of Caucasia and Transcaucasia taken together—belongs to the Aral-Caspian depression. It has, however, the Mugojar Hills on its western border and includes a part of the southern Urals; and from Akmolinsk it is separated by a range of hills which run between the two largest rivers of the Kirghiz steppe—the Turgai and the Sary-su. In the north it includes the low belt of undulating land which stretches north-east from the Mugojar Hills and separates the rivers belonging to the Aral basin from those which flow towards the Arctic Ocean, and beyond this range it embraces the upper Tobol. The remainder is steppe land, sloping gently towards the Sea of Aral.

The Mugojar Hills consist of an undulating plateau nearly 1000 ft. in altitude, built up of Permian and Cretaceous deposits and deeply trenched by rivers. They are not the independent chain which our maps represent them to be:[1] they merely continue the Urals towards the south, and are connected with the Ust-Urt plateau by a range of hills which was formerly an island of the Aral-Caspian Sea. Their northern extremity joins the undulating plateau (400 to 600 ft.), built up of sandstones and marls, which separates the tributaries of the Tobol from those of the river Ural, and falls by a range of steep crags—probably an old shore-line of the Aral basin—towards the steppes. The steppe land of Turgai is only some 300 ft. above the sea-level, and is dotted with lakes, of which the Chalkar-teniz, which receives the Turgai and its tributary the Irgiz, is the largest. The Turgai was, at a recent epoch, a large river flowing into the Sea of Aral and receiving an extensive system of tributaries, which are now lost in the sands before joining it. Remains of aquatic plants buried in the soil of the steppe, and shells of *Mytilus* and *Cardium*, both still found in the Sea of Aral, show that during the Glacial period this region was overflowed by the waters of the Aral-Caspian Sea.

The climate of Turgai is exceedingly dry and continental. Orsk, a town of Orenburg, on its north-western border, has a January as cold as that of the west coast of Novaya Zemlya (−4° F.), while in July it is as hot as July in Morocco (73°); the corresponding figures for Irgiz, in the centre of the province, are 7° and 77°. At Irgiz and Orsk the annual rainfall is somewhat under 10 in. and 12 in. respectively (3 in. in summer). The west winds are parched before they reach the Turgai steppes, and the north-east winds, which in winter bring cold, dry snows from Siberia, raise in summer formidable clouds of sand. A climate so dry is of course incompatible with a vigorous forest growth. There is some timber on the southern Urals, the Mugojar Hills and the water-parting of the Tobol; elsewhere trees are rare. Shrubs only, such as the wild cherry (*Cerasus chamaecerasus*) and the dwarf almond (*Amygdalus nana*) grow on the hilly slopes, while the rich black-earth soil of the steppe is chiefly clothed with feather grass (*Stipa pennata*), the well-known ornament of the south Russian steppes. In spring the grass vegetation is luxuriant, and geese and cranes are attracted in vast numbers from the heart of the steppe by the fields of the Kirghiz. The jerboa (*Dipus jacutus*) and the marmot (*Spermophilus rufescens*) are characteristic of the fauna; another species of marmot (*Arctomys bobac*) and the steppe fox (*Canis corsac*) are common; and the saiga antelope of Central Asia is occasionally met with. Farther south the black earth disappears and with it the feather grass, its place being taken by its congener, *Stipa capillata*. Trees disappear, and among the bushes along the banks of the rivers willows and the pseudo-acacia or Siberian pea tree (*Caragana microphyla*) are most prevalent. In the middle parts of the province the clayey soil is completely clothed with wormwood (*Artemisia fragrans* and *A. monogyna*), with a few grassy plants on the banks of the rivers and lakes (*Lasiagrostis splendens*, *Alhagi camelorum* and *A. kirghizorum*, *Obione portulacoides*, *Halimodendrum argenteum*); while large areas consist of shifting sands, saline clays clothed with various *Salsolaceae*, and the desiccated beds of old lakes. Such lakes as still exist,

[1] See P. S. Nazarov, in "Recherches zoologiques dans les steppes des Kirghizes," in *Bull. soc. des natur. de Moscow* (1886), No. 4.

notwithstanding the rapid desiccation now going on, are surrounded by thickets of reeds—the retreat of wild boars. Turgai is thus the borderland between the flora of Europe and that of Central Asia.

The population was estimated in 1906 at 511,800, composed mainly of Kirghiz, though Russians have immigrated in large numbers. The province is divided into four districts, the chief towns of which are Turgai, the capital; Ak-tyubinsk in the district of Iletsk; Irgiz and Kustanaisk in the Nikolayevsk district, a prairie town which has grown with great rapidity. Agriculture is mainly carried on by the Russian settlers in the Nikolayevsk district, where the crops do not suffer so much from droughts as they do elsewhere. But the Kirghiz have also begun to cultivate the soil, and in 1900 there were in all 612,200 acres under cereals.

The principal crops are rye, wheat, oats, barley and potatoes. Livestock breeding is the leading occupation of the Kirghiz. Camels are bred and kept by the nomads both for their own personal use and for the transport of goods between Bokhara, Khiva and Russian Turkestan. Considerable quantities of cattle and various animal products are exported to Orenburg, Orsk and Troitsk, and to Ust-Uisk and Zverinogolovsk, where large fairs are held. The Kirghiz of the southern parts migrate in winter to the better sheltered parts of the province of Syr-darya, while in the summer some 30,000 *kibitkas* (felt tents) of nomads come from the neighbouring provinces to graze their cattle on the grassy steppes of Turgai. Salt is obtained from the lakes. There are a few oil-works, tanneries and flour-mills, and the Kirghiz are active in the making of carpets and felt goods. Education is a little more advanced than in the other steppe provinces; the system of "migratory schools" has been introduced for the Kirghiz.

See Y. Talferov, *The Turgai Province* (1896), in Russian.

(P. A. K.; J. T. Be.)

TURGOT, ANNE ROBERT JACQUES, Baron de Laune (1727–1781), French statesman and economist, was born in Paris on the 10th of May 1727. He was the youngest son of Michel Étienne Turgot, "provost of the merchants" of Paris, and Madeleine Françoise Martineau, and came of an old Norman family. He was educated for the Church, and at the Sorbonne, to which he was admitted in 1749 (being then styled abbé de Brucourt), he delivered two remarkable Latin dissertations, *On the Benefits which the Christian Religion has conferred on Mankind*, and *On the Historical Progress of the Human Mind*. The first sign we have of his interest in economics is a letter (1749) on paper money, written to his fellow student the abbé de Cicé, refuting the abbé Terrasson's defence of Law's system. He was fond of verse-making, and tried to introduce into French verse the rules of Latin prosody, his translation of the fourth book of the *Aeneid* into classical hexameters being greeted by Voltaire as "the only *prose* translation in which he had found any enthusiasm." In 1750 he decided not to take holy orders, giving as his reason, according to Dupont de Nemours, "that he could not bear to wear a mask all his life." In 1752 he became *substitut*, and later *conseiller* in the parlement of Paris, and in 1753 *maître des requêtes*. In 1754 he was a member of the *chambre royale* which sat during an exile of the parlement; in 1755 and 1756 he accompanied Gournay, then intendant of commerce, in his tours of inspection in the provinces, and in 1760, while travelling in the east of France and Switzerland, visited Voltaire, who became one of his chief friends and supporters. In Paris he frequented the salons, especially those of Mme Graffigny—whose niece, Mlle de Ligniville ("Minette"), afterwards Mme Helvétius and his lifelong friend, he is supposed at one time to have wished to marry—Mme Geoffrin, Mme du Deffand, Mlle de Lespinasse and the duchesse d'Enville. It was during this period that he met the leaders of the "physiocratic" school, Quesnay and Gournay, and with them Dupont de Nemours, the abbé Morellet and other economists. All this time he was studying various branches of science, and languages both ancient and modern. In 1753 he translated the *Questions sur la commerce* from the English of Josias Tucker, and wrote his *Lettre sur la tolérance*, and a pamphlet, *Le Conciliateur*, in support of religious tolerance. Between 1755 and 1756 he composed various articles for the *Encyclopédie*, and between 1757 and 1760 an article on *Valeurs et monnaies*, probably for the *Dictionnaire du commerce* of the abbé Morellet. In 1759 appeared his *Éloge de Gournay*.

In August 1761 Turgot was appointed intendant of the *généralité* of Limoges, which included some of the poorest and most over-taxed parts of France; here he remained for 13 years. He was already deeply imbued with the theories of Quesnay and Gournay (see Physiocratic School), and set to work to apply them as far as possible in his province. His first plan was to continue the work, already initiated by his predecessor Tourny, of making a fresh survey of the land (*cadastre*), in order to arrive at a juster assessment of the *taille*; he also obtained a large reduction in the contribution of the province. He published his *Avis sur l'assiette et la répartition de la taille* (1762–1770), and as president of the *Société d'agriculture de Limoges* offered prizes for essays on the principles of taxation. Quesnay and Mirabeau had advocated a proportional tax (*impôt de quotité*), but Turgot a distributive tax (*impôt de répartition*). Another reform was the substitution for the *corvée* of a tax in money levied on the whole province, the construction of roads being handed over to contractors, by which means Turgot was able to leave his province with a good system of roads, while distributing more justly the expense of their construction. In 1769 he wrote his *Mémoire sur les prêts à intérêt*, on the occasion of a scandalous financial crisis at Angoulême, the peculiar interest of which is that in it the question of lending money at interest was for the first time treated scientifically, and not merely from the ecclesiastical point of view. Among other works written during Turgot's intendancy were the *Mémoire sur les mines et carrières*, and the *Mémoire sur la marque des fers*, in which he protested against state regulation and interference and advocated free competition. At the same time he did much to encourage agriculture and local industries, among others establishing the manufacture of porcelain. During the famine of 1770–1771 he enforced on landowners "the obligation of relieving the poor" and especially the *métayers* dependent upon them, and organized in every province *ateliers* and *bureaux de charité* for providing work for the able-bodied and relief for the infirm, while at the same time he condemned indiscriminate charity. It may be noted that Turgot always made the *curés* the agents of his charities and reforms when possible. It was in 1770 that he wrote his famous *Lettres sur la liberté du commerce des grains*, addressed to the comptroller-general, the abbé Terray. Three of these letters have disappeared, having been sent to Louis XVI. by Turgot at a later date and never recovered, but those remaining demonstrate that free trade in corn is to the interest of landowner, farmer and consumer alike, and in too forcible terms demand the removal of all restrictions.

Turgot's best known work, *Réflexions sur la formation et la distribution des richesses*, was written early in the period of his intendancy for the benefit of two young Chinese students. Written in 1766, it appeared in 1769–1770 in Dupont's journal, the *Ephémérides du citoyen*, and was published separately in 1776. Dupont, however, made various alterations in the text, in order to bring it more into accordance with Quesnay's doctrines, which led to a coolness between him and Turgot (see G. Schelle, in *Journal des économistes*, July 1888). A more correct text is that published by L. Robineau ("Turgot," in *Petite bibliothèque économique*, 1889), and is followed by Professor W. J. Ashley in his translation (*Economic Classics*, New York, 1898), but the original MS. has never been found.

After tracing the origin of commerce, Turgot develops Quesnay's theory that the land is the only source of wealth, and divides society into three classes, the productive or agricultural, the salaried (*stipendiée*) or artisan class, and the land-owning class (*classe disponible*). After discussing the evolution of the different systems of cultivation, the nature of exchange and barter, money, and the functions of capital, he sets forth the theory of the *impôt unique*, *i.e.* that only the *produit net* of the land should be taxed. In addition he demanded the complete freedom of commerce and industry.[1]

[1] For the controversy as to how far Adam Smith (*q.v.*) was influenced by Turgot, see S. Feilbogen, *Smith und Turgot* (1892); also E. Cannan's introduction to Smith's *Lectures on Justice*, &c. (Clarendon Press, 1896); and H. Higgs's review of the latter in the *Economic Journal*, Dec. 1896. The question may still be considered an open one. See also Neymarck, i. 332, footnote, for the French authorities. Condorcet's statement that Turgot corresponded with Smith is disproved by a letter of Smith to the duc de la Rochefoucauld, published in the *Economic Journal* (March 1896), p. 165, in which he says, "But tho' I had the happiness of his acquaintance

Turgot owed his appointment to the ministry to Maurepas, the "Mentor" of Louis XVI., to whom he was warmly recommended by the abbé Véry, a mutual friend. His appointment as minister of the marine on the 20th of July 1774 met with general approval, and was hailed with enthusiasm by the *philosophes*. A month later he was appointed comptroller-general (August 24). His first act was to submit to the king a statement of his guiding principles: "No bankruptcy, no increase of taxation, no borrowing." Turgot's policy, in face of the desperate financial position, was to enforce the most rigid economy in all departments. All departmental expenses were to be submitted for the approval of the comptroller-general, a number of sinecures were suppressed, the holders of them being compensated, and the abuse of the "acquits au comptant" was attacked, while Turgot appealed personally to the king against the lavish giving of places and pensions. He also contemplated a thorough-going reform of the *ferme générale*, but contented himself, as a beginning, with imposing certain conditions on the leases as they were renewed—such as a more efficient personnel, and the abolition for the future of the abuse of the *croupes* (the name given to a class of pensions), a reform which Terray had shirked on finding how many persons in high places were interested in them, and annulling certain leases, such as those of the manufacture of gunpowder and the administration of the *messageries*, the former of which was handed over to a company with the scientist Lavoisier as one of its advisers, and the latter superseded by a quicker and more comfortable service of diligences which were nicknamed "turgotines." He also prepared a regular budget. Turgot's measures succeeded in considerably reducing the deficit, and raised the national credit to such an extent that in 1776, just before his fall, he was able to negotiate a loan with some Dutch bankers at 4%; but the deficit was still so large as to prevent him from attempting at once to realize his favourite scheme of substituting for indirect taxation a single tax on land. He suppressed, however, a number of *octrois* and minor duties,[1] and opposed, on grounds of economy, the participation of France in the War of American Independence, though without success.

Turgot at once set to work to establish free trade in corn, but his edict, which was signed on the 13th of September 1774, met with strong opposition even in the *conseil du roi*. A striking feature was the preamble, setting forth the doctrines on which the edict was based, which won the praise of the *philosophes* and the ridicule of the wits; this Turgot rewrote three times, it is said, in order to make it "so clear that any village judge could explain it to the peasants." The opposition to the edict was strong. Turgot was hated by those who had been interested in the speculations in corn under the régime of the abbé Terray —among whom were included some of the princes of the blood. Moreover, the *commerce des blés* had been a favourite topic of the salons for some years past, and the witty Galiani, the opponent of the physiocrats, had a large following. The opposition was now continued by Linguet and Necker, who in 1775 published his treatise *Sur la législation et le commerce des grains*. But Turgot's worst enemy was the poor harvest of 1774, which led to a slight rise in the price of bread in the winter and early spring of 1774–1775. In April disturbances arose at Dijon, and early in May took place those extraordinary bread-riots known as the "guerre des farines," which may be looked upon as a first sample of the Revolution, so carefully were they organized. Turgot showed great firmness and decision in repressing the riots, and was loyally supported by the king throughout. His position was strengthened by the entry of Malesherbes into the ministry (July 1775).

All this time Turgot had been preparing his famous "Six Edicts," which were finally presented to the *conseil du roi* (Jan. 1776). Of the six edicts four were of minor importance, but the two which met with violent opposition were, firstly, the edict suppressing the *corvées*, and secondly, that suppressing the *jurandes* and *maîtrises*, the privileged trade corporations. In the preamble to the former Turgot boldly announced as his object the abolition of privilege, and the subjection of all three orders to taxation; the clergy were afterwards excepted, at the request of Maurepas. In the preamble to the edict on the *jurandes* he laid down as a principle the right of every man to work without restriction.[2] He obtained the registration of the edicts by the *lit de justice* of the 12th of March, but by that time he had nearly everybody against him. His attacks on privilege had won him the hatred of the nobles and the parlements, his attempted reforms in the royal household that of the court, his free trade legislation that of the "financiers," his views on tolerance and his agitation for the suppression of the phrase offensive to Protestants in the king's coronation oath that of the clergy, and his edict on the *jurandes* that of the rich bourgeoisie of Paris and others, such as the prince de Conti, whose interests were involved. The queen disliked him for opposing the grant of favours to her protégés, and he had offended Mme de Polignac in a similar manner (see Marquis de Ségur, *Au Couchant de la monarchie*, p. 305–306).

All might yet have gone well if Turgot could have retained the confidence of the king, but the king could not fail to see that Turgot had not the support of the other ministers. Even his friend Malesherbes thought he was too rash, and was, moreover, himself discouraged and wished to resign. The alienation of Maurepas was also increasing. Whether through jealousy of the ascendancy which Turgot had acquired over the king, or through the natural incompatibility of their characters, he was already inclined to take sides against Turgot, and the reconciliation between him and the queen, which took place about this time, meant that he was henceforth the tool of the Polignac clique and the Choiseul party. About this time, too, appeared a pamphlet, *Le Songe de M. Maurepas*, generally ascribed to the comte de Provence (Louis XVIII.), containing a bitter caricature of Turgot.

Before relating the circumstances of Turgot's fall we may briefly resume his views on the administrative system. With the physiocrats, he believed in an enlightened absolutism, and looked to the king to carry through all reforms. As to the parlements, he opposed all interference on their part in legislation, considering that they had no competency outside the sphere of justice. He recognized the danger of the recall of the old parlement, but was unable effectively to oppose it, since he had been associated with the dismissal of Maupéou and Terray, and seems to have underestimated its power. He was opposed to the summoning of the states-general advocated by Malesherbes (May 6, 1775), possibly on the ground that the two privileged orders would have too much power in them. His own plan is to be found in his *Mémoire sur les municipalités*, which was submitted informally to the king. In Turgot's proposed system landed proprietors alone were to form the electorate, no distinction being made between the three orders; the members of the town and country *municipalités* were to elect representatives for the district *municipalités*, which in turn would elect to the provincial *municipalités*, and the latter to a *grande municipalité*, which should have no legislative powers, but should concern itself entirely with the administration of taxation. With this was to be combined a whole system of education, relief of the poor, &c. Louis XVI. recoiled from this as being too great a leap in the dark, and such a fundamental difference of opinion between king and minister was bound to lead to a breach sooner or later. Turgot's only choice, however, was between "tinkering" at the existing system in detail and a complete revolution, and his attack on privilege, which might have been carried through by a popular minister and a strong king, was bound to form part of any effective scheme of reform.

and, I flattered myself, even of his friendship and esteem, I never had that of his correspondence," but there is no doubt that Adam Smith met Turgot in Paris, and it is generally admitted that *The Wealth of Nations* owes a good deal to Turgot.

[1] For an account of Turgot's financial administration, see Ch. Gomel, *Causes financières*, vol. i.

[2] Turgot was opposed to all labour associations of employers or employed, in accordance with his belief in free competition.

The immediate cause of Turgot's fall is uncertain. Some speak of a plot, of forged letters containing attacks on the queen shown to the king as Turgot's, of a series of notes on Turgot's budget prepared, it is said, by Necker, and shown to the king to prove his incapacity. Others attribute it to the queen, and there is no doubt that she hated Turgot for supporting Vergennes in demanding the recall of the comte de Guines, the ambassador in London, whose cause she had ardently espoused at the prompting of the Choiseul clique. Others attribute it to an intrigue of Maurepas. On the resignation of Malesherbes (April 1776), whom Turgot wished to replace by the abbé Véry, Maurepas proposed to the king as his successor a nonentity named Amelot. Turgot, on hearing of this, wrote an indignant letter to the king, in which he reproached him for refusing to see him, pointed out in strong terms the dangers of a weak ministry and a weak king, and complained bitterly of Maurepas's irresolution and subjection to court intrigues; this letter the king, though asked to treat it as confidential, is said to have shown to Maurepas, whose dislike for Turgot it still further embittered. With all these enemies, Turgot's fall was certain, but he wished to stay in office long enough to finish his project for the reform of the royal household before resigning. This, however, he was not allowed to do, but on the 12th of May was ordered to send in his resignation. He at once retired to la Roche-Guyon, the château of the duchesse d'Enville, returning shortly to Paris, where he spent the rest of his life in scientific and literary studies, being made vice-president of the Académie des Inscriptions et Belles-lettres in 1777. He died on the 18th of March 1781.

In character Turgot was simple, honourable and upright, with a passion for justice and truth. He was an idealist, his enemies would say a doctrinaire, and certainly the terms "natural rights," "natural law," &c., frequently occur in his writings. His friends speak of his charm and gaiety in intimate intercourse, but among strangers he was silent and awkward, and produced the impression of being reserved and disdainful. On one point both friends and enemies agree, and that is his brusquerie and his want of tact in the management of men; Oncken points out with some reason the "schoolmasterish" tone of his letters, even to the king. As a statesman he has been very variously estimated, but it is generally agreed that a large number of the reforms and ideas of the Revolution were due to him; the ideas did not as a rule originate with him, but it was he who first gave them prominence. As to his position as an economist, opinion is also divided. Oncken, to take the extreme of condemnation, looks upon him as a bad physiocrat and a confused thinker, while Léon Say considers that he was the founder of modern political economy, and that "though he failed in the 18th century he triumphed in the 19th."

Bibliography.—G. Schelle, *Turgot* (Paris, 1909); and Marquis de Ségur, *Au Couchant de la monarchie* (Paris, 1910), contain much that is based on recent research. The principal older biographies are those of Dupont de Nemours (1782, enlarged in his edition of Turgot's *Works*, 1807–1811), and Condorcet (1786); the best modern ones are those of A. Neymarck (Paris, 1885), Léon Say (Paris, 1887); and W. W. Stephens (London, 1895). See generally, Oncken, *Geschichte der Nationalökonomie*, vol. ii. ch. 1; Schelle, *Dupont de Nemours et l'école physiocratique* (1888); Henry Higgs, *The Physiocrats* (1897); R. P. Shepherd, *Turgot and the Six Edicts* (1903), in Columbia Univ. Studies, vol. xviii. No. 2.

TURGUENIEV, IVAN (1818–1883), Russian novelist, the descendant of an old Russian family, was born at Orel, in the government of the same name, in 1818. His father, the colonel of a cavalry regiment, died when our author was sixteen years of age, leaving two sons, Nicholas and Ivan, who were brought up under the care of their mother, the heiress of the Litvinovs, a lady who owned large estates and many serfs. Ivan studied for a year at the university of Moscow, then at St Petersburg, and was finally sent in 1843 to Berlin. His education at home had been conducted by German and French tutors, and was altogether foreign, his mother only speaking Russian to her servants, as became a great lady of the old school. For his first acquaintance with the literature of his country the future novelist was indebted to a serf of the family, who used to read to him verses from the *Rossiad* of Kheraskov, a once celebrated poet of the eighteenth century. Turgueniev's early attempts in literature, consisting of poems and trifling sketches, may be passed over here; they were not without indications of genius, and were favourably spoken of by Bielinski, then the leading Russian critic, for whom Turgueniev ever cherished a warm regard. Our author first made a name by his striking sketches "The Papers of a Sportsman" (*Zapiski Okholnika*), in which the miserable condition of the peasants was described with startling realism. The work appeared in a collected form in 1852. It was read by all classes, including the emperor himself, and it undoubtedly hurried on the great work of emancipation. Turgueniev had always sympathized with the *muzhiks*; he had often been witness of the cruelties of his mother, a narrow-minded and vindictive woman. In some interesting papers recently contributed to the "European Messenger" (*Viestnik evropy*) by a lady brought up in the household of Mme Turgueniev, sad details are given illustrative of her character. Thus the dumb porter of gigantic stature, drawn with such power in *Mumu*, one of our author's later sketches, was a real person. We are, moreover, told of his mother that she could never understand how it was that her son became an author, and thought that he had degraded himself. How could a Turgueniev submit himself to be criticized?

The next production of the novelist was "A Nest of Nobles" (*Dvorianskoe gniezdo*), a singularly pathetic story, which greatly increased his reputation. This appeared in 1859, and was followed the next year by "On the Eve" (*Nakanunge*)—a tale which contains one of his most beautiful female characters, Helen. In 1862 was published "Fathers and Children" (*Otzi i Dieti*), in which the author admirably described the nihilistic doctrines then beginning to spread in Russia. According to some writers he invented the word nihilism. In 1867 appeared "Smoke" (*Dîm*), and in 1877 his last work of any length, "Virgin Soil" (*Nov*). Besides his longer stories, many shorter ones were produced, some of great beauty and full of subtle psychological analysis, such as *Rudin*, "The Diary of a Useless Man" (*Dnevnik lishnago chelovieka*), and others. These were afterwards collected into three volumes. The last works of the great novelist were "Poetry in Prose" and "Clara Milich," which appeared in the "European Messenger."

Turgueniev, during the latter part of his life, did not reside much in Russia; he lived either at Baden Baden or Paris, and chiefly with the family of the celebrated singer Viardot Garcia, to the members of which he was much attached. He occasionally visited England, and in 1879 the degree of D.C.L. was conferred upon him by the university of Oxford. He died at Bougival, near Paris, on the 4th of September 1883.

Unquestionably Turgueniev may be considered one of the great novelists, worthy to be ranked with Thackeray, Dickens and George Eliot; with the genius of the last of these he has many affinities. His studies of human nature are profound, and he has the wide sympathies which are essential to genius of the highest order. A melancholy, almost pessimist, feeling pervades his writings, a morbid self-analysis which seems natural to the Slavonic mind. The closing chapter of "A Nest of Nobles" is one of the saddest and at the same time truest pages in the whole range of existing novels.

The writings of Turgueniev have been made familiar to persons unacquainted with Russian by French translations. There are many versions in English, among which we may mention the translation of the "Nest of Nobles" under the name of "Lisa," by Ralston, and "Virgin Soil," by Ashton Dilke. There is also a complete and excellent translation by Mrs Garnett.

(W. R. M.)

TURI, a Pathan tribe on the Kohat border of the North-West Frontier Province of India. The Turis inhabit the Kurram valley, which adjoins the western end of the Miranzai valley and number nearly 12,000. Though now speaking Pushtu and ranking as Pathans, they are by origin a Turki tribe, of the Shiah sect, who subjected the Bangash Afghans some time early in the eighteenth century. They are strong, hardy, and courageous, and make first-rate horsemen. Their early dealings with the British government were inclined to turbulence, and they were concerned in the Miranzai expeditions of 1851 and 1855 (see MIRANZAI). But the only expedition specially sent against them was the Kurram expedition of 1856 (see KURRAM). Since then they have settled down and engaged in trade. During the Second Afghan War they supplied Sir Frederick Roberts with guides and provisions. In 1892 they voluntarily accepted British administration, and they now furnish a large part of the tribal militia in the Kurram Valley.

TURIN, a city of Piedmont, Italy, capital of the province of Turin, formerly of the kingdom of Sardinia until 1860, and of Italy till the removal of the seat of government to Florence in 1865. Pop. (1906), 277,121 (town), 361,720 (commune), with a garrison of 8500, the town being the headquarters of the I. army corps. The area of the city is 4155 acres, and its octroi circle measures nearly 9 m. Its geographical position is excellent; built upon alluvial soil 784 ft. above sea-level at a short distance from the Alps, it stands upon the river Po, which here runs from south to north just above the confluence of the Dora Riparia. The streets and avenues, almost all of which are straight, cut each other at right angles, forming blocks of houses, here as elsewhere called " islands." As viewed from the east the city stands out boldly against the Alps. Taken as a whole it is modern in aspect, but its regularity of form is in reality derived from the ancient Roman town of Augusta Taurinorum, which formed its nucleus. The mean temperature at Turin (1871–1900) is 53° F. (winter 35°, summer 71°), with an average maximum of 90°, and an average minimum of 17°. Mists are frequent in the winter mornings, and to a less degree in autumn. Snow falls on an average only on seven days per annum. The rainfall averages 34 in.

The cathedral of St John the Baptist is a cruciform Renaissance building dating from 1492–1498, by the Florentine Meo da Caprina. The site was first occupied by a church erected, it is said, by the Lombard duke Agilulf (7th century). Behind the high altar of the cathedral (from which it is separated by a glass screen) is the chapel of the Sudario or Sindone, built (1657–1694) by Guarini as a royal burial-place. The " sudario " from which it takes its name is asserted to be the shroud in which Joseph of Arimathea wrapped the body of Jesus. La Beata Vergine della Consolata, another of Guarini's works, has a tower which originally belonged to the church of St Andrew, founded by the monk Bruning in 1014, and attracts attention by Vincenzo Vela's beautiful kneeling statues of Queen Maria Teresa and Queen Maria Adelaide, as well as by the image of the Madonna, which has the credit of having warded off the cholera in 1835. Other churches of some note are San Filippo Neri (1672–1772), the dome of which fell in just as it was approaching completion under the hands of Guarini and was restored by Juvara, and La Gran Madre de Dio, erected to commemorate the return of the royal family in 1814. Of the secular buildings the more interesting are the Palazzo Madama, first erected by William of Montferrat at the close of the 13th century on the Roman east gate of the town, remains of the towers of which were incorporated in it, and owing its name to the widow of Charles Emmanuel II., who added the west façade and the handsome double flight of steps from Juvara's designs; and the extensive royal palace begun in the 17th century. Many of the palaces have fine pillared courtyards of the baroque period, some of which are the work of Guarini. For the Porta Palatina and other remains of the ancient city walls see below. The citadel, erected in 1565, has been almost entirely demolished. There is practically nothing of the Renaissance period except the cathedral. The Castello del Valentino is a building partly in the French style of the middle of the 16th century. The university, founded in 1400 by Lodovico di Acaja, has faculties of jurisprudence, medicine and surgery, literature and philosophy, and the mathematical, physical and natural sciences. The number of students is about 2500. The old university buildings erected in 1713 by the Genoese architect Ricca proved too small; and new buildings, fitted more especially for the medical and scientific departments, have been erected. The original building contains the valuable library (now national), many of the treasures of which were destroyed by fire in 1906, and a collection of Roman antiquities. The academy of sciences was founded in 1757. It occupies a building erected in 1687 by Guarini as a Jesuit college. The museum of antiquities and the picture gallery, of which it has the custody, are both of high interest—the former for the local antiquities of Piedmont and Sardinia (notably from Industria) and for the Egyptian treasures collected by Donati and Drovetti, and the latter for its Van Dycks and pictures by north Italian masters. There is a museum of zoology and mineralogy in Palazzo Carignano (another of Guarini's buildings), and the royal palace contains the royal armoury (a fine collection made by Charles Albert in 1833) and the royal library with its rich manuscript collection and its 20,000 drawings, among which are sketches by Raphael, Michelangelo, and Leonardo da Vinci. The civic museum has a great variety of artistic and literary curiosities, among them a remarkable collection of autographs and the Lombard missal (1490).

There are many modern public monuments—considerably more than in other Italian towns—and some of them are fine. The Mole Antonelliana, built by Alessandro Antonelli, is the most important example of modern architecture in Turin. It belongs to the municipality, and is used for the Risorgimento Museum. It is the highest brick edifice in Europe, its summit being 510 ft. above ground. It is a square edifice with a large dome and lofty spire, the dome being raised upon a hall with three galleries, one above the other, so that from the floor to the top of the dome is over 300 ft.

Among the hospitals is that called by the name of its founder, Cottolengo, a vast institution providing for more than 5000 persons; there are also the Ospedale Maggiore di San Giovanni, the Ospedale Mauriziano, and many other hospitals for special diseases, as well as asylums and charitable institutions of all kinds.

The industries comprise metallurgy, machine-making, chemicals, silk and cotton weaving, tanning and leather-working. The manufacture of motor-cars has become of great importance, and Turin is the chief seat of the industry in Italy, nearly 5000 workmen being employed. Chocolate, liqueurs and vermouth are also made here. The application of electricity is widely developed on account of the proximity of Alpine valleys rich in torrents. The supply of drinking water is furnished by three aqueducts.

The opening of the St Gothard tunnel exercised a prejudicial influence upon the traffic of the network of railways of which Turin is the centre, and Milan, owing to its nearness both to this and to the Simplon, has become the most important railway centre of Italy. Turin has, however, the advantage of being the nearest to the Mont Cenis, while the completion of the line through Cuneo over the Col di Tenda affords direct communication with the French Riviera. Main lines run also from Turin to Vercelli and thence to Novara and Milan (the direct route), to Casale Monferrato, to Alessandria (and thence to Piacenza or Genoa), to Genoa via Asti and Acqui, to Brà and Savona, and branch lines to Lanzo, Torre Pellice, Aosta, Rivoli, Rivarolo, &c., and steam tramways in various directions.

For administrative purposes the city is divided into two municipal police sections and into seven government districts or *mandamenti*. The military organization is proportionate in importance to the strategical position of Turin near the French frontier. There is a military arsenal with laboratories, a military academy for artillery and engineer officers, a war school, and a military hospital.

Among the surroundings of Turin the Hill of Superga (2300 ft. above the sea) merits special mention. Victor Amadeus II. erected there a votive basilica in memory of the liberation of Turin from the French in 1706. King Charles Albert and other kings and princes of the Savoy dynasty are buried in the crypt. Not far from Turin are also the castles of Moncalieri, Stupinigi, Rivoli, Racconigi, Aglè, Venaria, and the ancient monastery of the Sagra di San Michele (753 metres above sea-level), famous for its view of the Alps as far as the beginning of the Lombard plain.

Turin was always a place of importance and military strength, in spite of numerous vicissitudes, till at length it was made the chief town of Piedmont by Amadeus, first duke of Savoy. Under Emmanuel Philibert it became the usual residence of the ducal family, and in 1515 the bishopric was raised to metropolitan rank by Leo X. Between 1536 and 1562 Turin was occupied by the French, and in 1630 it lost 8000 of its citizens by the plague. The French were masters once more from 1640 to 1706, and again from 1798 till 1814, when Piedmont was restored to the house of Savoy. From 1860 to 1865 Turin was the capital of Italy.

The ancient *Augusta Taurinorum* was a city of Gallia Cisalpina, the chief town of the Taurini. The natural advantages of its site and its position with relation to the pass over the Alpis

Cottia (Mont Genèvre; see COTTII REGNUM) made it important in early times, though it cannot have been very strongly fortified, inasmuch as Hannibal, after crossing the Alps in 218 B.C., was able to take it after a three days' siege. It became a colony either under the triumvirs or under Augustus, and it was then no doubt that it was fortified. It was partly burned down in A.D. 69, but continued to be prosperous, as may be gathered from the remains of its fortifications and from the many inscriptions which have been discovered there. The Roman town formed a rectangle 2526 ft. by 2330; the line of the walls, which were 21 ft. high, 7 ft. thick at ground level and 3 ft. at the top, is well known, inasmuch as they were standing till about 1600; and the north gate, the Porta Palatina, still exists; it has a double opening, and two orders of arches above, and is flanked by two sixteen-sided brick towers. The east gate, similar in character, still exists in part within the Palazzo Madama. The north-west corner tower is also in part preserved, and traces of other parts of the enceinte have been found. The interior of the town was divided by seven streets from east to west and eight from north to south into 72 *insulae*; and the ancient pavement and the drains below it are frequently found under the streets of the central portion of the modern town, indicating that they follow the ancient lines (see especially *Notizie degli Scavi*, 1902, p. 277). In the great extensions which the city has undergone since 1600, the old rectangular arrangement has been followed. Remains of a theatre have been discovered beneath the Palazzo Vecchio, demolished in 1899 (A. Taramelli, in *Notizie degli Scavi*, 1900, p. 3).

See C. Promis, *Storia dell' antica Torino* (Turin, 1869); A. d'Andrade, *Relazione dell' ufficio regionale per la conservazione dei monumenti del Piemonte e della Liguria*, 7 seq. (Turin, 1899).

(T. As.)

TURKESTAN, a name conventionally employed to designate the regions of Central Asia which lie between Siberia on the N. and Tibet, India and Afghanistan on the S., the western limit being the Caspian Sea and the eastern Mongolia and the Desert of Gobi. Etymologically the term is intended to indicate the regions inhabited by Turkish races. How far this name was appropriate in the past need not be considered here; at present the regions called Turkestan not only contain races which do not belong to the Turk family, but it excludes races which do, *e.g.* the Turks of the Ottoman Empire. Nevertheless the term, in its dual application of West Turkestan and East or Chinese Turkestan, has long been established, and in default of any better designations cannot very well be dispensed with.

I.—West Turkestan

West Turkestan is very nearly, though not quite, coincident with the territories which Russia possesses and controls in Asia, Siberia excepted. Thus it includes (1) the governor-generalship of Turkestan, embracing the provinces of Ferghana, Samarkand, Semiryechensk, and Syr-darya; the provinces of Akmolinsk and Semipalatinsk, and sometimes that of Turgai belonging to the governor-generalship of the Steppes; the Transcaspian region; and the semi-independent states of Bokhara and Khiva. Its total area amounts approximately to 1,290,000 sq. m.

Physical Geography.—Physically this region is divided into two sharply contrasted parts, the mountainous and highland country in the east and the flat steppes and deserts in the west and north. The former are sufficiently described under the heading TIAN-SHAN. It will be enough to say here that the mountainous region belongs to the great orographical flange which runs from south-west to north-east along the north-western margin of the great plateau of Central Asia. Hence it consists (1) partly of ranges, mostly snow-capped, which stretch from south-west to north-east, and which in several cases terminate *en échelon* on the verge of the desert, and (2) partly of ranges which strike away from the above at various angles, but in a predominantly north-western direction. The latter, including such ranges as the Chingiz-tau, Chu-Ili Mountains, Kandyk-tau and Khan-tau, the Ferghana range, the Kara-tau and the Nura-tau, are geologically of later origin than the great border ranges of the Tian-shan proper, *e.g.* Trans-Alai, Alai, Kokshal-tau, Alexander range, Terskei Ala-tau, Kunghei Ala-tau, Trans-Ili Ala-tau and Dzungarian Ala-tau. The Tarbagatai Mountains, still farther north, are often classified as belonging to the Altai system. Generally speaking, the ranges of both categories run at 10,000 to 20,000 ft., though altitudes as high as 23,000 ft. are attained by individual peaks, such as Mt Kaufmann and Khan-tengri. Most of the loftier summits are capped with perpetual snow, and on some of them, *e.g.* Khan-tengri (Mushketov, Semenov, Inylchik) and the Kok-su Mountains (Fedchenko, Shurovsky), south of Peak Kaufmann, there are well-developed glaciers. Nearly all these border ranges rise abruptly and to great heights from the plains on the north or north-west, but have a much shorter and easier descent on the south or south-east. Hence the passes lie at great altitudes, ranging from about 9000 to 14,000 ft. On the other hand the fact of the ranges radiating outwards towards the west, and the further fact that they are in more than one place penetrated by deep depressions (*e.g.* Dzungaria, Kulja, Issyk-kul, Ferghana) for a considerable distance towards the east, greatly facilitate access to the loftier plateau lands of Central Asia, and have from time immemorial been the highways of human intercourse between East and West.

Lowland Plains.

Like the highlands of Siberia, those of Turkestan are fringed by a girdle of plains, having an altitude of 1000 to 1500 ft., and these again are skirted by an immense lowland area reaching only 400, 300 and 150 ft. above sea-level, or even sinking below the level of the ocean. Some geographers divide them into two sections—the higher plains of the Balkash (the Ala-kul and Balkash drainage areas) and the Aral-Caspian depression, which occupies nearly two-thirds of the whole and has been ably described by I. V. Mushketov under the appropriate name of Turanian basin—the Kara-tau Mountains, between the Chu and the Syr-darya rivers, being considered as the dividing line between the two. The Balkash plains, more than 1000 ft. above the sea, and covered with clay, with a girdle of loess at their foot, are well drained by the Ili and other feeders of Lake Balkash and support the numerous flocks and herds of the Kirghiz. To the south-west the clayey soil becomes saline. There is the Famine steppe (Bek-pak-dala), while in the Ak-kum steppe, which surrounds Lake Kara-kul, large areas consist of nothing but sands, partly shifting. The plains and lowlands of the Turanian basin are subdivided by a line drawn from north-east to south-west along a slight range of hills running from the sources of the Ishim towards the south-east corner of the Caspian (Bujnurd and Elburz edge of Khorasan). This low range, which most probably separated the lowlands of the Aral-Caspian region (submerged during the Post-Pliocene period) from the higher plains which had emerged by the end of the Tertiary period, now divides the Transcaspian steppes from the somewhat different higher plains. In the Turanian basin the contrast between desert and oasis is much stronger than in the Balkash region. Fertile soil, or rather soil which can be rendered fertile by irrigation, is limited to a narrow terrace of loess along the foot of the mountains, and is surrounded by barren deserts. Even where the loess stretches out over terraces at some distance from the mountains, as in the south-east of the Transcaspian region, it can be cultivated only when irrigated. Two rivers only—the Syr and the Amu—succeed in getting across the desert and reaching the Sea of Aral. But their former tributaries no longer run their full course: the glacier-fed Zarafshan dries up amid the gardens of Bokhara soon after emerging from the highlands; and the Tejeñ and the Murghab lose themselves in the recesses of the Kara-kum desert. The only tributaries which the Amu retains are those whose whole course is within the highlands. In the north such formerly important tributaries of the Syr-darya as the Chu, with its sub-tributary the Sary-su, now dry up some hundreds of miles before reaching the main stream.

Desiccation.

The whole area is now undergoing geological changes on a vast scale. Rivers have changed their courses, and lakes their outlines. Far away from their present shores the geologist finds indubitable signs of the recent presence of lakes in the shells they have left amid the sands. Traces of former rivers and channels, which were the main arteries of prosperous regions within the period of written history, have now disappeared. Of the highly developed civilizations which grew up and flourished in Bactria, Bokhara and Samarkand the last survivals are now undergoing rapid obliteration with the simultaneous desiccation of the rivers and lakes. The great "Blue Sea" of Central Asia, the Sea of Aral, which at a recent epoch (Post-Glacial) extended south-west as far as Sary-kamysh, and the shells of which are found north and east of its present shores 50 to 200 ft. above its present level (157 ft. above the ocean, and 248 above the Caspian), now occupies but a small portion of its former extent. It fills a shallow depression which is drying up with astonishing rapidity, so that the process of desiccation can be shown on surveys separated by intervals of only ten years; large parts of it, like Aibughir Gulf, have dried up since the Russians took possession of its shores. The whole country is dotted over with lakes, which are rapidly disappearing under the hot winds of the deserts.

Geology.[1]—Like the highlands of eastern Asia, those of Turkestan are mostly built up on Pre-Cambrian gneisses and metamorphic slates, resting upon granites, syenites, old orthoclase porphyries, and the like. These upheavals date from the remotest geological ages; and since the Primary epoch a triangular continent having its

[1] R. Pumpelly and others, *Explorations in Turkestan* (Washington, 1905), contains references to the geological literature to the date of publication.

apex turned towards the north-east, as Africa and America have theirs pointing southward, rose in the middle of what now constitutes Asia. It is only in the outer foldings of the highlands that Palaeozoic fossiliferous deposits are found—Silurian, Devonian, Carboniferous and Permo-Carboniferous. Within that period the principal valleys were excavated, and their lower parts have been filled up subsequently with Jurassic, Cretaceous and Tertiary deposits. One of the most striking instances of this is the very thick Cretaceous and Tertiary deposits which cover the bottom of the valley of the Vakhsh (right tributary of the Amu) and are continued for about 300 m. to the north-east, as far as the Alai valley—probably along the edge of the Pamir plateau. The deposits of the Secondary period have not maintained their horizontal position. While upheavals having a north-eastern strike continued to take place after the Carboniferous epoch,[1] another series of upheavals, having a north-western strike, and occasioned by the expansion of diabases, dolerites, melaphyres and andesites, occurred later, subsequently at least to the close of the Tertiary period, if not also before it, dislocating former chains and raising rocks to the highest levels by the addition of new upheavals to the older ones. Throughout the Triassic and Jurassic periods nearly all Turkestan remained a continent indented by gulfs and lagoons of the south European Triassic and Jurassic sea. Immense fresh-water lakes, in which were deposited layers of plants (now yielding coal), filled up the depressions of the country. Cretaceous and Tertiary deposits occur extensively along the edge of the highlands. Upper and Middle Cretaceous, containing phosphates, gypsum, naphtha, sulphur and alum, attain thicknesses of 2000 and 5000 ft. in Hissar. Representatives of all the Tertiary formations are met with in Turkestan; but while in the highlands the strata are coast-deposits, they assume an open sea character in the lowlands, and their rich fossil fauna furnishes evidence of the gradual shallowing of that sea, until at last, after the Sarmathian period, it became a closed Mediterranean. During the Post-Pliocene period this sea broke up into several parts, united by narrow straits. The connexion of Lake Balkash with the Sea of Aral can hardly be doubted; but this portion of the great sea was the first to be divided. While the Sea of Aral remained in connexion with the Caspian, the desiccation of the Lake Balkash basin, and its break-up into smaller separate basins, were already going on. The Quaternary epoch is represented by vast morainic deposits in the valleys of the Tian-shan. About Khan-Tengri glaciers descended to a level of 6800 ft. above the sea,[2] and discharged into the wide open valleys or *syrts*. It is most probable that, when allowance has been made for the obliteration of glacial markings, and the region has been better explored, it will appear that the glaciation of Turkestan was on a scale at least as vast as that of the Himalayas. In the lowlands the Aral-Caspian deposits, which it is difficult to separate sharply from the later Tertiary, cover the whole of the area. They contain shells of molluscs now inhabiting the Sea of Aral, and in their petrographical features are exactly like those of the lower Volga. The limits of the Post-Pliocene Aral-Caspian sea have not yet been fully traced. It extended some 200 m. north and more than 90 m. east of the present Aral shores. A narrow strait connected it with Lake Balkash. The Ust-Urt plateau and the Mugojar Mountains prevented it from spreading north-westward, and a narrow channel connected it along the Uzboi with the Caspian, which sent a broad gulf to the east, spread up to the Volga, and was connected by the Manych with the Black Sea basin. Great interest, geological and historical, thus attaches to the recent changes undergone by this basin. Since the theory of geological cataclysms was abandoned, and that of slow modifications of the crust of the earth accepted, new data have been obtained in the Aral-Caspian region to show that the rate of modification after the close of the Glacial period, although still very slow, was faster than had been supposed from the evidence of similar changes now going on in Europe and America. The effects produced by desiccating agencies are beyond all comparison more powerful than those which result from the earthquakes that are so frequent in Turkestan. All along the base of the highlands, from Khojent to Vyernyi, earthquakes are frequent;[3] but their effects lie beyond the scope of our observational methods.

Climate.—The climate of West Turkestan is exceedingly dry and continental. Although the country is approximately comprised within the latitudes of Sicily and Lyons, it has a south Norwegian January and a Persian summer. Temperatures of more than 100° F. in the shade are common, and the heat is rendered still more unbearable by the reflection from a soil destitute of vegetation. The winter is for the most part so cold that the average temperature of January is below the freezing point, and even reaches 0° F. Snow falls for several months on the lower Syr-darya, and, were it not blown away by the winds, sledge-communication would be possible. This river is frozen for an average of 123 days every year in its lower parts and nearly 100 days at Perovsk. At Tashkent there is snow during two months and temperatures of − 10° F. have been observed; on the other hand the maximum observation is 108°. To the south of Khojent the winter becomes more clement. Absence of rain is the distinctive feature of the climate. Although it rains and snows heavily on the mountains, only 11 in. of rain and snow fall throughout the year at Tashkent, at the base of the highlands; and the steppes of the lower Amu have less. A few showers are all that fall from the almost invariably cloudless sky above the Transcaspian steppes.

Fauna.—The fauna of Turkestan belongs to the zoo-geographical domain of northern Asia, and is only differentiated by the presence of species which have disappeared from the peripheral parts of the Old World and now find a refuge in the remotest regions of the uninhabited plateau. From the Palaeoarctic region it is distinguished by the presence of Himalayan species. The distinctive animal of the Pamir plateau is the magnificent *Ovis poli* (conjectured to be the ancestor of the common sheep). In the alpine tracts of the Tian-shan, on the borders of the Pamir, their horns and skulls are frequently met with, but there the place of the species is now taken by *Ovis karelini*. The wild horse, which occurred in Poland a few centuries ago, was discovered by Prezhevalsky in the highlands of Dzungaria. The wild camel inhabits the lonely plateaus south of the Ala-shan. The other mammals of Turkestan are mostly those which are met with elsewhere in north Asia. The Himalayan bear (*Ursus isabellinus*) has its home on the Pamir, and the smaller *Leuconyx* up to the highest levels on the Tian-shan. Antelopes, *Lepus lehmanni*, *Lagomys rutilus*, various species of *Arvicolae*, and the Himalayan long-tailed marmot (*Arctomys caudatus*), the most characteristic inhabitant of the alpine meadows, are the only mammals of the Pamir proper. In the alpine region are found the badger (*Meles taxus*), the ermine (*Putorius ermineus*) and six other Mustelidae, the wild dog (*Canis alpinus*), the common and the black-eared fox (*C. melanotis*), while the corsac fox (*C. corsac*) is met with only on the plains. Two species of lynx, the cheetah (*Felis jubata*), *F. manul*, and *F. irbis*, must be added to the above. The tiger is met with only on the lower Amu-darya, except when it wanders to the alpine region in pursuit of the maral deer (*Cervus maral*). The jackal is characteristic of the steppes; it banishes the wolves and foxes. Hares are represented by several species, *Lepus lehmanni* being the most characteristic. Both the common and the long-tailed marmot (*A. baibacinus* and *A. caudatus*) live at the foot of the mountains, as well as four species of *Spermophilus*, three of voles, two of the mouse and three of the hamster. The *Meriones* (four species) and the jerboa (five species) are only met with in the steppe region. Of ruminants, beside the sheep (*O. poli*, *O. karelini*, *O. nigrimontana*, *O. heinsii*), we find one moufflon (*Musimon vignei*), formerly known only in the Himalayas, the Chinese antelope (*Antilope subgutturosa*) and the saiga antelope in the steppes, the Siberian ibex and another goat, the yak, the zebu or Indian ox, the common ox, the camel and the dromedary. The wild boar is common in the reed thickets along the rivers and lakes, where it stays during the winter, migrating to the highlands in summer. The hedgehog and porcupine are common in the plains.

No fewer than 385 species of avifauna are recorded, most of them being middle-European and Mediterranean. A large number were formerly known only in the Himalayas, or in Persia, while others have their origin in East Asia. The commonest are mostly European acquaintances. The insect fauna is truly multitudinous. Among the Lepidoptera of the Pamir there is an interesting mixture of Tian-shan with Himalayan species. G. E. Grum-Grshimailo found on the Pamir the butterfly *Colias nastes*, a species characteristic of Labrador and Lapland; like the alpine plants which bear witness to a Glacial period flora in the Himalayas, this butterfly is a survival of the Glacial period fauna of the Pamir.[4] Of 50 species of molluscs found in Turkestan quite one half are peculiar to the region.

Flora.—As a whole the flora of Turkestan is identical with that of Central Asia, which was formerly continued by geo-botanists as far west as the steppes of Russia, but which must now be considered as a separate region subdivided into two—the Central Asian proper and that of the Gobi. It has its own habitus, notwithstanding the number of species it has in common with Siberia and south-east Russia on the one hand and with the Himalayas on the other, and this habitus is due to the dryness of the climate and the consequent changes undergone by the soil. Towards the end of the Glacial period the Tian-shan Mountains had a flora very like that of northern Caucasia, combining the characteristics of the flora of the European Alps and the flora of the Altai, while the prairies had a flora very much like that of the south Russian steppes. During the Stone Age the human inhabitants lived in forests of maple, white beech and apple trees. But the gradual desiccation of the country resulted

[1] I. V. Mushketov's *Turkestan* (pp. 35, 681) seems to justify this conclusion.

in the immigration from the Central Asian plateau of such species as could adapt themselves to the dry climate and soil, in the disappearance of European and Altaic species from all the more arid parts of the region, in the survival of steppe species, and in the adaptation of many of the existing species to the needs of an arid and extreme climate and a saline soil.[1] The Pamir vegetation and that of the Aral-Caspian steppes constitute two types with numberless intermediate gradations.

There is no arboreal vegetation on the Pamir, except a few willows and tamarisks along the rivers. Mountain and valley alike are carpeted with soft grass, various species of *Festuca* predominating. In the immediate vicinity of water the sedge (*Carex physoides*) grows, and sporadic patches of *Allium*. To these may be added a few Ranunculaceae, some *Myosotis*, the common *Taraxacum*, one species of *Chamomilla*, and a few Leguminosae. In the north and west the *Stipa* of the Russian steppes supersedes *Festuca* and affords splendid pasture for the herds of the Kara-Kirghiz. In the gorges and on the better-watered slopes of the mountains the herbaceous vegetation becomes luxuriant. Besides the above-named there are many other Gramineae, such as *Lasiagrostis splendens*, the whole seas of *Scabiosae*. *Eremurus*, 6 to 7 ft. in height, forms thickets along with *Scorodosma foetida*. The northern slopes of the Alai chain are richer in trees. Up to 12,000 ft. full-grown specimens occur of the *archa* or juniper (*Juniperus pseudo-Sabina*), characteristic of the whole northern slopes of the Turkestan highlands, the poplar, spruces, cedars, a very few birches (*B. Sogdiana*), and a copious undergrowth of shrubs familiar in European gardens, such as *Rhododendron chrysanthum*, *Sorbus aucuparia* (rowan), *Berberis heteropoda* (berberry), *Lonicera Tatarica* (honeysuckle) and *Crataegus* (hawthorn). Farther east and north comes the Turkestan pine (*Picea Schrenkiana*), while at lower levels there grow willows, black and white poplars, tamarisk, *Celtis*, as well as *Elaeagnus* (wild olive), *Hippophae rhamnoides* (sallow thorn), *Rubus fructicosus* (blackberry), *Prunus spinosa* (blackthorn) and *P. Armeniaca* (apricot). The characteristic poplar, *Populus diversifolia*, and the dwarf *Acer Lobelii*—very different from the European maple—also occur.

The above applies to most of the highlands of the Tian-shan. The drier southern slopes are quite devoid of arboreal vegetation. On the northern slopes, at the higher levels, *Juniperus pseudo-Sabina* is the only tree that grows on the mountains, and luxuriant meadow grasses cover the *syrts*. Lower down, at 7500 to 8000 ft. the coniferous zone begins, characterized by the *Picea Schrenkiana*. Of course the juniper and a few other deciduous trees also occur. The richest zone is that which comes next, extending downwards to 5000 and 4500 ft. There woods of birch, several species of poplar, the maple (*Acer Semenovii*), and thick underwoods spread over the mountain slopes. Orchards of apple and apricot surround the villages. The meadows are clothed with a rich vegetation—numberless *Paeoniae*, *Scabiosae*, Convolvulaceae, Campanulae, *Eremurus*, Umbelliferae, *Gallium*, Rosaceae, *Altheae*, *Glycyrrhizae*, *Scorodosma foetida* and Gramineae. But as soon as the soil loses its fertile humus it produces only a few *Phlomis*, *Alhagi camelorum*, *Psammae*, *Salsolaceae*, *Artemisiae*, *Peganum* and some poppies and *Chamomillae*, but only in the spring. The invading steppe plants appear everywhere in patches in the Turkestan meadows.

The "culture" or "apricot" zone is followed by the prairie belt, in which black-earth plants (*Stipa* and the like) struggle for existence against invading Central Asian forms. And then come the lowlands and deserts with their moving sandy *barkhans*, *shors* and *takyrs* (see TRANSCASPIAN REGION). Two species of poplar (*P. pruinosa* and *P. diversifolia*), *Elaeagnus angustifolia*, the ash, and a few willows grow along the rivers. Large areas are wholly destitute of vegetation, and after crossing 100 m. of such a desert the traveller will occasionally come upon a forest of *saksaul* (*Anabasis Ammodendron*). Contorted stems, sometimes of considerable thickness, very hard, and covered with a grey cracked bark, rise out of the sand, bearing green plumes with small greyish leaves and pink fruit. Sometimes the tree is a mere knot peeping above the sand with a sheaf of thin branches. In spring, however, the steppe assumes quite another aspect, being clothed, except where the sands are shifting, with an abundance of vegetation. Persian species penetrate into Bokhara and the region of the upper Amu.

Vegetable Products.—As already stated the climate of Turkestan varies considerably from north to south. In Akmolinsk and Semiryechensk most of the kinds of corn which characterize Middle Russia are grown. South of the Chu and the Syr-darya gardening is a considerable industry; and, although rye and wheat continue to be the chief crops, the cultivation of the apple, and especially of the apricot, acquired importance. Attempts are also made to cultivate the vine. The inhabitants of the neighbourhood of Tashkent and Samarkand, as well as those of the much more northern but better sheltered Kulja oasis, add the cultivation of the almond, pomegranate and fig. Vines are grown and cotton planted in those districts. Finally, about Khojent and in Ferghana, where the climate is milder still, the vine and the pistachio tree cover the hills, while agriculture and horticulture have reached a high degree of perfection. Successful attempts are being made to grow the tea-plant in the Transcaspian region. Large numbers of oleaginous plants are cultivated, such as sunflower.

Agriculture.—The arable land, being limited to the irrigated terraces of loess, occupies little more than 2% of the whole area of West Turkestan. The remainder is divided between pasture land (less than 44%) and desert (54%). Owing to a very equitable distribution of irrigation water in accordance with Moslem law, agriculture and gardening have reached a high stage of development in the oases. Altogether close upon 4,000,000 acres are irrigated, and the crops are usually taken every year. Wheat, barley, millet, pease, lentils, rice, sorghum, lucerne and cotton are the chief agricultural products. Carrots, melons, vegetable marrows, cucumbers and onions are extensively grown. Rye and oats are cultivated at Kazalinsk and Kopal. Corn is exported. Owing to the irrigation, total failure of crops and consequent famines are unknown, unless among the Kirghiz shepherds. The kitchen gardens of the Mahommedans are, as a rule, admirably kept. Potatoes are grown only by the Russians. The cultivation of cotton is extending rapidly—from 1300 acres in 1883 to 531,000 acres in 1902, of which 402,000 acres were in Ferghana. Sericulture, a growing industry, is chiefly carried on in Ferghana, whence silk cocoons are an important item of export, the output having doubled between 1892 and 1903 (3869 tons). Livestock breeding is extensively pursued. The flocks of sheep on the Kirghiz steppe are so large that the proprietors themselves do not know their exact numbers.

Minerals.—The mineral wealth of Turkestan is considerable. Traces of auriferous sands have been discovered at many places, but the percentage of gold is too poor to make the working remunerative. Silver, lead and iron ores occur in several localities; but the want of fuel is an obstacle to their exploitation. The vast coal-beds of Kulja and some inferior ones in Samarkand are not seriously worked. The petroleum wells of Ferghana and the beds of graphite about Zairamnor are neglected. There are abundant deposits of gypsum, alum, kaolin, marble and similar materials. Asphalt is obtained in Ferghana. Notwithstanding the salt springs of Ferghana and Syr-darya, the salt lakes of the region, and the rock-salt strata of the Alexander Mountains, salt is imported.

Industry and Trade.—Turkestan has no manufacturing industry carried on by means of machinery, except distilleries and establishments for dressing raw cotton. These last have greatly increased in number; over a score are driven by steam and about a hundred by water. But there is a great variety of artisan work, such as copper and brass, paper, knives (at Bokhara), silver filigree, shoes, caps (at Samarkand and Andijan) and carpets; but most of these have been for some time declining and now stand at a rather low level. Trade is very actively carried on. Tashkent and Bokhara are the chief commercial centres, the principal articles of export to Russia, via Orenburg and Semipalatinsk, being raw cotton and silk, cattle and their products, while manufactured wares are imported in return. There is also an import and export trade to and from Urumchi and China, via Kulja and Ak-su.

Population.—Turkestan has been the theatre of so many migrations and conquests that its present population could not fail to be very mixed. Both Aryans and Mongols have their representatives there, the former settled for the most part, the latter chiefly nomad. The Ural-Altaians are numerically the predominant element, and consist of Turkomans, Kirghiz, Uzbegs and Sarts. The Turkomans inhabit chiefly the Transcaspian region. They number less than a quarter of a million. The Kara-Kalpaks ("Black Bonnets") number about 104,000. They are supposed to be recent immigrants to Syr-darya, having come from the former Bulgarian Empire on the middle Volga. Their language and habits are the same as those of the Kirghiz; but for the last century and a half they have had some acquaintance with agrculture. Their pacific temper exposed them to the raids of the Kirghiz, who compelled them first to settle in Dzungaria, then to move their dwellings several times, and ultimately (in 1742) to recognize the sovereignty of Russia. Even since that time they have been driven by the persecution of their old enemies to cross the Aral-Caspian steppes and seek refuge near Astrakhan. The real masters of the steppes and highlands of Turkestan are the Kirghiz, of whom there are two branches—the Kazak (Cossack) Kirghiz, who number about 3,787,000, and the Kara (Black) Kirghiz or Burut, who number nearly 202,000. The Uzbegs, who played a predominant political part in Turkestan before the Russian conquest, are of Turko-Tatar origin and speak a pure Jagatai (Turkish) dialect; but they are mixed to a great extent with Persians, Kirghiz and Mongols. They are subdivided into clans, and lead a semi-nomadic life, preserving most of the attractive features of their Turkish congeners—especially their honesty and independence. They number some 726,500 in

[1] See Krasnov's researches in *Izvestia* of Russ. Geog. Soc. (1887), vol. xxiii.

all. When settled they are mostly designated Sarts—a name which has reference more to manner of life than to anthropological classification, although a much stronger admixture of Iranian blood is evident in the Sarts, who also speak Persian at Khojent and Samarkand. Their numbers amount to very nearly 1,000,000. Taranchi or Taranji ("labourer" in Chinese) is the name given to those Sarts who were settled in the Kulja region by the Chinese government after the rising of 1758. They constitute about two-fifths of the population of Kulja. The origin of the Dzungans is somewhat problematical. They number nearly 20,000, and inhabit the valley of the Ili in Kulja and partly are settled in Russian Turkestan. They are Mahommedans, but have adopted Chinese manners of life. The Mongol branch is represented in Turkestan by Kalmucks (191,000) and Torgutes (Torgod) in the north-east and in Kulja, where they are intermingled with Solons, Sibos and Chinese. The Aryan Tajik, the aborigines of the fertile parts of Turkestan, were subdued by the Turko-Mongol invaders and partly compelled to emigrate to the mountains, where they are now known as Galchas. They number over 350,000 and constitute the intellectual element of the country and are the principal owners of the irrigated land—the Uzbegs being their labourers—merchants, and mollahs or priests. They are Sunnite Mussulmans. The other representatives of Aryan race in Turkestan are a few (8000) Persians, mostly liberated slaves; Indians (300), who carry on trade and usury in the cities; a few Gipsies (800), and the Russians. Among these last two distinct elements must be noticed—the Cossacks, who are settled on the borders of the Kirghiz steppe and have assumed many Kirghiz habits, and the peasant-settlers, who are beginning to colonize the valley of the Ili and to spread farther south. Inclusive of the military, the Russians number about 100,000. The total population numbers approximately 9,000,000.

Notwithstanding immigration, the Russians still constitute a very small proportion of the population, except in the province of Semiryechensk, where the Cossacks, the peasants, and the artisans in towns number 130,000, and, with the Russian troops, constitute 14% of the aggregate population. The only other province containing any considerable number of Russians is Syr-darya, where there are about 10,000 settlers (less than 1% of the population). About 12,000 Russians are settled in Bokhara and about 4000 in Khiva. The total estimated population of Russian Turkestan in 1906 was 5,746,600.

There are several populous cities in Russian Turkestan. Its capital, Tashkent, in the Syr-darya province, had 156,414 inhabitants in 1897, and other cities of importance are Samarkand (58,194), Marghilan (42,855 in Old Marghilan, and 8977 in New Marghilan) in Ferghana, Khojent (31,881) in Syr-darya, Khokand (86,704), Namangan (61,388) and Andijan (49,682) in Ferghana.

Education.—In the way of education nearly everything has still to be done; but a technical school and an experimental agricultural station with a school have been opened at Tashkent.

Railways.—Turkestan possesses only two railway systems; the Transcaspian line and the Orenburg-Tashkent line. The former, built in 1880–1888, starts at Krasnovodsk on the Caspian and runs east-south-east between the Kara-kum desert and the Kopet-dagh Mountains until it reaches the oasis of Tejen. Then it turns north-east via Merv to Bokhara and Samarkand, the total distance being 940 m. From Samarkand it is continued east-north-east via Khojent to Andijan (330 m.), sending off on the way a branch to Tashkent (94 m.). This last city was in 1905 connected by rail via Perovsk, Kazalinsk, and Irgiz with Orenburg (1149 m.).

General Condition.—Populous cities adorned with fine monuments of Arabian architecture, numerous ruins of cities decayed, grand irrigation canals now lying dry, and written monuments of Arabian literature testify to a time when civilization in Turkestan stood at a much higher level than at present. This period was during the first centuries after its conversion to Islam. Now all is in decay. The beautiful mosques and *madrasas* (theological colleges) are dilapidated; no astronomers study the sky from the tops of their minarets; and the scholars of the *madrasas* waste their time on the most deplorably puerile scholasticism. The inspiration of early belief has disappeared; the ruling motive of the mollahs (priests) is the thirst for personal enrichment, and the people no longer follow the khojas or theologians. The agricultural labourer has preserved the uprightness, diligence and sobriety which characterize the Turkish peasant; but the richer inhabitants of the cities are grossly sensual.

It remains, however, an open question whether the Russians will be able to bring new vigour to the country and awaken intellectual life. The followers of Islam, whose common law and religion know only of a temporary possession of the land, which belongs wholly to the Prophet, cannot accept the principles of unlimited property in land which European civilization has borrowed from Roman law; to do so would put an end to all public irrigation works and to the system by which water is used according to each family's needs, and so would be fatal to agriculture. The Russians have abolished slavery; and their rule has put an end to the interminable intestine struggles which had weakened and desolated the whole region. The barbarous tortures and executions which rendered Khiva notorious in the East are no longer heard of; and the continual appeals of the khojas for "holy" war against their rivals find no response. But the Russian rule has imposed many new taxes, in return for which Turkestan only gets troops of Russian merchants and officials, who too often accept the worst features of the depraved Mussulman civilization of the higher classes of the country. Schools are being diligently built; but the wants of the natives are subordinated to the supposed necessities of Russification. A consulting hospital for Mahommedan women has been opened by women graduates in medicine at Tashkent.

II.—East Turkestan

East or Chinese Turkestan, sometimes called Kashgaria, is a region in the heart of Asia, lying between the Tian-shan ranges on the north and the Kuen-lun ranges on the south, and stretching east from the Pamirs to the desert of Gobi and the Chinese province of Kan-su (98° E.). The country belongs to China, and to the Chinese is known as Sin-kiang; but administratively the Chinese province of Sin-kiang crosses over the Tian-shan and includes the valleys of Kulja or Ili and Dzungaria on the north.

Physical Geography.—Along with the desert of Gobi East Turkestan occupies the lower terrace of the great central Asian plateau, which projects from the Himalayas north-east towards the Bering Straits. But though it is in reality an elevated plateau, with a general altitude of 4600 down to 2675 ft., it is nevertheless a depression when compared with the girdle of mountains which surround it on every side except the east, and even on that side it is shut in by the crumbling remains of a once mighty mountain system, the Pe-shan (see Gobi). The region as a whole slopes very gently towards the Lop district, where the lake, or rather marsh, of Kara-koshun, in 39° 51′ N. and 89° 24′ E., lies at an altitude of 2675 ft. This is not, however, the absolutely lowest point in East Turkestan: that is found in the local depression of Turfan-Lukchun, south-east of Urumchi, between the Chol-tagh and the Bogdo-ola ranges of the Tian-shan. The deepest part of that depression lies 56–426 ft. *below* the level of the sea; but this remarkable pit in the surface is of very limited area, for within less than 30 m. to the north the level rises up to 250 ft. (at the town of Turfan) and to 3500 ft. in the Chol-tagh only 12 m. to the south, while at Pichang, 60 m. east, it is 3400 ft. above the sea, and immediately behind Turfan the Jargöz Mountains run up to an altitude of 10,000 ft. There are also two other depressions which lie at a lower altitude than the Kara-koshun, but they lie, one (Kulja or Ili) among the Tian-shan ranges and the other (Dzungaria) beyond them. The town of Kulja, which stands about the middle of the Chinese part of the valley of the Ili river, has an altitude of 2165 ft., but the valley of Dzungaria ranges at 900 to 3000 ft., and in the lakes (*e.g.* Ebi-nor) which dot its surface it descends to 820 ft. The mountain ranges which shut off East Turkestan from the rest of the world rank among the loftiest and most difficult in Asia, and indeed in the world. The Kuen-lun on the south rise steeply from the flat deserts of the Takla-makan and Kum-tagh by successive terraces until they reach an elevation of 19,000 to 20,000 ft. on the summit of the Tibetan plateau. The passes in them range generally at altitudes of 10,000 ft. to 18,300 ft. (*e.g.* Kyzyl-davan, 16,900 ft.; Sughet-davan, 17,825 ft.; a pass in the Arka-tagh 18,300 ft.). On the west East Turkestan is generally approached from India by the famous pass of Karakorum (18,300 ft.), from Ferghana and West (Russian) Turkestan by the passes of Kyzyl-art (14,015 ft.) and Terek (12,730 ft.), and the mountains on this side attain to altitudes of 25,780 ft. in the Muztagh-ata or Tagarma, of 23,000 ft. in the Kaufmann Peak, in the Trans-Alai range, and of 19,680 ft. in the Alai range. The Tian-shan Mountains skirt East Turkestan on the north-east, where the Kokshal-tau range rises to 16,000 to 18,000 ft. and is crossed by passes (*e.g.* Bedel and Jan-art) which reach 13,000 to 14,500 ft., and on the north, where the mountain knot of Khan-tengri has an altitude of 22,800 ft. and the Bogdo-ola and Karlyk ranges run up to 15,000 to 18,000 ft., while the passes (*e.g.* Muz-art on the north-east shoulder of Khan-tengri) climb up to 8000 to 12,000 ft. But here two natural gaps or gateways, those of Urumchi at 2790 ft. and Otun-koza at 2390 ft., facilitate communication between the basins of the Tarim and the Ili (Dzungaria). The Pe-shan swelling, with its flanking ranges of the Chol-tagh and Kuruk-tagh, which, by gradually approaching the Nan-shan section of the Kuen-lun in about 98° E., narrow the desert, are a good deal lower, namely 5000 to 9000 ft.

Within this mountain girdle lies the basin of the Tarim, extending over an area of 354,000 sq. m., but of this 51·2% consists of arid and almost impassable deserts, namely the Takla-makan (*q.v.*), the desert of Lop, the Ghashiun Gobi, and the desert of Kum-tagh, which are described under GOBI. The principal stream is, of course, the Tarim, about 1000 m. in length. It is virtually composed of the Yarkand-darya, the Kashgar-darya, and the Ak-su-darya, with constant augmentation from the Koncheh-darya, which drains Lake Bagrash-kul (at the south foot of the eastern Tian-shan), and intermittent augmentation from the Khotan-darya and the Cherchen-darya from the south. The basin of the Tarim contains, indeed, numerous other streams, most of them summer torrents seaming the flanks of the encircling mountains, but once no doubt affluents of the Tarim, though now all swallowed up in the desert soon after quitting the shelter of the mountains. The Tarim, which is on the whole a sluggish, shallow, winding stream, fringes the great desert of Takla-makan on the west, north and east, and, after being extensively drawn upon for irrigation purposes in the oases (Yarkand, Kashgar, Maral-bashi, Ak-su), through which it passes, it eventually dies away in the salt reed-grown lake or marsh of Lop-nor (Kara-koshun). Along the south foot of the Tian-shan, and in the high valleys which intervene between the constituent ranges of that system, there exist numerous flourishing oases, such as Uch-turfan, Ak-su, Kucha, Korla, Kara-shahr, Hami, Barkul, Turfan, Urumchi, Manas and Kulja. A similar string of oases exist all along the north foot of the Kuen-lun, *e.g.* Kargalik, Khotan, Keriya, Niya, Cherchen, Charkhlik, Sa-chou, and An-hsi-chou, but these settlements, some of them of very great antiquity, have to maintain a constant fight against the encroachments of the desert sand. In broad, general terms the Takla-makan may be described as a tumbled sea of sand, with waves (*barkhans* or sand-accumulations) as much as 300 ft. in height, diversified by occasional patches of hard clay, mostly elongated from north-east to south-west, between the ridges of the dunes. In the deserts that lie east of the Lop-nor the sand is not piled up to such great heights, nor is it generally of such a shifting character. There are ampler expanses of hard saliferous clay (*shor*) and on the north side of the desert of Lop the surface has been carved and sculptured by the wind into innumerable flat, table-topped masses (*jardangs*) with vertical or even overhanging sides, separated from one another by deep-cut, wind-swept gullies, running from north-east to south-west. During the later Tertiary period all these desert regions would appear to have been covered by an Asian Mediterranean or, at all events, by vast fresh-water lakes, a conclusion which seems to be well warranted by the existence of salt-stained depressions of a lacustrine character; by traces of former lacustrine shore-lines, more or less parallel and concentric; by discoveries of vast quantities of fresh-water mollusc shells (*e.g. Limnaea* and *Planorbis*); the existence of belts of dead poplars, patches of dead and moribund tamarisks, and vast expanses of withered reeds, all these crowning the tops of the jardangs, never found in the wind-scooped furrows; the presence of ripple-marks of aqueous origin on the leeward side of the clay terraces and in other wind-sheltered situations; and, in fact, by the general conformation, contour lines, and shapes of the deserts as a whole. From the statements of older travellers, like the Venetian Marco Polo (13th century) and the Chinese pilgrim Hsüan Tsang (7th century), as well as from other data, it is perfectly evident, not only that this country is suffering from a progressive desiccation, but that the sands have actually swallowed up cultivated areas within the historical period.

Climate.—The climate is characterized by great extremes and a wide range of temperature, not only between summer and winter, but sometimes also in the course of twenty-four hours. In the desert of Gobi the thermometer descends as low as −19·3° F. in January, and in the desert of Cherchen as low as −26° in the same month, and snow falls in winter even in the heart of the latter desert. At Yanghi-kol (40° 52′ N. and 86° 51′ E.), beside the lower Tarim, the January mean is −1·3° F., the June mean 88°, and the lowest minimum recorded −14° (February). In both the desert of Gobi and in the desert of Lop a diurnal range of 44° has been observed. The lower Tarim begins to freeze early in November. As regards the summer temperature, as early as the 12th of March a reading of 70·5° has been obtained in the desert of Lop, and as high as 90° at Charkhlik early in May. In June beside the lower Tarim the thermometer has registered 104° before a buran, 77° during its continuance, and 48·7° at night. At Kashgar (alt. 4275 ft.) the mean temperature for the year is 55·4°, the January mean 21·2°, and the July mean 81·5°; at Yarkand (alt. 4165 ft.) the annual mean is 54·0°, the January mean 20·3°, and the July mean 81·4°. In the Lukchun depression (55 ft. below sea-level), which is situated at approximately the centre of the Asiatic continent (42° 42′ N. and 89° 42′ E.), the climate is fairly typical of Central Asia, the mean for the year being 55·5°, for January 16·7° and for July 89·6°; in other words, while the summer is as hot as in the Sahara, the winter is as cold as at St Petersburg. Minimal observations of −4·0° and −4·5° have been taken at Yarkand and Lukchun respectively, and maximal observations of 103·2° and 109·5° at the same two places. The atmosphere in the desert regions is remarkably dry, and though a little rain falls occasionally on the lower slopes of the mountains, scarcely any falls in the desert, at the most a smart shower at intervals of several years. At Kashgar the annual rainfall amounts to less than 18 in. During a large part of the year, and more especially in spring, the atmosphere is heavily charged with sand, and blinding sandstorms (*burans*) are of frequent occurrence.

Fauna.—In the more arid regions animal life is naturally not abundant. The tiger and wild boar haunt the thickets beside the Tarim, wild duck and wild geese throng its waters, and more especially the waters of its marginal and deltaic lakes. There also the wild swan is found. Antelopes, hares and occasionally the lynx, fox, deer, rats, vultures, crows, ravens, hawks, with lizards are other denizens of the borders of the deserts. The wild camel frequents the scattered oases along the margins of the desert and roams into the desert itself. Gadflies and mosquitoes are a veritable plague around the lakes of the lowlands in the hot weather. In the higher mountainous parts animal life is more abundant, the typical forms being the wild yak, the *kulan* or wild ass, the arkhari or wild sheep, the orongo and other antelopes, the marmot, wolf, hare partridge and bear. Fish are plentiful in the lower Tarim and in its lakes.

Vegetable Products.—In the desert regions vegetation is, of course, extremely scanty, being restricted almost entirely to the tamarisk, *Elaeagnus*, tussock grass, and a few *Salsolaceae.* Poplars and in some places willows grow along the river-sides, and dense reed brakes, often 6 to 10 ft. high, fill the lakes and dot the quieter reaches of the river beds. But as the slopes of the mountains are ascended the rainfall becomes more copious and grass makes its appearance, together with a few species of arboreal vegetation, such as the juniper. What cultivation there is, is confined to the oases which nestle at the foot of the mountains all round the Tarim basin. The soil in them is of great fertility wherever it is irrigated, and despite the supineness of the Chinese authorities, irrigation is very extensively practised in nearly all the oases. Excellent crops of wheat, barley, maize, sesame, millet, cotton, opium, tobacco and rice are grown, and several of the oases, *e.g.* Khotan, Kashgar, Korla, Turfan and Hami, are famous for their orchards, in which cucumbers, the mulberry, apple, pear, apricot, peach, melon, grape, pomegranate and walnut ripen to perfection.

Population.—The people who inhabit the plains and mountain slopes of East Turkestan consist partly of Aryans and partly of races of Ural-Altaic stock, and are partly of mixed blood. In Dzungaria they are Dzungans or Dungans, a Turko-Tatar tribe who nominally profess Mahommedanism, and in Kulja they are Kirghiz, Tatars, Mongols, Dungans and others. The agricultural population of the oases are principally of Turkish stock, powerfully influenced by Aryan blood. The townsmen are more distinctly Turkish, *i.e.* Sarts and Uzbegs. The language universally spoken is Jagatai Turkish. Kirghiz graze the slopes of the Tian-shan. The trade is mostly in the hands of the Chinese, natives of West Turkestan (known as Andijanis from the town of Andijan) and Hindus. The total population, excluding Kulja and Dzungaria, is estimated by A. N. Kuropatkin at 1,200,000, by M. V. Pyevtsov at 2,000,000, and by Sven Hedin at 1,800,000 to 2,000,000. The last named distributes it thus—1,500,000 rural, 200,000 urban, and 100,000 shepherds. The principal towns and their populations are Yarkand, 100,000; Khotan, 40,000; Kashgar, 33,000; Ak-su, 15,000; Keriya, 12,000; and Kulja, 20,000. The population of Dzungaria is estimated at 600,000 and of Kulja at 150,000. The prevailing religion all over East Turkestan is Mahommedanism. The country belongs politically to China, and Chinese fill all the higher administrative positions and form the garrisons in the towns. The region is divided into the administrative districts of Kashgar, Yarkand, Ak-su and Urumchi. The capital is the town of Urumchi.

Industries.—In addition to agriculture, the breeding of livestock, more especially sheep, camels, horses and asses, fishing in the waters of the lower Tarim, and the transportation of merchandise are all important means of livelihood. East Turkestan contains several minerals, such as gold, mined to a very small extent in the Kuen-lun Mountains; lead found in the country west of Kashgar and once worked in the Kuruk-tagh, and copper and petroleum near Kashgar; coal exists in abundance in the Kulja valley and is found at Ak-su, Korla, Kara-shahr, Turfan and Hami on the northern verge of the deserts. Salt is obtained from stagnant lakes and from certain parts of the desert. Jade, which is very highly valued by the Chinese for making into ornaments, vases, cups, &c., has been extracted from time immemorial, and is still extracted to-day at Khotan. In a region like East Turkestan, where the settlements are so scattered and the population so thin, the arts and crafts are prosecuted necessarily on only a local scale. Nevertheless certain of the oases are famous individually for one or more handicrafts: for instance, Khotan for its silks, white carpets and felt goods; Kashgar and Turfan for cottons, Kucha and Kara-shahr for leather and saddlery, Ak-su for felts and leather and metal goods, Yarkand for silks, carpets and felts, and Urumchi and Uch-Turfan for sulphur.

Trade and Communications.—A considerable amount of trade is done in the export of wool, hides, cotton, carpets, silks, felts, cereals (wheat, barley, maize, rice), sheep, fruit and vegetables, and in tea, silver, porcelain and opium imported from China, cloth and groceries from India, and cloth, cottons, silks, sugar, matches and leather from West Turkestan and Russia. The entire trade with India does not exceed £200,000 per annum. Traffic is carried on principally by means of caravans of camels, horses, asses and oxen. The caravan routes mostly followed between China and the more populous centres (Kashgar and Yarkand) of East Turkestan start from An-si-chow and Sa-chow respectively, converge upon Hami on the north side of the Pe-shan swelling, and continue westward along the south foot of the Tian-shan Mountains through the oases of Turfan, Kara-shahr, Korla, Kucha, Ak-su and Uch-turfan. From Hami other routes proceed to Barkul and to the main caravan road which skirts the southern edge of the Dzungarian valley and leads to Vyernyi in the Russian province of Semiryechensk. A similar branch route strikes off at Turfan and cuts through the Tian-shan ranges at Urumchi. Ak-su is an important trading town. From it three routes start for West Turkestan; the one principally used climbs over the Bedel pass (13,000 ft.) in the Kokshal-tau and makes a detour round the east and along the north side of the Issyk-kul, while the others cross over the Muz-art pass (12,000 ft.), on the north-east shoulder of Khan-tengri, and the Terek pass (12,730 ft.) respectively, the latter into Ferghana. Kashgar has connexion with Ferghana and Bokhara over the Kyzyl-art pass (14,015 ft.) and down the Alai valley. Yarkand and Khotan communicate with India over the lofty pass of Karakorum (18,300 ft.) and through Leh in Ladak, and thence over the difficult pass of Zoji-la (11,500 ft.). There is another route between Kashgar and China along the southern edge of the desert via Lop-nor, but it is not much used. A telegraph line was constructed between Lanchow in the Chinese province of Kan-su and Turfan in 1893.

History.—It appears very probable that at the dawn of history East Turkestan was inhabited by an Aryan population, the ancestors of the present Slav and Teutonic races, and that a civilization not inferior to that of Bactria had already developed at that time in the region of the Tarim.[1] Our knowledge, however, of the history of the region is very fragmentary until about the beginning of the Christian era. When the Huns (Hiung-nu) occupied west and east Mongolia in 177–165 B.C., they drove before them the Yue-chi (Yutes, Yetes or Ghetes), who divided into two hordes, one of which invaded the valley of the Indus, while the other met the Sacae in East Turkestan and drove them over the Tian-shan into the valley of the Ili. Thus by the beginning of our era the Tarim region had a mixed population of Aryans and Ural-Altaians, some being settled agriculturists and others nomads. There were also several independent cities, of which Khotan was the most important. One portion of the Aryans emigrated and settled in what is now Wakhhan (on the Pamir plateau), the present language of which seems very old, dating anterior to the separation of the Vedic and Zend languages. Between 120 and 101 B.C. the Chinese extended their rule westwards over East Turkestan as far as Kashgar. But their dominion seems to have been merely nominal, for it was soon shaken off. By the end of the 5th century the western parts fell under the sway of the "White Huns" (Ephthalites, or Tochari), while the eastern parts were under Tangut (Thygun) dominion. The Chinese, however, still retained the region about Lop-Nor. Buddhism penetrated into the country at an early date, and possessed famous monasteries there in the 5th and 7th centuries. There were also at the same time followers of Zoroastrianism, of Nestorian Christianity, and even of Manichaeism. An active trade was carried on by means of caravans, corn and silk especially being mentioned at a very early date. The civilization and political organization of the country were dominated by the Chinese, but were also influenced to some extent by Graeco-Bactrian civilization, which had probably secured a footing in the country as early as the 3rd century B.C. Our information as to the history of this region from the 2nd century to the first half of the 7th is slight, and is derived chiefly from the *Journeys* of the Chinese pilgrims, Fa-hien in 399–415, Song-yun and Hwei-seng in 518–521, and Hsüan-Tsang in 629–645. By this time Buddhism had reached its culminating point: in Khotan there were 100 monasteries and 5000 monks, and the Indian sacred literature was widely diffused. But already there were tokens of its decay; even then the eastern parts of the Tarim basin seem to have been growing less and less populous. To the east of Khotan, cities which were prosperous when visited by Song-yun had a century later fallen into ruins.

Little is known about these regions during the 7th, 8th and 9th centuries. In the 7th century the Tibetan king, Srong-btsan, with the help of the western Turks, subjugated the western part of the Tarim basin. During the following century the Mahommedans under Kotaiba ibn Moslim, after several excursions into West Turkestan, invaded (712–13) East Turkestan, penetrating as far as Turfan and even China. The Chinese supremacy was not shaken by these invasions. But, on the outbreak of internal disturbances in China, the Tibetans took possession of the western provinces of China, and intercepted the communications of the Chinese with Kashgaria, so that they had to send their troops through the lands of the Hui-khe (Hoei-ke, or Hoei-hu). In 790 the Tibetans were masters of East Turkestan; but their rule was never strong, and towards the 9th century we find the country under the Hoi-he. Who these people were is somewhat uncertain. According to Chinese documents they came from the Selenga; but most Orientalists identify them with the Uighurs. In the opinion of M. Grigoriev,[2] the Turks who succeeded the Chinese in the western parts of East Turkestan were the Karlyk Turks, who extended farther south-west up to Kashmir, while the north-eastern parts of the Tarim region were subdued by the Uighurs. Soon Mongol hordes, the Kara-Kitais, entered East Turkestan (11th century), and then penetrated into West Turkestan. During the following century the Mongol conqueror Jenghiz Khan overran China, and Turkestan and Kashgaria fell under his rule in 1220, though not without strenuous resistance followed by massacres. The Mongol rule was, however, not very heavy, the Mongols merely exacting tribute. In fact, Kashgaria flourished under them, and the fanaticism of Islam was considerably abated. Women again acquired greater independence, and the religious toleration then established permitted Christianity and Buddhism to spread freely. This state of affairs lasted until the 14th century, when Tughlak Timur, who extended his dominions to the Kuen-lun, accepted Islam. He transferred his capital from Ak-su to Kashgar, and had a summer residence on the banks

[1] Such is the conclusion reached by C. Lassen, *Indische Alterthumskunde* (4 vols., Bonn, 1844–1861), and supported by M. Grigoriev (Ritter's *Asien* in Russ. trans.; addenda to "East Turkestan"). In connexion with the objection based upon the sub-boreal character of the regions which were the cradle of the Aryans, as proved by the so-called palaeontology of the Aryan languages, it may be observed that by the end of the Glacial, and during the earlier Lacustrine (Post-Glacial) period, the vegetation of Turkestan and of Central Asia was quite different from what it is now. It was Siberian or north European. The researches by M. Krasnov (in *Izvestia* of Russ. Geog. Soc., St Petersburg, 1887, vol. xxiii.) as to the characteristics of the former flora of the Tian-shan, and the changes it has undergone in consequence of the extremely rapid desiccation of Central Asia, must be carefully borne in mind in all speculations founded upon the testimony of language as to the original home of the Aryans.

[2] See Ritter's *Asien*: "East Turkestan" (Russ. trans.), ii. 282; also A. N. Kuropatkin's *Kashgaria* (1883).

of the lake Issyk-kul. His son reigned at Samarkand, but was overthrown by Timur (Tamerlane), the Mongol sovereign of Samarkand, who, to put an end to the attacks of the wild Tian-shan tribes, undertook in 1389 his renowned march to Dzungaria, which was devastated, East Turkestan also suffering severely.

The reintroduction of Islam was of no benefit to the Tarim region. In the 14th and 15th centuries Bokhara and Samarkand became centres of Moslem scholarship, and sent great numbers of their learned doctors to Kashgaria. Rubruquis, who visited East Turkestan in 1254, Marco Polo between 1271 and 1275, and Hoïs in 1680, all bore witness to great religious tolerance; but this entirely disappeared with the invasion of the Bokharian mullahs or Mahommedan priests. They created in East Turkestan the power of the *khojas*, or "theologians," who afterwards fomented the many intestine wars that were waged between the rival factions of the White and the Black Mountaineers. In the 17th century a powerful Kalmuck confederation arose in Dzungaria, and extended its sway over the Ili and Issyk-kul basins, having its capital on the Ili. To this power or to the Kirghiz the "Whites" and "Blacks" alternately appealed in their struggles, in which Yarkand supported the latter and Kashgar the former. These struggles paved the way for a Chinese invasion, which was supported by the White khojas of Kashgar. The Chinese entered Dzungaria in 1758, and there perpetrated an appalling massacre, the victims being estimated at one million. The Kalmucks fled, and Dzungaria became a Chinese province, with a military colonization of Sibos, Solons, Dahurs, Chinese criminals and Moslem Dzungars. The Chinese next re-conquered East Turkestan, marking their progress by massacres and transporting 12,500 partisans of independence to the Ili (Kulja) valley. Hereupon the dissentient khojas fled to Khokand in West Turkestan, and there gathered armies of malcontents and fanatic followers of Islam. Several times they succeeded in overthrowing the Chinese rule—in 1825, in 1830 and in 1847—but their successes were never permanent. After the "rebellion of the seven khojas" in 1847 nearly 20,000 families from Kashgar, Yarkand and Ak-su fled to West Turkestan through the Terek-davan pass, many of them perishing on the way. In 1857 another insurrection broke out; but a few months later the Chinese again took Kashgar. In the course of the Dzungarian outbreak of 1864 the Chinese were again expelled; and Yakub Beg became master of Kashgar in 1872. But five years later he had again to sustain war with China, in which he was defeated, and East Turkestan once more became a Chinese province.

Antiquities.—In 1896 Dr Sven Hedin discovered in the desert not far from the town of Khotan, in a locality known as Borasan, objects in terra-cotta, bronze images of Buddha, engraved gems, coins and MSS.; the objects, which display artistic skill, give indications of having been wrought by craftsmen who laboured to reproduce Graeco-Indian ideals in the service of the cult of Buddha, and consequently date presumably from the 3rd century B.C., when the successors of Alexander the Great were founding their kingdoms in Persia, Khwarezm (Khiva), Merv, Bactria (Afghanistan) and northern India, and from that date to the 4th or 5th century A.D. At the same time the same explorer excavated part of the ruins of the ancient city of Takla-makan (near the Keriya-darya), which had been overwhelmed by the moving sands of the desert. There he found mural paintings, some of which represented local lake or river scenes, carved woodwork, fragments of pottery, gypsum images of Buddha, and traces of gardens. These discoveries were followed by others made by Dr M. Aurel Stein in the same part of East Turkestan, though at other localities, namely, at Yotkan, the ancient capital of the kingdom of Khotan, and at Dandan-uiliq, Endere, Karadong, Rawak and other places, all lying east and north-east of the town of Khotan. His "finds" consisted of pottery, images, statues, coins, seals, frescoes, MSS. written in Sanskrit, Brahmi and Chinese characters, wooden tablets in the Kharoshti script, furniture and various cereals. These things appear to date from the very beginning of the Christian era, and continue down to the end of the 8th century. Again, in another part of the country, namely, in the heart of the desert of Lop, in approximately 40° 40′ N. and 90° E., Dr Sven Hedin was fortunate enough to discover early in 1901 the ruins of the ancient city of Lôu-lan or Shanshan, which was destroyed, apparently by a desert storm or by an inundation, or perhaps by both, towards the end of the 3rd century A.D. Among the objects found on this site were documents testifying to the name of the locality and furnishing materials for fixing the date.

A little before the date of these last discoveries, others of a somewhat similar nature were made by D. A. Klements in the Lukchun depression already mentioned. Here in 1898 the explorer discovered the ruins of ancient monasteries, dating from the beginning of the Christian era down to the 13th and 16th centuries. Among these ruins Klements found several very interesting MSS., some of them written in the language of the Uighurs, an ancient Turkish race, and others in tongues unknown. Finally, in 1904, Dr von Le Coq, when excavating the sand-buried ruins of Kara-khoja, between Turfan and Lukchun, discovered extremely valuable MSS., some written on Chinese paper, some on white leather, and some on wood, besides Buddhistic wall-paintings. The MSS. are written in ten different alphabets, and of the languages employed two are entirely unknown. The excavators also brought to light a vast number of human corpses in the garb of Buddhist monks. Other finds were subsequently made by the same explorer, in conjunction with Professor A. Grünwedel, at Kucha and Korla, two other oases at the south foot of the Tian-shan Mountains.

In 1906–1908 Dr Stein made a second and more important journey, principally for the purpose of antiquarian research, though he also carried out important geographical investigations, with the assistance of a native surveyor, in the Eastern Pamirs (about Mustagh-ata), in the Nissa valley south of Khotan, and elsewhere. His archaeological investigations were carried on chiefly in the following localities: (i.) at and about Tashkurghan. (ii.) North-east of Khotan, where a large Buddhist temple, with relievos derived from Graeco-Buddhist models, were investigated and numerous MSS. and wooden tablets were discovered, inscribed in Sanskrit, Chinese, Tibetan and the Brahmi script of Khotan, the arid conditions, here as elsewhere, having caused these and other perishable objects to remain remarkably well preserved. (iii.) At Niya, east of Keriya, where many Kharoshti documents on wood were recovered, sometimes retaining their clay seals of Greek type and wooden covers as envelopes, together with implements, furniture, &c. (iv.) At Miran, near the western extremity of Lop-nor, where Buddhist shrines with frescoes, &c., were investigated. (v.) At Lop-nor itself, where Chinese and Kharoshti records on paper, wood and silk were recovered, and flint implements and other evidences of prehistoric occupation were discovered. (vi.) At and about the oasis of Tung-hwang, east of Lop-nor. Here the explorer traced a Chinese wall with watch-towers, guard-stations, &c., for a considerable distance, and made an important archaeological collection. Evidence of settlement back to the close of the 2nd century A.D. was obtained, and also of commercial traffic from the distant west in the shape of records in Indian, Kharoshti and Brahmi scripts and an unknown script resembling Aramaic. The sacred grottoes known as the Halls of the Thousand Buddhas, south-east of Tung-hwang, were visited, with their frescoes and cave temples, and a large number of documents and examples of early Chinese art were recovered. Dr Stein also investigated sites in the neighbourhood of Kara-shahr and others to the north-east of the great desert.

BIBLIOGRAPHY.—The best and the most exhaustive accounts of East Turkestan are contained in Sven Hedin's *Scientific Results of a Journey in Central Asia, 1899–1902* (vols. i.–ii., Stockholm, 1905–1906), *Through Asia* (2 vols., London, 1898), and *Central Asia and Tibet* (2 vols., London, 1903). TURKESTAN, or HAZRET, a town of Russian Turkestan, in the province of Syr-darya, on the railway from Orenburg to Tashkent, from which it lies 165 m. to the N.N.W. Pop. (1897), 11,592. It lies on the right bank of the Syr-darya river, 20 m. from it, at an altitude of 833 ft. It has a very old mosque of the saint Hazret-Yassavi, which attracts many pilgrims. It is an important dépôt for hides, wool and other produce of cattle-breeding. The town was captured by the Russians in 1864.

TURKEY. The Turkish or Ottoman Empire comprises Turkey in Europe, Turkey in Asia, and the vilayets of Tripoli and Barca, or Bengazi, in North Africa; and in addition to those provinces under immediate Turkish rule, it embraces also certain tributary states and certain others under foreign administration. Turkey in Europe, occupying the central portion of the Balkan Peninsula, lies between 38° 46′ and 42° 50′ N. and 19° 20′ and 29° 10′ E. It is bounded on the N.W. by Montenegro and Bosnia, on the N. by Servia and Bulgaria, on the E. by the Black Sea and the Bosporus, on the S. by the Sea of Marmora, the Dardanelles, the Aegean Sea and Greece, and on the W. by the Ionian and Adriatic Seas. Turkey in Asia, fronting Turkey in Europe to the south-east, and lying between 28° and 41° N. and 25° and 48° E., is bounded on the N. by the Black Sea, on the N.W. by the Bosporus, the Sea of Marmora and the Dardanelles, on the W. by the Aegean Sea, on the E. by Persia and Transcaucasia, and on the S. by Arabia and the Mediterranean. So far as geographical description is concerned, the separate articles on ASIA MINOR, ALBANIA, ARMENIA, and other areas mentioned below—constituting the Turkish Empire—may be consulted. (For maps of Asiatic Turkey, see ARABIA; ARMENIA; ASIA MINOR; PALESTINE; SYRIA.)

The possessions of the sultan in Europe now consist of a strip of territory stretching continuously across the Balkan Peninsula from the Bosporus to the Adriatic (29° 10′ to 19° 20′ E.), and lying in the east mainly between 40° and 42° and in the west between 39° and 43° N. It corresponded roughly to ancient Thrace, Macedonia with Chalcidice, Epirus and a large part of Illyria, constituting the present administrative divisions of Stambul (Constantinople, including a small strip of the opposite Asiatic coast), Edirne (Adrianople), Salonica with Kossovo (Macedonia), Iannina (parts of Epirus and Thessaly), Shkodra (Scutari or upper Albania). To these must be added the Turkish islands in the Aegean usually reckoned to Europe, that is, Thasos, Samothrace, Imbros and, in the extreme south, Crete or Candia. In December 1898, however, Crete was granted practical independence, under the protection of Great Britain, France, Italy and Russia (see CRETE), and the suzerainty of the sultan is purely nominal.

Asiatic Turkey.—The mainstay of the Ottoman dynasty is the Asiatic portion of the empire, where the Mahommedan religion is absolutely predominant, and where the naturally vigorous and robust Turki race forms in Asia Minor a compact mass of many millions, far outnumbering any other single ethnical element and probably equalling all taken collectively. Here also, with the unimportant exception of the islands of Samos and Cyprus and the somewhat privileged district of Lebanon, all the Turkish possessions constitute vilayets directly controlled by the Porte. They comprise the geographically distinct regions of the Anatolian plateau (Asia Minor), the Armenian and Kurdish highlands, the Mesopotamian lowlands, the hilly and partly mountainous territory of Syria and Palestine and the coast lands of west and north-east Arabia. Asiatic Turkey is conterminous on the east with Russia and Persia; in the south-west it encloses on the west, north and north-east the independent part of Arabia. Towards Egypt the frontier is a line drawn from Akaba at the head of the Gulf of Akaba north-westwards to the little port of El Arish on the Mediterranean. Elsewhere Asiatic Turkey enjoys the advantage of a sea frontage, being washed in the north-west and west by the Euxine, Aegean and Mediterranean, in the south-west by the Red Sea, and in the south-east by the Persian Gulf.

Turkey's Arabian possessions comprise, besides El-Hasa on the Persian Gulf, the low-lying, hot and insalubrious Tehama and the south-western highlands (vilayets of Hejaz and Yemen) stretching continuously along the east side of the Red Sea, and including the two holy cities of Mecca and Medina.

African Territories.—Turkey in Africa has gradually been reduced to Tripoli and Barca. Egypt, though nominally under Turkish suzerainty, has formed a practically independent principality since 1841, and has been *de facto* under British protection since 1881.

Population.—The total population of the Turkish Empire in 1910, including Egypt and other regions nominally under the sultan's suzerainty, was 36,323,539, averaging 25 to the square mile; in the provinces directly under Turkish government, 25,926,000.

The following towns have over 50,000 inhabitants each: Constantinople, 1,150,000; Smyrna, 250,000; Bagdad, 145,000; Damascus, 145,000; Aleppo, 122,000; Beirut, 118,000; Adrianople, 81,000; Brusa, 76,000; Jerusalem, 56,000; Caesarea Mazaca (Kaisarieh), 72,000; Kerbela, 65,000; Monastir, 53,000; Mosul, 61,000; Mecca, 60,000; Homs, 60,000; Sana, 58,000; Urfa, 55,000; and Marash, 52,000.

Race and Religion.—Exact statistics are not available as regards either race or religion. The Osmanlis or Turks (*q.v.*) are supposed to number some 10 millions, of whom 1½ million belong to Turkey in Europe. Of the Semitic races the Arabs—over whom, however, the Turkish rule is little more than nominal—number some 7 millions, and in addition to about 300,000 Jews there is a large number of Syrians. Of the Aryan races the Slavs—Serbs, Bulgarians, Pomaks and Cossacks—and the Greeks predominate, the other representatives being chiefly Albanians and Kurds. The proportion borne to one another by the different religions, as estimated in 1910, is: 50% Mussulman, 41% Orthodox, 6% Catholic, 3% all others (Jews, Druses, Nestorians, &c.). In the European provinces about two-thirds of the population are Christian and one-third Mahommedan. Full and fairly accurate statistics are available for a considerable portion of Asiatic Turkey. Out of a population of 13,241,000 (1896) in Armenia, Kurdistan and Asia Minor, 10,030,000 were returned as Mahommedans, 1,144,000 as Armenians, 1,818,000 as other Christians, and 249,000 as Jews. There are also about 300,000 Druses and about 200,000 Gipsies. The non-Mussulman population is divided into *millets*, or religious communities, which are allowed the free exercise of their religion and the control of their own monasteries, schools and hospitals. The communities now recognized are the Latin (or Catholic), Greek (or Orthodox), Armenian Catholic, Armenian Gregorians, Syrian, and United Chaldee, Maronite, Protestant and Jewish. The table on the following page, for which the writer is indebted to the kindness of Carolidi Effendi, formerly professor of history in the university of Athens, and in 1910 deputy for Smyrna in the Turkish parliament, shows the various races of the Ottoman Empire, the regions which they inhabit, and the religions which they profess.

Administration.—Until the revolution of 1908, with a very short interval at the beginning of the reign (1876) of the deposed sultan Abd-ul-Hamid, the government of Turkey had been essentially a theocratic absolute monarchy. It was subject to the direct personal control of the sultan, who was himself a temporal autocrat, which he now is not, and the most generally recognized caliph, that is, "successor," of the Prophet, and consequently the spiritual head of by far the greater portion of the Moslem world—as he still is. Owing principally to the fact that the system of the caliph Omar came to be treated as an immutable dogma which was clearly not intended by its originator, and to the peculiar relations which developed therefrom between the Mussulman Turkish conquerors and the peoples (principally Christian) which fell under their sway, no such thing as an Ottoman *nation* has ever been created. It has been a juxtaposition of separate and generally hostile peoples in territories bound under one rule by the military sway of a dominant race. Various endeavours have been made since the time of Selim III. (1789–1807), who initiated them, to break down the barriers to the formation of a homogeneous nation. The most earnest and

Races.	Regions inhabited, or Vilayets.	Religions.
Albanians . .	Iannina, Scutari of Albania, Kossovo, Monastir	Mussulman, Orthodox, Catholic
Bulgarians . .	Salonica, Kossovo, Monastir	Orthodox (dissenting)
Servians. . .	Kossovo	Orthodox
Greeks . . .	Constantinople, Adrianople, Salonica, Monastir, Kossovo, Janina, Archipelago, Vilayets of Asiatic Turkey, (Hudavendighiar, Aidin, Konia, Angora, Kastamuni, Trebizond, Sivas, Adana Syria, Aleppo, Sanjak of Jerusalem) Crete	Orthodox and partly Greco-catholic
Kutzo-Vlachs (See MACEDONIA)	Monastir, Iannina	Orthodox
Turks . . .	The whole of European Turkey, Vilayets of Asia Minor, (Bitlis, Van, Mamuret-ul-Aziz, part of Mosul and certain islands of Vilayet of the Archipelago, of Cyprus, Crete)	Mussulman
Lazes . . .	Trebizond and throughout the whole of Eastern Asia Minor	Mussulman and Orthodox
Kurds . . .	Erzerum, Sivas, Seert, Angora, Mosul	Mussulman
Circassians . .	Spread over the whole of Asia Minor	Mussulman
Avchar . . .	Adana, Angora, Sivas	Mussulman
Arabs . . .	Adana, Aleppo, Syria, Bagdad, Sanjak of Jerusalem, Hejaz, Yemen, Beirut, Basna	Mussulman
Armenians . .	Constantinople and spread over the other Vilayets of Turkey in Europe; also Sivas, Angora, Trebizond, Adana, Erzerum, Bitlis, Mamuret-ul-Aziz, Mosul, Aleppo, Van	Gregorian and Catholic
Jews . . .	Spread through Turkey in Europe and Asia, and largely congregated in the Sanjak of Jerusalem, and in the Vilayets of Bagdad, Mosul, Syria, Beirut.	Jew
Samaritans . .	Only in the Sanjak of Napluze (Vilayet of Beirut)	Samaritan Jew
Gipsies . . .	Spread throughout the whole empire	Mussulman
Chaldaeans or Nestorians, speaking partly Syrochaldaic and partly Arabic (Syro-chaldaic in their churches)	Bagdad, Mosul and partly Aleppo, Beirut and Mamuret-ul-Aziz	Nestorian Christian
Melchites, or Syrian Greco-Catholics (Greek in feeling, speaking Arabic)	Beirut, Aleppo, Syria	United Orthodox
Jacobite Syrians, speaking Arabic and partly Syrian (Syrian in their churches)	Beirut, Syria, Aleppo, Mosul, Mamuret-ul-Aziz	Monophysite and Jacobite
Monites (speaking Arabic and in their churches Syrian)	Mt Lebanon, Beirut	Monophysite (Catholic monothelite)
Druses . . .	Mt Lebanon, Sanjak of Hauran	Druse
Mendaites or Ben-i-Yahya	Basra	Sabaean: or of the sect of the son of John the Baptist (Ben-i-Yahya) whom they regard as their only prophet.
Yezzites . . .	Mosul, Bagdad, Basra	Yezzite (Mahommedan sect)

important of these attempts under Abd-ul-Mejid (1839–1861) proved, however, for various reasons abortive. So also did the "Midhat Constitution" promulgated by Abd-ul-Hamid almost immediately after his accession to the throne, owing largely to the reactionary spirit at that time of the *'Ulema* and of the sultan's immediate advisers, but almost, if not quite, in equal measure to the scornful reception of the Constitution by the European powers. The 'Ulema form a powerful corporation, whose head, the Sheik-ul-Islam, ranks as a state functionary almost co-equal with the grand vizier. Until quite recent times the conservative and fanatical spirit of the 'Ulema had been one of the greatest obstacles to progress and reform in a political system in which spiritual and temporal functions were intimately interwoven. Of late years, however, there has been a gradual assimilation of broader views by the leaders of Islam in Turkey, at any rate at Constantinople, and the revolution of 1908, and its affirmation in the spring of 1909, took place not only with their approval, but with their active assistance. The theoretical absolutism of the sultan had, indeed, always been tempered not only by traditional usage, local privilege, the juridical and spiritual precepts of the Koran and the *Sunnet*, and their 'Ulema interpreters, and the privy council, but for nearly a century by the direct or indirect pressure of the European powers, and during the reigns of Abd-ul-Aziz and of Abd-ul-Hamid by the growing force of public opinion. The enthusiastic spirit of reform which heralded the accession of the latter sultan never altogether died out, and from about the last decade of the 19th century has been rapidly and effectively growing in force and in method. The members and sympathizers of the party of reform who styled themselves "Young Turks," working largely from the European centres and from the different points in the Turkish Empire to which the sultan had exiled them for the purpose of repression—their relentless persecution by the sultan thus proving to be his own undoing—spread a powerful propaganda throughout the Turkish Empire against the old régime, in the face of that persecution and of the open and characteristic scepticism, and indeed of the hostile action, of some of the European powers. This movement came to a head in the revolution of 1908. In July of that year the sultan Abd-ul-Hamid capitulated to the Young Turks and restored by Iradé (July 24) the constitution which he had granted in December 1876 and suspended on the 14th of February 1878. A reactionary movement started in April 1909 was promptly suppressed by the Young Turks through the military occupation of Constantinople by Shevket Pasha and the dethronement of Abd-ul-Hamid, who was succeeded by his younger brother Reshad Effendi under the title of Mahommed V. A new constitution, differing from that of Abd-ul-Hamid only in some matters of detail, was promulgated by imperial Iradé of the 5th of August 1909.

In temporal matters the sultan is a constitutional monarch, advised by a cabinet formed of executive ministers who are the heads of the various departments of state, and who are responsible to the elected Turkish parliament. All Turkish subjects, of whatever race or religion, have equal juridical and political rights and obligations, and all discrimination as to military service has been abolished. The sultan remains the spiritual head of Islam, and Islam is the state religion, but it has no other distinctive or theocratic character. The grand vizier (*sadr-azam*), who is nominated by the sultan, presides *ex officio* over the privy council (*mejliss-i-khass*), which, besides the Sheikh-ul-Islam, comprises the ministers of home and foreign affairs, war, finance, marine, commerce and public works, justice, public instruction and "pious foundations" (*evkaf*), with the grand master of ordnance and the president of the council of state.

For administrative purposes the immediate possessions of the sultan are divided into vilayets (provinces), which are again subdivided into sanjaks or mutessarifliks (arrondissements), these into kazas (cantons), and the kazas into nahiés (parishes or communes). A vali or governor-general, nominated by the sultan, stands at the head of the vilayet, and on him are directly dependent the kaimakams, mutassarifs, deftardars and other administrators of the minor divisions. All these officials unite in their own persons the judicial and executive functions, under the "Law of the Vilayets," which made its appearance in 1861, and purported, and was really intended by its framers, to confer on the provinces a large measure of self-government, in which both Mussulmans and non-Mussulmans should take part. It really, however, had the effect of centralizing the whole power of the country more absolutely than ever in the sultan's hands, since the Valis were wholly in his undisputed power, while the *ex officio* official members of the local councils secured a perpetual Mussulman majority. Under such a system, and the legal protection enjoyed through it by Ottoman functionaries against evil consequences of their own misdeeds, corruption was rife throughout the empire. Foreigners settled in the country are specially protected from exactions by the so-called Capitulations (*q.v.*), in virtue of which they are exempt from the jurisdiction of the local courts and amenable for trial to tribunals presided over by their respective consuls. Cases between foreigners of different nationalities are heard in the court of the defendant, and between foreigners and Turkish subjects in the local courts, at which a consular dragoman attends to see that the trial is conducted according to law. (See further, as regards Turkish administration, the account given under *History* below, regarding the reforms instituted under the sultan Abd-ul-Mejid in 1839.)

Education.—The schools are of two classes: (1) public, under the immediate direction of the state; and (2) private, conducted either by individuals or by the religious communities with the permission of the government, the religious tenets of the non-Mussulman population being thus fully respected. State education is of three degrees: primary, secondary and superior. Primary education is gratuitous and obligatory, and superior education is gratuitous or supported by bursaries. For primary education there are three grades of schools: (1) infant schools, of which there is one in every village; (2) primary schools in the larger villages; (3) superior primary schools. Secondary education is supplied by the grammar school, of which there is one in the capital of every vilayet. For superior education there is (1) the university of Constantinople, with its four faculties of letters, science, law and medicine; and (2) special schools, including (*a*) the normal school for training teachers, (*b*) the civil imperial school, (*c*) the school of the fine arts and (*d*) the imperial schools of medicine.

Public instruction is much more widely diffused throughout the empire than is commonly supposed. This is due partly to the Christian communities, notably the Maronites and others in Syria, the Anatolian and Rumelian Greeks, and the Armenians of the eastern province and of Constantinople. Under the reformed constitution (Aug. 5, 1909) education is free, and measures have been taken largely to extend and to co-ordinate the education of all "Ottomans," without prejudice to the religious educational rights of the various religious communities. Primary education is obligatory. Among the Christians, especially the Armenians, the Greeks of Smyrna and the Syrians of Beirut, it has long embraced a considerable range of subjects, such as classical Greek, Armenian and Syriac, as well as modern French, Italian and English, modern history, geography and medicine. Large sums are freely contributed for the establishment and support of good schools, and the cause of national education is seldom forgotten in the legacies of patriotic Anatolian Greeks. Much educational work has also been done by American colleges, especially in the northern provinces of Asia Minor, in conjunction with Robert College (Constantinople).

Army.—In virtue of the enactments of May 1880, of November 1886, of February 1888 and of December 1903, military service had been obligatory on all Mussulmans, Christians having been excluded but under obligation of paying a "military exoneration tax" of £T50 for 135 males between the ages of 15 and 75. Under the new régime this system, which had greatly cramped the military strength and efficiency of the Ottoman Empire, has been changed, and all "Ottomans" are now subject to military service. Under certain conditions, however, and on payment of a certain exoneration tax, exemption may still be purchased. The revision of the whole military system was undertaken in 1910, especially as regards enrolment and promotion of officers, but, as things then stood, the term of service was twenty years (from the age of 20 to the age of 40), for all Ottoman male subjects: active service (*muasaff*) nine years, of which three with the colours (*nizam*), in the case of infantry, four in the case of cavalry and artillery; six and five respectively in the reserve (*ikhtiat*); Landwehr (*redif*) nine years; territorial (*mustahfiz*) two years. In case of supreme necessity all males up to 70 years of age can be called upon to join the colours. There are certain recognized rights to exemption from military service, such as some court officials, state officials, students in normal schools, medicine and law colleges, &c. The redifs form the principal part of the army in time of war, and are divided into two classes: *Class I.* comprises all men in the service who have completed their time with the nizam. In peace-time it is composed of weak *cadres*, on which falls the duty of guarding magazines and stores, and of carrying through musketry instruction and drill of the rank and file of the ikhtiat and the redif. *Class II.* was first established in 1898 under the name of *ilaweh*, and became "redif, class II." in 1903. This class is distributed in very weak cadres in time of peace. In time of war, it is completed by all troops not serving with the nizam, the redif class I. or the mustahfiz. As the organization proceeded, and stronger cadres were formed, the redif class II. would become completely absorbed in class I. The mustahfiz have no cadres in peace-time.

The army is divided into seven army-corps (*ordus*), each under the command of a field marshal, and the two independent commands of Tripoli (Africa) and the Hejaz. The headquarters of the ordus are I., Constantinople; II., Adrianople; III., Salonica; IV., Erzerum; V., Damascus; VI., Bagdad; VII., Yemen; 15th division, Tripoli; 16th division, Hejaz. Only the first six army-corps have, however, their proper establishment: the seventh ordu and the commands of Tripoli and the Hejaz have only garrison troops, and are fed by drafts from the first six ordus. Each ordu territory, from I. to VI., is composed of 8 redif brigade districts of 2 regimental districts of 4 battalion districts apiece, each ordu thus counting 64 battalion districts. The total strength of the Ottoman army in 1904 was returned at 1,795,350 men all told, made up as follows: (1) Active (4 years' service) 230,408 (called), reserve (ikhtiat) 251,511 (called), total 481,919; (2) nizam (class I., completely trained) 237,026 (called); (3) redif (class II., not completely trained), from 21–29 years old, 585,846; from 30–38 years old, 391,563; total 977,409 (uncalled); (4) mustahfiz, trained 53,715 (called), untrained 40,286 (uncalled), total 94,001.

The strength of the different arms is given as follows:—

Infantry.—79 nizam infantry regiments 1 to 80 (4 is missing), each regiment consisting of four battalions of four companies apiece. Allowing for certain battalions unformed, there are altogether 309 nizam battalions; 20 separate chasseur battalions, of four companies each; 4 special chasseur battalions stationed on the Bulgarian frontier—total, 333 battalions in the first line. There are 96 infantry battalions of redif class I.; each regiment composed of 4 battalions—total 384 battalions. (In 1904 the 4th battalion of the 94th regiment, and regiments 95 and 96 had not yet been formed, but, it was stated, had by 1910 been made good.) The projected strength of redif class II. was 172 regiments of 4 battalions each—total, 688 battalions. At the end of 1904 the organization of this class was stated as completed in Turkey in Europe at 40 battalions with a total of 160 regiments: how far the organization had progressed in 1910 in Asiatic Turkey was not known.

The following table shows the war strength of battalions, and the total war strength of the infantry arm:—

Class.	War Strength of Battalions.				Total War Strength of Infantry.			
	Officers.	N.C.O.'s and Men.	Draft Animals.	Rifles.	Officers.	N.C.O's and Men.	Draft Animals.	Rifles.
Special Chasseurs	26	800	200	650	520	.16,000	4,000	13,000
Nizam	24	700	106	650	7,896	230,300	34,874	213,850
Redif I.	24	900	106	850	10,320	337,500	39,750	318,750
Redif II.	24	800	106	750	16,512	550,400	72,968	515,000
Mustahfiz	8–15	400–600	—	400–600	1,760	98,000	—	98,000

The troops are armed principally with Mauser repeating rifles (models 1887 and 1890) of which there are 1,120,000 issued and in store; there are also 510,000 Martini-Henry rifles in reserve.

Cavalry.—Cavalry of the Guard: 1 regiment "Ertogrul" or 5 squadrons, 2 regiments of hussars of 5 squadrons each, and 1 regiment of lancers of 5 squadrons. *Nizam Cavalry*: 38 regiments of 5 squadrons each, or 190 squadrons in all.

Redif Cavalry.—12 regiments of 4 squadrons each, or 48 squadrons in all, attached to the first three ordus. It was further proposed to appoint one regiment of redif cavalry to each redif division. On war footing the strength of a squadron of cavalry is 6 officers, 100 men, 80 horses (Ertogrul—140 men, 135 horses). The nizam cavalry is incorporated with the first six ordus, one cavalry division of 3 brigades of 2 regiments each being appointed to each ordu. The redif cavalry is not organized with large units, and in time of war would be employed as divisional troops. The total war strength of the cavalry is 54 regiments (210 squadrons); 1580 officers, 26,800 men, 21,900 horses. The cavalry is armed with repeating carbines (the N.C.O.'s with repeating revolvers) and swords.

Artillery.—From ancient times the artillery has formed an altogether independent command in the Turkish army. The grand master of ordnance is co-equal with the minister of war, and his department is classed separately in the budget; the artillery establishments, parts of the infantry and of the technical corps, and even hospitals are placed under his direct orders. The artillery is divided into (*a*) field artillery, horse artillery, mountain artillery and howitzer regiments; (*b*) fortress artillery; (*c*) artillery depôts. All artillery troops are nizam: there is no second line. On principle an ordu would have with it 30 batteries of field artillery, 3 batteries of horse artillery and 3 batteries of mountain artillery, or in all 36 batteries with 216 guns, all batteries being 6 guns strong. But the unequal strength of the ordus and political and other reasons have prevented this organization from being carried out.

On war-footing each field battery has 4 officers, 100–120 N.C. officers and men, 100–125 horses and draught animals, 3–9 ammunition wagons; each horse battery, 4 officers, 120 N.C. officers and men, 100 horses, &c., 3 ammunition wagons; each mountain battery, 3 officers, 100 N.C. officers and men, 87 horses, &c.; each howitzer battery, 4 officers, 120 N.C. officers and men, 100 horses, &c., 3 ammunition wagons.

In 1904 the total strength of the artillery was given as 198 field batteries (1188 guns), 18 horse batteries (108 guns), 40 mountain batteries (240 guns) and 12 howitzer batteries (72 guns): total 268 batteries (1608 guns). The guns are of various Krupp types. The ammunition train counts 1254 wagons. On a war-footing the strength of the artillery troops is 1032 officers and 29,380 men.

Technical Troops.—These are formed into battalions of pioneers, railway troops, telegraph troops, sappers and miners, &c.; in all 11 battalions (55 companies) numbering 245 officers and 10,470 men. Other non-combatant troops, such as military train, medical corps, &c., are undergoing reorganization. (For the history of the Turkish army, see ARMY, § 98.)

Navy.—The Turkish sea-power, already decayed owing to a variety of causes (for the effect of the revolt of the Greek islanders see GREEK INDEPENDENCE, WAR OF), was shattered by the catastrophe of Sinope (1853). Abd-ul-Aziz, however, with the aid of British naval officers, succeeded in creating an imposing fleet of ironclads constructed in English and French yards. Sultan Abd-ul-Hamid, on the other hand, pursued a settled policy of reducing the fleet to impotency, owing to his fear that it might turn against him as it had turned against Abd-ul-Aziz. He added, it is true, a few torpedo boats and destroyers, but he promptly had them dismantled on arrival at Constantinople. These now refitted, a cruiser ordered from Cramp's shipyard (America) and another from W. G. Armstrong, Whitworth & Co., and the battleship "Messudiyeh" (9100 tons displacement) reconstructed by the firm of Ansaldo (Genoa) in 1902, and re-armed by Vickers, Sons & Maxim, formed the only really effective war-ships at the disposal of Turkey in 1910, although a few armoured ships in addition might still serve for coast defence at a pinch, and a few more for training ships. Taking all into account, the available strength of the fleet might be put at 7 armour-clad ships, of which the "Messudiyeh" was one, the six others varying in displacement from 2400 to 6400 tons; two cruisers (unarmoured) of 3800 tons displacement; some 18 gunboats; 12 destroyers, 16 first-class torpedo boats and 6 second-class torpedo boats. There were also two Nordenfeldt submarine boats of doubtful efficiency.

Up to 1908 the personnel was found by yearly drafts of two to three thousand men from army recruits designated by the minister of war; the term of service was 12 years, of which 5 were in the first line, 3 in the reserve, 4 in the coastguard. The peace cadres (including 2 battalions of marines and 4 battalions of mechanics) were supposed to comprise 12,500 men on peace-footing, to be increased on declaration of war to 37,000; but these cadres were mainly on paper.

Under the "new régime" the Turkish government displayed commendable energy in reconstructing and reorganizing the sea-power of the empire. New construction to an amount of £T5,000,000, repayable over ten years at the rate of £T500,000 a year by national subscription guaranteed by the government, had by 1910 been voted by parliament. The programme of construction which this initial expenditure was to cover was fixed at two battleships of about 16,000 tons displacement, one armoured cruiser of about 12,000 tons displacement, some few auxiliary vessels (destroyers and gunboats), and a floating dock to lift about 17,000 tons. The main armament of the battleships was to be three pairs of 12-in. guns in three turrets, and three pairs of 9·2-in. in three turrets. The secondary armament was to be sixteen 4-in. Q.F. guns, and a few smaller guns (boat and field). The armoured cruiser was to carry four pairs of 9·2-in. guns in four turrets as main armament, and fourteen 4-in. Q.F. guns, and a few boat and field guns as secondary armament. British naval officers were engaged for training the personnel, and to assist in the reorganization of the fleet.

Communications.—A considerable hindrance to the development of the empire's resources has been the lack of an adequate system of communications; but although it is still deficient in good roads, much has been done of late years to develop railways, extend canals and improve river communications. From 1250 in 1885, of which 903 were in Europe and 347 in Asia, the mileage of railways had increased to some 4440 in 1909, of which 1377 are in Europe, 1810 in Asia Minor, 418 in Syria and 835 fall to the share of the Hejaz railway, including the Ed-Dera-Haifa branch. The construction of this last line is one of the most remarkable achievements of the reign of Abd-ul-Hamid. It may be said to be an absolutely autocthonous enterprise, no recourse having been had to foreign capital to find the means requisite for construction and equipment, which were provided by means of a "national subscription"—not entirely voluntary—and from other sources which, although the financial methods were not strictly orthodox, were strictly Turkish. The line was designed, surveyed and constructed by Turkish engineers—employing Ottoman navvies and labourers—in a highly efficient and economical manner, the average cost per mile having been £3230, although considerable engineering difficulties had to be overcome, especially in the construction of the Haifa branch. The line, stations, sheds and stores are all solidly built, and the rolling stock is sufficient and of the best quality (see further under *Finance*, below).

Production and Industries.—The Ottoman Empire is renowned for its productiveness, but enterprise and skill in utilizing its capabilities are still greatly lacking. For the introduction of improvements something, however, was done by the creation in 1892 of a special ministry of agriculture, to which is attached the department of mines and forests, formerly under the minister of finance. Since the year named an agricultural bank has been established, which advances money on loan to the peasants on easy terms. Schools of agriculture have been opened in the chief towns of the vilayets, and in connexion with those schools, and elsewhere throughout the empire, model farms have been instituted, where veterinary instruction can also be obtained.

To prevent the gradual destruction of the forests by unskilful management and depredations, schools of forestry have been founded, and means have been taken for regulating the cutting of wood and for replanting districts that have been partially denuded. About 21 millions of acres are under wood, of which over 3 millions are in European Turkey.

Wheat, maize, oats, barley and rye are the chief agricultural products. The culture of cotton is making rapid progress, immigrants who receive a grant of land being obliged to devote one-fourth of it to cotton culture. Tobacco is grown all over the empire, the most important market for it being Smyrna. Opium is mainly grown in Anatolia. All the more common fruit-trees flourish in most districts. In Palestine and elsewhere there is a large orange trade, and Basra, in Turkish Arabia, has the largest export of dates in the world. The vine is largely cultivated both in Europe and Asia, and much Turkish wine is exported to France and Italy for mixing purposes. The chief centres of export are Adrianople (more than half), Constantinople and Smyrna, the others being Brusa, Beirut, Ismid, Mytilene and Salonica. Under the auspices of the Ottoman public debt administration silk culture is also carried on with much success, especially in the vilayets of Brusa and Ismid. In 1888 a school of sericulture was founded by the public debt administration for the rearing of silkworms according to the Pasteur method. The production of salt is also under the direction of the public debt administration. About a fourth of the salt produced is exported to foreign countries, and of this about three-fourths goes to British India. Since 1885 great attention has been paid to the sponge fisheries of Tripoli, the annual value of which is about £30,000. With its extensive sea-coast, and its numerous bays and inlets, Turkey has many excellent fishing-grounds, and the industry, the value of which is estimated at over £200,000 a year, could be greatly developed. Its general progress may be seen in the increase of the fishery revenue—derived from duties, permits, &c.—of the public debt administration. Among other important productions of the Ottoman Empire are sesame, coleseed, castor oil, flax, hemp, aniseed, mohair, saffron, olive oil, gums, scammony and liquorice. Attar of roses is produced in large quantities both in European and Asiatic Turkey, and to aid in furthering the industry numerous rose plants are distributed gratuitously. The empire is rich in minerals, including gold, silver, lead, copper, iron, coal, mercury, borax, emery, zinc; and only capital is needed for successful exploitation. The silver, lead and copper mines are mainly worked by British capital. The more special industries of Turkey are tanning, and the manufacture of muslin, velvet, silk, carpets and ornamental weapons.

Shipping and Commerce.—The figures obtainable with respect to shipping are approximate, the statistical data not being altogether complete. In 1890–1891 the number of steamers that entered and cleared Turkish ports was 38,601, and of sailing vessels 140,726, the total tonnage of both classes of vessels being 30,509,861. In 1897–1898 the number of steamers was 39,680 of 32,446,320 tons, the number of sailing vessels being 134,059 of 2,207,137 tons, thus giving a total tonnage of 34,653,457. In 1904–1905 the number of steamers was 49,235 of 44,180,000 tons, and of sailing vessels 133,706, with a tonnage of 2,506,000 tons, the total tonnage being thus 46,686,000 tons. In 1909 the total tonnage was 43,060,515. About a third of the tonnage belongs to British vessels. The number of steamships belonging to Turkey in 1899–1900 was 177 of 55,938 tons, as compared with 87 of 46,498 tons in 1897–1898, the number of sailing vessels in the same years being respectively 2205 of 141,055 tons and 1349 of 252,947 tons. The following tables show the total value of exports and imports arranged according to countries of origin or destination for 1905–1906 and 1908–1909; the same information for the year 1905–1906 with respect to the principal ports of the empire, and the tonnage of vessels cleared thereat during the year 1908–1909; and the value of the principal articles imported and exported for the year 1905–1906.

Finance

Preliminary Sketch.—From the outset of their history the Osmanli Turks adapted to their own needs most of the political, economic and administrative institutions which existed before them. Primarily their system was based on the great principles enunciated by the immediate successors of the Prophet, especially by Omar, involving the absolute distinction between, and impartiality of treatment of, the Mussulman conquerors and the

[1] As Dedeagatch is gaining, and will gradually gain, importance, it has been included in this table.

races which they conquered; and from this point of view a careful study of the financial history of Turkey will afford most valuable insight into the Eastern Question.

In reward for the brilliant services rendered him by Ertoghrul (the father of Osman) and by Osman himself, Ala-ud-din, the last of the Seljuk sultans, conferred certain provinces in fief upon these two great warriors. They in their turn distributed the lands so acquired among their sons and principal emirs on strictly feudal principles, the feudatory lands being styled *ziamet* and *timar*, a system long continued by their successors in regard to the territories which they conquered. The conquered peoples fell into an inferior caste, made to work for, and to pay for the subsistence of, their conquerors, as under the Arab domination; the principal taxes exacted from them were the *kharaj*, a tax of indeterminate amount upon realty, based on the value of lands owned by unbelievers—(in contradistinction to the tithe [*åshār*] which was a tax of fixed amount upon lands owned by believers)—and levied in payment of the privilege of gaining means of existence in a Mussulman country, and the *jiziyé*, a compulsory payment, or poll-tax, to which believers were not subjected, in lieu of military service. The conquerors were feudatories of the reigning prince or sultan, and their payments consisted principally in providing fighting forces to make up the armies of the prince. The *kharaj*, the *jiziyé*, and the whole feudal system disappeared in theory, although its spirit, and indeed in some respects its practice, still exists in fact, during the reforming period initiated by Sultan Selim III., culminating in the Tanzimat-i-Khairiyé (1839) of Abd-ul-Mejid, and the Hatt-i-Humayun issued by the same sultan (1856). The administration of the state revenues was managed by a government department known as the Beit-ul-Mal or Maliyé, terms generally employed throughout Islamic countries since the commencement of Islam. But the entire financial authority resided in the sultan as keeper, by right, of the fortune of his subjects. The public revenues were passed under three principal denominations: (1) the public treasury; (2) the reserve, into which was paid any surplus of revenues over expenses from the treasury; (3) the private fortune (civil list) of the prince. Expenditure, as under the Seljuk sultans, was defrayed partly in cash, partly in "assignations" (*havalé*).

The Osmanli sultans, as also the Mamelukes and the Seljuks, were accustomed to give *largesse* to their military forces on their accession to the throne, or on special occasions of rejoicing, a custom which still is practised in form, as for instance on the first day of the year, or the birthday of the Prophet (*mevlûd*). Largesse was especially given on the field of victory, and was, moreover, liberally distributed to stifle sedition and mutiny among the troops, the numerical strength of which was continually increased as the empire enlarged its borders. This vicious system, grafted as it was upon an inefficient administration, and added to the weight of a continually depreciated currency, debased both by ill-advised fiscal measures and by public cupidity, formed one of the principal causes of the financial embarrassments which assailed the treasury with ever increasing force in the latter part of the 16th and during the 17th and 18th centuries. The Turkish historian, Kutchi Bey, attributes the origin of the decline of the empire to the reign of Suleiman the Magnificent (1520–1566), when the conversion of many *emiriyé* lands into *vakufs* was effected, and the system of farming out revenues first introduced. Impoverished by these different causes, as well as by prodigal extravagance in interior expenditure, by shameless venality among the ruling classes, and by continual wars, of which the cost, whether they were successful or not, was enormous, the public treasury was frequently empty. So long as the reserve was available it was drawn upon to supply the void; but when that also was exhausted recourse was had to expedients, such as the borrowing, or rather seizure, of the *vakuf* revenues (1622) and the sale of crown properties; then ensued a period of barefaced confiscation, until, to restore public confidence in some measure, state budgets were published at intervals, viz. the partial budget of Ainy-Ali (in 1018 or A.D. 1609), the budget of Ali Aga (in 1064, or 1653) and that of Eyubi Effendi (in 1071, or 1660). At this time (1657–1681) the brilliant administration of the two Kuprilis restored temporary order to Ottoman finance. The budget of Eyubi Effendi is particularly interesting as giving the statement of revenue and expenditure for an average year, whereas the budget of Ainy-Ali was a budget of expenditure only, and even in this respect the budget of Eyubi Effendi is far more detailed and complete. The budget of Ali Aga is almost identical with that of Eyubi Effendi, and is worthy of special note for the conclusions which accompanied it, and which although drawn up 250 years ago, described with striking accuracy some of the very ills from which Turkish finance was suffering throughout the reign of Abd-ul-Hamid.

Apart from unimportant modifications, the form of the budget must have remained unchanged until the organic reforms of Selim III., while its complete transformation into European shape dates only from the year 1278 (1862), when Fuad Pasha attached a regular budget to his report on the financial situation of the empire. Since that time there had been no further change worth noting until the "new régime" was established in 1908. Although the publication of the budget had only taken place at very irregular intervals, it must also be observed that the published budgets were by no means accurate. From the time of Eyubi Effendi until the end of the grand vizierate of Ibrahim Pasha (1730), the empire experienced periodical relief from excessive financial distress under the series of remarkable grand viziers who directed the affairs of state during that time, but the recovery was not permanent. Ottoman arms met with almost systematic reverses; both the ordinary and the reserve treasuries were depleted; a proposal to contract a foreign loan (1783) came to nothing, and the public debt (*duyun-i-umumiyē*) was created by the capitalization of certain revenues in the form of interest bearing bonds (*sehims*) issued to Ottoman subjects against money lent by them to the state (1785). Then came forced loans and debased currency (1788), producing still more acute distress until, in 1791, at the close of the two years' war with Russia, in which the disaster which attended Ottoman arms may be largely ascribed to the penury of the Ottoman treasury, Selim III., the first of the "reforming sultans," attempted, with but little practical success, to introduce radical reforms into the administrative organization of his empire. These endeavours were continued with scarcely better result by each of the succeeding sultans up to the time of the Crimean War, and during the whole of the period the financial embarrassment of the empire was extreme. Partial relief was sought in the continual issue of debased currency (*beshlik*, *altilik* and their subdivisions), of which the excess of nominal value over intrinsic value ranged between 33 and 97 %, and finally paper money (*kaimé*) which was first issued in 1839, bearing an interest of 8 %, reduced in 1842 to 6 %, such interest being paid on notes of 500 piastres, but not on notes of 20 or 10 piastres, which were issued simultaneously. Finally, usage of paper money was restricted to the capital only, and in 1842 this partial reform of the paper currency was followed by a reform of the metallic currency, in the shape of an issue of gold, silver and copper currency of good value. The gold coins issued were 500, 250, 100, 50, and 25 piastres in value, the weight of the 100-piastre piece (Turkish pound), 7·216 grammes, ·916⅔ fine. The silver coins were of 20, 10, 5, 2, 1 and ½ piastre in value, the 20-piastre piece weighing 24·055 grammes, ·830 fine. The copper money was in pieces of a nominal value of 40, 20, 10, 5 and 1 paras, 40 paras being equal to 1 piastre. In 1851 further attempts were made to withdraw the paper money from circulation, but these were interrupted by the Crimean War, and the government was, on the contrary, obliged to issue notes of 20 and 10 piastres. Finally, at the outbreak of the Crimean War Turkey was assisted by her allies to raise a loan of £3,000,000 in London, guaranteed by Great Britain and France; in 1855 an organic law was issued regulating the budget, and in the same year a second guaranteed loan of £5,000,000 was contracted in Great Britain. In 1857 an interior loan of 150,000 purses in bonds (*esham-i-mumtazē*), repayable in three years and bearing 8 % interest, was raised; the term of repayment was, however, prolonged indefinitely. In the same year another series of bonds (*haziné tahvili*), bearing 6 % interest, and repayable in 1861, was issued; in 1861 the term of reimbursement was prolonged until 1875. In 1858 a third loan was contracted in Great Britain for £5,000,000, and thereafter foreign loans followed fast on one another in 1860, 1862, 1863, 1864, 1865, 1869, 1872, 1873 and 1875, not to mention the two Egyptian tribute loans raised on Egyptian credit in 1871 and 1877. In 1859 the settlement of palace debts gave rise to the issue of 1,000,000 purses of new interior bonds (*esham-i-jedidē*) spread over a period of three years, repayable in twenty-four years, and bearing interest at 6 %. Further 6 % bonds, repayable in ten years, and styled *serguis*, were issued in the same year. Seeing the rapid increase of the financial burdens of the state, a commission of experts, British, French and Austrian, was charged, (1860) with setting the affairs in order, and with their assistance Fuad Pasha drew up the budget accompanying his celebrated report to the sultan in 1862. Meanwhile *kaimē* was being issued in great quantities (about 60,000 purses a month) and fell to a discount (December 1861) of 75 %. In 1862 further *sehims* were issued, and these and the loan of 1862 (£8,000,000) were devoted to the withdrawal of the *kaimē*. Later, however, the *kaimē* was again issued in very large amounts, and the years succeeding 1872 up to the Russian War (1877) presented a scarcely interrupted course of extravagance and financial disorder, the result of which is described below.

The Budget was supposed to be drawn up according to an excellent set of regulations sanctioned by imperial decree, dated the 6th of July 1290 (1875), of which the first article absolutely prohibited the increase, by the smallest sum, of any of the expenses, or the abandonment of the least iota of the revenues fixed by the budget. Under these regulations the revenues were divided into two categories, viz. the direct and the indirect. The first category included the "imposts" properly so called, the fixed contributions (*redevances fixes*) to be paid by the "privileged provinces," and the military exoneration tax. In the second were comprised tithes, mine-royalties, forests and domains, customs, sheep-tax, tobacco, salt, spirits, stamps and "various." The expenses were also divided into two categories —(1) "Periodic and fixed" expenditure, which admitted of neither reduction nor delay; and (2) the credits allowed to the various departments of state, which might be increased or diminished according to circumstances. The expenditure of the first category was made up of the service of foreign loans, of the general debt, of the dotations replacing *ziamet* and *timarat* (military fiefs) and of fixed contributions such as *vakufs*. In the second category were included the imperial civil list, the departments of the Sheikh-ul-Islamāt and of religious establishments, the ministries of the interior, war, finance, public instruction, foreign affairs, marine, commerce (including mines and forests), and public works, and, finally, of the grand master of ordnance. For every province (*vilayet*) a complete budget of receipts and expenditure was drawn up by its *defterdar* (keeper of accounts) under the supervision of the *vali* (governor); this budget was forwarded to the minister of finance, while each state and ministry of department received communication of the items appertaining to it. Each ministry and department then sent in a detailed budget to the Sublime Porte before the end of November of each year. (The Turkish financial year is from the 1st of March to the 28th of February o.s.). The Sublime Porte forwarded these budgets, with its own added thereto, to the minister of finance, who thereupon drew up a general budget of receipts and expenses and addressed it to the Sublime Porte before the 15th of December. This was summarily considered by the council of ministers, and then referred to the budget commission, which was to be composed not only of State functionaries, but of private persons "worthy of confidence, and well versed in financial matters," and which was invested with the fullest powers of investigation and inquiry. The report drawn up by the commission on the results of its labours was submitted to the Council of Ministers, which then finally drew up a general summary of the definitive budget and submitted it by *mazbata* (memorandum) for the imperial sanction. When this sanction had been accorded the budget was to be published. The remaining regulations set forth the manner in which extra-budgetary and extraordinary expenses were to be dealt with, and the manner in which the rectified budget, showing the actual revenues and expenditure as proved at the close of the year was to be drawn up with the assistance of the state accounts department (*divān-i-mouhassebāt*). This rectified budget, accompanied by an explanatory memorandum, was examined by the budget commission and the Council of Ministers, and submitted for the imperial sanction, after receiving which it was ordered that both be published. Special instructions and regulations determined the latitude left to each department in the distribution of the credits accorded to it among its various heads of expenditure, the degree of responsibility of the functionaries within each department and the relations regarding finance and accounts between each department and its dependencies. These regulations provide carefully and well for all contingencies, but unfortunately they were only very partially carried out. It may indeed be said that it was only the *previsionary* budget (*anglicé*, the estimates) that received any approximately proper care on the lines laid down, while the rule that both the estimates and the definite budget (at the close of each year) should be published was almost wholly honoured in the breach; until 1909, when the Constitution had been re-established the budget had only twice been published, in 1880 and 1897, since the regulations were put into force. Not only were the budgets not published, but no figures whatever were allowed to transpire in regard to the true position of the Turkish treasury—which laid the accuracy of even the limited number of budgets published open to suspicion.

All this has now been changed, and the above regulations are conscientiously carried out with the differences in procedure necessary for compliance with constitutional methods, and with the submission of the Budget to the houses of parliament. The Budget is now published in full detail and that for the year 1326 (1910–1911), with the explanatory memorandum which prefaces it, is an admirable work, mercilessly exposing the financial shortcomings and sins of the previous system, or rather want of system, while unshrinkingly facing the difficulties which the present government has inherited. The account thus presented to us of what the previous confusion was, underlines and attests the summary exposition of it given in the last edition of this work. It was there stated that, on the most favourable estimate, the normal deficit of the Turkish treasury was £T2,725,000, (upwards of £T,1,700,000 below the truth as now declared) and the following observations were appended:—

"This budget represents the normal situation of Ottoman finance; it does not tally with the budget published in 1897, which was prepared with a special object in view, and was obviously full of inaccuracies, nor indeed does it agree with figures which could be officially obtained from the Porte. It is, however, compiled from the best sources of information, and it exaggerates nothing. The formidable deficit is met principally in three ways. (1) By leaving the salaries of state officials and the army unpaid. In many parts of the empire the soldiers rarely receive more than eight months' pay in the year, although in Constantinople the arrears are not so large. The reverse is the case with the civil officials, whose salaries in the provinces are paid more regularly than in Constantinople, owing to their being charged on the provincial budgets; the average arrears are from two to three months in Constantinople, and from one to three in the provinces. The arrears in civil and military salaries average annually about £T1,750,000. (2) By means of loans, both public and from individuals. By financial expedients of this kind payments were effected by the treasury in fifteen years (1881–1896) amounting to £T11,666,000 or at the rate of nearly £T800,000 per annum. (3) By anticipating the revenues of future years. This is the method so frankly condemned by Ali Aga, as was seen above, in 1653. Delegations (*havalē*) are granted on the provincial treasuries for one or two years in advance, sometimes for a series of years, in order to pay pressing debts too heavy to be met in a single payment. No better description of the financial distress and disorder of the empire can be given than that set forth in the official report of the budget commission of 1888. "It has hitherto been considered necessary owing to financial embarrassment, to commence financial years with unbalanced budgets. Later, without taking into consideration the effective amounts in cash at the disposal of the vilayets, considerable sums were drawn upon them, by means of *havalēs*, out of proportion to their capacity. For these reasons, during the last two or three months of the financial year, the vilayets have not a para to remit to the central administration, and it has been considered imperatively necessary to draw on the revenues of the following year. Thus, especially during the last two years, urgent extraordinary expenses have been perforce partially covered by the proceeds of the ordinary revenues, the revenues of 1303 (1887) were already considerably anticipated in the course of 1302 (1886). The former year naturally felt the effect of this, and the tithes which should have been encashed in the last months of the year were discounted and spent several months in advance. Moreover, in order to meet to some extent the deficit arising as well from the accumulation of arrears of state departments since 1300 (1884) as, to a large degree, from gross deficiencies due to the neglect of the civil officials of the government to encash the revenues—to meet, further, the needs of the central administration, and above all, the urgent military expenses of the empire, and to provide a guarantee for bankers and merchants in business relations with the government and the treasury, part of the revenues of 1304 were perforce spent in 1303." This commission proved the deficit of the year to be £T4,370,000. It set out also at length the very defective and disorderly condition of the state accounts. During the finance ministry of Agop Pasha (1889 to 1894) a good deal was done to set matters in order, but most of the ground then gained has since been lost."

To this may be added a short extract from the Explanatory Preface to the Finance Bill for the year 1910–1911. After pointing out the immense difficulties which he had had to encounter owing to the absence of any regular accounts, and above all of any of "those statistics which constitute the soul, indeed the very life of a public administration," and that it was therefore impossible for him to pretend that he had been able to free himself altogether from the effects of the past, the minister continues, "every time we have endeavoured to have recourse to the previous elements of appreciation, we found ourselves faced by the chaos which characterized former years. We have sometimes ascertained things so strange that we cannot forbear expressing our astonishment at the idea that a great power such as ours could maintain itself under such conditions." M. Ch. Laurent, the financial adviser to the Turkish government, stated in a lecture on Turkish Finance, delivered in Paris on the 22nd of April 1910, that the Ministry of Finance has now been largely reorganized. Officials, he says, with grand titles and no responsible duties have been abolished, and departments with responsible chiefs created. The agents of the finance ministry, instead of being mere clerks, are now employed in "the assessment and collection of taxes, the control of expenditure, the preparation and execution of the budget, the estimates of the necessary cash required at different points of the empire—all that, in fine, constitutes the real financial administration of a great empire." Laurent points out that direct taxes furnish 54% of the revenues of the empire, that agriculture is accordingly very heavily taxed, and that the tax on realty is both excessive and unfairly administered. The summary history given above of the origin of the system of taxation prevailing in Turkey explains how this came about. Reform of this system, and, further, very necessary reforms of the methods of collection of the wines and spirits revenue (which is protection turned upside down, the home-growers being far more heavily taxed than importers), and of the customs (in which almost every possible administrative sin was exemplified), were also undertaken. Three bills, moreover, were presented to parliament, the first regulating Public Accountancy, the second regulating the Central Accounts Department, and the third the service of the Treasury. By this last the centralization of receipts and expenditure and the movement of funds in the provinces were to be confided to the Imperial Ottoman Bank, which extended and perfected its own organization for the purpose.

Passing now to the examination of the budget, it should be observed that the method of estimating the revenues—a matter of great difficulty owing to the previous want of method—is described by Laurent as follows: "For every nature of receipts the total effective collections for the five last known years were set out, the averages were taken of these and the increase or decrease of the yearly average of those same years was worked out and added to or deducted from the figure previously obtained. The only exception made to this rule was in the case of revenues showing a yearly increase, such as Post Office revenue, tobacco, salt, for which were taken the figures of 1323 (1907) increased by a certain average." The expenditure was arrived at in the manner previously described—and when the general budget came to be made up the severest pruning was found necessary, the original demands of the various ministries and departments having resulted in a deficit of upwards of £T9,000,000. It is thought better here, for the sake of clearness, to reserve observations on revenues specially assigned to the international administration of the Ottoman Public Debt, and on the expenditure of that administration, and to deal with that subject separately, while, however, including the total figures of both in the general figures in order to reproduce exactly the totals shown in the budget of the empire. The principal items of revenue and expenditure are as follows, the figures being taken from the published budget above-mentioned.

Revenue. Direct Taxes.[1]—The tax on realty (*verghi*) is estimated to yield £T2,599,420. Duties on profession (*temettū*) consist (*a*) of a fixed duty leviable at rates declared in a schedule forming part of the special law (Dec. 8, 1907) regulating the tax, and (*b*) of a proportional duty at the rate of 3 % on the value of buildings occupied by companies or individuals in the prosecution of their business; of 3 % on salaries (subject to certain deductions) of employés of such companies and individuals; and on government contractors and revenue farmers, at the rate of 3 % of 10 % of the value of contracts filled and of revenues farmed. The law is defective and unfair in its incidence, and it is not applicable to foreigners. The government promised in 1910 to remedy the law with the assent of the Great Powers, and, if successful in its negotiations, to present an amended law. The duties are estimated to produce £T393,107; other professional duties £T110,887—together £T503,994. A "Military Exoneration tax" is levied on male Ottoman subjects between the ages of 15 and 75 to the amount of £T50 for 135 persons—certain exceptions such as priests, religious orders, &c., are allowed. The estimated revenue from this source is £T1, 289,612. "Prestations" are payments in lieu of services (apart from military service) to the state, such as maintenance of highways, &c.—in effect, purchase of exoneration from forced labour. These duties vary in different parts of the empire: in the vilayets of Constantinople, Bagdad and Adrianople, and in the sanjaks of Bigha and Tchatalja the day's work is calculated at 5 piastres (about 11d.); in the vilayets of Aleppo, Trebizond, Angora, Iannina, Konia, Sivas and Kastamuni at 4 piastres (about 9d.); and in most other parts of the empire at 3 piastres (about 7d.). These taxes were formerly levied either in cash or in kind: it has now been decided to levy them in cash only, although this change was expected to cause some arrears. Allowing for these, the estimated revenue is £T553,938. The "tax on sheep, camels, buffaloes and hogs" (*aghnam*, meaning literally "sheep," but for taxing purposes the other animals are included under the same name), formed originally part of the "tithe." It was transformed long since into a fixed amount per head of the animals taxed, which amount varies according to the region in which the tax is levied, the highest tariff being in the sanjak of Jerusalem (7½ piastres) and the lowest in the Yemen (1 piastre). The estimated receipts are, from sheep £T1,790,720, from camels and buffaloes £T144,520, and from hogs £T8890, or together £T1,814,152. "*Tithes*" are the direct descendant of the *kharaj* already alluded to above. It should here be noted that, from the fiscal point of view, the reforms instituted at the commencement of the 19th century may be summarized thus. In permanent remuneration of certain services to be rendered to the state, the sovereign assigned to civil or military functionaries territorial regions for the purpose, and with the power, of collecting land taxes imposed by Mussulman and Imperial law, *i.e.* the *kharaj* or tithe, and transfer and succession duties. The tithes were originally based on one-tenth of the agricultural produce of the country, but this proportion was gradually raised under the euphemistic pretence of "public instruction," but really, under financial pressure, to 12 % and again in 1900 for military "equipments" (Tejhīzāt-i-'Askeriyeh) by a further ½% to 12½%. This last surtax, which produces about £T90,000 per annum, was specially affected to a loan, known as the "Tejhīzāt-i-'Askerieh of 1905," of £T2,640,000, by virtue of a contract between the government and the Deutsche Bank (April 17, 1905). The estimated receipts from the "Tithes" (including tobacco and silk, both hypothecated to the Public Debt Administration) are £T6,731,107. The remaining taxes under the category "direct" are the forest-dues (generally speaking 15 % of the value of wood cut), estimated to produce £T130,094; the mining dues (being a fixed duty of 10 piastres per 10,000 sq. metres of the superficial area covering the mine, and a proportional duty varying from 1 % to 20 % of the gross value of metal contained in the ore, according to the kind of metal and the method of extraction of the ore), £T45,141; and tax-papers (*Tezkērēs*), £T58,434. The total "direct taxes" (inclusive of tobacco and silk tithes) are thus estimated to amount to £T13,725,892.

Section II. of the budget is composed entirely of revenues from *stamp-duties*. Of these, commercial stamps are among the revenues specifically hypothecated to the Public Debt Administration, £T460,079; the others, consisting of legal stamps of various kinds, registration and transfer-duties, &c., are estimated to produce £T653,373 forming a combined total of £T1,113,452.

Under Section III. fall the "indirect contributions" as now reclassified. The first revenue specified among these in the budget is that accruing from the wine and spirit duties, which is again among those assigned to the Public Debt, £T283,079. Licenses for sale of Tumbēki, a variety of Persian tobacco used for the *narghilē*, £T2046. By far the most important "indirect" revenue is that produced by the customs, consisting of import, export and transit duties, and various unspecified receipts. Under the old commercial treaties which lapsed about 1890—but which have been maintained "provisionally" in force until one or other of the great powers consents to set a term to the negotiation of fresh treaties—an *ad valorem* duty of 8 % was imposed on all articles imported into the Turkish empire. In 1905 financial resources had to be found for the special administration of the three European vilayets as insisted upon by the powers, and to this end the Porte initiated negotiations with the latter to increase the import duties by 3%. As is usual in Turkey, this opportunity was seized for the demand of redress of grievances by such powers as considered they had any, and the negotiations were protracted until July 1907, when France finally gave in her adhesion. Since then the import duties have been collected at the rate of 11 % *ad valorem* under the supervision of the Public Debt Administration, the bondholders having certain rights, under the decree of Muharem, described below, over any increase of revenue arising from modification of the commercial treaties. By the provisions of the "Annex Decree," also described below, three-quarters of the additional revenue is assigned to the Turkish government, and one-quarter to the Public Debt Administration to swell the sinking-fund. Fresh negotiations were also undertaken to increase the import-duties by a further 4% in order to balance the deficit shown in the budget. In the year 1910–1911 the import duties were estimated to produce £T3,980,395, the transit duties £T20,276, and the export duties (1% *ad valorem*, which it was hoped the government might soon afford to abolish) £T168,993—total customs revenue, £T4,217,752. The remaining "indirect contributions" are port and lighthouse dues, £T148,426. Sanitary taxes, £T20,519, and fisheries and sporting licenses affected to the service of the public debt, £T153,990. The revenues figuring under "indirect contributions" thus reach a total of £T4,825,812.

Monopolies form Section IV. of the budget, and include in the first place the salt revenue (£T1, 227,750), which is assigned to the Public Debt Administration, and tobacco revenues of which the larger part, £T865,737, is assigned to the same administration, the total (including share of Tumbēki profit) producing £T965,754; the remaining monopolies are: fixed payment from the Tumbēki Company, £T40,000; explosives, £T106,323; seignorage (Mint), £T10,466; and posts and telegraphs, £T912,129. The "Monopolies" thus render a total revenue of £T3,262,424.

Section V. includes receipts from commercial and industrial undertakings belonging to the state. These are the Hejaz railway, £T152,000; the Dolma-Bagtchē gas-works, £T59,130; technical school, £T8536; the Tigris and Euphrates steamships, £T62,513; and mines (Heraclea coal and other), £T120,710; forming a combined total of £T402,889.

Section VI. is composed of receipts from "State Domains" of which a large proportion was formerly included in the civil list. Under the deposed sultan the Civil List Administration had encroached in every direction not only on the revenues properly accruing to the state, but upon private and upon state property in most parts of the empire. Thus it is explained in the preface to the budget that the revenues "proceeding from the deposed sultan" are not classed together under one heading, but that they have been apportioned to the various sections under which they should fall "whether taxes on house property or property not built upon, tithes, aghnam, forests, mines, cadastre, sport, military equipment, private domains of the state, various receipts, proceeds of sales, rents"—a truly comprehensive list which by no means set a limit to the private resources of Abd-ul-Hamid II., who looked upon the customs also as a convenient reserve on which he could, and did, draw when his privy purse was short of money. Apart from the sources of revenue specified above, of which the amounts actually transferred from the civil list are not stated, Section VI. is estimated to produce £T513,651. In the previous budget there

[1] It should be noted that the classification of the revenues included respectively under the "direct" and "indirect" categories has now been quite properly changed, the sheep-tax, tithes, mining royalties and forest royalties being comprised under "direct taxes"; stamps and registration duties are placed in a special category, and salt and tobacco under "monopolies."

had been a special heading, "Proceeds of Domains transferred from the Civil List," estimated to produce £T620,233, which may have been intended to include all the various receipts above enumerated.

Section VII., formed of the tributes of dependencies of which the two principal are the Egyptian, £T765,000, and that of Cyprus, £T102,590 (assigned to the public, debt) comprises a total revenue of £T871,316. Finally, various receipts of which the principal separately specified are government share of railway receipts (Oriental railways and Smyrna-Cassaba railway), £T201,710, and "subscriptions" for the Hejaz railway, £T264,600, form Section VIII.

The total revenues of the empire are thus estimated to produce £T25,848,332, and seeing the careful and moderate manner in which the estimates have been framed, this may be looked upon rather as a minimum than a maximum. The minister of finance stated in his budget speech to parliament, delivered on the 23rd of April 1910, that the revenues for the year 1909–1910, which had been estimated to produce £T25,000,000, had as a matter of fact produced £T26,500,000.

Expenditure. Ministry of Finance.—The first item of expenditure shown in the budget is the service of the public debt, amounting to £T8,288,394. The Public Debt Administration plays so considerable a part in the finances of the Ottoman Empire, and its history is of such importance that a special section of this article will be devoted to it below. Under the budgetary heading "Public Debt" is included, as it should be, all expenditure in connexion not only with the public debt proper, but also with advances from banks and others, railway guarantees, an account of which will also be found below, and all capitalized liabilities, as far as known, contracted by the state.

It is explained in the preface to the budget that one of the abuses of the previous régime had been to obtain advances from credit establishments at high rates of interest varying from 7 % to 9 %, when it was found impossible to issue a public loan. The rates on these advances have now been generally reduced to 6 % with the exception of that on the advances from the lighthouse administration, which refused to allow any reduction below 7 %. In the years 1908–1909 the advances were reduced by £T688,000, in addition to repayments allowed for in the budget, and the credit agreed for the year 1909–1910 is £T663,000, as compared with £T1,160,000 for the previous year. In the year 1910–1911 the outstanding advances were to be so far paid off that the credits to be opened under this head would be still further reduced by £T500,000.

The civil list has been reduced to the definite amount of £T443,880, which, without the consent of parliament, cannot be increased. The sultan receives an annual allocation for himself and household of £T240,000, the crown prince one of £T24,000, and a sum of £T153,000 is assigned to the Imperial princes and the sultanas. The deposed sultan was allowed £T12,000 a year, and a similar amount was set aside to provide dowries for two sultanas who were just about to be married. The debts of the former are stated in the preface to the budget to be very large, and as payments are effected fresh creditors present themselves with undeniable vouchers in their hands, causing much embarrassment to the minister of finance: no figures, however, are given. The Finance Bill provides that these debts are to be paid out of supplementary credits.

Under the reformed constitution every senator is entitled to a salary of £T100 per month, any remuneration which he may receive from the government for other services to be deducted from the senatorial allowance which, however, it may of course exceed. Deputies are allowed £T300 for each session of parliament, and £T50 per month in addition should the session exceed its legal duration. They are further allowed travelling expenses from and to their constituencies on the basis of rules governing journeys of functionaries receiving a monthly salary of £T50. The amount reserved in the budget for these purposes is £T181,871.

The ministry of finance absorbs £T2,989,600. In this are included the expenses of the administration of both the central and provincial departments of the finance ministry, the mint, charitable allowances, expenses and presents in connexion with the holy cities (£T121,410), pension funds of state officials (£T628,038), administrative allowance made to the agricultural bank (£T225,380) and various other expenses. Various administrative reforms were in hand in 1910–1911, by which it was expected considerably to reduce the credits demanded by the finance ministry—especially those in connexion with the holy cities. Special attention was called by the minister to the fact that the system of contributions of officials to the pension funds has been modified, the deduction from salaries being now 10 % instead of 5 %, and the contributions to the funds being made as to one-third by the treasury, and two-thirds by the officials, instead of the reverse as formerly: the economy effected is about £T300,000. A credit of £T17,124 is allowed for the central accounts department. The total credits for the ministry of finance are, then, as follows: Ottoman public debt, £T8,288,394; House of Osman, £T443,880; legislative corps, £T181,871; treasury, £T2,989,600; central accounts department, £T17,124; forming an aggregate of £T11,920,869.

Indirect contributions, or more familiarly "customs," are allowed a credit of £T512,670. The minister of finance points out the immense importance of the thorough reorganization of the customs administration. The services of a first-rate English expert (Mr R. F. Crawford) were obtained, and much has been done at Constantinople, but the provincial customs offices are still lamentably defective. These were immediately to be taken in hand, and considerable sums are being voted for repairs of existing customs buildings and the construction of new buildings. The reforms already accomplished have resulted in a marked increase in the customs revenues.

Posts and telegraphs, which absorbed a credit of £T782,839 in 1910–1911, have also long been in urgent need of extension and better administration. An additional credit of £T90,000 was granted, as compared with the previous year, and increased expenditure was foreshadowed for the future; on the other hand, it was confidently expected that the post office receipts would increase in far more rapid ratio than the expenditure.

The ministry of the interior was estimated to require £T1,157,230. This sum covered "immigration expenses," *i.e.* assistance given in settling Mussulmans immigrating from provinces detached from the Ottoman Empire. There can be no doubt that this expenditure is remunerative, since many rich regions of Asia Minor have long suffered from want of population.

Military expenditure, including the three departments of war, is as follows: the army (excluding artillery), £T8,280,452; ordnance, £T356,439; and gendarmerie, £T1,694,778. As regards the first of these, it is curious to observe that the budget decree of 1880 stringently limited the peace strength of the Ottoman army to 100,000 men, "including officers and generals," in order to put a stop to the rapidly increasing military expenditure; but this was merely the expression of a pious wish, at a time when European financial good will was indispensable, that expenditure might be kept down. No real attempt has ever been made to observe the decree, and indeed observance has been impossible seeing the dangers which never cease to menace the empire. To some extent the real level of military expenditure has been masked by the separation of certain payments into "extraordinary" expenditure, a course which, it is understood, has not been followed in the budgets of the "new régime," and which will not be revived. It should however, be remarked that out of an "extraordinary" budget, which will be mentioned below, sums of £T709,305 and of £T27,827 were allocated to the ministry of war and the ordnance department respectively in 1909. It is not expected that military expenditure can be much reduced, except in the direction of supply contracts, which have been the cause in the past of iniquitous waste of means.

The official budget shows a credit for admiralty expenditure of £T1,000,327, which is apparently less than that for the previous year by some £T220,000. This, however, is not a real decrease, salaries of functionaries not on the active list having been removed to the region of supplementary credits, as are those of civil departments. As a matter of fact, the marine budgets of the two years are almost identical. The vote of £T500,000 a year for ten years for the reconstruction of the Ottoman navy by "national subscription," as already mentioned, was not included in the official budget, nor was there any allusion to it in the prefatory memorandum. The minister of finance did, however, allude to it in his budget speech, (April 23, 1910), and stated that four destroyers purchased in Germany had been paid for from the national subscription only, without touching the ordinary state revenues. It should be added that the Greek War (1897) revealed to the sultan the decrepit state into which the Ottoman navy had fallen, and considerable "extraordinary" expenditure—much of which was wasted—has been incurred since (and including) 1902 to put the least out-of-date warships into a serviceable condition.

The ministry of commerce and of public works absorbed £T883,161 a reduction of some £T180,000 on the previous year. The government acknowledges the unavoidable necessity of greatly extending and improving the internal communications of the country, but cannot see its way to doing so satisfactorily out of the ordinary resources of the country. This question was being seriously studied, and it was hoped that a comprehensive scheme would be presented ere long. The Hejaz railway figures in the budget for £T550,180, and it is explained that this will not only cover working expenses, but also the final completion of the line.

Floating Debt.—This is really an accretion of undetermined liabilities which has been indefinitely, and probably alternately, advancing and receding for a great number of years, and which no previous minister of finance, or Turkish government, had the courage to face. Now and then it has been dealt with piecemeal, when some particular class of creditors has become too pressing, but it is more than probable that the piece got rid of has been more or less rapidly replaced by fresh liabilities occasioned by budgetary deficits, or by the mere accumulation of interest on debts allowed to run on.

In March 1897 the floating debt was calculated by a financial authority in the *Fortnightly Review* to amount to upwards of £T55,000,000, which might be compressed to £T25,000,000 since a large proportion was certainly composed of salaries in arrear and other items of a similar kind which the government would never, under any circumstances, make good. Laurent tells us that the present government having found it absolutely impossible to arrive at even an approximate estimate of this "occult debt," recourse was had, in order to fix it, to the creditors themselves, and a short act of parliament was passed declaring all debts prescribed which should not be claimed by a fixed date. In consequence of this 560,000 claims were received, and a first examination showed that the aggregate amount reached by these claims was not less than £T13,000,000. Considering the dilatory methods of Orientals, even when they are creditors, it is doubtful whether this sum adequately covers the whole of the claims outstanding, and it may be found difficult, even for a parliament, to refuse claims which should equitably be admitted and which may be preferred later. High authority in Constantinople put the true amount of the floating debt in 1910–1911 at the amount previously estimated, viz. £T25,000,000. No provision was then made in the budget to meet these liabilities, nor did the minister in his prefatory memorandum make any allusion to them; in his budget speech, however, he announced that a scheme for dealing with them would be presented with the budget for 1911–1912. Under the heading "Floating Debt" in the budget for 1910–1911 are placed the advances before described.

No other items in the budget call for special remark, but in order that the information given may be complete, each head of expenditure is shown separately below, and the budget for 1910–1911, as first placed before the Turkish parliament, presents the following picture, from which it may be observed that the public debt absorbs 26% of the revenue, war service 38% and civil services 36%.

Expenditure.	£T	*Revenue.* (See above for details of general headings here given.)	£T
Public debt	8,288,395	"Direct contributions"	13,725,892
Civil list	443,880	Stamps and registration duties	1,113,452
Legislative corps	181,870	"Indirect contributions"	4,825,812
Finance	2,989,600	Monopolies	3,262,424
Accounts (central)	17,124	State undertakings, commercial and industrial	402,889
Customs	512,670	Domains	513,651
Posts and telegraphs	782,840	Tributes	871,316
Cadastre	109,820	Various receipts	1,132,896
Grand vizierate	25,096	Total	£T25,848,332
Council of state	33,050	Deficit	£T4,421,914
Interior	1,157,230		
Public security	400,405		
Foreign affairs	213,400		
War	8,280,453		
Ordnance	356,440		
Gendarmerie	1,694,778		
Marine	1,000,328		
Sheikh-ul-Islamāt	483,341		
Justice	751,580		
Public instruction	744,086		
Forests, mines and agriculture	370,520		
Public works and commerce	883,160		
Hejaz railway	550,180		
Total	£T30,270,246	Total	£T30,270,246

This deficit was increased, by the action of parliament, to £T9,678,000. Almost immediately after the budget was drawn up a change of government took place, and largely owing to this fact the parliamentary budget commission introduced various modifications on the expenditure side of the account, which increased the estimated deficit to the account just mentioned.[1] The principal increase is due to the war departments, according to the budget speech of the minister of finance (April 23, 1910), although he states that some increase is apparent in all departments. The actual figures of the increase are not, however, given. Exaggerated importance must not be attributed to the swollen deficit. The demands of the various departments of state had been much cut down, and according to the minister of finance's own statement much of the reduction was merely unavoidable expenditure deferred; the fact that some of this expenditure, which had been jealously scrutinized, was to be undertaken at once, meant that demands on future years would be relatively reduced. A loan of £T7,040,000 was arranged with a German group headed by the Deutsche Bank. This loan followed upon one of £T4,700,000 in 1908, and another of £T7,000,000 in 1909 (of which the service is provided by the revenues assigned to the Russian War indemnities amounting to £T350,000 per annum, of which payment has been deferred for forty years), the year 1909 having shown a realized deficit of about that amount—a condition of affairs which would appear alarming were it not that the Turkish Empire was passing through absolutely abnormal times, and was attempting to convert the unstable morass of disorder, ineptitude and corruption left by the previous system into a solid foundation for good and orderly constitutional government. With the two previous loans above mentioned, £T5,500,000 capital liabilities were paid off, the work of reorganization had made considerable progress, and £T2,000,000 remained in hand at the beginning of 1910–1911 to continue it. As before stated reorganization was quickly followed by a marked increase of revenue, and it seemed probable that the forecast of the minister of finance that within a comparatively short time that increase would amount to £T5,000,000 was not excessive. Negotiations were undertaken to increase the customs import duties by a further additional 4%. This measure would produce about £T1,250,000 per annum.

Further expenditure was voted in the course of 1909, to be met by an extraordinary budget. On the receipts side of this budget were comprised the Austrian indemnity for the annexation of Bosnia and Herzegovina (£T2,500,000), cash and securities belonging to the deposed sultan (£T1,600,000), sale of old guns (£T300,000), sale of lands and other property recovered from civil list encroachments (£T908,000), and finally the unexpected balance of the proceeds of the 1908 loan (£T655,000), the whole forming an aggregate total of £T5,963,000. It was intended to assign to the war department £T3,804,918, to the grand master of ordnance £T358,108, to the admiralty £T93,912, and to the ministry of finance £T2,443,202 for the payment of the war indemnities in Thessaly and other urgent liabilities, the estimated aggregate extraordinary expenditure thus amounting to £T6,700,140. Some of the assets above mentioned proved, however, not to be easily realizable. Ready buyers were not found for the state lands, and the sale of the ex-sultan's securities was disputed by the German Reichsbank with which they were deposited, while the government did not consider it good policy to sell the Anatolian railway shares, which it seized at Yildiz, so that only £T450,000 were encashed by the ministry of finance from these sources. Of the sums really received the ministry of finance expended some £T3,000,000, in payment of the Greek indemnity, in repayment of £T1,000,000 of advances to the treasury and by assigning the credit voted to the ordnance department, and it was stated that these payments exhausted the extraordinary resources so far as it has been possible to realize them.

Collection of Taxes.—The Ottoman Empire possesses a very complete system of local self-government within certain limits. Every village or town district has a kind of mayor (*mukhtar*) appointed by election and approved by the official provincial authorities, and a "council of ancients" whose members are elected directly. The taxes are collected by means of the *mukhtars*, termed for this purpose *kabz-i-mal* (receiver of treasure), and under the supervision of gendarmes specially named, termed *tahsildar* (collectors). The official authorities provide lists of all the taxes to be collected to the *tahsildars*, who hand them, against formal receipt, to the *kabz-i-mals*. The latter are bound to pay in to the local authorities all sums collected in five days in town districts, and in fifteen days in villages, if under 1500 piastres; sums of 1500 piastres and over are paid in at once. The *tahsildars* check the accounts of the *kabz-i-mals*, and, if they discover peculation, send them at once to be dealt with by the chief official authorities of the *caza* (department); all the electors of a *mukhtar* are, *ipso facto*, joint sureties for him. If the tax-payer declines to pay his due, he is brought before the proper authorities by the *tahsildar*; if he persists in his refusal, all his goods, except those indispensable for his dwelling and the pursuit of his trade, are sold by auction, without recourse to a judgment by tribunal. If he has no goods which may be seized, he may be summarily imprisoned for a term not exceeding 91 days: two imprisonments for the same debt are not permitted. The military exemption tax is not collected as above, but by the spiritual chiefs of the various religious communities. None of the above regulations apply to Constantinople, where no military exemption tax is imposed, and where separate official regulations for the collection of taxes are in force. The system of farming out the revenues is admitted, and is almost invariably followed in the case of the tithes. When this is done, the revenues to be farmed are put up to public auction and sold to the highest bidder, provided he can prove himself amply solvent and produce sufficient sureties. Elaborate regulations are in force for this method of collection to secure the state receiving its full due

[1] On the 25th of June 1910 the chamber finally passed the budget for 1910–1911. The figures were as follows:—

Ordinary expenditure, £T32,997,000; extraordinary expenditure, £T2,696,000; revenue £T26,015,000, leaving a deficit of £T9,678,000, which was brought up to over £T10,500,000 by special credits for the pension fund, the payment of debts incurred by Abd-ul-Hamid and indemnities to officials. On the other hand, the minister of finance reckoned that the revenue would probably show an increase of £T1,500,000, while about £T2,000,000 of expenditure would remain undisbursed, which, with a reserve of £T2,000,000 from 1909, would reduce the deficit to roughly £T5,000,000.

from the farmers, who, on the other hand, are entitled to full official assistance to enforce their rights.

Assessment of Taxes.—For the purposes of assessment the taxes may be divided roughly into two classes: (1) variable taxes; (2) non-variable taxes. Under the first head would be included proportional taxes dependent upon the value of the property taxed; under the second, taxes whose amount does not depend upon that value. The first class contains such revenues as the *emlak verghi-si* (duty on realty), *'ashār* (tithes), *temettū* (professional tax), &c. In all such cases the taxable values are fixed by a commission of experts, sometimes chosen by the tax-payers themselves, sometimes by the official authorities; in all cases both tax-payers and authorities are represented on the commissions, whose decisions may be appealed against, in last resort, to the council of state at Constantinople, whose decision is final. Revenues composing the second class such as the *tapu* (registration tax) do not vary, unless by special decree, and the assessment is automatic.

The systems, both of assessment and collection, were equitable and far from oppressive in theory. In practice they left almost everything to be desired. The officials, already too numerous and underpaid, frequently, as has been stated above, found such pay as they had far in arrear. They were therefore naturally open to bribery and corruption, with the result that, while the rich often got off almost scot free, the poor were unduly taxed, and often cruelly oppressed by the tax collectors and farmers of revenue. In all departments there ensued, thus, an alarming leakage of revenue, amounting, it was credibly estimated, to quite 40%. The new government energetically proceeded to remedy this state of affairs.

International Administration of the Ottoman Debt.—In consequence of the piling up of the exterior public debt as described above, it amounted after the issue of "general debt" in 1875 to £T190,750,000, and swallowed up annually upwards of £T10,000,000, or nearly half the revenue of the empire as it was then constituted. The revolt of various disaffected provinces brought matters to a climax; in September 1875 one-half of the service of the interest was suspended, paper certificates known as "Ramazans" (since they were issued in the Arabic month of that name) being issued for that half in lieu of cash, and in the following March it was suspended altogether. After the war with Russia, in order to obtain credit from the Imperial Ottoman Bank and local financiers, who refused any further accommodation unless their previous and further advances were amply secured, revenues known as the "six indirect contributions" were handed over to a committee of local bankers (by decree of Nov. 22, 1879), to be administered and collected directly by them. These "six indirect contributions" were the revenues from tobacco, salt, wines and spirits, stamps (commercial), certain specified fisheries, and the silk tithe in specified provinces. Two years later, partly in view of the recommendations of the Congress of Berlin, partly to overcome insuperable difficulties in obtaining any kind of credit, the sultan authorized the Sublime Porte to issue an invitation to the various bondholders' committees in Europe to send delegates to Constantinople for the purpose of negotiating a resumption of payments. These "committees" were the "Council of Foreign Bondholders" for Great Britain, the Imperial Ottoman Bank and its "group" for France, Herr S. Bleichröder for Berlin, the Credit-Anstalt and its "group" for Austria-Hungary, and the Chamber of Commerce and of Arts of Rome for Italy. The Dutch bondholders placed their interests in the hands of the British council. Russia declined to countenance the negotiations in any way. Delegates from the various committees assembled in Constantinople in the early summer of 1881. The commission formed by them in conjunction with the delegates of the Sublime Porte is more generally known as the "Valfrey-Bourke commission," from the leading parts played by the Right Hon. R. Bourke (Lord Connemara), the British delegate, and M. Valfrey, the French delegate. The outcome of the negotiations was the issue of an imperial decree, known as the "Decree of Muharrem," owing to its bearing the date (Turkish style) of the 28th of Muharrem (Dec. 20) 1881. By this decree the outstanding capital of the exterior debt, to which were added the Ramazan certificates above mentioned, and all interest fallen due, making a grand total of £252,800,000, was scaled down to £106,437,234 (£T117,080,958). On this reduced capital a minimum interest of 1% was to be paid, the rate of interest to be increased by quarters per cent. as the revenues set aside for the service of the reduced debt permitted. For purposes of sinking fund the old loans were combined into four groups:[1] group i. containing the 1858 and 1862 loans, with a reduced nominal capital of £T7,902,259; group ii. the 1860, 1863, 1864 and 1872 loans, with a reduced nominal capital of £T11,265,153; group iii. the 1865, 1869 and 1873 loans, with a reduced nominal capital of £T33,915,762, and group iv. the "general debt," of which the last issue was in 1875, with a reduced nominal capital of £T48,365,236, and the "lottery bonds" (railway loan), with a reduced nominal capital of £T15,632,548, the total of group iv. being thus £T63,997,784. As security for the service of the new reduced debt it was provided that an international council should be formed, composed of one delegate each from the bondholders of the United Kingdom, France, Germany, Austria-Hungary, Italy and Turkey, and one representing the "priority bondholders," a term which will be explained later. On this council the Turkish government has the right of naming an imperial commissioner with "consultative voice," *i.e.* no voting power, but the right to express his opinion on the proceedings of the council, who would make all reports he considered necessary to his government. The government was empowered also to name controllers to whom all the accounts of the administration should be open for inspection on demand. In all other respects the council, provided that it kept within the limits of the laws the administration of which was entrusted to it, was to be entirely independent of the Ottoman government, free to appoint and dismiss its own officials from highest to lowest, and to carry on its administration on such lines as it thought best. Proposals made by the council for the modification and improvement of the existing laws and regulations which concerned it were to receive an answer from the government within six months; this provision has remained a dead letter. Any difference between the government and the council, if not possible of adjustment, was to be settled by arbitration.

To this council, with these extended powers, was handed over the absolute administration, collection and control of the "six indirect contributions" above enumerated, for the benefit of the bondholders, and in addition, it was to encash for the same purpose bills on the customs, to be drawn half-yearly in its favour by the minister of finance, amounting annually to £T180,000, representing the tax on Tumbēki (£T50,000) and the surplus revenue of Cyprus (£T130,000); and the Eastern Rumelian annuity, originally fixed at £T245,000, but gradually reduced by force of circumstances, until after frequent suspensions of payment it reached in 1897 the level of £T114,000, and has, since the declaration of Bulgarian independence, been definitely stopped. In order to assist the young kingdom of Bulgaria, which could only with great difficulty and with much damage to its resources have found means to indemnify Turkey for this serious breach of treaty engagements, the Russian government intervened, and proposed as compensation to the Turkish government the deferment for forty years of the annual payment (£T350,000) of the 1877 war indemnity. This proposal was accepted by the Turkish government, which undertook to continue the annual payment of £T114,000 to the public debt administration until the extinction of the debt. The public debt council consented with good grace, although the minister of finance, by omitting to consult that council during the progress of negotiations, lost sight of the fact that a sum of £T87,823 was due to the public debt administration on account of arrears of the Eastern Rumelian annuity up to December 1887, and that a further sum of £T430,741 was due by the Bulgarian to the Turkish government itself in compensation for the Rustchuk-Varna railway under the Treaty of Berlin. As pointed out by Sir Adam Block, the representative of the British and Dutch bondholders, in his report for 1908–1909, the above arrangement would have been prejudicial to the bondholders had the public debt not been "unified" (as described below) since, however, as a result of that unification, the ceded revenues now produced a sum more than sufficient for the service of the debt, it was only the surplus of revenue reverting to the government which was affected. There were further handed over, under the Muharrem decree, to the public debt council, the tribute of Bulgaria, the amount of which has never even been fixed, but as compensation for which the tobacco tithe up to a yearly amount of £T100,000 was ceded to the council in the same conditions as the "six indirect contributions"; the proportional shares (generally known as the "contributive

[1] For simplicity's sake, the lottery bonds having a special treatment different from that of the rest of the loans, these groups, when the new bonds of the reduced debt were exchanged against the old bonds of the original loans, became "series" thus: Series A, group i.; series B, group ii.; series C, group iii.; series D, group iv. and lottery bonds.

parts") of the Ottoman public debt to be borne by Bulgaria, Servia, Greece and Montenegro, which according to the Treaty of Berlin were to be adjudged by the representatives of the Great Powers at Constantinople, one of whom (the Russian) never succeeded in obtaining his instructions, and which therefore have never been fixed; and, finally, the excess of revenue resulting from a revision of the commercial treaties. The ceded revenues, exclusive of the "contributive parts" and the excess from commercial treaties, were estimated by Bourke, in his report to the bondholders on the decree of Muharrem, at £1,812,562 (£T1,993,818). A substantial reduction however, had to be made in favour of the 5% "priority bonds," which were bonds issued to the local banks before mentioned in satisfaction of their claims, and formed an annual first charge of £T590,000 on the whole of the revenues ceded to the bondholders; the capital amount of the "priority bonds" was £T8,169,986, which was to be extinguished by 1906. Four-fifths of the net product of the revenues, after deduction of the first charge of £T590,000, was to be applied to the service of the interest on the new reduced debt, and provided that the four-fifths were sufficient to allow the distribution of 1% interest, one-fifth was to be devoted to sinking fund; but this latter fifth was to be reduced, if necessary, by an amount sufficient to maintain the rate of interest at 1%. The interest on bonds amortized was to be added to the funds available for sinking fund. The sinking fund was to work as follows: First ¼% on the whole reduced capital was to be applied to group i.; if there were any surplus this was to be applied to group ii., until that also received the same full ¼%, and so on for group iii. and group iv., until the whole sinking fund amounted to 1% on the reduced capital. It was to be applied by redemption at the best price possible on the market, until that price stood at £T66·66, when, if the rate of interest served were 1%, it was to proceed by drawings; if the interest were anything more than 1%, and less than 3%, the limit of price for redemption was to be raised to £T75; if the interest were between 3% and 4% inclusive, the limit was to be raised to par. Any surplus of revenue beyond that necessary to provide 4% interest and 1% sinking fund was to be handed over to the government. The lottery bonds receive a special treatment both in regard to interest and sinking fund; full information as to the intricate arrangements made for these bonds will be found in the decree of Muharrem and the published reports of the council of administration of the Ottoman public debt. In 1890 the sinking fund was increased by the conversion of the "priority loan" into a 4% loan and the extension of the term of its redemption for 15 years. In this manner an annuity of £T159,500 was set free, of which £T11,000 per annum was allotted as "extraordinary sinking fund" to series A and £T49,500 per annum each to series B, C and D; the lottery bonds were originally excluded from this arrangement, and special compensation was granted to these later. Each series receives the benefit of the interest on bonds belonging to it amortized by this special annuity. Thus, in the financial year 1900–1901 the total amount of the fund had risen from £T159,500 to £T231,500.

The arrangement set forth in and sanctioned by the decree of Muharrem on the whole worked admirably. Gradually, however, it became apparent that it would be desirable to give Turkish state securities, of which those governed by the decree of Muharrem formed the principal part, a better standing in European financial markets than was possible for bonds bearing so low a rate of interest; to obliterate thus, as far as possible, the effects of the past bankruptcy; and, further, to give the Turkish government a joint interest with the bondholders in the progress of the ceded revenues. The French bondholders, who hold by far the largest proportion of Turkish securities, took the principal initiative in this matter, and, after protracted negotiations with the Turkish government and the other "syndicates" of bondholders, they succeeded, in 1903, in obtaining the following modifications of the original decree of Muharrem.

Series B, C and D (series A having already been completely redeemed by the action of the sinking fund) were replaced by the creation of new 4% bonds to a nominal amount of £T32,738,772, with a sinking fund of 0·45% per annum, bearing identical rights and privileges, and ranking immediately after, the priority bonds. The rates at which the series were respectively exchanged against the new unified bonds were £100 series B against £70 unified, £100 series C against £42 unified and £100 series C against £37, 10s. unified. Bonds of the old series not presented for exchange within a period of fifteen years are prescribed. The amortization is to proceed by purchase when the unified bonds are below par, and when at or above par, by drawings. Coupons and drawn bonds not presented within six and fifteen years respectively of their due dates of payment are prescribed. Interest on amortized bonds goes to swell the sinking fund. When the net product of the ceded revenues amounts to £T2,157,375, the surplus is divisible as to 75% to the Turkish government and 25% to the public debt administration. A variation from this was provided as soon as the priority bonds should become extinct; but these bonds having since been repaid (as mentioned below) by a further issue of unified bonds, this variation lapses. The above 25% is to be employed as additional sinking fund for the unified debt and lottery bonds, in the proportion of 60% and 40% respectively. A reserve fund was created of which the nucleus was the sum already standing to the credit of the "Reserve fund for increasing the rate of interest" (£T1,113,865), plus £T300,000 at least in cash by the issue of sufficient unified bonds to produce that amount and the sum of £T150,000 to be paid by the government to the public debt at the rate of £T15,000 per annum. It should be added that the total issue was made sufficient to reserve also £T1,460,000 for expenses, after taking into account £100,000 in cash paid by the government to the public debt administration out of the said issue. The reserve fund was created primarily to make good any deficiency in the revenues below the amount required to pay the interest due. If such drafts upon the reserve fund become necessary, they are to be made good in the following years out of the surplus above mentioned. The reserve fund is increased by the interest it may earn, but when the capital amount of the fund reaches £T2,000,000 the interest earned is merged in the general receipts of the public debt administration. As soon as the unified debt is reduced to £T16,000,000 the reserve fund is to be reduced to £T1,000,000, the surplus over this last amount being paid to the government. The unified bonds and coupons are exempt from all Turkish taxation existing or to come. Further special stipulations regarding the Turkish lottery bonds were made, but these are, as before, omitted. They will be found in art. x. of the "Annex-Decree" of September 1–14, 1903, which gave the modifications to the Muharrem decree here described force of law. Finally the Imperial Ottoman government reserved to itself the right of paying off the whole unified debt at par at any moment, and all the dispositions of the decree of Muharrem not modified by the new "Annex-Decree" were formally confirmed and maintained. In 1906 a further modification took place in the shape of the final and complete repayment of the priority bonds by the additional issue of £T9,537,000 of unified bonds for the purpose, taken firm by the Ottoman bank at 86. The rate at which the exchange was effected was par with a cash bonus of 6%. The previous annuity required for the service of these bonds having been £T430,500, and the additional charge for the service of the unified debt as a result of the operation being £T424,396, while the government received £T1,272,600 in cash for its own purposes, there was a slight immediate advantage to be found in it: as, however, the priority debt would have been completely extinguished in 1932, the financial wisdom of the change is not apparent.

The ceded revenues administered directly by the public debt council have shown remarkable expansion, and may be fairly looked upon as exemplifying what would occur in the general revenues of the empire when good and honest administration and regular payment of officials finally took the place of the carelessness, corruption and irregularity which existed up to the change of régime. The council has not limited its duties to the collection of the revenues placed under its administration, but has taken pains to develop commercially the revenues capable of such development. A large and remunerative export trade in salt to India is now established, whereas formerly not one grain found its way there; the first steps in this direction were taken in 1892 when works were begun to place the great rock-salt salines of Salif, on the coast of the Red Sea, on a commercial footing. The gross receipts from this export trade amounted in the year 1908–1909 to £T99,564, and the profits approximately to £T12,000, in spite of the contest between Liverpool and Spanish salt merchants on the Calcutta market, which led to a heavy cutting of prices. Pains, moreover, have been taken by the public debt council to develop the sale of salt within the empire. These efforts have been rewarded by the increase of the salt revenue from £T635,000 in 1881–1882, the year preceding the establishment of the council, to £T1,075,880 in 1907–1908. Again, in the early years of the administration (1885), the Pasteur system of selection of silk-worms' eggs for the rearing of silkworms was introduced, and an "Institute of Sericulture" on modern lines was erected (1888) at Brusa for gratuitous instruction in silk-rearing to students from all parts of the empire. Up to the end of 1907–1908, 919 students had received the diploma of the institute, and 465 silk-growers in addition had passed through the course of instruction. These men, returning to their various districts, impart to others the instruction they have received, and thus spread through the regions adapted to sericulture the proper methods of selection and rearing. As a result some 60,000,000 mulberry trees were planted in Turkey during 1890–1910, involving the plantation of about 130,000 acres, and new *magnaneries* and spinning factories sprang up in every direction; while the revenue (silk tithe) increased in the regions administered by the council from £T17,000 in 1881–1882 to

£T125,000 in 1906–1907, the value of the silk crop in those regions having thus advanced by over £T1,000,000. But the regions not under its administration benefited at least equally by the methods above described. Thus the total value of the silk tithe in Turkey increased in the period named from about £T20,000 to £T276,500, and the total annual value of the crop from about £T200,000 to £T2,765,000, or by nearly 2½ millions pounds sterling.

Table A gives the produce of the revenues in 1881–1882, the last year of the administration of the "Galata Bankers," the average product of the first, second, third, fourth and fifth quinquennial periods since the public council was established, and of the year 1907–1908.

Table B shows the total indebtedness of the Ottoman Empire, exclusive of tribute loans.

Tobacco Régie.—From the beginning of the year 1884 the tobacco revenue has been worked as a monopoly by a company formed under Ottoman law, styled "La Régie Impériale Coïntéressée des Tabacs Ottomans." This company has the absolute monopoly of the manufacture and of the purchase and sale of tobacco throughout the Ottoman Empire, with the exception of the Lebanon and Crete, but exportation remains free. It is bound to purchase all tobacco not exported at prices to be agreed between itself and the cultivators; if no agreement can be arrived at, the price is fixed by experts. It is obliged also to form entrepôts for the storage of the crops at reasonable distances from each other, and, on certain conditions, to grant advances to cultivators to aid them in raising the leaf. The cultivators, on the other hand, may not plant tobacco without permits from the régie, although the power of refusing a permit, except to known smugglers or persons of notoriously bad conduct, seems to be doubtful; nor may they sell to any purchaser, unless for export, except to the régie, while they are bound to deposit the whole of the tobacco crops which they raise in any one year in the entrepôts of the régie before the month of August of the year following,

and may not move any tobacco from the place where they cultivate it without the régie's express authority. In order to facilitate supervision, a minimum area of one-half of a *deunum* (a deunum = about one-fourth of an acre) is fixed for ground upon which tobacco may be cultivated; in the suburban districts of Constantinople and some other towns, and in enclosures surrounded by walls and attached to dwelling-houses, it is altogether prohibited. For its privileges the régie has to pay a rent of £T750,000 per annum to the government (assigned to bondholders), "even if it has no revenues at all," and after the payment of a dividend of 8% to its shareholders, and certain other deductions, it has to share profits with the government and the bondholders according to a sliding scale agreed upon between the three parties. The régie did badly during the first four years of its existence, owing principally to two causes: (1) its ineffectual power to deal with contraband to which the system described above leaves the door wide open; (2) the admission of other than Turkish tobaccos into Egypt, which deprived it at once of about £T100,000 per annum. So great were its losses that in the year 1887–1888 it was obliged to write them off by reducing its capital from £2,000,000 to £1,600,000. At the same time it was granted an extension of penal powers, and the losses on *reftieh* (duty on tobacco exported to Egypt) were to be partially borne by the public debt administration. Things went better with it from that time until 1894–1895, when, owing to internal troubles in the empire, and the consequent fear of creating worse disorders, by the strict enforcement of the monopoly, the government withdrew most of its support, and contraband enormously increased. The following table shows the movement of the revenue of the régie from the year 1887–1888 to 1908–1909 inclusive:—

Average for 5 years.	Gross receipts from all sources.	Total expenses, including fixed charges.	Net revenue.
	£T	£T	£T
1887–1892	1,924,264	1,735,896	188,368
1892–1897	2,330,786	2,037,190	*293,596
1897–1902	2,098,537	1,898,646	*199,891
1902–1907	2,511,921	2,104,739	407,182
Year 1907–8	2,660,895	2,146,864	514,031
,, 1908–9	2,597,909	2,167,795	430,114

* There was a heavy fall in the receipts in the four years 1895–1896 to 1898–1899 inclusive. The climax was reached in 1897–1898 when the net revenue amounted to only £63,975 as compared with £T352,000 in 1894–1895, and it did not revert to its previous level until 1902–1903. This was the result of the Armenian massacres, the wholesale emigration of Armenians of all classes, the accompanying profound political unrest throughout the country, and the great extension of contraband which ensued from it.

Negotiations were initiated in 1910 for the prolongation of the concession of the tobacco monopoly, which reaches its term in 1913.

Railway Guarantees.—Up to 1888 the only railways existing in the Turkish Empire (exclusive of Egypt) were, in Europe, the Constantinople-Adrianople-Philippopolis line and the Salonica-Mitrovitza line (finished in 1872); and in Asia Minor, the Smyrna-Aïdin (completed in 1866), the Smyrna-Cassaba (completed in 1866), the Constantinople-Ismid (completed in 1872), the Mersina-Adana (completed in 1886). The want of railways in Asia Minor was urgently felt, but no capitalists were willing to risk their money in Turkish railways without a substantial guarantee, and a guarantee of the Turkish government alone was not considered substantial enough. In 1888 it was proposed by the public debt administration to undertake the collection of specified revenues to be set aside for the provision of railway guarantees, the principle to be followed being, generally, that such revenues should consist of the tithes of the districts through which the railways would pass, and that the public debt should hand over to guaranteed railway companies the amounts of their guarantees before transmitting to the imperial government any of the proceeds of the revenue so collected. The government adopted this proposal, and laid down as a principle that it would guarantee the gross receipts per kilometre of guaranteed railways, such gross receipts to be settled for each railway on its own merits. Considerable competition ensued for the railway concessions under this system. The first granted was for the extension of the Constantinople-Ismid railway to Angora to a group of German and British capitalists in 1888. The Germans having bought out the British rights, this concession became a purely German affair, although a certain proportion of the capital was found in London. Since that time various other concessions have been granted to French and German financial groups, principally the Imperial Ottoman Bank group of Paris and the Deutsche Bank group of Berlin.

The systems of guarantee above described are clearly faulty, since theoretically the railway company which ran no trains at all would, up to the limit of its guarantee, make the largest profits. The concessionnaire companies have, however, wisely taken the view that it is better to depend upon their own revenues than upon any government guarantee, and have done their best to develop the working value of the lines in their charge. The economic effect of the railways upon the districts through which they run is apparent from the comparative values of the tithes in the regions traversed by the Anatolian railway in 1889 and 1898 in which years it so happened that prices were almost at exactly the same level, and again in 1908–1909, when they were only slightly higher. Thus in 1889 they produced £T145,378, in 1898 £T215,470, and in 1908–1909 £T281,919.

A different system, still more uneconomic than the kilometric guarantee pure and simple, was adopted in the case of the Bagdad railway. In January 1902 the German group holding the Anatolian railway concession was granted a further concession for extending that railway from Konia, then its terminus, through the Taurus range and by way of the Euphrates, Nisibin, Mosul, the Tigris, Bagdad, Kerbela and Nejef to Basra, thus establishing railway communication between the Bosporus and the Persian Gulf. The total length, including branches to Adana, Orfa (the ancient Edessa) and other places was to exceed 1550 m.; the kilometric guarantee granted was 15,500 francs (£620). It should be noted that this concession was substituted for one negotiated by the same group, and projected to pass through Diarbekr. This raised strong objections on the part of Russia, and led to the Black Sea Basin agreement reserving to Russia the sole right to construct railways in the northern portion of Asia Minor. The Anatolian railway company, apparently unable to handle the concession above described, initiated fresh negotiations which resulted in the Bagdad railway convention (March 5, 1903). This convention caused much excitement and irritation in Great Britain, owing to the encroachment of German influence sanctioned by it on territories bordering the Persian Gulf, hitherto considered to fall solely within the sphere of British influence. Attempts were made by the German group, assisted by their government, to secure the participation of both Britain and France in the concession. These were successful in France, the Imperial Ottoman Bank group agreeing to undertake 30% of the finance without, however, any countenance from the French government—the "Glarus Syndicate" being formed for apportioning interests. The British government seemed, at one time, rather to favour a British participation, but when the terms of the convention were published, the strongest objection was taken to the constitution of the board of directors which established German control in perpetuity, while it was evident from the general tenor of the convention that a political bias informed the whole; in the end public feeling ran so high that any British participation became impossible.

The financial advantages, however, granted by the Turkish government were singularly favourable to the concessionnaires and onerous to itself. The kilometric guarantee of 15,500 francs (£620) was split into two parts, 4500 francs (£180) being granted as the fixed working expenses of the line, all receipts in excess of which amount were to be credited to the Turkish government in reduction of the remaining 11,000 francs (£440) which took the form of an annuity to be capitalized as a 4% state loan redeemable in 99 years, that being the period fixed for the duration of the concession. The line was to be constructed in sections of 200 kilometres (125 m.) each, and as the complete plans and drawings of each were presented at the times and in the order specified in the convention, the government was to deliver to the concessionnaires government securities representing the capitalization of the annuity accruing to that section. The capital sum per section was fixed, in round figures, at 54,000,000 francs (£2,160,000), subject to adjustment when the section was completed and its actual length definitely measured up. A minimum net price of 81½% was fixed for the realization of these securities on the market. The bonds are secured on the surplus of the revenues assigned to the guarantee of the Anatolian railway collected by the Public Debt Administration, on the excess revenue, after certain deductions, accruing to the government under the "Annex-Decree to the Decree of Muharrem" above described, on the sheep tax of the vilayets of Koniah, Adana and Aleppo, and on the railway itself. The first series (54,000,000 francs or £2,160,000), was duly handed over to the concessionaires in 1903, and was floated in Berlin at 86·4% realizing the sum of £1,868,000. The division of the line into equal sections of 200 kilometres apiece produced at once a somewhat ridiculous result. The little town of Eregli, some 190 kilometres distant from Konia, presented the only excusable locality for the terminus of the first section, and even that place is 90 kilometres distant from Karaman, the last town of any importance for some hundreds of miles on the way to the Euphrates valley, the country between the two towns being desolate and sparsely inhabited. But the Bagdad Railway Company[1] (the share capital of which is £600,000 half paid up), naturally anxious to earn the whole of the capitalized subvention, completed the construction of the entire 200 kilometres. The line was thus continued to a station taking its name from Bulgurlu, a small straggling village four miles away, between which and Eregli there is not a single habitation. But even this did not quite complete the distance, and the line was carried on for still another kilometre and there stopped, "with its pair of rails gauntly projecting from the permanent way" (Fraser, *The Short Cut to India*, 1909). The outside cost of construction of the first section, which lies entirely in the plains of Konia, is estimated to have been £625,000; the company retained, therefore, a profit of at least 1¼ millions sterling on this first part of the enterprise. In the second section the Taurus range is reached, after which the construction becomes much more difficult and costly. On the 2nd of June 1908 a fresh convention was signed between the government and the Bagdad Railway Company providing, on the same financial basis, for the extension of the line from Bulgurlu to Helif and of the construction of a branch from Tel-Habesh to Aleppo, covering a total aggregate length of approximately 840 kilometres. The principle of equal sections of 200 kilometres was thus set on one side. The payments to the company were to be made in two lump sums forming "series 2 and 3" of the "Imperial Ottoman Bagdad railway loan," series 2 amounting to £4,320,000, which was delivered to the company on the signature of the contract, and series 3 to £4,760,000. The Bagdad railway must for much time be a heavy weight on the Turkish budget, the country through which it passes—with the exception of the sections passing from Adana to Osmanieh, through the Killis-Aleppo-Euphrates district (that is, the first point at which the line crosses the Euphrates some 600 m. from Bagdad), and to a lesser extent through the plains of Seruj and Harran—being very sparsely populated, while the financial system adopted offers no inducement to the concessionaire company to work for increasing earnings. It should be mentioned that the Bagdad Railway Company has sublet the working of the line to the Anatolian Railway Company at the rate of £148 per kilometre, as against the £180 per kilometre guaranteed by the Turkish government

[1] Specially formed by the Anatolian railway group for the execution, which the Anatolian Railway Company guarantees under the Bagdad Railway Convention, of the Bagdad railway concession.

[2] The line from Mustafa-Pasha to Vakarel now lies in the kingdom of Bulgaria.

[3] Constructed and worked by the State.

[4] Extension of Anatolian Railway.

[5] The Anatolian Railway group (German) has obtained control of this little railway, which was originally British.

—an additional indication, if any were needed, of the thriftlessness of the latter in the matter. Moreover, the Anatolian railway receives, under the original Bagdad railway convention (1) an annuity of £14,000 per annum for thirty years as compensation for strengthening its permanent way sufficiently to permit of the running of express trains, and (2) a second annuity of £14,000 in perpetuity to compensate it for running express trains—this to begin as soon as the main Bagdad line reaches Aleppo.

It was stated in the preface to the budget of 1910 that the government would grant no more railway concessions carrying guarantees. The amount inscribed for railway guarantees in the budget of 1910 was £746,790. The tables on p. 440 show the respective lengths of the various Ottoman railways open and worked at the end of 1908 and the amount of kilometric guarantees which they carried—and the lengths, &c., of railways worked by the various companies according to the nationality of the concessionaire groups.

Banks.—At the close of the Crimean War a British bank was opened in 1856 at Constantinople under the name of the Ottoman Bank, with a capital of £500,000 fully paid up. In 1863 this was merged in an Anglo-French bank, under a concession from the Turkish government, as a state bank under the name of the *Imperial Ottoman Bank*, with a capital of £2,700,000, increased in 1865 to £4,050,000 and in 1875 to £10,000,000, one-half of which is paid up. The original concession to the year 1893 was in 1875 extended to 1913, and in 1895 to 1925. The bank acts as banker to the government, for which it has a fixed annual commission, and it is obliged to make a permanent statutory advance to the government of £T1,000,000, against the deposit by the government of marketable securities bearing interest at a rate agreed upon. The bank has the exclusive privilege of issuing bank-notes payable in gold. Its central office is in Constantinople, and it is managed by a director-general and advisory committee appointed by committees in London and Paris.

The National Bank of Turkey (a limited Ottoman Company) is a purely British concern with a capital of £1,000,000, founded by imperial firman of the 11th of April 1909, under the auspices of Sir Ernest Cassel. It is understood that it was originated at the unofficial instigation of both the British and Ottoman governments, with the idea of forming a channel for the more generous investment of British capital in Turkey under the new régime, so that British financial interests might play a more important part in the Ottoman Empire than has been the case since the state bankruptcy of 1876. This bank brought out the Constantinople municipal loan of 1909 (£1,000,000). Other banks doing business in Constantinople are the *Deutsche Bank*, the *Deutsche-Orient Bank*, the *Crédit Lyonnais*, the *Wiener Bank-Verein*, the *Russian Bank for Commerce and Industry*, the *Bank of Mitylene*, the *Bank of Salonica* and the *Bank of Athens*.

Monetary System.—The monetary system presents a spectacle of perplexing confusion, which is a remnant of the complete chaos which prevailed before the reforms initiated in 1844 by Sultan Abd-ul-Mejid. The basis of the system adopted was the double standard with a fixed relation of 1 to 15·09, and free coinage. The unit was the piastre (=2⅛d.), nominally subdivided into 40 paras. The gold pound (18s. 2d.) was equivalent to 100 piastres; the gold pieces struck were £T5, £T1, £T½ and £T¼; the standard is 0·916⅔ fine, and the weight 7·216 grammes. The silver coinage consisted of the mejidie (weight 24·055 grammes, 0·830 fine), equivalent to 20 piastres, and its subdivisions 10, 5, 2, 1, and ½ piastre pieces. The altilik, beshlik and metallik currencies struck, the first and last in the reign of Mahmud II. and Abd-ul-Mejid, and the second in the reign of Mahmud only, were not included in the reform; these were debased currencies bearing a nominal value, the altilik of 6, 3 and 1½ piastres, the beshlik of 5 and 2½ piastres, the metallik of 1, ½ and ¼ piastres; they represented the last degree of an age-long monetary depreciation, the original piastre having had a value of about 5s. 7d., which had fallen to 2⅛d. The heavy depreciation in silver causing large losses to the government, free coinage was suspended in 1880, and the nominal value of the mejidie was reduced by decree to 19 piastres (105·26 piastres thus = £T1), while in the same year the debased currencies were reduced, altilik, the 6-piastre piece to 5 piastres, the 3-piastre piece to 2½ piastres, the 1½-piastre piece to 1¼ piastre; beshlik, the 5-piastre piece to 2½ piastres, the 2½-piastre piece to 1¼-piastre; metallik, the 1-piastre piece to ½ piastre, the ½-piastre piece to ¼ piastre, the ¼-piastre piece to ⅛ piastre—these values representing approximately the intrinsic value of the silver, at mejidie standard, contained in the debased coins. The copper coinage (113,000,000 piastres) and the paper currency (kaïmē) (1,600,000,000 piastres) referred to in the above sketch were withdrawn in 1880 by repudiation. The 20-piastre mejidie currency, in spite of the further enormous depreciation of silver since 1880, has scarcely varied in the Constantinople market, but has always remained at a discount of about 3% (between 108 and 109 piastres to the pound) under government rate; this is doubtless due to the fact that the demand and supply of the coins in that market are very evenly balanced. The parity thus working out at 102·60, gold continued to be held away from the treasury, and in 1909 the government decided to accept the Turkish pound at the last named rate. The fractional mejidie coins (5, 2 and 1 piastres) are quoted at a separate rate in the market, usually at a premium over the 20-piastre piece. In the last twelve years of the 19th century the altilik currency was almost entirely withdrawn, and replaced by fractional mejidie; a large proportion of the beshlik has also been withdrawn, but the metallik has not been touched. These debased currencies are usually at a premium over gold owing to the extreme scarcity of fractional coinage. The standard of the altilik is about 0·440 fine, that of the beshlik is 0·185 to 0·225 fine, that of the metallik is 0·170 fine. Foreign gold coins, especially the pound sterling (par value 110 piastres) and the French 20-franc piece (par value 87½ piastres) have free currency. Throughout Arabia and in Tripoli (Africa) the principal money used is the silver Maria Theresa dollar tariffed by the Ottoman government at 12 piastres. The Indian rupee and the Persian kran are widely circulated through Mesopotamia; in Basra transactions are counted in krans, taking as a fixed exchange £T1 = 34·15 krans. The general monetary confusion is greatly intensified by the fact that the piastre unit varies for almost every province; thus, while the pound at Constantinople is counted at 108 piastres silver, it is at about 127 piastres for one kind of transaction and 180 for another in Smyrna, 135 piastres at Adrianople, 140 at Jerusalem, and so forth, accounts being kept in "abusive piastres," which exist no longer. In some towns, *e.g.* Adrianople, small change is often supplemented by cardboard tickets, metal discs, &c., put into circulation by private establishments or individuals of good credit.

A commission (the successor of many) was instituted at the ministry of finance in 1910, to draw up proposals for setting this confusion in order. In his 1910 budget speech the minister of finance, Javid Bey, demanded authority to create a new aluminium coinage of 5, 10, 20 and 40 para pieces, of which he would issue, in the course of three years, a nominal amount of £T1,000,000 to those provinces in which there was a great scarcity of small coins. The amounts of Turkish gold, silver and debased coinage in circulation are approximately £T16,500,000, in gold, £T8,700,000 (940,000,000 piastres at 108) in silver mejidies and fractions, and 200,000,000 piastres in beshlik and metallik.

Tenure of Property.—Real property is held in one of four various ways: either *mulk*, *emiriyē*, *vakuf* or *khaliyē*. (1) *Mulk* is the absolute property of its owner, and can be disposed of by him as he wills without restrictions, save those enumerated lower down (*General Dispositions*) as general for all the four classes. *Mulk* property is governed chiefly by the *Sheri* (sacred law). A duty of 10 per mille on its estimated value has to be paid on transfer by sale, donation or testament; 5 per mille on transfer by inheritance; and a registration duty on expenses of transfer. (2) *Emiriyē* is practically "public domains." The state may grant land of this category to private persons on payment by the latter of the value of the proprietary right—the tithes, ground-rent (should there be private buildings upon it), and the land-tax. It is administered by imperial functionaries called *arazi-mēmuru*; it is with the consent of the latter only that the proprietary rights can be sold. These rights are of simple possession, but they are transmissible in certain degrees to the heirs of the possessor. *Emiriyē* cannot be mortgaged, but can be given as security for debt on condition that it be restored when the debt has been repaid. The creditor may demand the *arazi-mēmuru* to proceed to a forced sale, but the *arazi-mēmuru* is not obliged to comply with that demand; no forced sale may take place after the decease of the debtor. *Emiriyē* is not transmissible by will, but may be transferred by donation, which returns to the donor should he outlive the beneficiary. Should a proprietor of *emiriyē* plant trees or vines, or erect buildings upon it, with the consent of the state, they are considered as *mulk*; an annual tax representing the value of the tithes on the portions of *emiriyē* thus utilized is levied. The *emiriyē* then becomes *mulk*, with certain restrictions as to transfer dues. A transfer duty of 5 % on the estimated value of *emiriyē* is paid on transmission by sale, inheritance or donation, of 2½ % on the amount of the debt in case of mortgage or release from mortgage, and of 10 % on expenses of registration. A different scale is established for *emiriyē* with *moukataa* (rent paid for *emiriyē* with *mulk* property established upon it). (3) *Vakuf* is "all property dedicated to God, of which the revenue is consecrated to His poor"; or "property of which the usufruct, such as tithe, taxes and rents, is attributed to a work of charity and of public interest." When once a property has been registered as *vakuf* it can never be withdrawn. There are two classes of *vakuf*: (*a*) Land so declared either directly by the sovereign or in virtue of imperial authority; (*b*) lands transformed by their proprietors from *mulk* into *vakuf*. The laws and regulations concerning *vakuf* are too intricate to be described; generally it may be said that they form a great obstruction to dealing with a large proportion of the most valuable property in Turkey, and therefore to the prosperity of the country. The *vakufs* are administered by a special ministerial department (*evkaf nazareti*), whose property, on behalf of the state, they theoretically are. The effect of the original system was that a *vakuf* property became the inalienable property of the state, and the original proprietor a mere tenant. All fundamental repairs thus fell to the charge of the state, which could not afford to effect them, and the *vakuf* revenues decreased so rapidly that already in the reign of Selim I. (1511–1520) a serious effort was made to deal with the difficulty. But this resulted in so heavy a burden upon the public that the law had again to be altered to extend hereditary rights, and to admit a system of mortgage which was assimilated to that for *emiriyē*; but the evils were little more than palliated. The curious gilds called *guedik* must here be mentioned. They were established at a time when industry was not free, and the government fixed the number of artisans of every kind of trade in each town, no one having the right to increase that number. The *guedik*, then, had the right to erect buildings on *vakuf* property and supply it with the tools, &c., necessary to exercise a trade. The ancient *guediks* have not been abolished, the government not daring to deprive them of their privileges; but since the Tanzimāt no new ones have been created, industry being declared free. The various special dues payable on *vakuf* form too long a list to be inserted; the highest is 30 per mille. (4) *Kkaliyē*. This property is also styled *mevad*. It consists of uncultivated or rough lands, such as mountains, stony ground, &c., which are useless without clearance, to which no possession is claimed, and which are at such a distance from the nearest dwelling that the human voice cannot be made to reach them from that dwelling. Any one can obtain a gratuitous permit to clear and cultivate such lands; the laws governing ordinary agricultural lands then apply to them. The permit is withdrawn if the clearance is not effected within three years. If the clearance is effected without the necessary permit, the land is nevertheless granted on application, and on the payment of the *tapu* or sum paid by the proprietor to the state for the value of the land.

General Dispositions.—By the "protocol of the 7th Sefer 1284 A.H." foreigners may enjoy the rights of proprietorship on the same conditions as Ottoman subjects throughout the empire, save in the Hejaz. The transmission of property from a foreigner to his heirs is therefore governed by the Ottoman laws, and not those of the country to which he belongs. The real property of a Mussulman does not pass by inheritance to non-Mussulman heirs, but may pass to his Mussulman heirs of a foreign nationality, and vice versa. Property of an individual who has abandoned Ottoman nationality without legal authority so to do does not pass to heirs, whether Ottoman or foreign, but devolves to the state; if legal authority has been granted the government under which the foreign heirs live must have accepted the protocol above cited. An heir who has voluntarily caused the death of the person from whom he should inherit loses all rights of succession. It is not proposed to trace the formalities of transfer and transmission of real property here; they will be found in vol. iii. of the *Dustur* (Ottoman Code). Minerals are worked according to the law of the 14th Sefer 1324 (March 26, 1906). Mines can only be exploited in virtue of an imperial iradē. The concessions are to be for 99 years with the exception of chrome, emery, boracite and other minerals found only in the form of deposits, which may be granted for not less than 40 years or more than 99 years. They may be disposed of under certain conditions to third parties, and they may be inherited. Immovable property, working plant, tools and fixtures, cannot be seized for payment of debts. For the discovery of mines, special permits of research, on which there is a fee of £T5 to £T15, are necessary; full details of the requisite formalities are given in the law. No researches are permitted in boroughs and villages or in forests, pasturages, &c., if it be considered that they would interfere with public convenience. Two permits are not granted for the same mineral within the same area, until the first has lapsed. Specimens may be sent to Europe for expert examination up to an aggregate weight of 2000 tons, on paying the requisite duties. Explosives are under the control of the local authorities. In order to obtain permits foreigners must first have adhered to the law of 1293 (A.H.). The original discoverer of a mine is entitled to a certain indemnity for "right of discovery" to be paid by the concessionaire of that mine, should the discoverer be unable to work it. To obtain a concession, formalities detailed in the law must be complied with, under a penalty of £T100 to £T1000. Should a different mineral from that specified in the imperial firman for a mining concession be discovered in a free state, a fresh firman is necessary to exploit it. Discovered mines not registered by the government, or not worked for a period of 99 years before the promulgation of the law of the 26th of March 1906, are considered as non-discovered. On the promulgation of the firman for the exploitation of a mine, a fee of £T50 to £T100 becomes payable. Two categories of rent, fixed and proportional, are payable to the state by mine-owners. The fixed rent is 10 piastres per *jerib* (about 10,000 square metres), to be paid whether the mine is worked or not. The proportional rent is from 1% to 5% on the gross products of mines of vein formation, and from 10% to 20% on those of mines of deposit formation; the percentages are calculated on the value of the mineral after deduction of freight, &c. to Europe and of treatment. The proportional rents are fixed by the Mines Administration according to the wealth, area and facility of working of the mine, and are inserted in the imperial firman governing the mine, and must be paid before the minerals are exported. Yearly returns, under a penalty of £T5 to £T25, of the results of working have to be rendered to the Mines Administration. If payments due to the government are not made within two months of due date, the mines may be seized by the authorities and sold to the highest bidder. The working of the mine must begin within two years of the date of the delivery of the mine to the concessionaire. Certain specified plans must be delivered annually, under penalty of £T5 to £T25, to the Mines Administration, and, under similar penalties, all information and facilities for visiting the mines in detail must be afforded to government inspectors. Should a mine-owner, in the course of developing his mine, damage the mine of a neighbouring owner, he must pay him an agreed indemnity. With the exception of the engineer and foreman, the employés must be Ottoman subjects. No part of the subterranean working of a mine may be abandoned without official permission obtained according to formalities specified in the law. Owners of the land in which a mine is located have a prior right to work such mine under imperial firman, on the obtention of which a duty of £T4 is payable; if they do not work it the concession may be granted to others, on payment of a certain compensation to the landowner. The research of a mine in no way impairs the rights of ownership of the land in which the mine is located. If a mining concession is granted within lands which are private property or which are "real *vakuf* lands" (*arazi-i-mevkufē-i-sahiha*) only one-fifth of the proportional rent is payable to the state, the other four-fifths reverting to the land-owner or the *vakufs*, as the case may be. As to ancient coins, and all kinds of treasure of which the proprietor is unknown, reference must be made to the *Dustur*, No. 4, p. 89.

BIBLIOGRAPHY.—1. *Topography, Travels, &c.*: The works of J. B. Tavernier, of Richard Knolles and Sir P. Rycaut, of O. G. de Busbecq (Busbequius), Sir T. Hanway, the Chevalier Jean Chardin, D. Sestine and W. Eton (*Survey of the Turkish Empire*, 3rd ed., 1801) are storehouses of information on Turkey from the 16th century to the end of the 18th. More recent works of value are those of J. H. A. Ubicini, *Lettres sur la Turquie* (1853–1854, Eng. trans., 2 vols., 1856); D. Urquhart, *The Spirit of the East* (2 vols., 1838); A. W. Kinglake (especially his *Eothen*, 1844); A. H. Layard, H. F. Tozer, E. Spencer, Ami Boué, A. Vambéry, W. M. Ramsay and J. G. von Hahn (in "Denkschriften" of the *K. Akad. der Wissenschaften zu Wien* for 1867–1869). Sir C. Elliot's *Turkey in Europe* (London, 1907) is comprehensive and accurate. See also P. de Laveleye, *La Péninsule des Balkans* (Brussels, 1886); V. HISTORY

Legend assigns to Oghuz, son of Kara Khan, the honour of being the father of the Ottoman Turks. Their first appearance in history dates from A.D. 1227. In that year a horde, variously estimated at from two to four thousand souls, with their flocks and their slaves, driven originally from their Central Asian homes by the pressure of Mongol invasion, and who had sought in vain a refuge with the Seljukian sultan Ala-ud-din Kaikobad of Konia, were returning under their chief Suleiman Shah to their native land. They were crossing the Euphrates, not far from the castle of Jaber, when the drowning of their leader by accident threw confusion into their ranks. Those who had not yet crossed the river refused, in face of this omen, to follow their brethren; the little band, numbering 400 warriors (according to others, consisting of 2000 horsemen) decided to remain under Ertoghrul, son of the drowned leader. Ertoghrul first camped at Jessin, east of Erzerum; a second appeal to Ala-ud-din was more successful—the numbers of the immigrants had become too insignificant for their presence to be a source of danger. The lands of Karaja Dagh, near Angora, were assigned to the new settlers, who found there good pasturage and winter quarters. The help afforded by Ertoghrul to the Seljukian monarch on a critical occasion led to the addition of Sugut to his fief, with which he was now formally invested. Here Ertoghrul died in 1288 at the age of ninety, being succeeded in the leadership of the tribe by his son Osman. When, exhausted by the onslaughts of Ghazan Mahmud Khan, ruler of Tabriz, and one of Jenghiz Khan's lieutenants, the Seljukian Empire was at the point of dissolution, most of its feudatory vassals helped rather than hindered its downfall in the hope of retaining their fiefs as independent sovereigns. But Osman remained firm in his allegiance, and by repeated victories over the Greeks revived the drooping glories of his suzerain. His earliest conquest was Karaja Hissar (1295), where first the name of Osman was substituted for that of the sultan in the weekly prayer. In that year Ala-ud-din Kaikobad II. conferred on him the proprietorship of the lands he had thus conquered by the sword, and presented him at the same time with the horse-tail, drum and banner which constituted the insignia of independent command. Osman continued his victorious career against the Greeks, and by his valour and also through allying himself with Keussē Mikhal, lord of Harman Kaya, became master of Aīnēgeul, Bilejik and Yar Hissar. His marriage with Mal Khatun, the daughter of the learned sheikh Edbali, has been surrounded by poetical legend; he married his son Orkhan to the beautiful Greek Nilofer, daughter of the lord of Yar Hissar, whom he carried off from her destined bridegroom on her marriage-day; the fruits of this union were Suleiman Pasha and Murad. In 1300 the Seljukian Empire crumbled away, and many small states arose on its ruins. It was only after the death of his protector and benefactor Sultan Ala-ud-din II. that Osman declared his independence, and accordingly the Turkish historian dates the foundation of the Ottoman Empire from this event. Osman reigned as independent monarch until 1326. He pursued his conquests against the Greeks, and established good government throughout his dominions, which at the time of his death included the valleys of the Sakaria and Adranos, extending southwards to Kutaiah and northwards to the Sea of Marmora. Infirmity had compelled him towards the end of his life to depute the chief command to his younger son Orkhan, by whom in 1326 the conquest of Brusa was at last effected after a long siege.

Ertoghrul, 1230–1288.

Osman I, 1288–1326.

Orkhan's military prowess secured for him the succession, to the exclusion of his elder brother Ala-ud-din, who became his grand vizier. At that time a number of principalities had replaced the Seljukian state. Though Yahsha Bey, grandson of Mahommed Karaman Oghlu, had declared himself the successor of the Seljukian sultans, the princes of Aidin, Sarukhan, Menteshē, Kermian, Hamid, Tekkē and Karassi declined to recognize his authority, and considered themselves independent, each in his own dominions. Their example was followed by the Kizil Ahmedli Emir Shems-ed-din, whose family was afterwards known as the house of Isfendiar in Kastamuni. The rest of the country was split up among Turcoman tribes, such as the Zulfikar in Marash and the Al-i-Ramazan in Adana. At his accession Orkhan was practically on the same footing with these, and avoided weakening himself in the struggle for the Seljukian inheritance, preferring at first to consolidate his forces at Brusa. There he continued to wrest from the Greeks the lands which their feeble arms were no longer able to defend. He took Aīdos, Nicomedia, Hērēkē, and, after a siege, Nicaea; Tarakli and Gemlik fell to his arms, and soon the whole of the shore of the Marmora up to Kartal was conquered, and the Byzantines retained on the continent of Asia Minor only Ala Shehr and Biga. These acquisitions were made between 1328 and 1338; in the latter year Orkhan achieved his first conquest from Mussulman hands by the capture of Karassi, the pretext being the quarrel for the succession on the death of the prince, Ajlan Bey.

Orkhan, 1326–1359.
